ELECTRICAL REVIEW.

THE

ELECTRICAL REVIEW.

Vol. C.

JANUARY 7 — JUNE 24, 1927.

LONDON :

THE ELECTRICAL REVIEW, LTD.

4, LUDGATE HILL, E.C. 4.

London:
Published by the Proprietors
at 4, Ludgate Hill, E.C.4.

The Electrical Review

VOL. C. JANUARY 7, 1927. No. 2,563.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES. Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Electrical Outlook.

THE electrical industry has entered the New Year in the right spirit and with a right determination.

The fact that it has passed practically unharmed through a period in which industrial upheaval has crippled so many other branches of activity would alone justify high hopes as the nation settles down to more normal conditions. But in addition to that fact there are the inherent potentialities of electrical development of every kind, which are always opening out for it a new and ever-brightening prospect.

The right spirit alluded to is the sure and certain confidence that great times are at hand. Electrical men do well to indulge this thought and dwell upon the reasons and the signs in general conversation, though, of course, they will not allow a rosy prospect to lull them into contentment and repose. The determination mentioned is the general will to scheme and plan and labour to bring about that increased electrical turnover which will make the times great. Accelerated electrical development in all departments, bigger production, bigger sales, more employment, and bigger profits—these are things which should be, and we believe will be, witnessed during the year 1927.

For reasons which are better known to our readers than to anybody else, because we have so often alluded to them in recent times, there should be record orders placed for plant, cables, switchgear and apparatus, telephone and wireless equipment, and very large sales of all classes of appliances for domestic and industrial service in the Home Market. Indeed, here there ought to be no looking back for years to come. There are many signs of a revival in our general industries which will call for electrical work and products, and the homes of England are demanding electrical service more than ever before. The improvement in the world position of affairs, too, is leading us into new export possibilities, so that the present satisfactory state of our electrical export trade as evidenced by the statistical returns, should not merely be maintained but substantially advanced.

In short, both at home and abroad there should be plenty to do. The larger orders booked during 1926, including a number of noteworthy ones secured quite recently, are likely to occupy some of the works for many months to come, while the atmosphere is just right for securing much new business in all sections of the electrical and allied industries. Yet there is no room for lack of vigilance in regard to foreign competition. British directors, councillors, and engineers who desire to see British electrical industry grow larger and more prosperous, and who wish to see the unemployment figures fall month by month, should continue to give reasonable preference to British products.

669868

The Time for Domestic Advance.

THE attention of all who are interested in domestic electrification is directed to the article from the pen of Mr. Herbert H. Berry, published elsewhere in this issue. Everybody is agreed that the time is fully ripe for electricity to stride straightforward in the domestic field. Influences normal and abnormal have combined in recent months to prepare the way—public discussion of electricity supply matters, coal shortage and dearness, and the widespreading activities set in motion under the E.D.A.-E.L.M.A. campaign. In some places great practical results in the shape of business have been achieved both in new connections and in output of appliances. This new business will itself be a powerful force in bringing on to the mains more and more consumers, for every new user will help the electrical educational movement. The campaign wheels will increase their speed of revolution for several months to come; the innumerable circles will do invaluable work carrying the truth in various ways from their centre out to the circumference of their respective areas. But why should a time limit to the campaign be set? Why should it not go on in some form or other? This is surely the moment when such a question should be raised. Therefore, in printing Mr. Berry's views on "The Electric Market-Place of the Future," we invite our readers to discuss the subject both amongst themselves and in the pages of the ELECTRICAL REVIEW. The opinions expressed by the author have our endorsement, as we have on various occasions stressed the need for co-operation of all interests in bringing electrical applications and electrical apparatus effectively before the notice of the public by means of exhibitions, in the form of Electric Houses, electric showrooms, electric shop windows and shops, local and travelling exhibitions, &c., in which efforts all sections of the industry—manufacturers, electricity supply authorities, and installation contractors—would contribute their quota. There is plenty of room for improvement in respect of organisation and selling on the retailing side of the electrical trade. There is wasted effort by some concerns overlapping in their door-to-door sales canvassing; some areas are overworked adding needlessly to selling costs, while others are under-worked. Local individualistic displays are excellent when planned with specialised local knowledge, but they might be more profitably and successfully conducted, so far as the trade is concerned, if dates could be fixed in collaboration with a centralised body. An Electrical Exhibition Committee, comprising delegates from all sections interested, has been set up, with Mr. Berry as chairman. It will operate under the auspices of the E.D.A., and, in our opinion, contains great possibilities for securing impressive electrical demonstration without undue waste of money if only the rank and file will support their leaders. There is much to be done by the raising of the status of electric selling depôts or centres throughout the United Kingdom. The atmosphere and the time are both suitable for co-ordinated effort. We must facilitate the purchase of all electrical contrivances everywhere if we design to assist to our utmost the domestic electrification movement.

The Central Electricity Board.

THE difficulty in finding suitable *personnel* to form the Central Electricity Board, which we have foretold on several occasions, appears to be making itself felt somewhat acutely at headquarters. Rumours are rife in the daily Press regarding overtures alleged to have been made by the Minister of Transport to various prominent men, with what degree of authenticity we do not know; and on the other hand, suggestions have been put forward apparently with the object of affording inspiration to the Minister, whose lot at the moment can hardly be a happy one. The salary said to be offered to the chairman was £10,000 a year. That is equal to the pay of the Lord High Chancellor, and is more than any other Cabinet Minister receives from the State—yet it is by no means comparable with the actual income of such an outstanding man of affairs as the Prime Minister apparently had in mind a year ago; and taxation would reduce it by one-half. As we have said, if the right man is obtained for this post, his motive for accepting the appointment must necessarily be a higher one than the hope of gain, for he will certainly be a loser in a pecuniary sense.

What salaries will be offered to the other seven members of the Board we do not know, but at least they should be equal to those paid to the Electricity Commissioners, which totalled about £15,000 a year when all the five offices were filled (one is still vacant).

Amongst the names that have been mentioned in the daily Press in connection with the formation of the Board are those of Sir Herbert Blain, Major H. Richardson, O.B.E., M.C., Sir Reginald Blair, Sir Philip Dawson, M.P., and Lieut.-Col. Sir Mathew Wilson, D.S.O., M.P. (the last two, of course, being members of Parliament, are ineligible at the moment). All members of the Board must divest themselves of any interests that they may hold in electricity supply undertakings and electrical manufacturing concerns within three months, and must afterwards refrain from acquiring or holding any such interests; these considerations must weigh heavily with many otherwise eligible persons.

Our sympathies are with the Minister of Transport; we look forward with keen interest to the announcement of his solution to this exceedingly difficult problem, and earnestly hope that it may prove to be a happy selection.

Transatlantic Telephony.

THE recent announcement that the Post Office would shortly be in a position to commence a commercial service of wireless telephony across the Atlantic, from subscriber to subscriber, aroused the interest of the public to an exceptional degree—and justly so, for the feat is indeed an astounding achievement. Some months ago we were favoured with an opportunity to participate in a "trial run," when conversation was maintained over a period of several hours between London and New York, the speech being extremely clear and distinct; it then only remained to organise the system on a permanent basis and to make the necessary arrangements for a regular public service, which work has been so expeditiously performed that the service will be inaugurated to-day.

Great credit is due to the wireless branch of the Post Office Engineering Department, which has displayed not only technical ability of a very high order, but also a degree of enterprise which is not usually associated with a State undertaking. The design and construction of the Rugby station—the most powerful in the world, and the first long-distance station to be wholly dependent upon valves for the high-frequency current—was in itself a first-class engineering feat, and it has been worthily followed up by the later developments, which, moreover, are not likely to represent the limit of the Department's ambitions.

To say that ten or twenty years ago the accomplishment of Transatlantic wireless telephony would have been regarded as an idle dream would be an error, for Dr. J. A. Fleming, who invented the thermionic valve in 1904, predicted it in 1907, and repeated his forecast in 1914. Only by the development of his invention has the achievement been made possible, and to him, with his co-workers in this field—many of them of British nationality—a large share of the credit should be given. Like Alexander Graham Bell, he has been privileged to see his work brought to triumphant fruition within his own lifetime. It should also be stated that the original experiments were carried out by the Western Electric Co., Ltd., in conjunction with their associated companies, and were described in the ELECTRICAL REVIEW of January 19th, 1923. Since that date research has proceeded continuously, and great advances have been made; the Western Electric Company has manufactured and installed the bulk of the plant, and continues to collaborate with the Post Office.

Dry Batteries for Radio Purposes.

Some Impressions of a Visit to the Woolwich Works of Siemens Brothers & Co., Ltd.; their methods of manufacture, and the care bestowed upon the assembly and testing of component parts.

ESTABLISHED in 1858, Siemens Brothers & Co., Ltd., has grown to be one of the largest electrical undertakings of its kind, enjoying a world-wide reputation: its Woolwich factories cover an area of 27 acres, and normally employ 6,000 persons.

Large extensions have been carried out at the works, and we were privileged recently to visit the enlarged

Fig. 1.—Principal Dry-battery Assembly Shop: Side Bays just Visible.

battery shops and, in particular, to witness the methods employed by the Company in manufacturing and testing dry-cell primary batteries for wireless purposes. The well-established reputation of Siemens batteries is backed by the fact that primary cells, both dry and wet, have formed an important and successful portion of the Company's manufactures for over 40 years, and the accompanying illustrations will indicate the spaciousness of the modern shops devoted to the production of dry batteries; they are well lighted, heated and ventilated, the arrangement of the electric lamps and fans being visible in fig. 1.

The Company's dry cell (originally known as the "Obach" type) is considered to be one of the most satisfactory on the market, being made in both the square and round forms. The chief component materials are made up as follows.

Retort carbon is ground, sifted, and mixed with tar and certain other ingredients, which permit the electrode to be suitably shaped (rod, plate, &c., according to type of cell) in hydraulic presses. After trimming off the superfluous material, the electrodes are placed in drying ovens and then baked, maybe for several days in the case of the larger sizes, in order to burn out the mixing ingredients; the resistance is, of course, ascertained by means of a Wheatstone bridge method before the carbons are placed in store.

The other electrode is made of sheet zinc, which is cut up to size and pressed and soldered to shape; the canisters thus formed are next tested for mechanical strength, and also by means of compressed air under water to detect leaky specimens, being dried, of course, before amalgamation. Other types are drawn, which process eliminates joints, but necessitates the use of very pure zinc. Another kind of zinc electrode is cast, the mercury amalgam being incorporated in the molten metal; the mixing process is critical on account of the mercury being very volatile. The Company makes a point of amalgamating all dry-cell zinc electrodes, and to prevent the mercury attacking the solder, a bitumen compound is poured down the inside joint and allowed to flow round the bottom.

When a simple element is allowed to generate a current, the chemical action evolves gas, some of which adheres to the electrodes and produces an e.m.f. which opposes that of the cell, diminishing the latter. This polarisation, due to the products of the electrolysis which takes place, may be almost eliminated if the altered condition of the electrolyte, or plates, which causes it is removed as quickly as it is produced; thus the lowering of the e.m.f. due to this cause may be made very slight, or transient, though the e.m.f. is permanently lowered as current is generated by the "exhaustion" of the cell. In practice, only polarisation at the electro-negative pole is of importance, and the polarising ion is generally hydrogen; in order to overcome its action, the two electrodes are separated by a depolarising agent. The latter, in the case of dry batteries, consists of a stiff paste containing manganese peroxide and carbon, some plumbago to reduce its internal resistance, and gum; its exact composition is not disclosed by makers, but is regulated by cost, service requirements, and skill in manufacture.

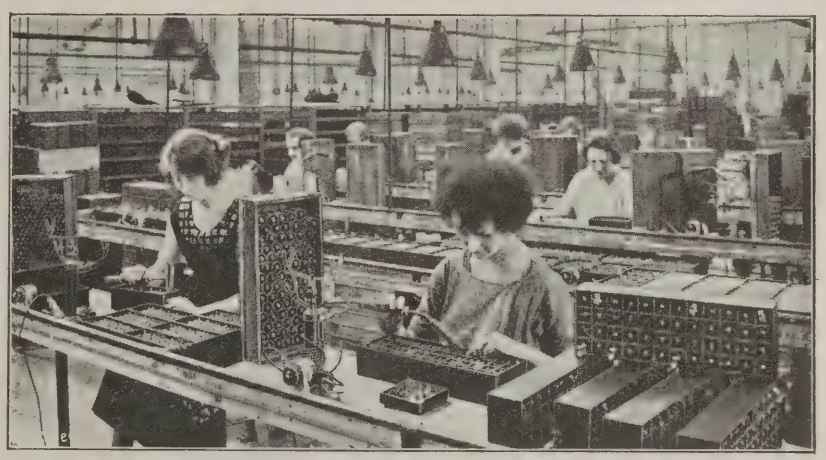

Fig. 2.—Assembly of Standard "RB3" Batteries.

Assembling a dry cell (fig. 1) consists in tamping the

depolariser in a mould round a dummy core, the whole being then placed centrally into the zinc vessel, which also serves as the positive plate of the cell; the inside of the bottom of the vessel is coated with a bituminous compound on which a thick paper disk is laid, thus reducing the possibility of internal short circuiting. The space between the zinc canister and depolariser is filled by pouring in a thin exciting paste consisting of a solution of sal-ammoniac, flour, and plaster-of-paris, the latter causing it to set fairly rapidly. The dummy core is next removed, and the carbon electrode inserted in the centre hole, having been previously fitted with a tinned brass soldering cap, brass screw terminal, or plug socket. A little compound is poured over the top to ensure that no electrolyte will creep across and bridge the electrodes; then the cell is filled up with seed husks, which allow for expansion, and covered with a paper disk through which two small glass ventilating tubes protrude in the case of large cells: the cell is finally sealed with pitch. The above-mentioned precautions are taken to allow a ready means of escape for the gases generated in the cell, and so prevent the outer case "bursting," due to the gradual expansion which seems to accompany the drying of the paste.

At this stage the cells have the appearance indicated in fig. 5, which illustrates the three standard sizes. Each complete cell is now tested individually, first, for e.m.f. and then for p.d. with one ohm resistance in shunt with the voltmeter, which readings enable the internal resistance of the cell to be determined; Siemens voltmeters, having a very small current consumption, are used.

Considerable misapprehension appears to exist regarding the correct method of testing a "high-voltage" dry battery intended for use with radio apparatus. A high-resistance moving-coil voltmeter is, of course, the only suitable instrument for the purpose; the internal resistance of a battery increases with age and use, but it is of relatively little importance in view of the high internal resistance of a thermionic valve, *i.e.*, from 8,000 to 30,000 ohms or more: therefore, a battery having a high internal resistance may nevertheless be still capable of furnishing the maximum current required to operate radio receiving apparatus, provided its overall voltage is sufficiently high. Even a high-grade moving-coil voltmeter with a resistance of at least 100 ohms per volt of scale will take a current of 10 milliamperes at its full-scale reading, and it can accordingly be assumed that if a battery shows a good voltage when indicated by such an instrument, it will give at least the same voltage when delivering current to a radio-receiver.

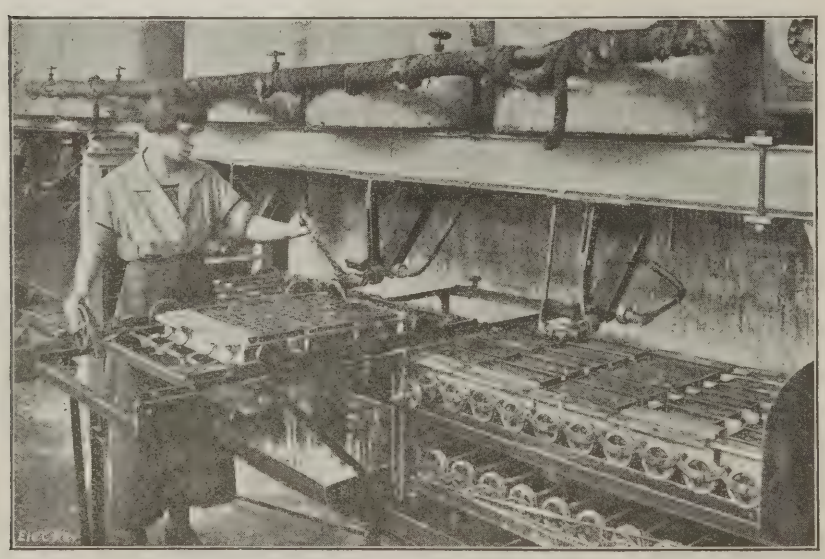

Fig. 4.—Filling Assembled Batteries with Liquid Wax.

Having passed the test successfully, the cells are assembled in the requisite number (according to size of battery) in cardboard boxes, the cells resting on a sheet of corrugated pasteboard at the bottom, and each separated from its neighbours by strips of pasteboard. The terminals and wire cross connectors are soldered on as indicated in fig. 2, which affords a comparison of size between the new (right) and the older smaller standard size to be seen on the left. All soldering operations are carried out with the aid of resin, no liquid fluxes being used, so as to avoid the formation of acids; electric soldering irons are employed.

At this stage the assembled batteries are subjected to further tests, fig. 3, the mechanical strength of the soldered wires being also checked; they are then allowed to stand in racks for several days in order that any incipient defects may have time to mature and reveal themselves in subsequent tests, which are applied before the batteries pass in rotation from the maturing racks to the waxing plant. Liquid paraffin wax is run into the boxes, as shown in fig. 4, the trays of batteries passing on to an endless belt conveyor, which carries them through a duct against a current of cool air, which sets the wax; all cardboard boxes and separators are impregnated with boiling wax to exclude moisture. Every cell is embedded solidly in the wax, and liberally spaced; the previously-mentioned sheet of corrugated paper at the bottom of the containing box assists the wax to penetrate beneath each cell bottom. After

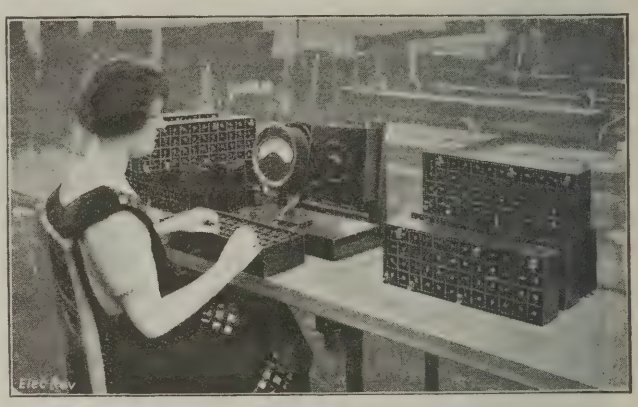

Fig. 3.—Testing Batteries after Assembly.

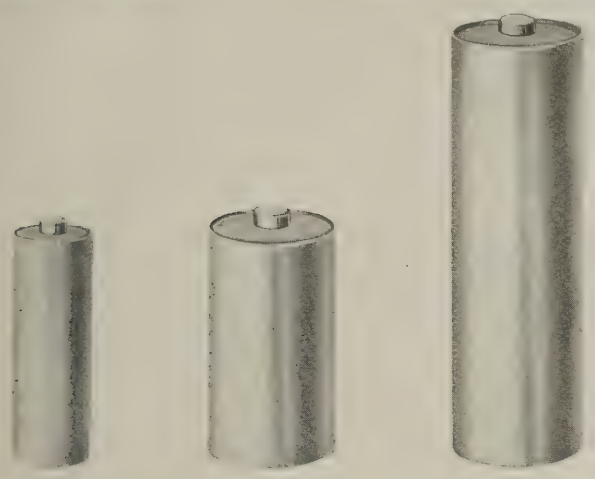


"topping up" to make good the shrinkage of wax, the surface is finished smooth by slightly heating it, and an electrically-heated and driven conveyor machine is being installed to carry out this operation automatically. Labels and printed instructions, at present stuck on to the side or top of the batteries, are to be "floated" under the surface of the wax. After a final test they enter the finished battery stores; on their emerging therefrom, a check test is applied, and each battery is stamped with a code mark to indicate its date of issue to a customer; packing in waterproof paper is facilitated by sealing-band machines.

It is now generally appreciated that a large plate-circuit battery not only assists reception, but is also more economical, notwithstanding its higher initial cost. The "RB3" type of battery consists of 48 cells giving 72 volts and weighing 15 lb., whilst the extra large-capacity pattern shown in fig. 6 is made up of 36 cells connected in series to give a nominal e.m.f. of 50 volts; its weight is 20 lb., maximum discharge rate 20 mA, and dimensions over the lid are $8\frac{3}{4}$ by $5\frac{3}{8}$ by $9\frac{1}{2}$ in. high. Both types are tapped and fitted with dull nickelled spring terminal clips. Thus, three types are now available, their respective maximum economical discharges being: small type, 5 mA; large type, 10 mA; and extra large, 20 mA.

The Company's products include grid-biasing dry batteries, which are now tapped in 1.5-volt steps, a needed convenience. Siemens inert batteries (originally known as the "Dura" type) are made in two 15-volt sizes, weighing 15 oz. and 3 lb. 4 oz. respectively. Their exciting agent is in the form of a powder that remains inert till the addition of clean water changes it into

a paste, thereby giving the cell the characteristics of a dry cell. The special advantage which is claimed for this form of cell is that it will keep, before being charged by the addition of water, for an unlimited time in any climate without deteriorating; it is, therefore, particularly suitable for use in hot climates and in other countries where it is essential to maintain large stocks.

To meet the requirements of those who prefer a wet primary battery for energising the valve-plate circuit, three sizes of Leclanché "sack" cells are made, their discharge rates being 5 mA, 10 mA, and 20 mA at 1.55 volts per cell. Each consists of a circular glass container, a semicircular zinc electrode (negative), and a sack element (positive) enclosing the carbon and depolarising material in fabric instead of a porous-pot,

Weight, oz.	1·25	3	6
Appx. capacity ratio ...	1	3	7·5
Price ratio	1	1·8	2·5

Fig. 5.—Standard Siemens Dry Cells.

which assembly reduces the internal resistance and increases the ampere-hour output. In place of sal-ammoniac crystals, "Siebrolyte" may be dissolved in water to form a viscous electrolyte, which renders the cell practically unspillable; when exhausted, the electrolyte is renewable.

Larger "sack" cells in earthenware jars with a maximum discharge rate of 0.5 A at 1.5 volts are suitable for heating valve filaments, and Siemens low-voltage dry batteries are obtainable for the same purpose; satisfactory service should result when the discharge rate is limited within the normal capability of the battery.

From what has been written, it will be appreciated that the range of dry batteries manufactured by Messrs. Siemens for radio purposes is a comprehensive one. In particular, to those radio enthusiasts who hesitate to use multi-valve receivers on account of the presumed necessity of employing accumulators for energising the valve-plate circuit, the Siemens "Super-Radio" dry battery should appeal strongly. In addition to those mentioned, other types are also made for general purposes, and the care taken in assembling them can only

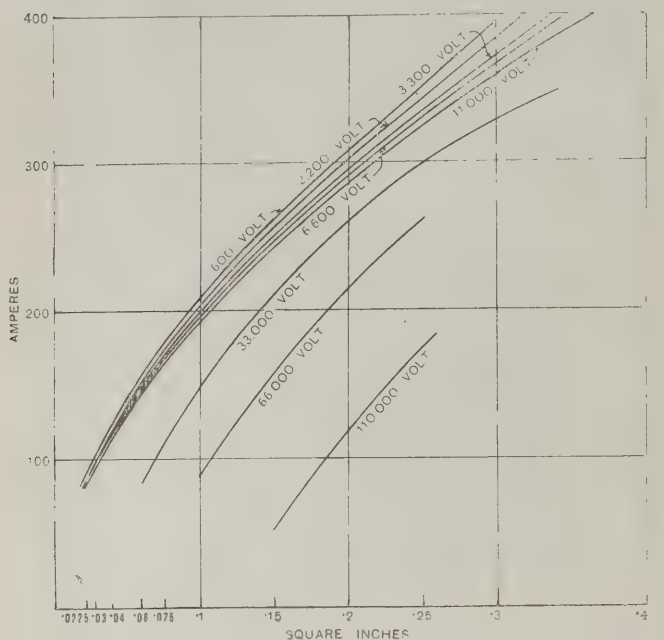
Fig. 6.—Extra-large "Super-Radio" Battery.

be adequately appreciated by witnessing their manufacture. The testing facilities provided in the factory are very complete, for only by actual measurement after each operation which may tend to alter values can the reliability of the product be maintained.

In conclusion, our thanks are due to Messrs. Siemens Bros. for the loan of the photographs reproduced above no less than for the courtesy with which we were received on the occasion of our visit to their Woolwich works.

The Design of Extra-High-Pressure Cables.

The Permissible Current-Carrying Capacities of High-pressure Cables embodied in Curves for three-core and single-core Cables laid direct in the ground.



By E. BERRY NIXON, A.M.I.E.E.

THE numerous articles which have been published dealing with what would appear to be the whole of the crucial points connected with cables of low, medium, and high pressures tend to deter one from adding to their number. The only excuse offered for doing so is that this article deals with and gives views upon what has long been a matter of importance to all potential purchasers and manufacturers of super-pressure cables—authentic carrying capacities.

It is not suggested that we are at present "working in the dark," rather is it meant that individual knowledge should be pooled, and from the collective information tables which would be universally appreciated could be constructed; when considering the formation of these, that portion of the cable which is vital, the core, should receive the major thought. Whether this takes the form of one with a rope centre, hollow, or other design at present depends upon individual opinion; the writer's views on this point have often been expressed in this journal.

Either of the former designs is suitable, but preference can be given to that form used with the Brooks oil system and as employed on the 130-kV experimental line of three single-core cables, each 600 metres long, which has been in operation for a considerable time in conjunction with the overhead line of the Societa Interregional, Italy (ELECTRICAL REVIEW, February 26th, 1926, p. 349).

Quite apart from the value of the large amount of copper saved by using this type of core, the advantage of continual impregnation is apparent, and the continued use of solid stranded cores seems all the more strange if we consider impregnation and carrying capacity. The reduction of the ineffective copper, and the distribution of the electrosatic stresses on these large-diameter conductors, would appear to be strong points in favour of the hollow core.

Reduce capacities to 85 per cent. for two cables laid together; 80 per cent., three cables; 72 per cent., four cables.

Fig. 1.—3-core, p.i. Cable : Carrying Capacities.

The following curves indicating the current-carrying capacities of armoured cables laid direct in the ground are wide in their application as they include the lower voltages. Tables for these have already been published,* but the addition of them was made with the view of increasing the usefulness of the curves. The capacities of cables working at 33 and 66 kV are based on

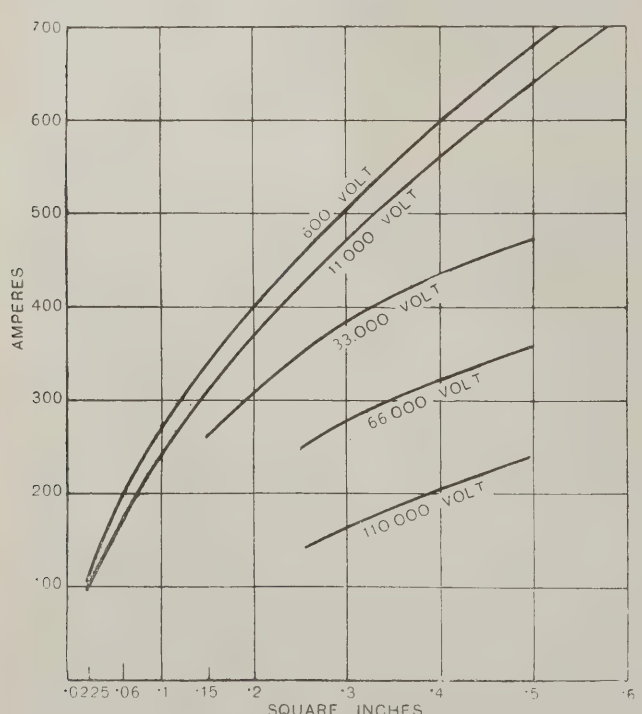


Fig. 2.—Single-core, p.i. Cable Capacities.

experience at these pressures, whereas those at 110 kV are purely theoretical, and in this case it will be realised that some modification of the normal style of a three-core cable would have to be made, possibly in the direction of the S.L. type of cable made by Messrs. W. T. Henley's Telegraph Works Co., Ltd.

* Permissible Current Loading of British Standard Impregnated Paper-Insulated Electric Cables (B.S.S. No. 1-1922) with Explanatory Notes.

Fig. 1 shows the current-carrying capacities for 3-phase, 3-core, cables at 50 periods for pressures up to 110,000 V. We have little or no experience of cable behaviour at this pressure to guide us, but it is fairly safe to decide what would appear to be safe and economical loadings. A cable for a capacity of 100 A at this voltage would, if based on the suggestions already given, consist of one or possibly two layers of core wires, the approximate core diameter being indicated by the sectional area; by this it is meant that the given section fixes the approximate diameter of core, while the amount of effective copper to be left inside this diameter is dependent upon the depth of current penetration.

The next set of curves, fig. 2, giving the current-carrying capacities for single-core cables, provides for three armoured cables being laid direct in the ground

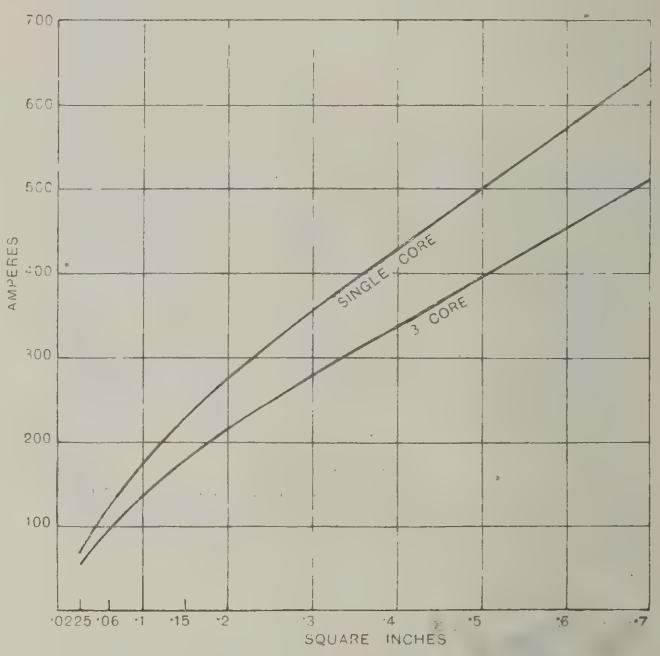

Fig. 3.—Capacities for Varnished-Cambric l.c. Cables.

for the pressures up to 11,000 V, but for the higher voltages they would be unarmoured. The current values suggested for the higher voltages are fairly accurate, and in the case of the 33-kV curve it would be possible to extend it to include cables of larger cross-sectional areas, but for general purposes it is not necessary to do so.

This opportunity is taken for including curves giving the suggested carrying capacities for varnished-cambric insulated and lead-covered cables for internal power station use, fig. 3, and in the case of the single core the basis is for three cables mounted together. It was intended to add curves to cover the higher pressures for this class of cable. but this has been left over until further figures are available.

Tests may prove that the values given in the various curves require some modification, but the curves should prove a useful guide until such time as it is possible to have them corrected. A table of core diameters, giving the actual amount of copper allowed, can be prepared for use with the permissible loading curves.

In conclusion, it is hoped the curves will prove to be of value to many readers and that some benefit will accrue from the above suggestions.

Smoke Abatement.

One of the new laws that became effective on January 1st, which specially affects the inhabitants of large cities, is the Smoke Abatement Act; it does not deal with the domestic chimney, but it increases the penalties for emitting smoke from industrial chimneys. Formerly it was an offence only when such chimneys sent out "black" smoke, but the new law includes white and grey smoke, grit, ash, and soot.

A Railway Electrification Scheme.

Completely Automatic Sub-stations, 33,000 or 12,000 V A.C., 1,500 V D.C. with Remote Control for Supplying the 30-mile line from Capetown to Simonstown of the Capetown Suburban Railway.

THE principal feature of interest in connection with a recent Press visit to the Witton works of the General Electric Co., Ltd., was a demonstration of the working of some of the apparatus which is to be used in connection with the electrification of the Capetown Suburban Railway. The scheme provides for the electrification of the track from Capetown to Simonstown, a distance of about 30 miles, and is believed to be unique in that it is the first occasion on which the equipment for supplying an entire railway line has been automatically operated and remotely controlled.

The power will be supplied from the Salt River power station, Capetown, and transmitted by both overhead and underground cables on a 33,000- and 12,000-V, 3-phase, 50-cycle system to six sub-stations along the track, all of which will be subjected to supervisory control from the generating station. Each "sub" will accommodate one or more pairs of 1,000-kW rotary convertors, each pair in series, for supplying the track at 1,500 V, and the necessary transformers and switchgear for obtaining automatic operation and supervisory control. Fig. 1 shows the outline of the scheme, which will be described in detail as follows:—

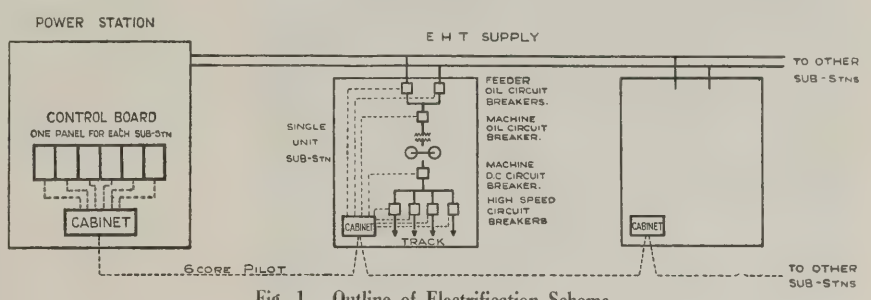

Fig. 1.—Outline of Electrification Scheme.

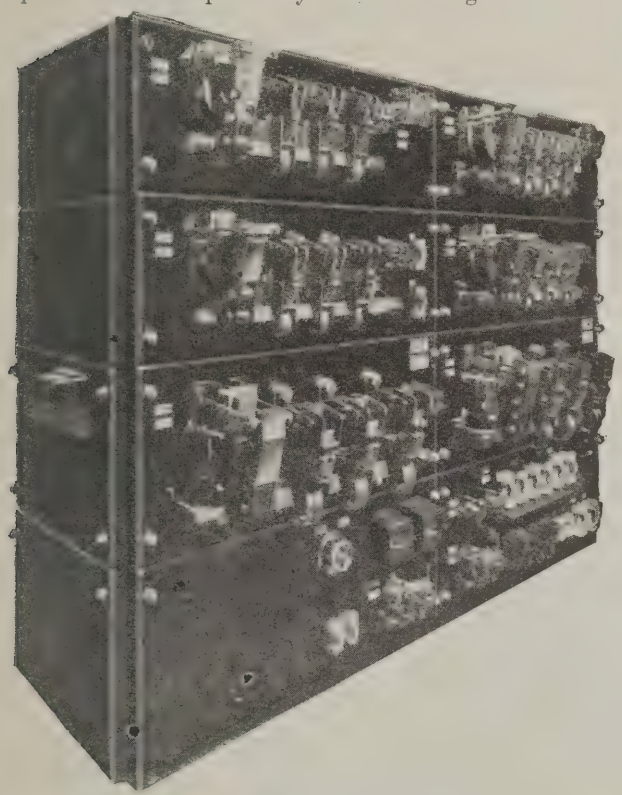

Fig. 2.—Machine Starting Panels.

An oil circuit breaker in each sub-station isolates each e.h.p. feeder cable from the station busbars, while a further oil circuit breaker is installed for disconnecting each pair of rotaries from the bars.

The machine starting equipment consists of two enamelled slate panels, fig. 2, on each of which are mounted three triple-pole contactors for starting, synchronising, and running purposes respectively, in addition to various auxiliary equipment for the machine operations. An interesting feature is a commutator-grinding switch, by means of which, when grinding is in progress, the starting contactors are closed, but the synchronising or running switches held open. The various relays and switching equipment essential to the supervisory and automatic operations at the sub-station end are accommodated on a slate-panel control board, fig. 4. This consists of a l.p. relay panel, a.c. and d.c. machine panels, and a number of outgoing feeder panels. The rotary operations are controlled by apparatus on the relay panel, which also houses an Angold leakage indicator.

On the convertor d.c. panel are the necessary instruments for indicating the load and field currents. Coloured lamps show whether the main d.c. circuit breaker is open or closed. The e.h.p. panel contains intermediate relays for closing the circuit breaker connected between the busbars and the transformer, and also a switch for the local operations. The usual indicating instruments are installed on this panel, and also a link box for testing and a three-phase time-limit overload relay for use with the oil circuit breaker. An auxiliary closing contactor is also provided for the remote control of the air circuit breaker. The feeder panels are similarly equipped.

The actual distribution is effected from a truck-type cubicle board accommodating the necessary incoming and outgoing feeders, designed and equipped in accordance with modern practice. In the incoming truck cubicle is mounted an air-break circuit breaker controlling the d.c. supply. An operating handle is mounted on the front of the truck for the local control of the breaker, referred to later. A butterfly nut handle must be operated before the truck is withdrawn, and should the circuit breaker be closed, the manipulation of this handle will open it automatically before the truck can be moved. The outgoing feeder trucks are similarly equipped, each being provided with a specially designed high-speed circuit breaker. The function of the butterfly nut of the incoming feeder truck is performed on the outgoing apparatus by an ironclad switch suitably mounted on the front of each cubicle.

A sub-station relay cabinet houses the entire equipment necessary to receive the controlling currents sent out from the power station; and, according to their number and sequence, selects the route to the intermediate relay or contactor which operates the desired apparatus. At the power station end the essential apparatus is a dispatcher's control board and a supervisory cabinet. The board has a panel for each sub-station, by means of which a load dispatcher controls the convertors and ascertains whether they are working satisfactorily. The mountings on each panel, fig. 5, are in such a position as to enable the operator to see from a single line diagram of connections the lay-out

of the plant he is controlling, and further, to ascertain immediately the location of any fault that may occur. The two incoming cables are represented at the top, and below these are two two-way control switches for the incoming circuit breakers, and two sets of two signal lamps, red and green, for indicating whether the corresponding oil circuit breaker is open or closed.

The e.h.p. busbars are next represented, and then the operating switch for the machine supply circuit breaker. Below this is shown the rotary-convertor set, and then the d.c. apparatus, with a similar arrangement of indicating lamps for the main d.c. breakers. There are also two white lamps on the panel, one at the top and one at the bottom, for indicating faults on the a.c. or d.c. systems respectively.

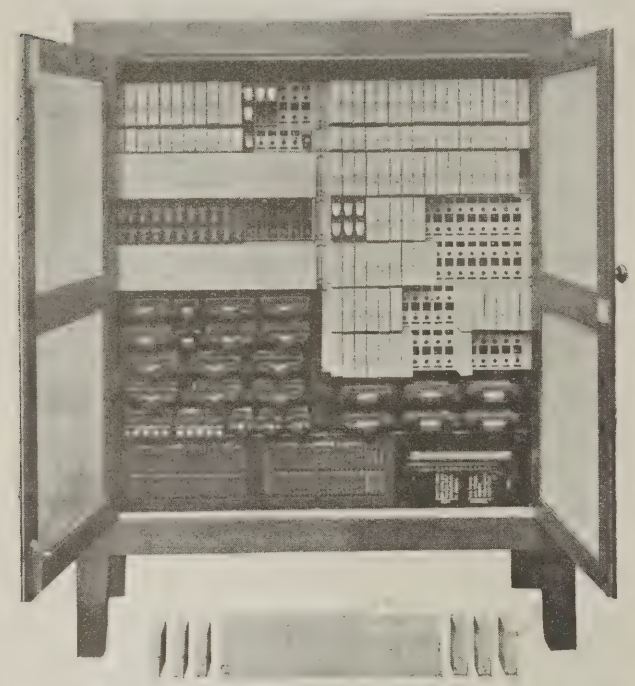

Fig. 3.—Generating-Station Supervisory Cabinet.

The selections of the supervisory remote-control system are arranged wholly by means of relays. A common control or pilot cable runs the whole length of the track, fig. 1, being looped into each sub-station, and is the medium for the supervision of the whole of the sub-station apparatus. Each circuit breaker functions by the simple operation of a single switch, and the selections are achieved by trains of self-generated impulses, the commencement of the impulsing being controlled at the transmitting end and its governing by the correct functioning of the receiving relay equipment. This is operated at 50 V from batteries installed at the power station and sub-stations.

The supervisory cabinet, fig. 3, houses the entire relay equipment for generating and transmitting, in their proper sequence, the impulses, and also the relays required to receive those sent back from the operated circuit breakers, which set up the circuit conditions required to light the signal lamps concerned. The selections of the apparatus and its operation are governed by a series of three trains of impulses. One selects the sub-station, another the group of circuit breakers and the operation to be performed, and a third the required breaker. The first impulse train is received by all the sub-stations, locking out the unwanted ones, and the two subsequent trains of impulses are only received by the selected station. When a circuit breaker has been selected, an indicating signal is sent back to the control station. If this agrees with that sent out from the control station, the operation is allowed to proceed.

The rotary convertors are started by specially designed pony motors and are self synchronising, the synchronising current being limited by means of choking coils inserted between the l.p. side of the power transformers and the machine slip-rings.

After the e.h.p. busbars in the sub-station have been energised, the machine circuit breaker is closed and the rotary-convertor set starts up, synchronises, and parallels with the d.c. bus-bars. The outgoing feeder high-speed circuit breakers are then closed by supervisory control. Where the sub-station has more than one rotary-convertor set, the machines are automatically paralleled when both are required on supply. The attendant at the power station operates the control switch of the rotary-convertor set he wishes to start, and the appropriate intermediate relay is selected and energised by the supervisory gear. The operation of the intermediate relay closes the convertor breaker, and the completion of this operation is indicated by a lamp in the power station, operated by auxiliary contacts on the breaker. The breaker operating transformers are now energised, and an interlock on the breaker completes the circuit which closes the starting contactors, the polarising fields being also switched on to both machines from the sub-station battery. The closing of the starting contactors completes the starting-motor circuit, and the machines run up to speed and build up their field circuits in a similar manner to d.c. generators. When the fields have reached a predetermined value and the machines about 90 per cent. of the synchronous speed, the voltage relay closes, and this in turn closes the synchronising contactors. The full transformer voltage is now connected to the armatures of the rotary-convertor sets and the synchronising chokers in series.

The synchronising relays which are connected across the contacts of one pole of each running contactor become de-energised when the machines are in step and, after a time delay, make contact. As each synchronising relay makes contact, circuits are completed which close the running contactors. When the rotary-convertor set synchronises, an interlock on each running contactor brings the field regulator into operation, and the voltage of the machine settles down to the value determined by the regulator.

When both machines have synchronised and their field relays functioned, the operating circuit for the d.c. breaker is completed and the rotary-convertor set parallels on the d.c. bus-bars. Interlocks on the d.c. circuit breaker then energise the supervisory gear, and the lamp in the power station indicates that the machine is on circuit. When shutting down a rotary-convertor set, after the control switch is set to the " off " position, the supervisory equipment selects and operates the required intermediate relay, which, in turn, completes the circuits for tripping the machine breakers simultaneously, and the remainder of the gear resets ready for the next occasion of starting up.

For testing or other purposes, arrangements are made for the local control of the sub-stations. In such a case

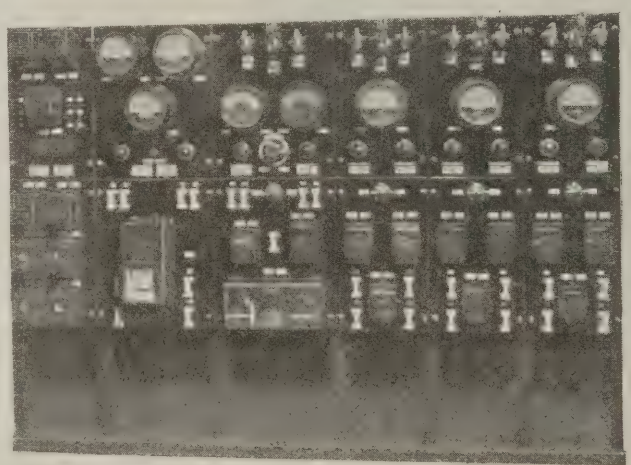

Fig. 4.—Sub-station Control Board.

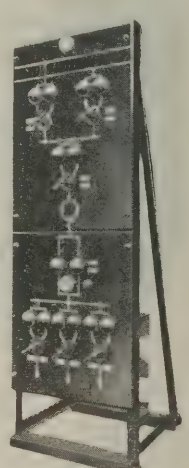

Fig. 5.—Dispatcher's Control Panel.

a "local and distant" controller in the sub-station is switched on to the "local" position, transferring the control to the sub-station control switches.

The machines are fully protected to meet any emergency. A voltage and phase relay prevents the rotary-convertor set from starting up, or shuts it down, when the e.h.p. voltage is low, or a phase is broken or reversed. Inverse time-limit overload and instantaneous earth-leakage relays are installed on the e.h.p. side of the rotaries. Each machine d.c. breaker is fitted with an overload relay having a time lag and a reverse-current relay. To guard against reversed polarity when starting up, polarised fields are fitted to the convertors. These have a 2- or 3-minute rating and are switched on during starting and excited from the battery. Further, should the machine build up with wrong polarity, reverse-polarity relays will shut down and lock out the set. If the set fails to synchronise within a given time, a stalling relay shuts it down and locks it out.

A system of earth-leakage protection, patented by the G.E.C., is used to protect the l.p. windings of the transformers, machine armatures, and the field systems, and will, it is claimed, shut down and lock out the rotaries on the occurrence of a 3 per cent. fault to earth. The machines are further protected against overspeed, unbalanced phase current, overheating, and field failure.

Particular attention has been given to the design of the relays; no oil dash-pots are employed and all the time-relay devices depend on revolving aluminium disks with magnetic braking. The polarity and reverse-current relays are designed to operate across ordinary ammeter shunts, absorbing only 0.075 V at full load.

Fig. 6 shows one of the rotary-convertors included in the contract, and it is interesting to note that the shielding shown is of 5-ply wood. The whole of the apparatus, with the exception of the e.h.p. machine breakers, is being supplied and manufactured by the G.E.C., the supervisory control equipment being made at the Peel-Conner Telephone Works.

The Electric Market-Place of the Future.

A Scheme for Establishing Centrally Situated Electric Market Places Throughout the United Kingdom.

By HERBERT H. BERRY.

THE year 1927 is full of promise for the Electrical Industry and, in my opinion, will mark a new era in the development of Domestic Electrical Engineering.

Whatever may be said of the merits or de-merits of the Electricity Bill which has become the law of the land, there can be no gainsaying that it will give a steadily increasing impetus to the sale of domestic electrical appliances. Many of the existing domestic anomalies will be removed, and it is to be hoped that it will not be long before the complaint is disposed of that whereas energy for heating and cooking purposes on one side of a road is ¾d. per unit, on the other (virtually) it is 3d. a unit, or 300 per cent. higher, while in outlying districts the discrepancy is even greater.

There is, however, in my opinion likely to be a vastly greater advance, even than the levelling-up of current rates, due to the historical fact that the feud between the Incorporated Municipal Electrical Association and the Electrical Contractors' Association Inc., which has existed for 17 years, is now definitely, and, I believe, permanently ended. Moreover, the incidence of the passage of the Electricity Bill through its successive stages in the Houses of Commons and Lords, during the period of *rapprochement*, has made it possible to get into the Bill a special Trading clause, with certain safeguards, which has not only been agreed by the respective parties to the old dispute, but which also includes among its signatories all the existing Electrical Associations which enjoy beneficial interest.

The situation, as I view it, therefore, will be briefly that the Electricity Act will gradually free a large number of engineers whose attention will be largely diverted to the development of their domestic load, and the consequent improvement in load factor.

It has been stated repeatedly that their avowed object in seeking "selling powers" is for the purpose of increasing the sale of current, and not for the purpose of making profits out of wiring and fittings to the local contractor's detriment. The safeguards introduced into the Bill have that premise in mind, and Advisory Committees will endeavour to stabilise the goodwill which has now been established between the parties.

From January, 1927, onwards, the lately contending parties will be working together for the benefit of the public in general and themselves in particular. I look forward to the time in the immediate future when the following dream will be realised.

My vision is that there shall be created in every city, town and village in the country an Electric House or Electric Market Place centrally situated and built on a "common plan." The standard plans, varying in size according to the population of the town or village, will be approved by a special Committee representing

the interested parties. The Electric Home atmosphere once created, with an adequately equipped Lecture and Demonstration room, what could be more fitting than that the Electrical Development Association should arrange a "Circuit" for lecturers and demonstrators, drawn doubtless, to a large extent from the Manufacturers' and other Associations vitally interested in the economic furtherance of electrical propaganda? Local electrical contractors will co-operate with the resident engineer in an endeavour to crowd the building with their actual and prospective customers. The results will be so far-reaching that the Government estimate as to the increase in current per capita during the next ten years will be found in my humble opinion greatly under-estimated. Herein lies the answer to a sceptical wiring contractor (if such still exists).

Nothing can now prevent an immediate expansion in volume of business, but the rate of progress will be slow without co-ordinate effort. Needless squandering of time and money can be avoided if, instead of an individual and haphazard equipment of showrooms in each separate locality a concerted plan is adopted, using the cumulative experience of those pioneers in electric houses such as Hackney and Croydon, who have already borne the burden and heat of the day, added to the selected skill and knowledge of manufacturers who "deliver the goods," plus the service that can be rendered by the British Electrical Development Association. It is quite conceivable that an architect will readily evolve a series of suitable schemes that will place the Electric House or Electric Market Place of the near future on a pinnacle so conspicuous that Great Britain will soon stand in the forefront as regards commercial domestic electric penetration.

In the meantime and during the period of transition an important development has taken place in another direction. A strong Electrical Exhibition Committee has been established comprising elected delegates from each of the industrial associations and the electrical undertakers.

The business of this Committee (which operates under the sheltering wing of the British Electrical Development Association) is to deal with all matters appertaining to the twelve classes of electrical exhibitions ranging from the world type such as Wembley to the minor local and travelling shows.

Those who are contemplating the holding of electrical exhibitions, of whatever magnitude or class will do well to send their preliminary inquiries or proposals to Mr. J. W. Beauchamp, Director of the British Electrical Development Association, 15 Savoy Street, Strand, W.C.

The Electrical Exhibition Committee of which the writer of this article is Chairman, will welcome constructive suggestions in any shape or form. Every attempt will be made to avoid overlapping of the dates of small shows and attention will be given to the "passing on" from one locality to another in the vicinity.

The existing wasteful methods of exhibition propaganda will be as far as possible curtailed by a process of co-ordination, and it is reasonably felt that with the same capital expenditure as formerly a vastly greater beneficial result will be obtained. Let us, therefore, take heart for the future, and for 1927 in particular.

For the first time in English history we have all the great industrial associations agreed upon a common plan. The loyal co-operation of the individual members to support the policy of their responsible leaders is all that is now needed, and it should be the duty of every member to strive earnestly to that end.

Let it be freely known that a new spirit of camaraderie now exists and that the old political differences are for ever buried with the Old Year.

Arc Welding Aided by Hydrogen.

Important Practical Processes result from Scientific Investigation; the Heat of Association of Atomised Hydrogen is used to intensify the Flame, and a Gas Envelope to prevent Oxidisation.

By P. L. ROBERTS.

TWO new adaptations of the electric arc, as employed for welding metals, have been developed as a result of investigations in pure science in the research laboratories of the General Electric Co. of America,* and recently patented. Both attain the same end by the use of different means, and are equally important in that they produce welds of extremely good mechanical properties; a further common advantage is the high speed of welding which can be attained. The first of these processes is known as "atomic-hydrogen arc welding," and owes its origin to the research work of Mr. R. A. Weiman and Dr. Irving Langmuir. The second process also involves the use of the well-known metallic arc, but in an atmosphere of hydrogen, and was investigated by Mr. P. Alexander partly under the direction of Dr. Elihu Thomson.

Atomic-Hydrogen Arc Welding.

The source of welding heat is not directly the electric arc, but the heat of association of hydrogen atoms. It is well known that hydrogen under atmospheric conditions exists in molecular form; if the temperature of the gas is raised sufficiently, it splits up into atoms (two hydrogen atoms to the molecule) and absorbs an enormous amount of heat during the change; as the temperature falls and the atoms recombine to form molecules, the same large amount of heat is given out. Use is made of this heat of association in the atomic-hydrogen process of welding.

The apparatus consists of two electrodes, preferably made of tungsten, held in two insulated heat-resisting holders, which are included at an angle of 45 deg. to each other, and held in close contact with each other under the action of a spring. The electrodes are separated, for striking the arc, by means of a small finger lever. The current is supplied to the electrode by means of a flexible cable fastened to the end of each. The electrode holders and cables are mounted on an insulated handle. Running through the handle with the cables is the hydrogen supply pipe, at the end of which a small jet is arranged immediately above the point of contact of the electrodes in such a manner as to impinge a jet of hydrogen through the arc. The other end of this pipe is connected to a rubber tube which supplies the gas from a near-by cylinder.

The voltage necessary to strike and maintain an arc in hydrogen is much higher than that needed for one

*See ELEC. REV., April 16th, 1926, p. 627.

in air; the characteristics of the electricity supply are, however, similar to those required for metallic-arc welding. If, then, direct current were used from the mains, a series resistance would be necessary for stability, and a line voltage of 250 V; if a reverse compound-wound generator were used, a lower voltage of approximately 175 V would be sufficient for arc striking. When alternating current is used, reactance in series with the arc and a supply voltage of from 350 to 400 V ensures satisfactory arc striking. The voltage drop across the arc is 80 V, as against 25 V for the metallic arc alone, and from 40 to 60 V for the carbon arc. The requisite current varies from 20 to 70 amps. according to the thickness of the work being welded.

The gas used varies also in proportion to the thickness of the work from 20 to 30 cu. ft. per hour. Tungsten electrodes are used on account of their resistance to disintegration under the intense heat of the arc. Their consumption varies from 3/16 in. to $\frac{3}{8}$ in. for every foot of plate ($\frac{3}{8}$ in. to $\frac{1}{2}$ in. thick) welded.

The *modus operandi* is simple and similar to that of an oxy-acetylene blowpipe. The hydrogen is turned on and the electricity supply switch closed; then the electrodes are separated by means of the lever referred to, so striking the arc. The flame formed by the arc and ignited hydrogen is directed on to the work to be welded, the arc being held about $\frac{1}{2}$ in. from the surface. The stream of hydrogen passing through the arc is heated to such a high temperature that it dissociates into atomic form, absorbing heat from the arc in doing so. Immediately the stream of atomic hydrogen strikes the surface of the metal to be welded, it reassociates to form molecules and the heat absorbed from the arc during the first change is given up to the metallic surface, raising it at once to the melting point.

The apparatus is light and flexible and may be held in the hand, or moved along the joint with the same action as an oxy-acetylene blowpipe. The process has all the advantages of the intense and local heat of the metallic arc, combined with the advantages of the oxy-acetylene source of heat, which is independent of any added metal. Additional metal may be added, as and when required, in the form of a rod of the same composition as the parts being welded. Another point in favour of the process is that metals can be penetrated with the flame to a depth of from $\frac{3}{8}$ in. to $\frac{1}{2}$ in. This obviates the necessity, usual with other processes, of preparing the work by bevelling or veeing for the reception of added weld metal and ensuring proper fusion. For instance, two plates 1 in. thick could be fused together completely by simply butting their edges and welding them on one side and then the other. Thus, considerable economy is effected in preparation alone, apart from the increased speed of welding which such penetration means. No rates of welding for the process are yet available.

The Hydrogen Metallic-Arc Process.

In this process the ordinary metallic arc is used, but surrounded by an envelope of hydrogen to prevent the oxidisation of the weld. The apparatus for accomplishing this consists of a blowpipe, much like the pattern used for oxy-acetylene welding; the metallic electrode is fed through the head of the blowpipe, which is fitted with a gas-tight gland, and out of the other end to the work. Surrounding the electrode guides inside the head is an annular space into which the gas is supplied by means of a side pipe, connected to a length of rubber tube. The open end of the blowpipe is just a small annular orifice for the exit of the gas, through the centre of which the electrode passes, so that it is at all times surrounded by a protecting envelope of gas. The hydrogen side pipe and the pipe through which the electrode passes to the head are shaped to run closely parallel to each other and at right angles to the blowpipe head; an insulated tube over both forms a suitable handle for wielding the blowpipe. The electrode wire passes through a flexible casing like a Bowdon cable, of sufficient length to give wide and free movement; the wire is fed automatically by an electric motor from a large reel. This is obviously the only satisfactory way of supplying electrode material, as the usual short hand-fed electrodes would have to be continually fitted through the gas-tight gland, with the loss of much time. The rate of feed of the electrode is automatically controlled by shunting the feed motor (of the reversing type) across the arc circuit, by which means fluctuations in the arc circuit are made to cause counter fluctuations in the motor circuit.

A modification of the apparatus consists of surrounding the work with a box into which the hydrogen is fed: an ordinary short electrode may then be deposited on to the work through a slot in the top of the box. As an alternative, the gas box may be made small and attached to the electrode holder, so that it moves over the work with the electrode.

The electricity supply required is similar to that for the atomic process. A striking voltage of from 180 to 200 V is necessary, while the voltage drop across the arc varies from 60 to 100 V for arc lengths of from 3/16 in. to $\frac{3}{4}$ in. When alternating current is used, an arc striking voltage of 300 V is necessary. The current required is approximately that needed for ordinary metal-arc welding, *viz.*, from 50 to 250 amps., according to the thickness of the work. The amount of gas employed is approximately 30 cu. ft. per hour at a pressure varying from 5 to 10 lb. per sq. in.

The process, like the atomic flame, has the property of deep penetration into the work being welded. This obviates to a large extent the usual necessity of preparing the work, directly increasing the speed of welding. The average rate of welding $\frac{1}{4}$-in. plates with the metallic arc is 15 ft. per hour (welding from alternate sides), while with the hydrogen metallic-arc 60 ft. has been welded in the same time. The method of operation is similar to that of manipulating the ordinary metallic arc, except that the arc length may be varied within wider limits without detriment to the weld. The gas is turned on and ignited before commencing to weld.

Experiments have been made to determine the suitability of other gases as a protective envelope. Coal gas, nitrogen, and carbon dioxide were tried, but not with such good results as could be obtained in air. It was found that the efficiency of the gas varied directly with the amount of hydrogen it contained. Water gas, containing 50 per cent. of hydrogen (by volume) was found to give good results, with the advantage of being cheap. For the sake of portability, liquids which can be made to produce a large proportion of hydrogen were tried. Methanol, which vaporises at 700 deg. C. to form hydrogen and carbon monoxide, was used with success; one gallon will produce 230 cu. ft. of gas, enough for nearly 8 hours' continuous welding. Ammonia, which consists of 75 per cent. hydrogen and 25 per cent. nitrogen by volume, vaporises into these gases at 600 deg. C.; 50 lb. of ammonia will produce 2,250 cu. ft. of the mixed gases, and the addition of the gas in liquid form to the usual apparatus for arc welding will have little or no effect on its portability.

Particular Features of the Processes.

The properties of the welds produced by both processes are similar, and will therefore be considered together. Owing to the intense heat of the arc, some of the hydrogen used in the second process is atomised, as when done intentionally in the atomic flame. Hydrogen in the atomic state has a very great affinity for oxygen, the result being that no oxygen, or other gas, from the atmosphere can reach the weld so long as there is a stream of hydrogen directed on it. The outer layers of the enveloping gas combine with the oxygen to form water, which passes off as steam. Even metallic oxides, such as rust, previously formed on the material being welded, are reduced to metal. In this way, the hydrogen is not only a preventative of oxidisation, but is an active flux for the metals under treatment. The result is to produce welds of high mechanical properties, the most important of which is remarkable ductility. A characteristic example of the properties of a mild-steel

weld made by the hydrogen metallic-arc is given below with average figures for welds made by the ordinary metallic-arc process:—

Method.	U.T.S. tons/sq. in.	Elastic limit.	Reduction of area per cent.	Elongation per cent.
Metallic arc ...	22.0	—	—	4.0
Hydrogen metallic-arc	25.0	42,000	55.0	36

A metallic-arc weld will usually only bend through an angle of from 20 to 30 deg. before fracture, but repeated tests on hydrogen-welded samples allowed of a bend of 180 deg. being made without fracture. Welded strip-steel has been rolled and drawn without fracture, a further demonstration of ductility. The atomic process is not limited to mild steel; high-speed steels containing vanadium, molybdenum, and cobalt have been welded with success. "Stainless" steels containing as much as 15 per cent. chromium have also been welded satisfactorily, and cast-iron may now be welded by either process with the advantage that such important elements as carbon and silicon are not burnt out. Equally good results have been obtained by the atomic process for welding copper and some of the copper alloys, and even aluminium.

Both processes may be adopted for automatic welding. As already indicated, it is desirable that the electrode in the hydrogen metallic-arc apparatus should be automatically fed at the same rate that it is deposited. Such an arrangement has not been tried with the atomic process, and would in any case be difficult in view of the nature of the apparatus. Either appliance, however, may be mounted on traversing gear over the work, and moved at a uniform rate along the joint, but this arrangement is only economical and even practicable on such work as straight or circular tank seams.

The high rate of welding which may be attained by the use of these processes opens up a very wide field of possible applications, purely on economical grounds. The other great advantage of ductility, equal to that of rolled or drawn metal, at once widens the scope beyond the present applications of the ordinary methods. Such structures as steel building frames, ship's hulls, and boilers suggest themselves as applications. The possibilities are very considerable, and point to a deservedly great future.

Correspondence.

The "H" Type of Cable.

Like Mr. Nisbett, I was amused by the article on Hochstadter's Cable in your issue of December 17th, but apparently for reasons dissimilar to his. I was amused, too, by his letter in the current issue of the REVIEW.

To say that I cannot understand his letter would be to underrate my intelligence, and so I do not say so. But I do say this: That the reasons given for condemning "H" type cable are inadequate. In fact, the whole letter strikes me as an attempt to silence opposition by making a loud noise. So, briefly, I will examine each of his paragraphs.

It may be granted that the screening does not prevent ionisation within the cores; but, by reducing the potential gradients, it reduces the tendency to ionisation. It may also be granted that the difficulty of impregnation is increased, but the increase is so slight that proper manufacture can easily overcome it.

That the withstanding of tangential stresses is within the capabilities of a well-made cable does not prove that a cable without such stresses is not a very desirable thing. In fact, Mr. Nisbett's statement on this point verges on one of those negative arguments far too often used by engineers.

That the Hochstadter cable is more costly to make than the belted type is not proved, for, by the elimination of tangential stresses, less insulation for the same reliability is required in the one case than in the other. In any case, cannot the one be bought at the same price as the other?

I am unable to agree that the screened cable is mechanically weaker than the belted type, because in any 3-core cable subjected to bending, the cores move relatively to each other and to the sheath; and such handling as I have given to Hochstadter cable has deformed the cable no more than similar handling of a belted cable. Further, transforming of the cable from a circular to a triangular section does not necessarily increase the cubic contents. Rather, the reverse is the tendency.

Why is the table of curves so unfair to the belted cable? Whether or not the P.F. tests indicate the quality of the cable matters not at the moment, but as a practical comparison was aimed at, it is to be presumed, although it is not explicitly stated in the article, that the experimental lengths were manufactured of similar paper similarly impregnated, and so the results obtained do throw light on the comparative values of the two methods of construction.

Those results show that there does seem to be reason for the claim that "H" type cable will carry more current than the belted type by reason of its lower dielectric losses. The additional heat conduction due to the thin film of metal round the cores may be quite small, but the increased heat conduction due to the thinner paper walls is considerable.

It would be interesting to read Mr. Nisbett's other points, but if they are not better grounded than those he has brought forward, I, for one, fear that, as in the present case, I shall disagree with him.

C. E. Watson, M.I.E.E.

Matlock Bath, *January 2nd*, 1927.

In your issue of December 31st, Mr. Nisbett pours scorn on the equipotential sheath construction as an old idea which has been tried and found wanting.

It frequently happens in the course of scientific progress that a principle is known for some years before any satisfactory means of applying it practically is developed. A classical instance will serve to illustrate this. Heaviside wrote in 1887: "It is the very essence of good long-distance telephony that inductance should not be negligible." It was not until some thirteen years later that it was first successfully applied to any actual line, and now that the necessary conditions are more fully understood, it is in universal use.

The principle of the equipotential sheath is admittedly not new; the patent dates from 1914. That Mr. Nisbett tried it some years ago and found it of no value does not mean that the principle is wrong, but only that he has apparently failed to find the correct conditions for its use.

What are his objections to it?

1. He says the screened cable is more difficult to dry and impregnate satisfactorily. Perhaps it is, a little, but the difficulty is easily overcome by suitable manufacturing methods, and once they are overcome it is actually easier to maintain uniform quality in output.

2. He says the tangential stresses are within the capabilities of the dielectric strength of a well-made cable. They are, on first manufacture if the impregnation is good, but do not remain so in service. Most breakdowns have been initiated at the point where tangential stress is greatest.

3. He says the three-core cable is unmechanical, and a cable made without a belt will be visibly triangular after handling. That depends on manufacture. Properly made with adequate filling, an "H"-type cable is no more liable to become triangular than any belted type.

4. He says that a power-factor voltage characteristic can be obtained with the belted type, which is as good as that obtained with the "H" type. This is nearly true on first manufacture. It is very far from accurate if the comparative tests are made on cooling after a full-load run sufficient to raise the core temperature to its working maximum. The belted-type cable shows a sharp rise in power factor on cooling after a heat run, *i.e.*, under service conditions. The "H" type shows practically no change. Stable characteristics are vital to permanent service.

5. He deduces that there is no foundation for the claim that the "H"-type cable will carry more current than the belted-type cable by reason of its lower dielectric losses. He is right. It will carry more current, however, although not for that reason. The main reason lies in the smaller dimensions to which it can be made to operate satisfactorily and to a slight extent only to the heat conduction along the sheath.

The equipotential sheath is sound in principle, but it is not the sole requirement of a good cable, and harm is sometimes done by over-enthusiastic advocates who claim too much for it. Although known for many years, its development was retarded by the difficulty of finding a suitable material for the equipotential sheath. That is now obtainable, and coupled with improved materials, satisfactory mechanical construction and methods of impregnation, it offers a satisfactory solution of the high-voltage cable problem.

Standard Telephones & Cables, Ltd.
G. H. NASH, *Chief Engineer.*

London, *January 3rd*, 1927.

I have read with interest the criticisms contained in Mr. G. H. Nisbett's letter (ELECTRICAL REVIEW, December 31st, 1926) relative to an article which appeared in your issue of December 17th, headed "A High-pressure Cable Development."

From Mr. Nisbett's letter of December 31st, and also from his letter to the *Electrical Times* concerning the same subject on December 23rd, one would be almost justified in thinking that the author of these letters was fully convinced in his own mind that the usual type of super-tension cable, which has been employed in the past, is the "ne plus ultra" of cable design, at least for pressures up to 33 kV.

For my own part, I am quite prepared to leave this question to be decided by those engineers who have had extensive experience with 33,000-volt normal-type cables.

The Hochstadter patent was taken out in 1914, but the special metallised paper was not then known. The war naturally delayed further development of the "H"-type cable,

but immediately afterwards American and Continental makers were not slow in taking up the "H"-type cable again, with the result that "H"-type cables for super-tension work have been successfully used for years past, after most exhaustive tests and experiments.

The fact that all the leading cable firms on the Continent, as well as six British firms, are now making the "H"-type cables, tends to prove that the principles on which the "H"-type cable is based are not only electrically, but also commercially, sound.

With reference to all the points raised by Mr. Nisbett, these have been disproved in actual practice, and not merely by factory tests; and as to the "H"-type cable being an unmechanical proposition, this is not correct, as the "H"-type cable may be handled and laid with, comparatively speaking, more ease and safety than the belted type of cable.

Concerning Mr. Nisbett's criticism of the power factor and voltage curves, I would like to remind him that in his letter to the *Electrical Times* he stated that "experience shows that power factor relative to voltage is an unreliable index to the dependability of a cable." Why, then, does Mr. Nisbett go to such length in criticising the various curves as published in the ELECTRICAL REVIEW of December 17th if this point is not of importance?

As a matter of fact, Mr. Nisbett's own explanations and criticisms *re* power factors are not at all clear, and I would say that the differences appertaining to the power factors of the Macintosh cable and the Birmingham Corporation cable are wholly dependent upon the temperatures at which the respective tests were made.

F. Richardson,

Research Department, Enfield Cable Works, Ltd.

Brimsdown, *January 3rd*, 1927.

Power Supply for Wireless Sets.

I note in your issue of December 24th a further letter from Mr. H. Hewlett on this subject.

If one does assume that the h.t. battery is going to receive no proper attention, it appears to me that neither accumulators nor any other type of wet cell would be really satisfactory, and one is reduced to the old-fashioned dry battery. But what I wished to point out in my last letter was that more enlightened views are now largely held, and certainly none of our clients are ever left to get their batteries charged "as best they can," except at their own special request.

With proper arrangements, the only attention needed is (*a*) to put the battery on charge by operating a switch about once a week, and to leave it on until the set is wanted next day, and (*b*) to look at the battery once in four or five months and top it up if necessary.

A more serious matter, however, is the estimate given by Mr. Hewlett as regards current consumption. Modern sets, in which precautions are taken to get something approaching distortionless amplification, invariably demand high currents for the last valve. Our own smallest set, using one ordinary and one power valve, consumes 13 mA, which rises to about 20 mA for the largest set, and I would emphasise that in the present state of our knowledge *it is impossible to get distortionless loud-speaker work with less current*, except by the use of excessively high voltages: in other words, a power of about 3 or 4 watts d.c. supply to the anodes is essential.

For those who are unfortunately compelled to use primary batteries, we invariably specify a capacity of the order of 9,000 milliamp.-hours as the minimum which is likely to be satisfactory: such batteries (which we do not trade in ourselves) cost approximately 25s. per 50-volt unit.

P. K. Turner.

Research Department, Burndept Wireless, Ltd.

Blackheath, *December 29th*, 1926.

Boiler-house Efficiency.

I should be much interested if your readers could tell me of a simple way of obtaining boiler-house efficiency—that is, without going too deeply into chemical and combustion problems. Some time ago articles on this subject appeared in the REVIEW, but although they were excellent, they were not so clear to me as they have have been to more studious readers.

December 24th, 1926. **A. W.**

[Possibly the methods devised by Mr. R. H. Parsons would meet the case. The system was described in the ELECTRICAL REVIEW of February 21st, 1919, and the article, reprinted in pamphlet form ("The Coal Consumption of Power Plants, and Bonuses for Coal Saving") is obtainable from this office.—EDS. ELEC. REV.]

Small British Motors.

We have been trying to obtain a British-made electric motor of one-third h.p., of the repulsion induction type, for single-phase circuit. We have sent out several inquiries, but in the majority of instances the quotations seem to be for motors of American origin.

Can you please give us the names of English firms who are likely to make such a small motor of the type mentioned? We must have one of the repulsion induction type, as the starting torque is approximately 180 per cent. full load.

December 29th, 1926. **Coldair.**

An All-Electric House.

A Harrogate Enterprise.

A RECENT development in the demonstration of domestic electricity is the all-electric house which has been equipped and recently opened for a short period to the public at Harrogate by the Corporation Electricity Department and the local contractors, with the object of demonstrating the latest electrical equipment for lighting, heating, and cooking, and the help, by increased convenience and comfort, which can be rendered to the amenities of domestic life only by electricity. Harrogate is a particularly suitable place for such an enterprise by virtue of its reasonable scale of charges for electrical energy. Lighting and heating can be obtained at 4d. and 1d. per kWh respectively, with the option of a ratable-value tariff.

We have received from Mr. Geo. Wilkinson, M.I.E.E., the chief engineer and manager of the Electricity Department, the following particulars of the apparatus installed. The house is an ordinary middle-class, two-storey dwelling of eight rooms, including a lounge, dining-room, kitchen, and five bedrooms, in addition to the hall and bathroom. Each room is equipped with the appropriate electrical apparatus, which includes fires and lighting fittings in each room, a cooking stove and washer in the kitchen, and an automatically-controlled cylinder water heater in the bathroom. A special feature of the installation is an electric thermal storage plant for heating the dining-room and supplying hot water. The illustration shows the dining-room, in which this is installed; it is in the form of the sideboard, on the right of the illustration, which harmonises with the

Dining Room, Harrogate.

other furniture in the room. The panels are of brown cork, and on the left-hand one is a thermometer showing the temperature of the water. The apparatus holds 50 gallons of water in a rectangular steel tank; the surface of the water is covered with oil to prevent evaporation, and also oxidisation of the tank. Submerged in the tank is a 12-gal. copper cylinder which is fed from a ball-tap cistern overhead, and supplies the kitchen and bathroom. Its contents are heated from the external water which is provided with a 2-kW immersion heater. The water temperature is controlled by a metallic thermostat located in the base. A fan propels air through the heater for warming the room, and is supplied from the lighting circuit, its consumption being about 40 W. A second thermostat controls the room temperature and puts the fan in and out of operation. It is claimed that this thermostat maintains the temperature of the room within a 1 deg. F. variation. Under normal conditions the storage heater is on an alternative circuit to that of the ground-floor heating and cooking; when the circuit is broken at night, indicated by a pilot light, the operation automatically closes on the thermal-storage circuit. Conversely, when the heating and cooking circuit is put on in the morning, the thermal-storage circuit is automatically broken, thus ensuring that no current is taken by the storage apparatus except during bed-time hours. In cases where an abnormal amount of water may be required, provision is made for the apparatus to be supplied from the heating circuit during the day. Electricity for the normal night consumption is supplied at a special low rate, thus rendering the apparatus quite competitive with coal or gas heating.

Electrical Currency.

The *Daily Mirror* reports the following conversation which took place at a garage:—

Customer: "What is the charge for this battery?"

Manager: "One and a half amps."

Customer: "How much is that in English money?"

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The official campaign report for the fortnight ended January 1st states that two more demonstration homes have been opened—one at Wembley and Potter's Bar and the other at Walsall. The fifth Birmingham demonstration house is to be opened next week. A house was to be opened at Bishop Auckland on Wednesday last; this will be a specially-constructed all-electric house, and will have no chimneys or fireplaces. Doncaster will open a demonstration house on January 10th and, while it is open, it will be advertised by the Corporation in a main-street shop window. House-to-house distribution of cheque-coupons is being carried out, and campaign posters are being freely used in trams and omnibuses and public places, while direction signs are being posted up in various parts of the town. Yet another house in prospect is that at Hull, which is being got ready for opening on January 18th. Two semi-detached houses adjoining the power station at Sheffield are available for inspection by the public. The Wembley demonstration house is floodlighted in a striking manner, the lower red brick portion being illuminated with red light and the upper stucco part with white light. Contractors in the inner London area are being asked, in the course of personal visits by members of the campaign staff, to give greater prominence to the campaign in their windows. The number of electrical shops and showrooms is very small in relation to other trades, so that "100 per cent." support is essential to make an effective show. A successful three-day exhibition was recently held at Greenock; another one is to be held at Falkirk from February 7th to 11th. Exeter reports that £100 has been raised for the promotion of the campaign in that district. No. 6 of "Home Lighting News" was published last week. This contains the January window display suggestion; a list of towns with demonstration houses; appreciations of the campaign from supply authorities, &c.

After certain unavoidable delays, the all-electric demonstration house at Denton, Manchester, was opened on December 31st. The initiative in the matter was taken by an electrical contractor, Mr. Barratt, of Rusholme, who suggested to the Campaign Committee that if a demonstration house would be of use, he would arrange the matter with a local builder who was prepared to lend the property for the purpose, and further, to add to the attraction of the W.O.B. competition, he offered to any person within 20 miles of his premises who won the competition house a first-class radio outfit. Subsequently, with the aid of the builders, Messrs. J. Riley & Son, the house at Denton was equipped, furniture was supplied by Messrs. Philip Hart, Ltd., Manchester, and many leading manufacturers loaned electrical apparatus. After a brief speech by Mr. R. C. Hawkins, the district officer in charge of the campaign, the house was officially opened by Mrs. H. C. Lamb, the wife of the chief electrical engineer of Manchester. Mrs. Lamb is the moving spirit in the Manchester Branch of the Electrical Association of Women, and is assiduously working to further its objects. The Corporation is offering a special rate of 20 per cent. on the pre-war rateable value of the property or its equivalent, and in the case of this type of house the all-in tariff works out at about 12s. 6d. per quarter, plus ¾d. per kWh used. The house is to remain open from 2 p.m. until 8 p.m. until January 29th.

In the South Midlands Area there are indications that the second half of the campaign will be pushed with more vigour and enterprise than before. Two demonstration houses were opened at Walsall on January 1st, by the chairman of the Corporation Electricity Committee (Councillor J. Thickett, who was accompanied by the Mayor (Councillor J. A. Leckie), both of whom emphasised the tremendous advances made by the domestic application of electricity. The houses are well equipped for demonstrations, and they are being extensively advertised. Personal invitations to visit the houses have been sent out to a large number of householders by the local committee.

The Birmingham local committee will open its fifth demonstration house next week. This will be at Erdington, and a point worthy of note in connection with it is that it has been built by an electrical contractor.

The Birmingham Electricity Supply Department has distributed approximately 2,000 competition booklets, a number which is equalled by the Worcestershire, Staffordshire and Shropshire Electric Power Co., which is continuing its series of rural exhibitions in support of the campaign.

The "All-Electric House" at Lochfield Road housing scheme, Paisley, has proved such a success that arrangements have been made for another exhibition in a house of the bungalow type.

British Empire Chambers of Commerce.

The general arrangements for the eleventh congress of the Federation of Chambers of Commerce of the British Empire, which is to be held in Cape Town during the first week of October, 1927, are already well advanced. The Congress will meet under the patronage of the Earl of Athlone, Governor-General of the Union of South Africa, and the delegates will be entertained at a State banquet. A 25-day tour is being arranged by the Association of Chambers of Commerce of South Africa, with the assistance of the Union Government, in order that when the actual business of the Congress has been concluded the delegates may have the opportunity of visiting the principal cities and other points of interest. The president of the Federation, Lord Kylsant, will preside over the Congress sessions; he will be supported by Sir Edward Dawson, chairman of the Council of the Federation.

Frauds on Electrical Companies.

Two Bradford men, Walter Smith and Martin Hewitt, were sentenced to six months' hard labour at Sheffield last week on a series of charges, including one of obtaining by false pretences radio goods, value £33, from the Siemens and English Electric Lamp Co., Ltd., and another of attempting to obtain nine guineas' worth of goods from Metro-Vick Supplies, Ltd. It was stated by the prosecution that the men came to Sheffield at the beginning of December. Hewitt took a room as an office, had bills and an order book printed, and began business, stating that he was an electrical and wireless engineer; Smith acted as his assistant. The latter went to various electrical firms in Sheffield with orders signed "A. Walker," and, if possible, got the goods. Smith signed for the goods in the name of "W. Jones." His real name was not Smith, but Carroll. There was no trace at the office of any electrical business being carried on. Hewitt, giving evidence, said he intended to pay for the goods. He could buy foreign lamps at 8½d. each and sell them at 1s. 6d. If he had had time he would have paid for the goods out of the profits he would have made from the lamps.

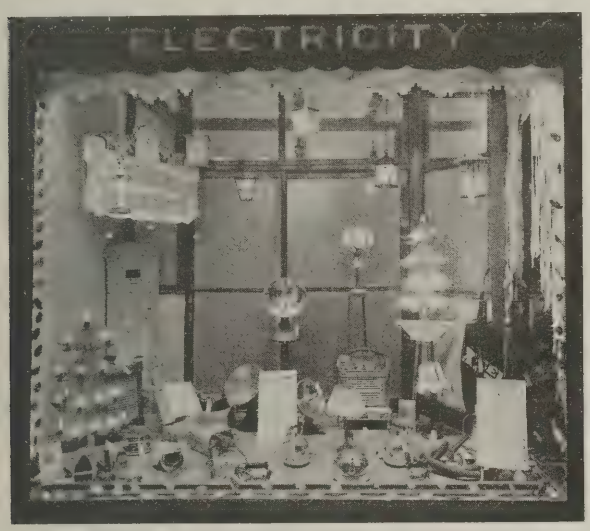
Germans to Construct Moscow "Tube."

The Berlin correspondent of *The Times* reports that the arrangements for the construction of an electric underground railway in Moscow by German firms are now understood to be complete. The work is to be undertaken jointly by the Allgemeine Electricitäts Gesellschaft and the Siemens Bau-Union. The cost is estimated at some 200,000,000 marks (£10,000,000). Apparently the difficulties which arose between the municipal authorities of Moscow and the German contractors have been overcome and negotiations have been resumed with the American syndicate which was to have financed the greater part of the undertaking and which recently became restless at the delays and sought to withdraw. It is understood that under the arrangement now reached the Soviet Government, the municipal authorities of Moscow, and the German electrical firms will all have an interest in the railway when completed.

British Exports to Australia.

The Sydney (N.S.W.) correspondent of the *Daily Telegraph* says that the official statistics of foreign trade for the year ended June 30th last show a decline in the proportion of imports provided by Great Britain, including most of the principal manufacturing groups. The machinery group percentage has declined steadily from 62.5 per cent., pre-war average, to 53 per cent. in 1925-26. Compared with the year 1925 the percentage of iron and steel shows a decline of 3 per cent., electrical machinery 2½ per cent., and other machinery 2 per cent.

Australian Tariff Decision.



The Australian Tariff Board has decided that alternators and generators of over 75-kW, but less than 500-kW, capacity shall be classed under Item 174 provided security is given that the machines will be used only as generators in plant for the production of electrical energy.

Production Management.

An address on this subject was given by Mr. J. F. Marsden, F.S.S., F.C.W.A., at a recent meeting of the Business Research Association of Great Britain. Mr. Marsden touched upon some of the many considerations which a company or firm has to make before actually embarking upon production, as well as the procedure which should be adopted when production has commenced. In one part of his address he set forth a number of matters which had to be studied when choosing a site for a factory. Some of these were: The proximity of the site to sources of supply of raw materials and to the market for the finished product; labour supply in the district; transport facilities; the accessibility of the plant to workers; the accessibility of fuel or power supply; the availability of water for sanitation, processes, and fire protection; drainage; room for expansion; local taxation, &c. While urging that all the natural light available should be obtained, Mr. Marsden impressed upon the meeting the need for properly-designed artificial lighting.

A Christmas Showroom Window.

The illustration which accompanies this note is a view of the showroom of the Bexley Urban District Council's Electricity Department (engineer: Mr. A. J. Abraham). The

The Bexley Christmas Showroom Window.

appliances shown were put forward as suggestions for Christmas gifts, and both these and the lighting equipment were "Siemens" or "Siemens-Xcel" products.

Spanish Tariff Decision.

The revision of the commercial treaty between Spain and France last August affected Great Britain as the special rates existing before the revision were applicable to British goods. The Spanish Government intended to cancel the concession, but as the result of conversations the special rates are to be continued until April next, when it is Spain's intention to definitely withdraw them.

British Trade with Argentina.

Speaking at the recent annual meeting of the British Chamber of Commerce in the Argentine Republic, Sir Malcolm Robertson, the British Minister, as reported by the *Review of the River Plate*, said that British trade in Argentina appeared to be giving way to that of other countries. There were several reasons for that, but they could all be summed up in the statement that we did not study the market. In these days it was of no use waiting for people to come and buy unless a keen demand had been created by advertising. We had to go out and sell, using the language of the country. The market was worth studying for it was the most important of many similar markets in that part of the world. It was not much use trying to sell first-class goods at high prices when the majority of the people wanted goods of lesser quality and lower price. That did not mean the abandonment of the first-class standard and finish, but the production of lower-grade goods side by side with the others. Among other points which should be emphasised to the Argentine buyer was the fact that Great Britain was Argentina's principal customer. Orders lost meant less work in England which, in turn, meant a lower balance available for Argentine products.

The Sydney Contract Dispute.

We have already recorded that the Commonwealth High Court held that it was *ultra vires* the Australian Shipping Board to undertake a contract for the manufacture of steam and generating plant for the Sydney City Council. Recently the Court delivered its considered judgment in the matter, which was that the activities of the Board were confined by its Act to shipbuilding, owning, and repairing. The Chief Justice said that whatever the position might be in time of war, there was no doubt that the Board had no power to undertake external manufacturing and trading in time of peace.

Radio Apparatus for Australia.

A writer in the January *Broadcaster and Wireless Retailer* draws attention to the fact that out of £6,000,000 worth of radio goods imported into Australia during the last 3¾ years only £700,000 worth came from Great Britain. He proceeds to state reasons for the Australian preference for American apparatus; briefly, these are as follows:—The American manufacturer gives better terms and aims to adapt himself to the Australian traders' requirements; better finish and packing characterise American goods; American models are more up-to-date, perhaps on account of the geographical position of the United States in relation to Australia; and prices are more favourable. Among actual examples quoted are accumulators. While it is agreed that the British types are good, it is held that they are wanting in appearance, and, moreover, are usually in celluloid cases, whereas hard rubber is preferred. Mention is also made of super-heterodyne kits, which are stated to be far heavier than the American patterns, which, in addition, are attractively got up. Two British companies, selling valves and loud speakers respectively, are congratulated upon the methods which they have adopted. The writer says that the Australians do not like the position, but, after all, they look for the best and are willing to pay for it.

Colonial Premier's Visit to Standard Works.

The Hon. J. C. Coates, M.C., Prime Minister of New Zealand, visited the Hendon factory of Standard Telephones and Cables, Ltd., last week, and inspected the new 5-kW broadcasting set recently manufactured there for installation at Wellington, N.Z. The apparatus was actually demonstrated, and Mr. Coates expressed his satisfaction with it. A model exchange, forming part of the new automatic telephone system for London, was also demonstrated, and Mr. Coates was shown many other aspects of the company's activities in the advancement of speech transmission.

German Instrument Companies Amalgamate.

With the title of the Zeiss Ikon Gesellschaft, a new company has been formed in Dresden to acquire and amalgamate the electrical and scientific instrument manufacturing businesses of the Cordessa-Nettel Co., Stuttgart, the C. P. Goerz Optische Anstalt Co., Berlin, and the Ica Co., Dresden.

Social Events.

The office staff and works employés of Messrs. Thorn and Hoddle, Ltd., held their annual dinner at the Old Colony Club, Aldwych, on Wednesday, December 29th, Mr. Albert Hoddle taking the chair. Some eighty members of the male sex were present, the ladies making their own party at the Coliseum. A musical entertainment provided a delightful termination to a very enjoyable evening.

The annual carnival dance of the staff and employés of the Automatic Telephone Manufacturing Co., Ltd., took place at the Grafton Rooms, Liverpool, on December 20th. There was a very good attendance, some 750 dancers taking the floor, and an excellent variety of custumes. Prizes were

Costumes at the A.T.M. Carnival Dance.

awarded to Miss Cairns, Mrs. M. Fisher, Mrs. J. Brown, Miss L. Brown, and Messrs. P. W. Jones, G. Allinson, M. Fisher, and E. Williams. These ladies and gentlemen are seen in the foreground of our illustration. Mr. G. W. Moore (manager of the company), assisted by Mrs. and Miss Moore, acted as judges, and Mrs. Moore presented the prizes.

The annual prize distribution of the St. James' Electric Rifle Club was held on December 23rd. The chairman (Mr. F. J. Walker) was supported by Sir A. B. W. Kennedy, F.R.S., and Messrs. O. M. Andrews and W. E. Rowland. Mrs. Andrews distributed the prizes, which included the "Walker" Cup (Mr. E. B. Powell), and the "Deane" cup and rose bowl (Mr. F. O. Andrews).

The Christmas parties organised by the employés of the Halifax Corporation Tramways and Electricity Departments, for their children, were brought to a close in Christmas week, when there was a gathering of 90 happy children at the fourth of the series. The functions took the form of a good tea, games, dancing, and performances by entertainers, with a visit by Father Christmas to distribute toys.

Midland Bank Maps.

The Midland Bank, Ltd., has just issued a new edition of the maps of its own branches and those of affiliated banks. They are folded and bound in a cover of pocket size. The principal map covers the whole of the United Kingdom, but there are also large-scale maps of Central London and of London and suburbs. The bank has 1,900 branches in England and Wales.

Direction-finder Installations.

The Marconi International Marine Communication Co., Ltd., reports further progress in the installation of Marconi direction-finding apparatus. Ships included in recent orders for equipment are six P. & O. liners, five New Zealand Shipping Co.'s liners, and 11 other vessels. The application of wireless direction finding to cross-Channel boats will obviate to a great extent the delays and uncertainty caused by the dense fogs and currents which are met with.

German Cables for Durban.

The *South African Engineer* says that the Durban Corporation has recently departed from its principle of buying British materials, in the matter of some telephone cables. The South African representative of a Berlin cable maker quoted a net price of £3,273 for material on which the lowest British offer was £1,268 higher. The interesting point emerges that another offer of German origin was but little less than the lowest British tender. "Under the circumstances, it is not surprising that in deciding to accept the lowest German bid, the various committees stipulated that the Corporation should have a representative at the factory to oversee the manufacture of the cable. This will absorb £200 or more of the saving, leaving roughly a difference of £1,000."

Modern Church Lighting.

The illustration herewith is a view of the interior of St. Mark's Church, Sheffield, which has recently been equipped with a modern lighting installation. The fittings and flood-lighting arrangement for the chancel were provided by Metro-Vick Supplies, Ltd. (Sheffield branch). The fittings include ten six-light pentagon fittings and two nine-light octagon (48-in. diameter) fittings, the other lighting being furnished by 36-in. diameter electroliers and single-light

St. Mark's Church, Sheffield.

brackets fitted with 75-W white-sprayed gasfilled lamps. The chancel is floodlighted with "Emvee" reflectors and 100-W gasfilled lamps. "Cosmos" lamps, "Emvee" switches and lampholders, and Glover's v.i.r. cable are used throughout. The contractors who carried out the work were Messrs. Marsh Bros., Fargate, Sheffield.

Italian Tariff Increases.

Under a recent decree certain increases in import duties were put into force on December 19th. Among the articles affected are vacuum cleaners for houses and buildings (portable types), threaded iron and steel tubes, and light-projecting apparatus and machines, with lenses or prisms and parabolic reflectors.

Local Exhibition.

GREENOCK.—An exhibition organised by the Corporation Electricity Department was opened on December 28th by Councillor Lemmon, convener of the Electricity Committee. All the latest electric lighting fittings, fires, and appliances were on view, while cooking demonstrations attracted much attention. Kinema films added to the brightness of the exhibition, which was visited by large numbers of citizens.

Australian Preference for British Goods.

We recently reported that the Commonwealth Government had directed its Tenders Board to give preference to goods made in the United Kingdom if such goods could not be manufactured in Australia. This direction has now been strengthened by a further one that, before foreign goods are considered, articles manufactured partly in the United Kingdom and partly in the Dominions should receive favourable attention.

New South African Tube Company.

A provisional agreement has been arrived at between Stewarts & Lloyds, Ltd., and the Union Steel Corporation (South Africa) for the formation of a company to be known as Stewarts & Lloyds of South Africa, Ltd. This company will undertake the manufacture of tubes at a works to be erected at Vereeniging, the steel for which will be provided by the Union Steel Corporation, and it will also take over the merchant business hitherto carried on by a subsidiary of Stewarts & Lloyds, Ltd.

The Japanese Electrical Industry.

In a recent report on Japanese conditions, the Kobe correspondent of the *Chamber of Commerce Journal* (London) says that force of circumstances has prevented a too radical pursuit of the retrenchment policy, and there have been some big foreign loans for productive enterprises, and this, while increasing indebtedness, has maintained prosperity, without imposing any inconvenient burdens. The electrical companies have been among the chief borrowers, and Japan has now some very big concerns manufacturing electrical machinery and fittings. It is mainly in high-power generation, where speeds are very high and metallurgical considerations are of the first importance, that machinery has to be bought abroad nowadays. The manufacture of power generators is naturally considered a very important matter, and though it has been usual to import all kinds of internal-combustion engines, there are promises of the early taking up of certain varieties of Diesel engines in the big dockyards.

Unemployment.

The total number of persons registered at the Employment Exchanges as wholly unemployed on December 20th was 1,309,700, as compared with 1,410,378 on December 13th, and 1,102,400 on December 21st, 1925.

Shop and Store Lighting.

The first Illumination Design Course of 1927, the twelfth of the series, will commence at the London Lighting Service Bureau on January 24th, when Mr. H. Girdlestone will lecture on "The Lighting of Shops and Stores." The lecture will be illustrated by several full-size windows and specimens of interior lighting.

Prices of Raw Materials.

Messrs. F. Smith & Co. report, January 4th:—Copper (electrolytic) bars, £64, 15s. dec.; ditto ditto sheets, no change; ditto ditto wire rods, £74, 15s. dec.; ditto ditto h.c. wire, 9 5/16d., 1/16d. dec.

Messrs. James & Shakespeare report, January 4th:—No change in the price of copper bars (best selected), sheet and rod; English pig lead, £29 15s., 15s. dec.

Messrs. Edward Till & Co. report, January 4th:—India-rubber, Para fine, 1s. 4¼d., ⅜d. to 1½d. dec.

In their weekly report on the lead position, Messrs. James Forster & Co. stated (January 1st):—"There is little fresh to report. A fair demand from consumers has been experienced this week, but in spite of this prices have sagged. Cable makers are still as slack as ever, and there are no signs yet of any Post Office orders being placed."

Company Law Amendment.

A deputation from the Association of British Chambers of Commerce was recently received by Sir S. Chapman (Permanent Secretary) and Mr. E. R. Eddison (Comptroller of the Companies Department) for the Board of Trade. The object was to suggest amendments to the existing law relating to limited companies which had not been dealt with by the Government Committee which has recently reported upon the subject. Mr. H. Lakin-Smith said that the Committee had suggested the issue of a separate profit and loss account by companies, to be available only at the general meeting; the Association suggested that the facts should be available to all shareholders. Mr. F. P. Robjent dealt with the subject of prospectuses, and said that the Association proposed that fuller information should be given in the case of contracts between the company and vendors and intermediary vendors, to disclose the amount of promoters' profits. Mr. Eddison replied to the points raised, and expressed the Department's unwillingness to impose any restrictive requirements which would only burden the majority of companies which were honest concerns. Sir S. Chapman said that the Bill would probably be based upon the Committee's recommendations, and the Association would have the opportunity of arranging for amendments to be moved during the Committee stage.

For Sale.

Mr. H. J. Shaw will sell by auction on January 12th and following day, at 13, High Holborn, the plant and stock of a wireless condenser manufacturer, the stock of a wireless goods factor, &c. (See our advertisement pages to-day.)

Successful Carol Singing.

As in previous years, the Osram G.E.C. Musical Society's carol-singing party during Christmas week carried out a series of successful "raids" on behalf of the Infants' Hospital, Westminster, the Industrial Orthopædic Society, and St. Hubert's Cripple School, Hammersmith. Various residential districts in Hammersmith, Barnes, Kensington, &c., were visited, resulting in the collection of £36, which has been divided equally between the three institutions mentioned. The party, with a specially illuminated "Osram" delivery van, proved a great attraction, and Mr. E. G. Gant, the conductor, is to be congratulated upon the results.

Failures in 1926.

A summary published by *Stubbs's Weekly Gazette* shows that the total number of failures in the United Kingdom in 1926 was 7,179, as compared with 7,916 in 1925. In England the total number of receiving orders and deeds of arrangement was 6,180, as against 6,768 in 1925; the total liabilities fell from £6,432,782 to £4,686,261, and the total assets from £2,166,553 to £1,972,989.

Important Birmingham Power Station Contract.

We are informed by Mr. R. A. Chattock, City Electrical Engineer, Birmingham, that his Committee has placed a contract with International Combustion, Ltd., for the erection and equipment of a new power station at Hams Hall, at an approximate total cost of £1,435,850. The contract provides that the electrical section, comprising turbo-alternators, condensing plant, and switchgear, shall be let as a sub-contract to the General Electric Co., Ltd., Witton, Birmingham.

Advertising Electric Cooker Hire.

The JACKSON ELECTRIC STOVE CO., LTD., has produced an adhesive stamp depicting one of its cookers and bearing the sentence "Hire Jackson Electric Cookers." These are being provided to electricity supply authorities who use the company's cookers for their hiring schemes.

West Midlands Industrial Council.

The annual meeting of the West Midlands Joint Industrial Council for the Electricity Supply Industry was held last week at Birmingham, and there was a full attendance of representatives from Warwickshire, Worcestershire, and Staffordshire, and from the six trade unions which are affiliated to the Council. Alderman A. G. Ellaway, Birmingham, was elected chairman, and Mr. Dempster, A.E.U., vice-chairman. Mr. E. J. Jennings, of the Birmingham Electric Supply Department, was cordially thanked for his services during the past year, and was re-elected secretary and treasurer.

The Belgian Telephone System.

The telephone question in Belgium now seems to be gradually approaching a solution. Two schemes are under the consideration of the Government. One is to establish a national company similar to the railway company, and the other is to transform the existing undertaking into an autonomous concern. A considerable sum is expected to be expended in developing communication with other countries, and Belgian cable makers have offered to grant credit facilities if they are given consideration in connection with the allocation of the orders for the cables. It is reported that the Ministry of Posts and Telegraphs has placed in Germany part of a large order for cables. The A.E.G. is said to have received orders of the value of 1,006,500 Belgas, and the Felten and Guilleaume Company one of 160,000 Belgas.

Trade Announcements.

Further to the note in our issue of December 24th, the FULLER ACCUMULATOR CO. (1926), LTD., advises us that it has now completed the improvements in the lay-out of the factory, which have greatly increased the manufacturing output, and the company is in a position to deliver from stock all standard types of batteries for wireless work and automobile starting and lighting. Stationary battery deliveries have also improved.

The NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO. has opened showrooms in High Street, Hoddesdon, and an all-electric exhibition flat has also been opened.

MESSRS. ANDERSEN, MEYER & CO., LTD., engineers, contractors, and importers, whose head offices are at Shanghai, have opened London offices at 30, Mincing Lane, E.C., where Mr. S. H. Morden, lately general manager to Messrs. J. Whittall & Co., Ltd., will be in charge.

MR. G. R. ALLEN, radio engineer, of Aldershot, has removed to larger premises at 156, Victoria Road.

THE BEKO LAMP CO., LTD., has removed to 5, Finsbury Square, E.C.2. Phone: "Clerkenwell 7346."

B.K.B. ELECTRIC MOTORS, LTD., has removed to 200, High Holborn, London, W.C.1. Telephone No.: "Museum 4265."

THE NEW PELAPONE ENGINE CO., LTD., are now in occupation of their new factory at Lofthouse Gate, Wakefield.

New Catalogues and Lists.

MESSRS. HOPKINSONS, LTD., Britannia Works, Huddersfield.—List No. 1,880, describing the company's patent "Mac" valves for steam pipes.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—The "Osram Bulletin" for December, containing notes and articles on "Osram" lamps, "Magnet" domestic appliances, and "Gecophone" radio apparatus.

INTERNATIONAL COMBUSTION, LTD., Africa House, Kingsway, W.C.2.—A well-produced brochure describing the "Lopulco" pulverised fuel system. Fully illustrated.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, W.C.2.—Leaflet No. 1,022-3, illustrating and describing Marconi magnetic drum recorders, Types 193 and U.g.4.

THE CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Place, S.W.1.—A mailing card bearing a map indicating the situation of the company's service depôts.

THE CANADIAN PORCELAIN CO., LTD., Hamilton, Ont., Canada.—Catalogue 403, a pocket catalogue containing illustrated details of the company's insulators for indoor and outdoor service. The publication measures only 2¾ in. by 4¾ in. (approx.), and has 91 pages.

THE WALKER ELECTRICAL SERVICE, Annandale Street, Edinburgh.—A folder illustrating and describing the firm's motor and generator repair service.

MESSRS. F. A. WILKINSON & PARTNERS, LTD., Gretton, near Kettering.—An illustrated and priced pamphlet describing the company's wind-dynamo installations. A new type is noted. This embodies a 100-W, 12/14-V generator with a specially-designed switchboard.

THE HART ACCUMULATOR CO., LTD., Stratford, E.15.—January blotter, with a view of Old Heidelberg, advertising "Hart" batteries with non-corrosive terminals.

POPE'S ELECTRIC LAMP CO., LTD., 5, Arthur Street, New Oxford Street, W.C.2.—January blotter advertising "Elasta" electric lamps.

THE NORMAND ELECTRICAL CO., LTD., 3, North Side, Clapham Common, S.W.4.—An illustrated folder containing details and prices of small geared motors, motor-generators, sirens, and grinders.

THE NATIONAL GAS ENGINE CO., LTD., Ashton-under-Lyne.—Catalogue No. 255, describing in some detail the company's vertical heavy-oil engines. Fully illustrated.

Bankruptcy Proceedings.

N. H. PAYNE, 4, The Triangle, Teignmouth, late of Dawlish, electrical and wireless engineer.—The first meeting of creditors was held recently at the Official Receiver's office, Exeter. The statement of affairs showed ranking liabilities of £798, against net assets of £560, leaving a deficiency of £238. Debtor attributed his failure to having no free capital to enable him to tide over the period of long-term credit which he was obliged to give most of his customers, and to his liabilities being considerably increased by suing creditors. He commenced business at Teignmouth in January, 1925, without capital. Two months ago he borrowed £45 from his father and his brother as surety for a bank overdraft. In September, 1925, he opened a branch at Dawlish under a manager. He estimated the turnover for the whole period of trading at £3,050, with a gross profit of £1,220, against which he placed trade expenses estimated at £1,103. He did not become aware of his position until he filed his petition, and maintained that if creditors had given him time to complete work that he had in hand and in prospect he could have overcome his financial difficulty. The following are creditors:—

	£		£
Agra Engineering Co., Ltd.	27	Bankers	21
British Thomson-Houston Co., Ltd.	28	Metro-Vick Supplies, Ltd.	23
Burris, Fred., & Sons ...	58	Park Wholesale Co., Ltd.	22
Capel, P.	36	Priestley & Ford ...	76
Drake & Gorham Wholesale, Ltd.	22	Payne, H. W. H. ...	45
Falk, Stadelmann and Co., Ltd.	37	Simpson, Baker & Co. ...	42
General Electric Co., Ltd.	63	South Wales Wireless Installation Co., Ltd.	26
Houghton-Butcher (Gt. Britain), Ltd.	60	Siemens & English Electric Lamp Co., Ltd. ...	28
		Sun Electrical Co., Ltd.	38

The public examination was fixed for January 11th, to take place at Exeter.

H. A. MILLS, electrical engineer, &c., 1, Lorne Villas, Old Windsor.—Receiving order made December 21st on debtor's own petition.

J. R. PEET, electrical engineer, "Earsdon," Linden Walk, Prestatyn.—First meeting held December 31st at the Official Receiver's office, St. Peter's Churchyard, The Cross, Chester. Public examination, January 28th, at the Court House, Bangor.

J. R. CHARNOCK, cycle dealer and electrical engineer, 6, Stonegate Road, and Meanwood Road, Meanwood, Leeds.—Last day for proofs for dividend, January 10th. Trustee, Mr. H. C. Bowling, Official Receiver, 24, Lower Bond Street, Leeds.

H. H. ATKINSON, electrical engineer, 33, Princess Avenue, Old Trafford, Manchester.—First and final dividend of 10s. 1d. in the £, payable at the Official Receiver's office, Byrom Street, Manchester.

D. T. DONOVAN and H. A. LANGLOIS (London Electrical Co.), 119, St. Mary Street, and 124, Queen Street, Cardiff.—First meeting held to-day at 34, Park Place, Cardiff; public examination February 11th, at the Law Courts, Cathays Park, Cardiff.

A. J. CULLUM, motor and electrical engineer, 34, Mount Pleasant, and 8, Church Street, Diss.—First meeting held January 7th, at 9, The Arcade, Ipswich; public examination January 14th, at the Shirehall, Ipswich.

W. H. DICKSON and A. J. SOLOMON (trading as Dickson and Solomon), radio engineers, 13 & 14, Tavistock Street, Devonport.—A meeting of creditors was held at Devonport

on December 31st. The gross liabilities were stated to be £390, and the debtors attributed their failure to the depression in trade and the heavy rental which they had been obliged to pay. The case remains in the hands of the Official Receiver.

Company Liquidations.

CLEAR HOOTERS, LTD., electric horn manufacturers, Birmingham.—A meeting of creditors was held recently, at the Birmingham Chamber of Commerce. Mr. L. J. S. Austin, the liquidator in the voluntary liquidation of the company, submitted a statement of affairs which disclosed liabilities of £6,133 and net assets of £1,126, leaving a deficiency so far as the creditors were concerned of £5,007. The liquidator, on behalf of the directors, submitted a scheme of reconstruction, under which it was proposed that creditors for sums of £30 and upwards should accept 5 per cent. third debentures in a new company in full settlement and discharge of their claims. These would be irredeemable for three years, except at the option of the company, and would be subject to first debentures of £2,200, and to second debentures of £1,000. Creditors whose claims amounted to £5 and upwards to £30 were given the option of either accepting third debentures or a composition of 4s. in the £, payable within two months of the completion of the scheme. Creditors whose claims did not amount to more than £5 were offered the latter alternative. The scheme was accepted, and an advisory committee was appointed consisting of Messrs. J. M. Dunkley (Callender's Cable & Construction Co., Ltd.), H. Harley (Coventry Gauge and Tool Co., Ltd.), and N. R. Nicholls (Birmingham Products, Ltd.).

FARRINGDON ELECTRICAL CO., LTD.—Winding up voluntarily. Liquidator, Mr. A. B. Neil, 22, Queen Street, E.C. A meeting of creditors was held on January 4th, at 22, Queen Street. Particulars of claims to the liquidator by February 28th.

NATIONAL WIRELESS CORPORATION, LTD.—Winding up order made by the High Court on December 21st, 1926.

GWYNNES ENGINEERING CO., LTD.—First meetings of creditors and contributories were held at Carey Street, W.C., on January 5th.

TELE DIS SERVICES (FOUNDERS CO.), LTD.—Liquidator, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C., released December 20th, 1926.

Private Arrangements.

MELROSE & DOW, ironmongers and electrical engineers, Main Street, Callander.—At a recent meeting of creditors it was resolved that Messrs. Galbraith, Glasgow, should prepare trading accounts, a profit and loss account, and a deficiency statement. It was further resolved that, failing the submission of a proposal approved of by the committee of creditors, the debtors' affairs should be realised under a trust deed in favour of Mr. W. B. Galbraith, in the meantime the business to be carried on in the interests of the creditors. A committee representing creditors was appointed to advise in the event of the estates being realised under the trust deed, &c. The statement of affairs as at December 15th showed total liabilities of £2,726 and net assets of £825, leaving a deficiency of £1,901. The following are creditors :—

	£		£
Baxendale & Co., Ltd. ...	33	North British Machine Co., Ltd.	71
Blundell, Spence & Co., Ltd.	20	M. Nairn & Co., Ltd. ...	36
T. Black & Son	27	T. Rowatt & Son ...	44
Cauldon Potteries, Ltd.	20	Remington Arms, Ltd.	24
Crowden & Keeves, Ltd.	39	T. Scott & Co., Ltd. ...	80
Croggon & Co., Ltd. ...	50	Scottish Oil Agency, Ltd.	21
Cathro & Roger, Ltd. ...	24	A. Sharp & Son	24
Falkirk Iron Co., Ltd.	32	Smith & Wellstood, Ltd.	39
Graham & Morton, Ltd.	45	Spence & Gerrard, Ltd.	67
Gardner, John	35	J. Shaw & Sons, Ltd. ...	23
W. Glen & Son	22	Thomson & Williamson, Ltd.	23
General Electric Co., Ltd.	32	Ferrier, James, & Son	21
Jellyman & Sons, Ltd.	24	Macintosh, Hugh ...	53
Lewis, W. & R.	22	Anglo-American Oil Co., Ltd.	38
Martinet, Nicolas ...	27		
W. McGeoch & Co., Ltd.	61		

Dissolutions of Partnership.

MASON & MARSHALL, cycle, motor-cycle and motor-car engineers, electrical engineers, and dealers in wireless sets and accessories, 11, Manor Parade, Stamford Hill, N.—Messrs. C. H. Marshall and C. E. Mason have dissolved partnership. Mr. Mason will continue the business.

J. MANNING & CO., electrical engineers and contractors, 27, Leek Street, Birmingham.—Mr. J. Manning and Mr. L. V. Hamblin have dissolved partnership.

Calendars and Diaries.

We are indebted to a further number of friends in the industry for their compliments and good wishes for 1927.

MESSRS. DAVIDSON & CO., LTD., of Sirocco Engineering Works, Belfast, have issued a card, entitled "Trade Winds," with a coloured view of "The Cutty Sark" in full sail, suggesting a spirit of optimism and a hope that trade in the New Year will eclipse all previous records.

To a card advertising "Elasta" lamps, and issued by POPE'S ELECTRIC LAMP CO., LTD., of 5, Arthur Street, New Oxford Street, London, W.C.2, is affixed a set of monthly 1927 calendar sheets.

MESSRS. DOWNES & DAVIES, Liverpool, have chosen a water-colour reproduction of a pretty girl with rather reproachful eyes as the subject of their 1927 calendar.

The calendar of the DAVENPORT ENGINEERING CO., LTD., Bradford, is a businesslike production bearing a view of some cooling towers and a block of black-upon-red daily slips.

The calendar of Messrs. FRANCIS POLDEN & CO., LTD., Cannon Street, E.C.4, is again equipped with a date-marking device which adds to its usefulness. The company has also sent us, as in previous years, one of its pocket diaries, which is really an excellent production. It has a folding-over leatherette case and four-day pages with ample memoranda space.

Barribal's "Exide Girl" again appears upon the 1927 calendar of the CHLORIDE ELECTRICAL STORAGE CO., LTD.

THE LONDON UNDERGROUND RAILWAYS CO. has sent us an interesting desk calendar, each tear-off sheet providing for one week's memoranda, and bearing a picture representing some notable feature of the railway system, a view in the district which it serves, or a person or incident associated with London or with its famous "Underground."

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2, has sent us a block of daily slips for 1927 to replenish its metal calendar.

We have again received from the KEY ENGINEERING CO., LTD., Trafford Park, Manchester, its pocket calendar, which is a celluloid strip bearing the full 1927 calendar, with English and metric measures on the edges.

MESSRS. W. H. WILLCOX & CO., LTD., have issued a businesslike "date remembrancer" comprising monthly sheets with illustrations of the company's packings, steam fittings, pumps, tools, lubricants, &c.

Bold-figured monthly sheets and illustrations of work carried out by the firm are the main features of a calendar received from the WALKER ELECTRICAL SERVICE, Edinburgh.

The "Orion" pocket diary for 1927 has been received from ORION LAMPS, LTD., 15-17, Eldon Street, E.C.2.

Our desk will be brighter all through the year because of the presence thereon of a metal calendar with ingenious date-changing device, received from Messrs. CRYSELCO, LTD., of Kempston Works, Bedford. Upon the metal case is engraved the impressively uniformed "Col. Chris. Elco," of the "Cryselco Light Brigade."

THE IRON & NICKEL BATTERY CO., LTD., of 17-19, Cockspur Street, London, S.W.1, has prepared for its friends a 10-in. advertising ruler, and will send one to any reader who makes application.

A neat vertically-opening vest-pocket book with squared memorandum pages has been received from the TUNGSRAM ELECTRIC LAMP WORKS, LTD., 72, Oxford Street, W.1.

The architecture of mediæval Chester has again been drawn upon by BROOKHIRST SWITCHGEAR, LTD., for its 1927 desk calendar. The prints are sepia on parchment, and are enclosed in a neat moulded black frame. The business side has been reduced to a minimum, and the beauty of the calendar is thus preserved.

MESSR. B. S. & W. WHITELEY, LTD., of Leeds, have again issued to their friends a wall or desk calendar bearing a block of daily slips with literary quotations.

From the S.E.A. Co., LTD., of Lichfield Street, Hanley, we have received a wall calendar with a picture of three "Kennel Companions" printed in appropriate colours.

Chinese Notes.

An electric power supply company has been organised at Kulangsu, Amoy (Fukien province). It has a capital of $250,000 (national currency).

The Superintendent of Telegraphs in the eastern provinces of Manchuria has closed down a number of telegraph offices which have been rendered superfluous by the growth of telephone communication.

Following upon the increasing of fares by the other Shanghai tramway companies, the Chinese Tramway Co., Nantao, has decided to do the same.

Book Notices.

"The Colliery Managers' Pocket Book, 1927." Pp. 520+cxxvii; illustrated. Edited by J. Vincent Elsden, D.Sc. London: The Colliery Guardian Co., Ltd.—This 58th edition maintains the policy of the work to assist the mining engineer in his daily routine, and the student who aspires to fill a managerial position in his preparation for such duties. The book opens with the usual chapter on Mining Progress during the past year, and includes a summary of the findings and recommendations of the Report of the Royal Commission on the Coal Industry. A valuable feature of the volume is a selection of statistics which are claimed to be completely up-to-date. The staple sections of the book, including Coal and its By-Products, and Electricity in Mines, have been thoroughly revised, while other sections, including winding and haulage, have been re-written by acknowledged experts.

"Marconi's International Register of Telegraphic and Trade Addresses, 1926-7." London: Marconi International Code Co., Ltd. Price 27s. 6d., carriage paid.—The principal change effected in this bulky directory is in the price, which represents a reduction of nearly 50 per cent. The volume contains the names and addresses of over 55,000 of the world's leading manufacturing and trading concerns in alphabetical order. The Classified Trades Section gives exhaustive lists which will be of service to both buyers and sellers. Another

important section is an international list of cable addresses. The Register should prove invaluable to all firms who are interested in overseas trade.

"The Electrical Engineer's Year Book, 1927." Edited by J. H. Johnson, M.I.E.E. (Pp. 508+diary.) London: S. Davis & Co. Price 21s., post free.—This is the nineteenth edition of a work which covers in an admirable manner all phases of electrical engineering—generation, distribution, contracting and manufacturing, as well as selling. The matter has been brought up to date, but the general scheme is similar to that of previous editions.

"Optical Instrument Catalogue." Pp. 336, quarto; fully illustrated, paper covered. London: The Optical Convention. Price 6s. net.—The exhibition to which this catalogue relates was held in connection with the Optical Convention, 1926, and the book is intended as a permanent work of reference to British optical manufactures at the time of the Convention; containing full illustrated descriptions of the instruments and apparatus exhibited by the leading makers in Great Britain, it is indispensable to all users of optical appliances. Descriptions of the experimental and research and historical exhibits at the Convention are also given.

"Proceedings of the Optical Convention." Part I, 512 pages; Part II, 578 pages. Fully illustrated, with plates and figures in the text. Price £3 net.—These two quarto volumes, bound in cloth, contain the full text of the presidential address and of the papers (numbering nearly 100) read at the Convention, together with a report of the discussions and of certain special lectures which were delivered. The publication constitutes a record of progress since the last Convention, in 1912.

From the Cripplegate Institute, Golden Lane, Barbican, E.C.1, we have received a 36-page booklet containing a programme of winter, spring, and summer courses, lectures, entertainments, &c., held at this increasingly popular City institute.

"The *Wireless Trader* Year Book and Diary, 1927" (pp. 215+clxiii). London: The Trader Publishing Co., Ltd. Price 5s. 6d., post free (7s. 6d. overseas).—This is the third edition of this useful wireless directory, and a number of new features are embodied in it. In addition to a great deal of technical and legal matter, the year book contains an ample diary, directories of traders, and proprietary names, and a section devoted to short reviews of books upon radio theory, experiment and construction. A section of particular interest to exporters is that devoted to tariffs imposed by Dominion and foreign Governments upon radio apparatus.

"Science Abstracts" (A. & B.). Vol. XXIX. December 25th, 1926. Part 12. London: E. & F. N. Spon, Ltd. Price 3s. each.

A Siemens-Schuckert Acquisition.

According to the *Financial Times* correspondent at Berlin, the Siemens-Schuckertwerke concern has taken over the National Automobil Gesellschaft, which manufactures automobiles and motor lorries.

Unemployment in France.

According to statistics prepared by the French Minister of Labour the number of French unemployed does not exceed 10,000 in Paris and 30,000 in the departments.—*Reuter* (Paris).

Lighting and Power Notes.

Amesbury.—SCHEME APPROVED.—The Rural District Council has given its consent to an application by the Durrington Electricity Supply Co., Ltd., for an Order to supply electricity in the parishes of Durrington and Bulford.

Aughton (Lancs.).—ELECTRICITY SCHEME.—Mr. G. P. Shallcross, formerly electrical engineer to Birkenhead Corporation, has prepared an electricity scheme, estimated to cost £14,000, for the Parish Council. The Council has decided to approve of the scheme, subject to the requisite number of consumers being obtained, and it will be submitted to a meeting of ratepayers to be held shortly.

Australia.—VICTORIA.—According to the *Electrical Engineer of Australia and New Zealand*, the seventh annual report of the State Electricity Commission, covering operations for the year ended June 30th last, reveals a considerable expansion of the Commission's services and distinct improvements both as regards the technical problems and the financial position of the undertakings. The amount of energy sold during the year was 161,990,327 kWh, as against 101,000,000 kWh in the previous year. The Yallourn power station and the plant at the briquetting factory generated 142,678,586 kWh, while the Newport B power station produced 46,031,164 kWh. The maximum demand on Yallourn was 36,000 kW and that on Newport B was 16,800 kW. A tabulated statement dealing with all generating authorities in the Melbourne metropolitan area shows that the total amount of energy generated for all purposes, including electric railways, was 463,000,000 kWh, as compared with 419,500,000 kWh in the preceding year. The *per capita* consumption of electrical energy was 503 kWh, as against 489 kWh and, excluding railway traction, the respective *per capita* consumptions were 335 kWh and 314 kWh. The total loss on the whole of the operations during the year was £262,000. The total revenue from the electric supply operations was £713,252, and the expenditure, including interest, amounted to £937,931, making a loss of £224,679. The loss on electric supply last year was £240,944. The briquetting operations resulted in a loss of £36,257, as compared with £39,925 last year.

Bolton.—INCREASED CHARGE REMOVED.—Increased electricity charges imposed by the Electricity Committee three months ago through the high cost of coal are to be removed.

Brazil.—SAO PAULO.—The Sao Paulo Power Co. has completed its new hydro-electric station at Cubatao. The two turbo-generators of this new plant are each of 40,000 h.p., and are said to be the largest yet constructed of this type. It was expected that the plant installed at the end of 1926 to meet the demand for electricity in Sao Paulo would have a capacity of 228,000 h.p.

Chesterfield. — LOANS. — The Electricity Committee is to apply for sanction to the following loans:—£48,700 for mains and services; £1,075 for the provision of transformer sub-stations; £12,000 for further hired wiring installations; £10,000 for meters; and £8,240 to cover amounts already spent on mains, services, meters, &c.

PROGRESS OF SUPPLY.—The Engineer (Mr. D. H. Davies) has reported to the Committee that applications for supply are being received in such large numbers that at the present rate all the available householders in the town would be taking a supply in the next five years.

PRICE REDUCTIONS.—Despite the coal dispute, the charges for lighting and large power purposes were reduced by 10 per cent., in March and July last, respectively.

Continental.—CZECHO-SLOVAKIA.—According to *Commerce Reports*, plans for the electrification of eastern Czecho-Slovakia were recently formulated in Kosice. The manager of the electrical works at Presov has suggested the erection of a central hydro-electric station on the banks of the Poprad river, where there is a fall of 65 metres, which could develop 6,000 h.p. The projected station will be the first plant of the proposed system to be known as the Eastern Slovak Electric Power Works. The Government will finance a part of the work, and the interested municipalities will contribute large sums, in accordance with the electrification law. The central power station will supply electricity to Presov and by way of Kezmarok to Levoca. On completion of this station an electric railroad will be constructed from Podelin to Luboteny in order to connect this part of the Poprad valley with the Slovak railway system.

SWEDEN.—The Stockholm correspondent of *The Times Trade and Engineering Supplement* reports that at the State hydro-electric works at Lilla Edet and Norrforsen, near Umea, 60,000 additional h.p. is now available, while works have been commenced near Hammersfors which will produce another 27,000 h.p. The total amount at present available is estimated at 1,400,000 h.p., as compared with 885,000 ten years ago.

Dundee.—EFFECT OF COAL STRIKE.—It was reported at a recent meeting of the Corporation Electricity Committee that the loss sustained by the Department as a result of the coal strike was £24,000. An effort is to be made to avoid a continuance of the 10 per cent. increase in price by resorting to the reserve funds.

East Anglia.—ELECTRICITY BILL.—The East Anglian Electric Supply Co. has deposited a Bill for next session, under which statutory power is sought to supply electricity within an area comprising the whole of the counties of Norfolk, Suffolk, and a large part of Essex. The company, which is already supplying electricity in these counties, is to submit to the Commissioners proposals for the development of the supply. These proposals are to be carried into effect within the time prescribed by the Commissioners, but if within three years from the passing of the Act the company has not, in the opinion of the Electricity Commissioners, substantially commenced its works for the purpose of carrying out its powers, the Minister of Transport may order the powers to cease as to the whole or any part of the area of supply.

Eastbourne.—NEW RING MAIN.—The Electricity Committee has approved an estimate of £22,834 for the proposed new ring main.

Japan.—KOBE.—*Eastern Engineering* states that the Municipal Electric Bureau's application for sanction to extend its steam power plant for generating electricity has been rejected by the Communications Department on the score that the Bureau's present plant, capable of generating 26,000 kW, is sufficient in view of the supply of hydro-electric power of 15,000 kW by the Ujikawa Electric Power Co. The Communications Department does not encourage the increase of steam power from the point of view of national economics, preferring that hydro-electric power be obtained.

Lyme Regis.—LOAN.—The Town Council is to obtain sanction to a loan of £16,065 for electricity purposes.

Newark-on-Trent. — CONSULTING ENGINEER. — The Town Council has appointed Mr. R. W. Willis as consulting engineer for the electricity undertaking at a retaining fee of 100 guineas per annum, plus expenses.

Northern Ireland.—Co. ANTRIM.—Fearing that the proposed electrical schemes in the county would be detrimental to the inland fisheries of the River Bann, the Coleraine Board of Fishery Conservators has appointed a deputation to place its views before the Bann Drainage Advisory Committee.

Price Increases.—Owing to the higher cost of coal, increases in the charges for electricity have been made or recommended in the following districts:—

HAMILTON.—An increase of 5 per cent.

RADCLIFFE.—An increase of 10 per cent.

Rawtenstall.—NEW PLANT.—The Corporation is to install an additional 6,000-kW turbo-generator at its generating station. The new plant will enable it to double its present output of electricity.

Rugby.—WIRING OF SMALL HOUSES.—The Urban District Council has adopted a scheme, submitted by the Electric Lighting Committee, for the wiring of its houses on the deferred payment system.

St. Helens (Isle of Wight).—STREET LIGHTING.—The Urban District Council has sealed a three-years' contract with the Isle of Wight Electric Light and Power Co., Ltd., for public lighting.

South-East Lancashire Electricity Advisory Board.—NEW STATION AT KEARSLEY.—In connection with the proposal of the Lancashire Electric Power Co. to erect a new power station at Kearsley, the Engineering Advisory Committee has received replies from Manchester, Oldham, and Salford Corporations to its inquiry as to whether they would be willing to extend their stations in order to meet the demands of the company, and if so, the terms upon which they would give such a supply. As no terms have been quoted by the three Corporations for bulk supplies as alternatives to the company's proposal, the Board has resolved that it is in the interests of the district that the proposal of the company for the erection of a new station at Kearsley should be carried out and that the Board be recommended to approve it.

MACCLESFIELD.—The Committee has received intimation that the Electricity Commissioners have sanctioned the installation of a 400-kW d.c. oil-driven set at the power station of the Electricity Company of Macclesfield, Ltd.

CHAPEL-EN-LE-FRITH AND DISTRICT.—The Engineering Advisory Committee has recommended the Board to support the application of the Power Development Co., Ltd., for a Special Order authorising it to supply electricity in the above area.

WIGAN.—The Committee has also recommended the Board to support the application of Wigan Corporation for a Fringe Order to supply electricity to the works of the Haigh Dyeing Co., Ltd., Haigh, subject to the approval of the Lancashire Electric Power Co. and Wigan Rural District Council.

The minutes of the proceedings of the Engineering Advisory Committee have been approved by the Board.

Staveley.—ELECTRICAL DEVELOPMENT.—The development of the h.p. electrical system of the Staveley Coal and Iron Co., which serves not only that company's works and collieries, but several Derbyshire villages and a part of Chesterfield, has necessitated the installation of a second very large gas engine at that company's Derbyshire works generating station. It is intended in due course to erect a third engine of this type at the Devonshire works.

Stirling.—ELECTRICITY SUPPLY.—Application is to be made by the Town Council to the Scottish Midlands Electricity Supply Co., Ltd., for its terms for supplying electricity to supplement the supply generated at the power station.

LOAN SANCTIONED.—Sanction has been received to a loan of £2,050 for mains and services.

Tring.—INAUGURATION OF SUPPLY.—An electricity supply for the district was recently formally inaugurated by the vice-chairman of the Urban District Council. The supply is obtained from Aylesbury Corporation.

York.—NEW BOILER PLANT.—The city electrical engineer has reported upon the question of raising the boiler steam pressure, and the Electricity Committee has recommended to the Corporation that three boilers and an economiser be removed, and one 36,000-lb. and one 18,000-lb. boilers with chimney, feed pumps, economisers, steam piping, &c., be installed, which would increase the boiler steam capacity by 54,000 lb., or 3,850 kW, making a total of nearly 13,000 kW. The estimated cost of the scheme is as follows:—Removing old boilers and economisers, fitting new boilers, chimney, &c., £19,500; reloading and adjusting existing boiler safety valves, £80; fitting new nozzles to the two 3,500-kW turbines, £500.

PRICE REDUCTION.—The committee has decided to reduce the charge for electricity by ¼d. per kWh as from the December quarter meter readings.

Wolverton.—ELECTRICITY SUPPLY.—At a recent meeting of the Urban District Council, the clerk reported that in reply to an inquiry made to the Northampton Electric Light Co. as to the price of electricity, he had received a reply from the company to the effect that when the overhead mains had been constructed and sufficient consumers were connected to wipe out the present loss in giving a supply to Wolverton, the price of electricity would be considered. It was decided to ask the Ministry of Transport to withhold consent to the erection of overhead cables until the Council received a satisfactory answer as to the cost of electricity.

Tramway and Railway Notes.

Australia.—ADELAIDE.—The report of the Municipal Tramway Trust (manager: Mr. W. G. T. Goodman) for the year ended July 31st last shows a total income of £629,394, as compared with £609,202 in the preceding year. Working expenses amounted to £446,791, as against £443,081, leaving a gross profit of £182,603 (£166,121). After deducting capital charges, there was a net deficit of £62,304, as compared with a deficit of £67,457. There was also a loss on the Port Adelaide tramway and motor-'bus systems, making a total deficit for the year of £89,958. The number of passengers carried increased from 59,663,457 to 62,562,249, and the car miles run from 6,860,256 to 7,021,400. During the year the power station at Port Adelaide, which supplies the energy for the tramways, was extended by the addition of a 10,000-kW turbo-alternator.

Continental.—ITALY.—Work is about to be commenced on the electrification of the railway between Chiasso, on the Italian-Swiss frontier, Milan and Voghera. Good progress has been made with the electrification of the railway between Florence and Bologna, and electric trains are about to be put in operation between Bologna and Pistoja. The necessary electricity is to be supplied from two hydro-electric stations in Tuscany.

Glasgow.—SUPPLY FOR TRAMWAY.—Hitherto the supply of electricity for the Corporation tramway has been drawn from the Tramway Department's own station at Pinkston, but consideration is now being given to a proposal for taking the necessary supply from the new Corporation station at Dalmarnock, thus bringing about a unification of control throughout the city.

Japan.—RAILWAY ELECTRIFICATION.—The scheme for electrifying the railways of Japan is receiving renewed attention. According to *Eastern Engineering*, under the present programme, the electrification of the line between Numadzu and Akashi, a distance of 378 miles, is to be carried out at the estimated cost of y. 7,777,000 in five years, from the next fiscal year, but it is now considered that the money appropriated for the purpose is hardly sufficient. As, on the other hand, it is out of the question for expenditure to be increased, in view of the dwindling railway revenue in recent years, the view is finding support that the proposed work should either be abandoned or postponed. As regards the Chuo line, it is proposed that electrification between Tokyo and Hachioji be completed by the end of the fiscal year 1928-29, while the electrification work on the line between Hachioji and Kofu is also to be started either during the next fiscal year or on the completion of the electrification of the line between Tokyo and Hachioji. So far as the electrification of lines in the suburban districts of big cities is concerned, work will proceed according to programme.

London.—SLOANE SQUARE STATION.—Sloane Square station will be the first District Railway station to be equipped with an escalator for its own traffic. All other stations which have escalators connect with deep-level tubes. The new escalator is to be an ascending one from the westbound platform to the street level, with an intermediate landing for eastbound passengers, and its construction forms part of a general scheme of reconstruction at this important station. The other improvements include the complete rebuilding of the booking hall and entrance to the station, and the installation of two booking booths which will take the place of the existing "hole-in-the-wall" method of booking. The new station will resemble closely the new Morden line stations, and will include a scheme of floodlighting.

HIGHGATE TUBE STATION.—To enable the traffic to be dealt with more expeditiously, the four lifts at Highgate tube station are to be superseded by comb-type escalators. Work will begin shortly, and it is hoped that the improvements will be complete by next summer. When the escalators are installed, the lifts will be dismantled and the space they occupy devoted to the formation of a larger booking hall, which will facilitate a freer movement of traffic entering and leaving the station. Passimeter booking booths will replace the existing booking office. The escalator will maintain a continuous service throughout the day and be able to deal with 20,000 passengers an hour.

Manchester.—NEW TIME-KEEPING DEVICE.—The Corporation has adopted a new time-keeping device, operated from the car platform, which will obviate delay caused by conductors leaving the cars and waiting for the correct time before "clocking" at roadside time boxes. The new device has been introduced in order to lessen the number of accidents to conductors when leaving their cars to "clock on."

Wharfedale.—RAILWAY ELECTRIFICATION.—The proposal of the clerk of the Ilkley Urban District Council for the electrification of the railways from Leeds and Bradford into Wharfedale has received the support of the Guiseley Urban District Council, the Menston and Poole Parish Councils, and the Wharfedale Rural District Council, who are to petition the L.M. & S. Railway and L.N.E. Railway Companies to carry out the electrification of the lines.

Telegraph and Telephone Notes.

Austria.—LONG-DISTANCE TELEPHONY.—The first trunk cable between Vienna and Passau, on the German frontier, has been completed, and was to be opened to the public on January 4th, says *The Times*. The authorities will now immediately proceed to lay cables successively to the Italian, Jugo-Slav, and Hungarian frontiers. The cost, which has been estimated at £2,100,000, is being met out of the international loan granted to Austria under the guarantee of the League of Nations.

Central America.—RADIO-TELEGRAPHY.—The radio stations presented by the Government of Mexico to Guatemala and El Salvador have been completed and put into public service. They deal with ordinary messages, night and special Press service, and day and night letters. The neighbouring States of Honduras and Costa Rica have been brought into radio communication range.—*Reuter's Trade Service* (Guatemala City).

Spain.—AUTOMATIC TELEPHONY.—We are informed by Standard Telephones & Cables, Ltd., London, that King Alfonso, together with leading citizens, participated in the establishment of a new European long-distance telephone record on December 29th, when a conversation was carried on over a circuit of 3,800 kilometres long, as a feature of the inauguration of "Standard" rotary automatic telephone service throughout Madrid. The record was established in a demonstration of the lines of the nation-wide system that has been built in the last eighteen months by the Compania Telefonica Nacional de España and, although the distance covered was equal to that from Madrid to Moscow, the circuit did not extend beyond Spanish territory. It did, however, cross the Straits of Gibraltar by submarine cable, uniting the continents of Europe and Africa; sixteen stations responded to the roll-call over the circuit, which event was preliminary to the formal opening by King Alfonso of the new Madrid local telephone system, completely installed in fourteen months by the Compania Nacional. The change in service was accomplished simultaneously throughout the capital, and Madrid is second in the series of nineteen cities in which the company will convert the telephone service to rotary automatic within the coming three years.

Sweden.—TELEPHONE DEVELOPMENTS.—The Director-General of the Swedish Telegraph Board stated in a recent interview that a third telephone cable between Sweden and Germany would be laid this year, 1927, not only to meet the steadily increasing communication between Sweden and Germany, but also for an extension of telephone traffic to England, in which very great interest is shown, and perhaps later on to France and Italy. The planned telephone cable to Finland will not be laid yet, no allowance having been made in the Finnish Budget for this purpose. Among other features will be the continued erection of automatic telephone stations at Stockholm, the extension of the telephone cable northwards to Upsala and Gaefle, and an increased use of the Stockholm-Gothenburg cable.—*Reuter's Trade Service* (Stockholm).

INVENTIONS.—Two Karlskrona inventors, Consul K. Vogel and engineer J. G. Larsson, have succeeded in constructing apparatus which may be coupled to the telephone and registers communications to the subscriber during his absence. The inventors emphasise the fact that their apparatus is not a variation of existing "parlograph" systems.—*Reuter's Trade Service* (Stockholm).

The Telephone Service.—NEW EXCHANGE.—A new public telephone exchange for Camberley is to be opened on January 11th. The switchboard, which is located in a new building in Park Street, was made and installed by Siemens Bros. & Co., Ltd., and is of the latest pattern common-battery type with accommodation for 780 subscribers, which can be increased to over 1,000 as required. The new exchange will provide Camberley subscribers with automatic "calling" and "ring-off" signals in place of the existing old style "turn-the-handle" system, which is rapidly being superseded throughout the country.

Radio Notes.

Argentina.—NEW RADIO STATION.—A contract has been concluded for an additional radio-broadcasting station in the Colon Opera House, Buenos Aires, at an estimated expenditure of 100,000 dollars (£20,000). The station, which is to be built by a United States company, is to be in operation by May, 1927, in time for the next opera season.—*Reuter's Trade Service* (Buenos Aires).

Loud-Speakers Banned.—EASTBOURNE.—Another by-law affecting the use of broadcasting loud-speakers has come into force in England. The Eastbourne Watch Committee has been informed by the Home Office that such a by-law will be sanctioned, says the *Morning Post*, in the following form:

"No person shall in any street or public place, or in any place which adjoins any street or public place, and to which the public are admitted, operate, or cause or suffer to be operated, any wireless loud-speaker or gramophone in such a manner as to cause annoyance to, or disturbance of, residents or passengers. Any person offending against the foregoing by-law shall be liable to a penalty not exceeding £5."

Reading has already a by-law of this kind, and other towns are likely to follow suit if users do not exercise a little more discretion. In the main these by-laws affect the proprietors of wireless shops who make a practice of fixing a loud-speaker outside their premises with the object of attracting purchasers.

FRANCE.—The new year commenced with the issue of a police order for the suppression of loud-speakers used for advertising and other purposes in the streets of Paris. They have long been threatened by the police.

France.—STATE CONTROL.—Wireless-telephony in France is to be placed on a legal basis, according to a proposal made by the Minister of Commerce which has been unanimously approved by the Cabinet. Broadcasting becomes the prerogative of the State, which will assume possession of all transmitting stations in five years' time. Meanwhile broadcasting will be State-controlled by a mixed committee of Government officials, authors, musicians, and lecturers, who will supervise operation, which will be carried out by authorised private enterprise. During the transition period the State will receive a percentage of the advertisement receipts.—*Reuter* (Paris).

High-power Stations.—REGIONAL PLAN.—It is reported that the scheme for the erection of new regional higher-power broadcast stations for Great Britain and for the provision of alternative programmes has been agreed to by the Postmaster-General in its broad outline. The main idea is for a certain number of high-power stations to be erected, some in parts of the country at present without a station, says the *Daily Mail;* they will number five or six, and will have a power of 10-15 kilowatts, and there will also be other stations with the same power as that of London. It is expected that part of the scheme will be ready for inauguration at the end of this year.

India.—STATION SITE.—The Indian Radio Telegraph Co., Ltd., has accepted the terms offered by the Improvement Trust for the lease of land in the Cossipore-Chitpore open space for the location of a broadcasting station.

Japan.—NEW STATION.—An order is said to have been placed for a 600-kW station, which will be ready in 1928. It is to be entirely the property of the Japanese Wireless Telegraph Co., an official concern enjoying the support of Parliament.

Licences.—BIRMINGHAM'S RECORD.—A campaign against "pirates" is being conducted by Post Office officials in the Birmingham district, and it was explained during the hearing of summonses that the possession of apparatus which was not assembled, or the erection of an aerial only, did not relieve the owner of the obligation to take out a licence. The number of licences now issued in the city is approximately 100,000, and the proportion of licence-holders to the population is probably higher in Birmingham than in any other centre.

Sweden.—INTERFERENCE ELIMINATOR.—An invention to prevent interference between broadcasting stations issuing the same programme on the same wave-length has been made by the broadcasting expert of the Swedish Telegraph Office (engineer, S. Lemoine).—*Reuter's Trade Service* (Stockholm).

United States.—CONTROL URGED.—In a recent address, according to *World Radio*, Major-General J. G. Harbord, president of the Radio Corporation of America, said that under the present developments there were only 89 wavelengths available within the United States, or approximately one-tenth the number of stations now in operation or projected in the immediate future. The National Radio Co-ordinating Committee had urged Congress to deal with the radio problem, saying that further delay would jeopardise a national industry involving $600,000,000 a year and disappoint 20,000,000 persons. The Co-ordinating Committee urged emergency legislation, necessary because broadcasting stations were increasing at the rate of one a day. The Committee urged prompt passage of a permanent control law, and endorsed the principle of the White Bill for control by a Federal Radio Commission and the United States Department of Commerce.

"ATMOSPHERICS."—In addressing a gathering of 1,500 scientists from all parts of the world at Philadelphia, Dr. Michael Pupin made the startling announcement that "atmospherics" and the fading nuisances so well known to wireless enthusiasts were "messages" from the sun and the planets. According to the *Daily Telegraph*, Dr. Pupin made it quite clear that he used the word "message" in a symbolic sense, and meant merely the electrical attraction between the earth and the planets as demonstrated by the periodical swing of great earth currents, the tidal flux of electricity through submarine cables, and objectionable noises in wireless instruments. These phenomena would in time be interpreted.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Ampthill.—January 12th. U.D.C. Electric light installation, public lavatories, depôt stores, and fire station; Mr. F. W. Walker, surveyor, 105, Dunstable Street.

Army Contracts.—Manufacturers who are not already on any War Office list of tenderers, and who wish to tender for Army requirements of cables, electrical stores, scientific instruments, &c., should apply to the Director of Army Contracts, Caxton House (West), Tothill Street, Westminster, S.W., for Form I, on which formal application for inclusion on the list of tenderers may be made. (See this issue.)

Australia.—MELBOURNE.—February 28th. City Council. Two 2,500-kW motor-convertors and accessories, or two 2,500-kW rotary convertors, with transformers and accessories. (B.X. 3124.)*

Argentina.—BUENOS AIRES.—February 24th. Department of Navigation and Ports. Three 10-ton electric shunting locomotives (Diesel type). (A.X. 4016.)*

Askern (near Doncaster).—January 18th. Electric light installation at Sutton Road new school. Education Department, West Riding County Hall, Wakefield.

Barking Town.—Electricity Committee. 1,000-kW motor-convertor.

Barnes.—February 8th. Electricity Department. One 1,000-kW rotary or motor convertor with transformer, l.p. switchgear and connections. (See this issue.)

Belgium.—Municipal authorities of Schaerbeek. 11,500 metres of h.p. and l.p. armoured cable and 1,500 electricity meters.

Bootle.—January 18th. Corporation. Electrician's work required in erection of 16 lock-up shops, with 16 flats above, Bailey Drive. Particulars from Borough Engineer, Town Hall.

Bradford.—January 11th. Corporation. Electric lighting installations at housing schemes, No. 3, Bradford Moor (12 combined shops and houses); No. 9, Bierley (16 combined shops and houses); and No. 11, Swain House (594 houses). City Architect, Town Hall, Bradford.

Burnley.—January 27th. Tramways and Omnibus Department. General stores for 12 months. Schedules from the General Manager, Queensgate Depôt, Burnley.

Canada.—GREAT FALLS.—January 17th. Manitoba Power Co., Ltd. Three 7,000-kVA single-phase oil-insulated indoor-type transformers for Lac du Bonnet, Manitoba. (B.X. 3118.)*

Doneraile (Co. Cork). — Cork County Sanatorium. Supply of electrical fittings and installation of electric bells, &c., at the Sanatorium. Mr. C. J. Murphy, secretary to the Committee of Management, Courthouse, Cork.

Ecuador.—QUITO.—Municipal Council. 3,000-h.p. hydro-electric plant for which water power with a fall of 42 metres is available, to be owned and worked by the city authorities. A second installation of similar capacity, for the port and city of Guayaquil, is also contemplated.

Falcarragh (Co. Donegal).—Installation of an electric lighting plant. Mr. A. J. O'Doherty, secretary, Falcarragh.

Haverfordwest.—January 15th. Water Department. One vertical treble plunger pump (16,000 galls. per hour capacity) and one 50-b.h.p. (approx.) semi-Diesel oil engine. Particulars from the Water Engineer.

India.—India Store Department. January 25th. Overhead electric travelling cranes (two 60 tons, four 25 tons, two 120 tons, three 8 tons, one 5 tons). Specifications (5s.) from 15, Belvedere Road, Lambeth, S.E.

Liverpool.—January 19th. Electricity Supply Department. 250,000 tons best quality steam slack during the 12 months to March 31st, 1928. City Electrical Engineer.
January 27th. Electricity Supply Department. Twelve months' supply materials, including cables and accessories, insulated cables, meters, lamps, &c. (See this issue.)

London.—LONDON COUNTY COUNCIL.—January 10th. Electrical installation at the Frankham Street, Deptford, S.E., elementary school (approx. 153 points). (December 31st.)
STEPNEY.—January 18th. Board of Guardians. Electric goods lift at the St. George's-in-the-East Hospital. (December 31st.)

Manchester. — January 11th. Tramways Committee. Electrolytic and cadmium copper trolley wire. Particulars from the General Manager and Chief Engineer.

Newport (Mon.).—February 5th. Electricity Department. Two water-tube boilers, steam and feed-water piping, economisers, air heaters, induced- and forced-draught plant, steel stack and grit catcher, coal and ash conveyors, extension of boiler house, including structural steelwork and foundations. (See this issue.)

New Zealand.—DUNEDIN.—February 19th. City Corporation Gas Department. One motor-generator with control board and accessories. (B.X. 3095.)*

Romford.—January 10th. Board of Guardians. Intercommunicating telephone installation. (December 31st.)

Salford.—January 8th. City Council. Electrical wiring of premises, 143 and 147, Regent Street. Specifications from Medical Officer of Health, 143, Regent Road.

South Africa. — PRETORIA. — February 3rd. Municipal Council. E.h.p. cable and accessories, switches and cut-outs. (B.X. 3097.)*
JOHANNESBURG.—January 20th. Municipal Council. Supply of electric lamps. (B.X. 3112.)*

Stoke-on-Trent.—February 8th. Stoke and Wolstanton Union. Alterations and additions to the central-heating and hot-water services at the London Road Institution. The work includes large calorifiers, two electric generating sets, pumps, &c. Specification from Mr. T. Wood, clerk to the Guardians, Union Offices, Stoke-on-Trent.
February 9th. Electricity Department. Steam and water piping, valves, &c., constructional steel work, platforms, crane gantries, &c. (See this issue.)

Torquay.—Electricity Department. Railway siding and coal-handling scheme for Newton Abbot power station. Construction of elevated railway siding upon reinforced concrete gantry; one rotary wagon tipper; one railway wagon weighbridge with weighhouse; electric capstan and fair leads; coal-conveying plant; one 1,000-ton concrete storage bunker. Forms of tender, Mr. H. F. G. Woods, Electricity Offices, Upton Valley, Torquay.

Uruguay.—MONTEVIDEO.—February 18th. State Electricity Works. 65,000 kg. unvarnished black iron wire and 10,000 kg. g.i. wire. (A.X. 4019.)*
February 11th. 37,500 electric filament lamps. (B.X. 3117.)*
February 15th. 55,500 iron pieces (angles, ties, bolts, &c.) for overhead lines. (A.X. 4018.)*

---

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Birmingham.—Electric Supply Department. Particulars are given in our "Business Notes" of an important contract (£1,435,850) awarded to International Combustion, Ltd., for a new power station.

Brentwood.—Essex Education Committee. Accepted:—
Installing electric lighting at the County High School for Girls (£675).—A. Goodwin & Co.

Erith.—Urban Council. Accepted:—
Stock cable (£418).—Callender's Cable & Construction Co., Ltd.

Hebden Bridge.—
Electrical wiring, &c., at Council houses.—J. Harrison and Co., Halifax.

London.—BOOTH STEAMSHIP CO.
12 months' supply of electric lamps.—Siemens & English Electric Lamp Co., Ltd.
ADMIRALTY.
Accumulators.—Edison Swan Electric Co., Ltd.
LONDON & NORTH-EASTERN RAILWAY CO.
Railway-carriage lighting.—Edison Swan Electric Co., Ltd.

Salford.—Health Committee. Accepted:—
Wireless receiving apparatus for the Ladywell Sanatorium (£138).—Marconiphone Co., Ltd.

Education Committee. Accepted:—
Alterations to the electric lighting installation at the Royal Technical College.—County Electrical Co., Ltd.
Installing electric lighting at the Trafford Road Council School (£125).—Taylor & Son.

Tramways Committee.
Sand-drying plant (£500 approx.).—Pneulec Co., Ltd.
Two Morris travelling electric hoist blocks (£207).—Herbert Morris, Ltd.

Electricity Committee.
9,000 yd. l.p. and 450 yd. e.h.p. cable (£2,740).—H. V. Nederlandsche Kabelfabriek, Delft, Holland.

Southend-on-Sea.—Town Council. Accepted:—
Five top covers for tramcars (£1,625).—Brush Electrical Engineering Co.
3-ton electric crane (£1,190).—Smith & Co.

Windermere.—Urban Council. Accepted:—
Laying cables for the Oldfield housing scheme (£325).—Windermere and District Electricity Supply Co., Ltd.
Supplying and installing wires (£168).—J. K. Thornborough & Co.

Worcester.—Infirmary Committee. Accepted:—
Installing a telephone system in the infirmary.—British Telephone Supply Co.

York.—Works Committee. Recommended:—
Electric wiring at Foss Islands depôt (£80).—H. Hetherington.

Forthcoming Events.

Edinburgh Electrical Society.—Friday, January 7th. Royal Scottish Society of Art, 117, George Street. 8 p.m. Social and dance.

Junior Institution of Engineers.—Friday, January 7th. 39, Victoria Street, S.W. 7.30 p.m. "Distortion in Heat-treated Case-hardened Carbon Steels." Mr. P. J. Haler.
Friday, January 14th. 7.30 p.m. "The Thermionic Valve and its Characteristics." Mr. R. L. Kirlew.

Institution of Fuel Economy Engineers.—Friday, January 7th. Royal Society of Arts, Adelphi, W.C. 6 p.m. "Utilisation of Low-grade Fuels for Steam Generation." Mr. W. F. Goodrich.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, January 8th. South Wales Institute of Engineers, Cardiff. 6 p.m. "Collieries and Public Supply." Mr. T. S. Thomas.

(Western Sub-Branch).—Saturday, January 8th. 60, Wind Street, Swansea. Informal discussion on "Chief Electrical Inspector's Report, 1925-1926." Mr. J. A. B. Horsley, Electrical Inspector of Mines, will reply to the discussion.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, January 10th. London. 7 p.m. "Some Notes on the Earthing of Metal Objects other than Conductors, and General Remarks on the Earthing of Electrical Circuits." Mr. S. W. Melsom.

(Mersey and North Wales (Liverpool) Centre).—Monday, January 10th. Liverpool University. 7.30 p.m. Faraday Lecture, "What is Electricity?" Prof. W. M. Thornton.

(North-Eastern Centre).—Monday, January 10th. Armstrong College, Newcastle-on-Tyne. 7 p.m. Ordinary meeting.

(North-Midland Centre).—Tuesday, January 11th. Hotel Metropole, Leeds. 7 p.m. "The Design of City Distribution Systems." Messrs. J. R. Beard and T. G. N. Haldane.

(North-Western Centre).—Tuesday, January 11th. Engineers' Club, Manchester. 7 p.m. Ordinary meeting.

(Western Centre).—Monday, January 10th. Royal Hotel, Bristol. 5.30 p.m. Reception 6 p.m. Annual dinner and visit of the President.

(Scottish Centre).—Tuesday, January 11th. North British Station Hotel, Edinburgh. 7 p.m. "The Applications of Electricity to Agriculture." Mr. R. B. Matthews.

(Dundee Sub-Centre).—Thursday, January 13th. University College. 7.30 p.m. "Government Scheme of the Electricity (Supply) Bill." Mr. D. H. Bishop.

(South-Midland Centre).—Friday, January 7th. Engineering and Scientific Club, Queen Street, Wolverhampton. 7 p.m. "Electrical Research." Mr. W. Wilson.

Nottingham Society of Engineers.—Monday, January 10th. "Electricity in the Home." Mr. G. S. Haydon.

Electrical Power Engineers' Association (Glasgow Section). Tuesday, January 11th. Reid's Restaurant, Gordon Street, Glasgow. 7.30 p.m. "Boiler Rings." Mr. J. A. Cogan.

(Manchester Section).—Thursday, January 13th. Geographical Hall, Manchester. 7 p.m. "Metering of Three-phase Supplies." Mr. O. Howarth.

Institute of Marine Engineers.—Tuesday, January 11th. The Minories. 6.30 p.m. "Progress in the Development and Practical Application of Heat-resisting and Non-corroding Steel." Sir R. A. Hadfield, Bart., F.R.S.

Röntgen Society.—Tuesday, January 11th. 32, Welbeck Street, W. 8.15 p.m. Ordinary scientific meeting.

Illuminating Engineering Society.—Tuesday, January 11th. Lighting Service Bureau, 15, Savoy Street, W.C. 6.30 p.m. "Flood Lighting." Messrs. W. J. Jones, H. Lingard, and T. Catten.

Electrical Society of Glasgow.—Tuesday, January 11th. 30, Gordon Street, Glasgow. 7.30 p.m. "A Survey of the Conditions of Trading in the Electrical Industry." Mr. A. Ramsay.

Institution of Civil Engineers.—Tuesday, January 11th. London. 6 p.m. "The Economics of Power Production and Utilisation at Collieries." Prof. D. Hay.

Royal Society of Arts.—Wednesday, January 12th. John Street, Adelphi, W.C. 3 p.m. "The Story of a Wireless Valve." (Juvenile Lecture.) Prof. C. R. Darling.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, January 14th. Literary and Philosophical Society, Newcastle-upon-Tyne. 6 p.m. "Progress in Economy of Turbine Machinery on Land and Sea." Sir Chas. A. Parsons and Mr. R. J. Walker.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

VEXTEX candle lamps.

Notes.

Wattmeter Calculations.

With reference to the article under the above title which appeared on p. 1064 of our issue of December 31st, it should be stated that the work described therein was carried out in the Research Department of Burndept Wireless, Ltd., and was published with their permission.

Royal Scholarships and Free Studentships.

The Board of Education has awarded Royal Scholarships to, amongst others, E. E. Wilkins and G. W. Dimmick, electrical fitter apprentices, and J. L. Howard, electrical engineer apprentice, and a Free Studentship to W. T. Pratt, electrical fitter apprentice—all at H.M. Dockyard.

Lectures.

THE POLYTECHNIC.—A course of four lectures, entitled "Sidelights on Broadcasting," is to be given by Capt. Jack Frost, M.I.R.E. (late of the B.B.C.), on Friday evenings, commencing on January 21st, at the Regent Street Polytechnic, London. The lectures will be popular in character, fully illustrated with lantern slides, and include demonstrations. The fee for the course is 5s.

LONDON COUNTY COUNCIL.—HACKNEY INSTITUTE, E.—A course of lectures on Electrical Power Control and Measurement will be given in the Institute on Wednesday evenings, commencing January 12th. Full particulars of the course may be had on application to the principal.

Appointments Vacant.

Temporary shift charge engineer for the Leigh Corporation Electricity Department. Electrical engineer (£350) for the Borough of Newark Electricity Department. Two charge engineers (400 taels per month) for the Shanghai Municipal Electricity Department. (See our advertisement pages to-day.)

Swiss Railway Electrification Economies.

In an article upon the Swiss Federal Railways, *Commerce Reports* states that considerable economy has been effected by electrification. A table is included which shows the actual costs of operating the electrified system in 1924, and compares the costs of steam working; this is reproduced below:

Operating item.	Electric. fr.	Steam. fr.
Cost of driving *personnel*	4,587,000	6,553,000
Cost of *personnel* at depôts ...	705,000	1,210,000
Surplus expenses for *personnel* on trains and for cleaning the cars, with steam traction	—	870,000
Cost of upkeep of locomotives and motor-coaches	3,082,000	4,150,000
Cost of greasing material	101,000	132,000
Surplus cost for upkeep of cars and wagons, with steam traction ...	—	50,000
Total	8,475,000	12,965,000

It is seen that the savings from these items alone reach nearly 4,500,000 Swiss francs, or approximately 35 per cent. of the cost under steam traction. Thus, with the electrification programme completed in 1929, the economy effected by the reduced cost for these items and for coal will ensure a very appreciable cut in the Swiss budget.

Fourth Conference on Large Extra-High-Pressure Systems.

This conference will be held in Paris from June 23rd to July 2nd, 1927. The Council of the Institution of Electrical Engineers will shortly nominate those who will attend the conference as the official delegates of the Institution, but, in addition, any members of the Institution can attend the conference as unofficial delegates. The latter should send their names, together with a remittance of £2, to the Secretary of the Institution, who will obtain the necessary membership cards.

University of London.

In connection with the celebration of the centenary of the University College, University of London, an appeal is being made for £500,000, one half of which is required to provide increased endowment for improving the salaries of the staff, and the other half is wanted for extensions and reconstructions to the present buildings, including a new block for chemical engineering. Sir Gregory Foster, Provost of University College, recently outlined the future programme of the University and its history to representatives of the Press. In 1831, when the first calendar of University College was issued, it had two faculties—Arts and Laws, and Medicine. The total staff numbered 30 and the number of departments 33. In 1926 there were five faculties—Arts, Laws, Science, Engineering, and Medical Science. There were 75 departments and 254 members on the academic staff. To-day the students of the college number 3,200, as compared with 420 in 1831. Engineering was introduced into the University in 1835, when a lectureship in civil engineering was established. Later, the chairs of civil, mechanical, electrical, and municipal engineering were established in the order given. One of the features of the progress made in University College is the co-operation which now exists between the departments, particularly between the engineering and science departments.

Accident.

Two men were severely burned by molten lead on December 30th as the result of an explosion at the Belvedere works of Callender's Cable & Construction Co., Ltd.

Wireless Telegraphy Commission.

This Commission was appointed in 1920 to decide upon the plant most suitable for carrying out the scheme of Imperial communication recommended by the Imperial Wireless Telegraphy Committee. A first report was submitted to the Cabinet on December 5th, 1921, and the second report (Cmd. 2781; Stationery Office, price 2d.) describes the proceedings of the Commission afterwards, the decision of the Cabinet in 1923 to go on with the construction of a powerful station in England, and the arrangement come to in 1924 between the Postmaster-General and Marconi's Co. for the construction of "beam" stations for telegraphy between England and Canada, with possible extensions giving similar communication with Australia, South Africa, and India. In each of these countries, the report says, the work on corresponding stations is well advanced. With regard to the Rugby station, the site was chosen to accommodate 16 masts, each 820 ft. high, but for economy it was decided to erect only 12 masts in the first instance. The power plant installed is capable of converting about 1,800 kW into suitable form for use in the wireless plant. The high-frequency generator consists of two exciting units in duplicate and a main amplifier of five similar panels, each containing eighteen valves and capable of giving a high-frequency output of 180 kilowatts at a frequency of 16,000 cycles per second. By using three panels a total output capacity of about 500 kilowatts is available for use on the whole aerial, leaving two panels in reserve. Alternatively, the two sections of the aerial, each working with two power panels, can deal with about 300 kilowatts and 200 kilowatts respectively, leaving one power panel in reserve. Up to the date of the report (July 7th, 1926) the smaller section of the aerial had been reserved for use with an experimental telephony transmitter, and good and reliable two-way conversation across the Atlantic to New York had been obtained repeatedly for many hours of the day.

The telegraphy installation had only been worked on the eight-mast aerial with about two-thirds power; even so, the signals had been heard all over the globe. A summary of the reports on the signals received at different distant places is appended to the report. The lay-out was designed to provide for the simultaneous use of two transmitters during the most favourable atmospheric periods. Experiments on the main telegraph transmitter and the transatlantic telephony transmitter will determine whether simultaneous operation is feasible. In addition, further installations are in contemplation, namely, short-wave and medium-wave plant, utilising the existing masts for supporting the additional aerials.

(The complete aerials, supported on 12 masts, have since been employed; the use of the north and south aerials combined in parallel has resulted in the normal working current being increased from 550 to 740 amperes. The present limiting condition with regard to the power output is the voltage on the aerial system, the normal working value of which is 156,000 V. With masts earthed, an aerial current of 810 A has been obtained.—EDS. ELEC. REV.)

B.E.S.A. Publication.

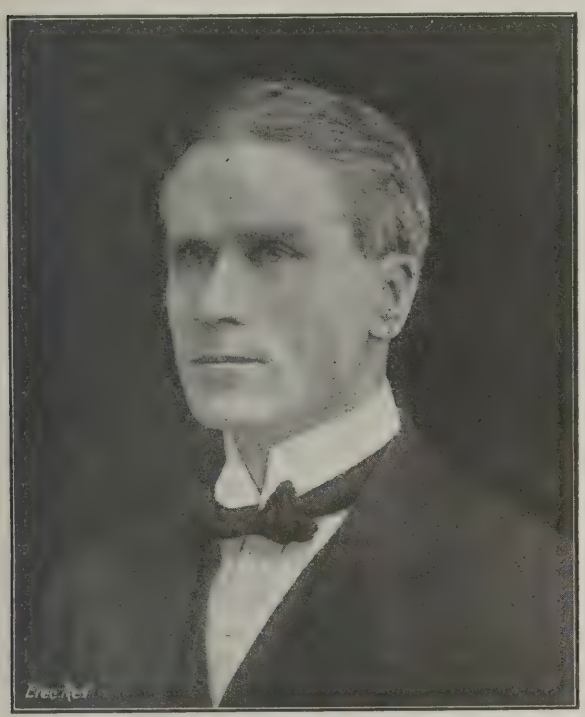
The British Engineering Standards Association has just issued a specification for flameproof enclosures for electrical apparatus and machinery (for use in mines and other places where an explosive atmosphere may be encountered) and of tests for such enclosures. The specification defines the tests which the flameproof enclosure must withstand, and the definition has received acceptance in several parts of the world. The test clauses have been associated with conditions which aim at securing that the certificates of compliance with the flameproof test should be issued only when the apparatus conforms to British Standard Specifications, where these exist, and the request has been made that more complete specifications for control gear than those now existing should be prepared. In this connection it is of interest to note that committees acting conjointly under the Electrical and Colliery Sections of the B.E.S.A. are preparing specifications for mining motors, switchgear and controllers for use in mines which make use of the tests given in this publication in order to ensure the flameproof properties of the gear. Copies of this new specification may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, S.W.1, price 2s. 2d., post free.

Fatality.

Thomas Hester, a ganger, recently employed on the construction of the new Albert Bridge over the Thames between Old Windsor and Datchet, pierced a temporary cable used in the construction of the bridge, and received a fatal electric shock. At the inquest, on December 29th, it was stated that rats and birds had scraped the earth away from the adjoining bank and covered the cable, which was usually laid above the ground.

Electric Telpherage.

In a publication under the above title, by G. W. Grossmith, M.C., issued by the Technical Section of the Association of Engineering and Shipbuilding Draughtsmen, the general design of electric telpher systems is considered, and typical selected examples are dealt with in detail. The advantages claimed for the telpher over other conveyor systems are, generally, that it has a comparatively small proportion of working parts, with consequent low maintenance costs, and that it is only in motion when there is useful work to be done. Calculations are given for obtaining the h.p. of the travelling motor, and the angle of bogie swivel, in addition to the necessary constructional dimensions for the various types of plant. The importance of obtaining correct balance for the bogies is stressed and the limits of accuracy for the different systems are defined. The top-rail and bottom-flange systems are briefly described and compared, and the designs for a 60-ft. span lattice girder and ordinary and open trestles are dealt with in detail. An interesting feature of the book is a description of the all-wheel-drive coal-handling plant installed at the Nechells power station of the Birmingham Corporation Electricity Department. Copies of the publication may be obtained from the Association Secretary, 96, St. George's Square, London, S.W.1, price 2s. each.



Incorporated Municipal Electrical Association.

ANNUAL CONVENTION.—The preliminary programme for the annual convention of the I.M.E.A. has now been issued. It will be held at Buxton, from May 30th to June 4th; on Tuesday, May 31st, the convention will be opened by the Mayor of Buxton, and Mr. R. W. L. Phillips, M.I.E.E., engineer and manager of the Bedford Corporation Electricity Department, will read his presidential address, which will be followed by a paper and discussion. In the afternoon the exhibition of electrical apparatus will be visited, the Mayor will entertain the visitors at tea in the Pavilion, Buxton Gardens, and in the evening the president will hold a reception. Papers and business meetings will occupy the following mornings, and visits to places of interest will be arranged for the afternoons, as usual. The annual dinner will take place on Thursday evening, June 2nd. Communications should be sent to the Secretary, Electric House, 38, High Street, Croydon.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

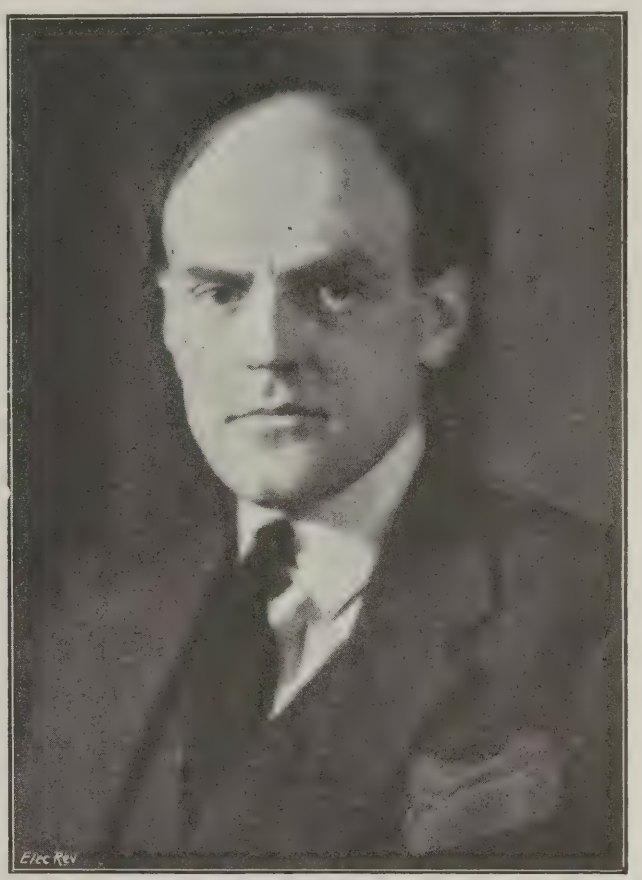
New Year Honours.—We offer our congratulations to two gentlemen well-known in the electrical world upon their inclusion in the List of New Year Honours. Mr. Duncan Watson, M.I.E.E., whose connection with the electrical contracting and manufacturing trades began very many years ago, and continues to-day as Duncan Watson & Co., and whose services rendered to Marylebone as chairman of the Borough Council Electricity Committee and subsequently as Mayor, stand out prominently in his career, has since late in 1925 been filling the important office of first chairman of the London and Home Counties Joint Electricity Authority. May Sir Duncan Watson live long to enjoy the honour of knighthood now conferred upon him. Mr. John Charles Walsham Reith, upon whom His Majesty also confers the honour of knighthood, is well known as managing director of the British Broadcasting Company, whose success during the pioneering years of the greatest and most rapidly developing undertaking ever known is fully recognised by electrical men.

Hana.] [*London.*

Sir Duncan Watson, M.I.E.E.

At Bangor borough electricity works, last week, Mr. C. H. GOODWIN, assistant electrical engineer of the city, was presented with a gold watch, subscribed for by the electricity works staff. The presentation was made by Mr. John Jones, the oldest workman, who was himself subsequently presented with an armchair. Mr. Price White, the borough gas and electrical engineer, presided.

Mr. W. E. C. LAMPERT, who was recently appointed assistant electrical engineer at Devonport Dockyard, was married at Plymouth, on December 29th, to Miss Lilian Glanfield.



MR. STANLEY HODGKIN, joint managing director of the Pulsometer Engineering Co., Ltd., of Reading, on completing 50 years' association with the firm, has been presented by the senior members of the staff with a gold watch and a framed address. The presentation was made at a complimentary dinner at Mr. Hodgkin's residence, Old Southcote Lodge, Reading, when as guests of Mrs. Hodgkin a number of members of the staff were present. Mr. C. E. Hodgkin, who has been associated with his brother in the control of the business for 25 years, testified to his brother's qualities.

The Maidstone Town Council has appointed Mr. D. MACBEAN as constructional engineer and draughtsman for the electricity works extension.

Modern Transport states that Mr. J. DALRYMPLE has been asked to act as tramway adviser to the Johannesburg Municipality, and he has decided to proceed to South Africa when his investigations in South America are completed. As a farewell gift, the staff and employés of the Glasgow Corporation Tramway Department have presented Mr. Dalrymple with a cabinet and bookcase, and a dressing case for Mrs. Dalrymple.

We are informed that MR. WILLIAM WHITE has joined the Buenos Aires telephone organisation as chief installer, and not as chief engineer as stated in our issue of December 24th, p. 1045.

It is announced that Mr. E. R. PEACOCK has resigned his position as chairman of the Mexican Light and Power Co., Ltd., and the Mexico Tramways Co. on account of the pressure of other business; he will remain a director and continue to act as chairman of the Bondholders' Committee. He is succeeded by Mr. Millar Lash, K.C., legal adviser and vice-president of the companies. Mr. R. C. Brown has resigned the position of president of the two companies, remaining as vice-president, and is succeeded by Mr. G. R. G. Conway, managing director in Mexico, who will undertake the duties of both offices.

Sir John Reith.

Mr. WILFRED F. SANDS, of the Wolverhampton Corporation electricity staff, has been appointed assistant manager of the Electrical Distribution, Ltd., North Wales, and will be stationed at Llandudno Junction.

MR. D. ALAN STEVENSON, of the firm of D. & C. Stevenson, Edinburgh, has been appointed lighthouse engineer to the Government of India to advise on the reorganisation of the Indian lighthouse service, and to advise generally on the lighting of the coasts of India, Burma, and the Persian Gulf. Mr. Stevenson has sailed for India, and will be some months engaged there in advising the Government.

Mr. S. J. GODDARD, vice-president of the Western Union Telegraph Co.; Rear-Admiral C. P. R. COODE, C.B., D.S.O., general manager of the European Division; Mr. R. D. PAULIN, European traffic manager; and Mr. H. K. KINGSBURY, assistant general manager, went to Penzance to be guests of honour at the 33rd annual dinner and smoking concert of the local staff of the company on Saturday last. The dinner took place in the room in which the event was inaugurated on January 1st, 1888, and 31 diners sat down under the chairmanship of the superintendent of the Penzance station, Mr. T. O'Donoghue.

Science reports that Dr. W. D. COOLIDGE, assistant director of the research laboratory of the General Electric Company (America), has been awarded the Edison medal for 1926, by the American Institute of Electrical Engineers, "for the origination of ductile tungsten and the fundamental improvement of the X-ray tube."

Mr. W. VINCENT WAITE, M.I.Mech.E., A.M.I.E.E., has resigned his position of London manager to Messrs. Clayton Wagons, Ltd., and Messrs. Clayton & Shuttleworth, Ltd., and asks that communications be sent to his temporary address:—Room 75, Empire House, 175, Piccadilly, W.1.

Obituary.—M. GASTON SCIAMA.—The death occurred on November 24th last of M. Gaston Sciama, the general director of the Maison Breguet, of Paris, France. The deceased, who had been associated with the firm since 1884, was an ex-president of the Société Internationale des Electriciens.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

H. Lewis, Ltd.—Private company. Registered December 28th. Capital £2,000 in £1 shares (1,000 7½ per cent. cumulative preference and 1,000 ordinary). Objects: To acquire the business of an electrical and mechanical engineer, &c., now carried on by H. Lewis at Wisbech, Cambs., as "H. Lewis." The permanent directors are:—H. Lewis, 5, North Street, Old Market, Wisbech; Mrs. Margaret G. Lewis, 5, North Street, Old Market, Wisbech. Qualification, £100 shares. Solicitors: Ollard & Ollard, Wisbech.

Continental Hydro-Electric Co., Ltd.—Private company. Registered December 28th. Capital, £20,000 in £1 shares. Objects: To seek for, prospect and test means and facilities in all parts of the world for the generation, utilisation, manufacture, distribution and supply of light, heat, sound, power and energy by the utilisation of rivers, watersheds, seas and water supplies and any other natural or other resources, to dispatch and supply commissioners, investigators, experts and agents, to carry out any works deemed expedient, to carry on the business of suppliers of electricity, &c. The provisional directors are:—B. C. Pearson, 47, Parliament Street, S.W., director of public companies; C. S. Gulbenkiau, 27, Quai d'Orsay, Paris, director of public companies. No qualification required. Solicitor: H. Davey, 47, Parliament Street, S.W.1.

J. R. Jennens, Ltd.—Private company. Registered December 28th. Capital £500 in £1 shares. Objects: To carry on the business of wireless apparatus manufacturers and dealers, &c. The first directors are:—J. R. Jennens, 51, Earlsbury Gardens, Handsworth, Birmingham; F. Stickley, 138, Winson Green Road, Birmingham; F. G. Layland, 42, Kentish Road, Handsworth; J. H. Jennens, 226, Boldmere Road, Wylde Green, Birmingham, manufacturer. Qualification, 50 shares. Solicitor: R. E. Parr, 83, Colmore Row. Registered office: 13, Jennens Row, Birmingham.

Elliott's Electrical Construction Co., Ltd.—Private company. Registered December 23rd. Capital, £1,000 in £1 shares. Objects: To acquire the business of an electrical contractor and engineer now carried on by A. J. Elliott at Coronation Buildings, High Street, Gateshead. The directors are:—A. J. Elliott, 113, Biddlestone Road, Heaton, Newcastle-on-Tyne; J. E. Stephenson, Highcliff, Windsor Crescent, Whitley Bay. Secretary: J. E. Stephenson. Registered office: Coronation Buildings, 136, High Street, Gateshead.

Solidite and Synthetic Mouldings, Ltd.—Private company. Registered December 24th. Capital, £20,000 in £1 shares. Objects:—To adopt an agreement with J. A. Swain and to carry on the business of manufacturers of and dealers in the preparations known as "solidite," and all improvements therein, and all goods to which solidite may be applicable, manufacturers of and dealers in india-rubber, vulcanite, ebonite, fibres, tires, chemicals and drugs, glassblowers, &c. The subscribers (each with one share) are:—L. R. Shaw, 4, Broad Street Place, E.C., accountant; B. Reynolds, 22, Dalmeny Avenue, N.7, accountant. First directors:—Sir C. S. Forbes, Bart., 25, Holland Park, W.11; T. E. Slaughter and A. J. Swain. Qualification, £1. Solicitors: Hoale, Smith & Field, 4, Broad Street Place, E.C.2.

Reliance Trading Co. (Liverpool), Ltd.—Private company. Registered December 24th. Capital £100 in £1 shares. Objects: To carry on the business of electrical, mechanical, marine engineering, aeronautical and general agents, manufacturers of and dealers in electrical plant and appliances, and wireless plant and accessories, &c. The subscribers (each with one share) are:—S. A. Romain, 31, Brompton Avenue, Liverpool, manufacturers' agent; P. Bredsni, 26, Montague Street, Liverpool, meat salesman. The first directors are to be appointed by the subscribers. Qualification, 25 fully-paid shares. Remuneration as fixed by the company. Secretary: S. R. Ashcroft, 36, Kirkdale Vale, Liverpool.

Husbands, Hart & Warburton, Ltd.—Private company. Registered January 3rd. Capital, £3,000 in £1 shares. Objects:—To acquire the business of electrical engineers or otherwise, carried on as "Husbands, Hart & Warburton," at City Road Mills, Derby, and elsewhere. The permanent directors are:—J. Husbands, 15, Chestnut Avenue; H. H. Hart, The Cottage, Alfreton Road; G. F. Warburton, Belper Road, all of Derby. Qualification, 25 shares. Solicitor: W. H. M. Marsden, 42, Full Street, Derby.

Foster-Boynton & Co., Ltd.—Private company. Registered January 1st. Capital, £300 in £1 shares. Objects:—To carry on the business of manufacturers of, or dealers in radio, cycles, and component parts thereof, &c. The directors are:—D. W. Foster, 1108, Stratford Road, Hall Green, Birmingham; H. Boynton, 4, Woodstock Road, Moseley, Birmingham. Qualification, 1 share. Registered office: 70, Lombard Street, Birmingham.

Maitland & Co. (Manchester), Ltd.—Private company. Registered January 3rd. Capital, £3,000 in £1 shares. Objects:—To acquire the business of an electrician, electrical engineer and contractor carried on by J. W. Maitland at 29, Princess Street, Manchester, as "Maitland & Co.," and to carry on the same and the business of armature winders, manufacturers of, and dealers in radio and other apparatus, &c. The subscribers (each with one share) are:—J. W. Maitland, 29, Princess Street, Manchester, electrical engineer; A. W. Maitland, Silver Street, Bury, solicitor. J. W. Maitland is permanent governing director, subject to holding a third of the issued capital, with power to appoint other directors. Qualification, after termination of original management, £100. Remuneration, after termination of original management, as fixed by the company. Solicitor: P. S. Howarth, Silver Street, Bury.

Official Returns of Electrical Companies.

Bastian Electric Co., Ltd.—H. G. Ash, of Finsbury Court, Finsbury Pavement, E.C.2, ceased to act as receiver or manager on December 15th, 1926.

Goswell Engineering Co., Ltd.—Debenture dated December 13th, 1926, to secure £300, charged on the company's undertaking and property, present and future. Holder: A. P. Barry, The Old Court House, Limpsfield.

General Radio Co., Ltd.—Satisfaction in full on November 18th, 1926, of debentures, second series dated June 2nd, 1925, securing £1,500.

J. H. Nott & Sons, Ltd.—Mortgage on Wessex Works, Frome, with machinery, &c., dated December 14th, 1926, to secure all moneys due or to become due from the company to the Midland Bank, Ltd.

Townson & Chadwick, Ltd.—E. Price, of Daisey Hill, Adlington, late of Cross Street, Manchester, ceased to act as receiver on November 26th, 1926.

Finston Manufacturing Co., Ltd.—Issue on November 23rd, 1926, of £500 debentures, part of a series already registered.

V. Badman, Ltd.—Debenture dated November 30th, 1926, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: V. Badman, 88, Western Road, Southall.

Ebonite Container Co., Ltd.—Satisfaction in full on November 10th, 1926, of charge dated January 20th, 1925, securing £1,500.

Grierson, Ltd.—Capital, £10,000 in 6,000 ordinary and 4,000 preference shares of £1 each. Return dated November 30th, 1926. 2,501 ordinary shares taken up. £2,501 paid. Mortgages and charges, nil.

Frinton-on-Sea and District Electric Light and Power Co., Ltd.—Capital, £10,000 in 7,300 preference and 2,700 ordinary shares of £1 each. Return dated November 16th, 1926. All shares taken up. £10,000 paid. Mortgages and charges, £4,000.

Kalgoorlie Electric Power and Lighting Corporation, Ltd.—Capital, £50,005 in 5 preference shares of £1 each and 100,000 ordinary shares of 10s. each. Return dated July 16th, 1926. 100,000 ordinary shares taken up. £3 10s. paid. £49,996 10s. considered as paid. Mortgages and charges, £111,235.

Electro-Mechanical Brake Co., Ltd.—Capital, £30,000 in 2,500 preference and 27,500 ordinary shares of £1 each. Return dated November 29th, 1926. 1,500 preference and 26,500 ordinary shares taken up. £21,965 paid on 1,500 preference and 20,645 ordinary shares. £6,035 considered as paid on 6,035 ordinary shares. Mortgages and charges, £7,500.

City Notes.

Edison Swan Electric Co., Ltd.

The annual meeting was held on December 29th. Mr. W. Shearer (chairman) presided, and in moving the adoption of the report (*vide* our last issue, p. 1086), said that as he and the majority of his colleagues had only been directors for some two or three months it would not be possible for him to present any elaborate or detailed review of the affairs of the company. They were fortunate in still having with them two of the old directors, Mr. C. H. Cox and Mr. E. A. Gimingham. Commenting on the balance sheet, he said that the item of patents, goodwill, &c., had been reduced during the year by £59,504, and the figure stood at £86,000 less than in 1923. Investments had increased during the year by reason of the shares which they had taken in the Edison Swan Cables, Ltd. They now held the whole of the ordinary shares in that company, and since they had become actively identified with the management of that concern considerable progress had been made. The output had been speeded up, the selling organisation had been improved, and they had taken over the principal selling agency. The works were now running at their full capacity, and considerable extensions were in contemplation. They looked upon that business as a sound acquisition, and one which had excellent prospects. Stocks, which included work in progress, amounted in the aggregate to £227,075. The reserve account was £50,000 more than at the corresponding date last year, and now stood at £130,000. The profits shown were not quite so favourable as those of the preceding year, which was an exceptionally good one. Having regard to the fact that the general strike occurred in the period covered by the accounts and that the last two months of the year's trading was affected by the coal dispute, he did not think the shareholders had any cause to be dissatisfied with the figures. As to the prospects for the current year, the labour disputes which continued for five months of the period had naturally had a detrimental effect upon the business, but he was pleased to tell them that since the termination of the coal trouble sales had increased very satisfactorily, and it was to be hoped that the improvement would be maintained notwithstanding the attenuated demand which would probably be experienced for some time. In conclusion, he paid a tribute to the work of the late board, who, he said, had had a very heavy task to perform during the last three years. In particular their thanks were due to the late chairman, Mr. C. F. Spencer. They had been endeavouring to induce him to rejoin the board and take up his old position again as chairman, and he (the chairman) was hopeful that he would do so at an early date. The report was adopted.

Low Temperature Carbonisation, Ltd.

The annual meeting was held on December 31st, Sir Arthur Wheeler, Bt. (chairman), presiding. In his address the chairman referred to the reorganisation which had taken place during the year, and said that the board comprised, in addition to himself, Messrs. W. H. Behrens, H. Langham-Reed, F. R. Wade, and R. P. Wilson. The new working capital provided by the issue of prior lien debenture stock was £135,000 net. The reconstruction of the Barnsley works was in progress; 160 retorts with a carbonising capacity of 250 tons per day were being erected, and within a few months it should be proved whether the profits anticipated could be realised in actual working practice. One battery of retorts should be in commission by the middle of March, and by the end of May the company hoped to be turning out between 400 and 500 tons of "coalite" and other by-products per week. He had every confidence in the future of the company and the "Parker" process, and claimed that the amount of rich gas which could be produced by the system would have an enormous influence upon the cost of generation of electric power. In conclusion, the chairman said that the company's year ended on July 31st next, and they hoped to issue a report and accounts early in the autumn.

Telephone Co. of Pernambuco, Ltd.

This week the company issued for information only a statement of its capitalisation and objects. The company has a share capital of £200,000, of which £100,000 has been issued. The vendor of the telephone business in Pernambuco received £10,000 in cash and 7,000 ordinary shares of £1 each. Under an agreement made in 1914 with the Pernambuco Tramways and Power Co., Ltd., that company agreed to take up 54,990 7 per cent. cumulative preference shares of £1 each, and in consideration of this the company was allotted 25,000 ordinary shares of £1 each as commission. The authorised debenture capital amounts to £200,000, and of this £150,000 has been issued to the Pernambuco Tramways & Power Co., Ltd., which has received as consideration 13,000 fully-paid ordinary shares.

North Metropolitan Electric Power Supply Co.

The company has decided to redeem the £250,000 8 per cent. cumulative preference stock on July 1st, 1927. It is intended to make an issue of other stock or shares into which he holders of the 8 per cent. stock will be able to exchange their holdings.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Compania de Electricidad de la Provincia de Buenos Aires, Ltd.—131,250 ordinary shares of £2 each, fully paid, Nos. 1 to 131,250.

The undermentioned have been ordered to be officially quoted:—

Compania de Electricidad de la Provincia de Buenos Aires.—131,250 ordinary shares of £2 each, fully paid, Nos. 1 to 131,250.

United River Plate Telephone Co.—152,000 ordinary shares of £5 each, fully paid, Nos. 912,001 to 1,064,000.

Japanese Electric Bond and Share Co.

The American Press reported last week that a company had been formed with the above title, representing Japanese, American, and English interests. The initial capital will be 10 million yen, of which 25 per cent. will be paid up immediately. The parties concerned in the matter are the Tokyo Electric Light Co., the Toho Electric Power Co., the Tokyo Marine and Fire Insurance Co., the Yasuda Holding Co., the Mitsui interests, the Guaranty Co. of New York, the International General Electric Co., the Electric Bond and Share Co., Lazard Bros. & Co. (London and New York), Sale & Co., and the Whitehall Trust.

Yorkshire Electric Power Co.

The company has deposited at the Private Bill Office of the House of Commons a Bill enabling it to increase its authorised capital by £2,000,000 by the creation of new ordinary or preference shares. It is also sought to increase the company's borrowing powers up to one-half of the issued capital.

Simms Motor Units, Ltd.

The directors have contradicted a report, circulated last week, that an offer had been made to purchase the company's shares at prices far in excess of those ruling in the market.

French Companies.

The *Société des Exploitations Electriques* reports net profits of 2,042,000 fr.; the dividend is at the rate of 17 fr. per share.

The *Société Alsacienne et Lorraine d'Electricité* reports net profits of 2,906,000 fr. for 1925-26, as against 2,809,000 fr. in the previous year. A dividend of 8½ per cent. has been declared.

Greenwood & Batley, Ltd.

An interim dividend of 2½ per cent. has been declared, as in 1922.

Quebec Railway, Light, Heat and Power Co.

A dividend of $1 per common share has been declared.

Stocks and Shares.

MONDAY EVENING.

THE New Year in the Stock Exchange markets opened with a cheerfulness that amounted to something akin to buoyancy in the case of investment stocks. The cause is traceable to the offer by the Government of a new issue of 4 per cent. consolidated stock at what seems to be the relatively high price of 85, such sinking-fund provisions being attached to the loan as render the latter likely to prove generally popular. The immediate effect was to strengthen quotations for existing securities of the gilt-edged order, and this served to impart a strong tone to investment prices in most of the markets. The London Power debenture, for instance, has strengthened to 2 premium, stock still being on offer at 97¼ free of stamp and fee, and carrying a three-months' interest payment due on April 1st. The return is the modest one of £5 2s. 6d. per cent. on the money, but the security is irreproachable, and it is stocks which have a character of this description that are in active demand.

During the first week of the New Year it is customary for Stock Exchange prices to exhibit a good deal of strength, owing to the fact that people feel more hopeful on the turning-over of a new leaf, besides feeling themselves released from the necessity of building up big balances at the banks. Later on in the spring there comes into operation the effect of sales made for the purpose of providing money wherewith to meet income tax demands, added to which there arise uncertainties in regard to the Budget. At the moment, however, pointers suggest cheaper money in the near future, and, as already mentioned, markets in most parts of the Stock Exchange are

cheerful, with business amongst investment stocks exhibiting noticeable activity.

The amount of new capital raised in London during 1926 was 230¾ million pounds, as compared with 232 millions in the previous year. Electric light, power and telegraph companies took £13,667,800 last year, against rather under eight millions in the previous twelve months the final quarter of the year 1926 calling for more money than the rest of the nine months put together. The new issues were taken in most cases with readiness, and in all such instances as those where sound security was offered at a reasonable price, subscription lists were closed in advance of the advertised time.

The New Year has started with indications that more capital will be required before long by some of the electricity supply companies. The East Anglian Electric Supply Company has a Bill to come before Parliament in the next session, the object of which is to extend the supply of electricity within Norfolk, Suffolk, and a large part of Essex. The Yorkshire Electric Power Company's Bill deposited in the House of Commons, proposes to empower the company to raise additional capital to the extent of two million pounds by the issue of ordinary or preference shares. Borrowing powers are also sought to the extent of one-half of the capital raised. The Bognor Gas Light and Coke Company is altering its name to the Bognor Gas & Electricity Company, and Parliament is being asked to grant permission for the company to supply electricity in West Sussex.

Last year's experience showed that, in spite of the demands for new capital, these had little apparent influence upon prices of existing stocks and shares. With the new issues made by manufacturing companies, the fact of the new shares being offered at what are called bonus prices assisted in the rises that occurred in this section. It is expected that several of the electricity supply companies, now that their finances are established upon a firm forty years' basis, will take an early opportunity for spending fresh capital, though the manner in which this will be raised is at present in doubt. It is impossible to imagine that a new authority such as that created by the London Electricity Acts will fail to follow in the familiar footsteps of other similar bodies in the matter of raising money.

Metropolitan Electrics are quoted ex rights, and so are Brompton ordinary, the prices being 26s. and 25s., respectively. No changes have occurred in the list of ordinary shares since the old year. Notting Hill preference at 10 ex dividend have recovered the distribution.

The surprising developments whereby telephonic communication has been established with New York, and the expectation that this will be extended to Australia very shortly, have failed to energise the price of Marconi shares, which remains dull at 13s. 9d. The auditors' investigations are known to be practically complete, and the report should be out before these notes appear. The company has notified that the statements concerning Australian beam service tests are unauthorised, but add that the preliminary tests, so far carried out, have been highly successful.

The cable market at a whole is quiet, with a slight improvement in Globe ordinary to 18⅝. The company has declared its usual quarterly dividends of 3s., less tax, on the preference, and 5s. net on the ordinary shares. The Chili Telephone Company announces an interim dividend of 6 per cent. tax free, payable January 15th, the same rate as that of a year ago, and the price remains unchanged at 6¾.

In the manufacturing group, there has been a trifling setback in Johnson & Phillips to 58s. 9d. On the other hand, Metropolitan-Vickers ordinary rose 3s. 9d. to 26s. 3d., upon announcement of some excellent contracts which the company has secured. Edison Swan continue dull, the price going back to 10s. in consequence of the contraction of £17,000 shown in the profit for the year ended June, 1926. Callenders are 1/16th off at 3⅜; Henleys fell ⅛ to 4¼. The interest recently aroused in the market has subsided to some extent, but prices continue firm as a whole, and there is a steady demand for General Electrics and others of this character. Babcock and Wilcox are better, a fairly general improvement taking place at the opening of the year in the shares of iron, coal and kindred companies. Hopefulness is the pervading note in most of the speeches and messages made by the principal industrialists, and it is felt that justification exists for this, in view of the conclusion of the coal stoppage and the knowledge that business is returning to the country's main arteries of commerce.

The Home Railway market has benefited with the rest. Rises have occurred in Metropolitans, in Districts, and in Underground Electric shares. At the extreme close of last year, an all-round recovery took place in the stocks of the steam railways, but these improvements have not been held in their entirety. The Southern and several of the other railways have in contemplation big schemes of extension, which will involve, it is known, the expenditure of substantial sums upon electrical equipment.

In the foreign group, Brazilian Tractions are better at 108½ and Anglo-Argentine Tramways preference shares, quoted ex dividend, retain the improvements that they secured at the end of last year. A good deal of hesitation is felt in connection with Mexicans. British Columbia Electric stocks met with support, in spite of the slight reduction in the dividend on the preferred. Rubber shares are better, on the whole, thanks to the impression that the price of the raw material will improve if the exportable allowance is again reduced—and there are prospects of such a step being taken—from the beginning of next month.

The Foreign Electrical Trade of Denmark.

The Last Two Years' Imports and Exports Compared.

THE following table shows Denmark's imports and exports of electrical machinery and apparatus in 1924 and 1925, indicating the principal countries of origin or destination. A note of increases and decreases is also given. Denmark is, on the whole, still more of an importer than an exporter of these goods. She does a very large and growing oversea business in batteries and cells. Imports of machinery declined, while exports of dynamos and motors advanced in 1925, and exceeded the total imports in that class. It will be noticed that although exports of electric wire and cable show fair increases, they are still considerably below the value of imports, which in 1925 marked a very large advance on 1924. Material for lighting installations (switches, fuses, &c.) is still imported in greater quantity than it is exported.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

New Mining Switchgear.

A recent production of MESSRS. JOHNSON & PHILLIPS, LTD., Charlton, London, S.E.7, is a new design of mining switchgear of the draw-out pattern, for 300-A loading at 3,300 V. It is made in units arranged for connecting up in switchboard form, and compensation is provided in each bus-bar chamber for any unevenness in the floor levels of adjacent units. The apparatus consists mainly of two parts, the bus-bar chamber and an oil circuit breaker. The former is arranged as a switchboard when a number of units are employed, and as a cable-sealing chamber when only a single unit is used. The oil circuit breaker is equipped with rollers which run on rails to allow the breaker to be withdrawn. Its travel is limited, but it may be lifted from the rails for repairs. The trips are adjusted by a simple device on the top of the breaker, so that it is not necessary to remove the oil tank or main covers to alter the trip settings. Safety interlocking is provided throughout the apparatus, and the usual instruments and automatic features are included. Fig. 1 shows a unit

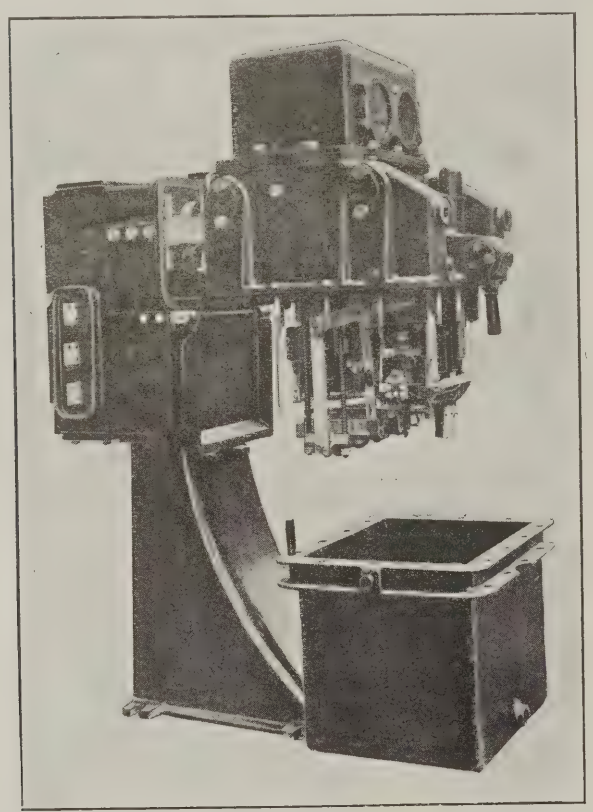

Fig. 1.—Mining Switchgear Unit.

with the breaker withdrawn and the tank removed. Series overload coils with a time-limit attachments can be fitted for any capacity up to the maximum scheduled rating, and self-setting low-voltage releases, or earth leakage trips, may also be provided.

A Motorless Refrigerator.

To assist in meeting the demand for a small refrigerating plant large enough to be of practical use and simple enough to be easily worked by unskilled labour, the PULSOMETER ENGINEERING CO., LTD., Nine Elms Iron Works, Reading, has developed a motorless apparatus, the "Pulsometer" refrigerator, fig. 2. It requires only a small amount of power for heating which can be provided electrically. As there are no moving parts, the equipment has the advantage of being, it is claimed, absolutely silent. The only refrigerating medium is securely confined in the machine, and is claimed to never need replenishing. The only attention required is with regard to the heating and the circulating water; the control of the former is arranged automatically, and the heating circuit is "on" for about 1¾ hours per day. The plant consists merely of a sealed system of containers and pipes, allowing no escape of its contents. The safe is thoroughly heat insulated, and its inside walls are water and damp proof. The apparatus is simple to install, the only requirements being suitable housing, and water and electric connections.

The cooling is effected by the expansion of a certain chemical vapour, dissolved in water, which readily leaves the water on the application of heat, and after it has done its work of cooling is condensed and re-dissolved in the water. On leaving the solution the vapour passes gradually into the special arrangement of pipes fixed inside the safe. When the heating is cut off and the circulation diverted, the cooling period starts. The refrigerant, which has been driven from the boiler into the evaporator in liquid form, then turns into gas and absorbs heat from the cabinet, returning slowly to

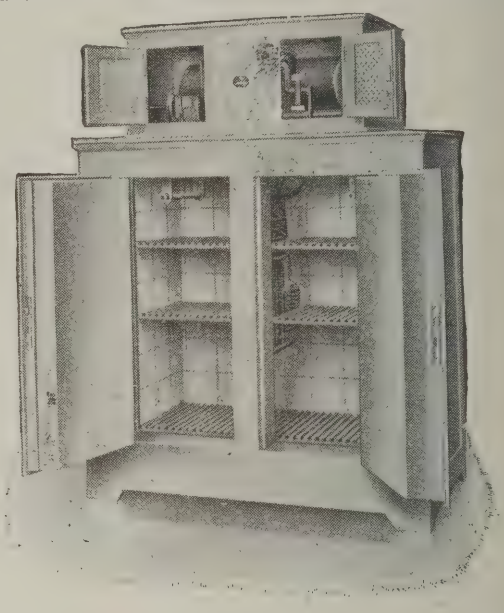

Fig. 2.—"Pulsometer" Refrigerator.

the boiler where it becomes once more absorbed in the original solution. The process of evaporation is gradual, and consequently the cooling continues for a considerable time. Where the advantages of electric heating are denied, other forms of heating can be arranged for.

A Short Rope Drive.

What should prove of interest to the textile industries is a new system of rope drive, the Texrope, introduced by MESSRS. FRANK WIGGLESWORTH & CO., LTD., Shipley, Yorks., which is claimed to permit unusually short distances between the drive centres. It consists essentially of driving and driven sheaves both V-grooved for a number of Texropes. These are of a specially designed material which acts as a cushioning medium. They are wedge-shaped and stretch slightly so as to pull into the grooves gradually when starting. They do not touch the

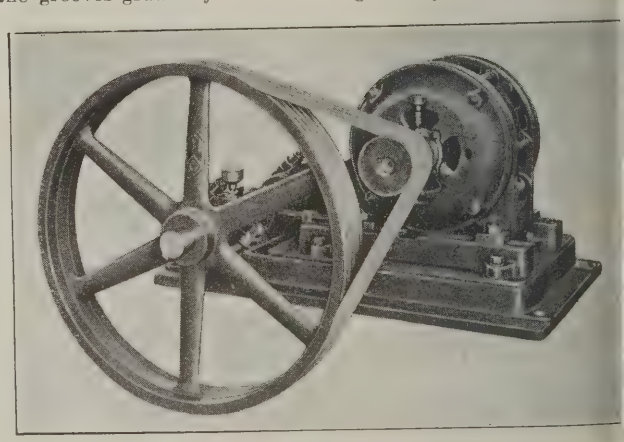

Fig. 3.—A "Texrope" Drive.

bottom of the grooves, being of trapezoidal cross section, so that at high speed no air is trapped to reduce the grip and driving power. These driving mediums are constructed as endless "belts," and are claimed to be more efficient than the ordinary V-belt. Another advantage claimed for this drive is that no lubrication is required, an important feature for drives in such places as food factories. There appears to be no limit to the shortness between the drive centres provided the minimum arc of contact on either sheave is not less than 120 deg. This will no doubt prove a desirable qualification in those cases where direct electric drive is not advisable. Fig. 3 shows a typical Texrope drive.

A Capacitance Bridge and New Inductometer.

A Simple, Self-contained Instrument of Wide Range with a Novel Scale System.

(Abstract of Paper read before the PHYSICAL SOCIETY OF LONDON.)

FOR the accurate measurement of capacitance, Mr. Albert Campbell introduced in 1907 Heydweiller's modification of Carey Foster's method, using as standard a mutual inductometer calibrated against a mutual inductance calculated from its dimensions. This method still holds its place as one of the best for precision measurements of capacitance and power factor, but it requires a rather large set of resistances if a wide range of values is to be dealt with. For tests which do not require the highest accuracy Mr. Campbell has designed a simple self-contained bridge which affords a quick and convenient means of measuring capacitance over a long range, also indicating the power factor with fair accuracy except in extreme cases, and he recently described it in a short paper before the PHYSICAL SOCIETY.

The method consists in placing an unknown condenser C in parallel with a known non-inductive resistance P, and reading the effective self-inductance and resistance of the combination by means of a bridge containing a mutual inductometer; C is obtained directly by multiplying the reading L of the inductometer by $1/P^2$, which factor is conveniently chosen to be some power of 10, so making the scale read the capacitance practically directly. The method has been designed for the convenient determination of capacitance, and treats power factor only as a secondary consideration. If P is not non-inductive, its self-inductance l can be kept so small that corrections are unnecessary in general.

The present model is arranged, as in fig. 1, with equal ratio arms (R=S), P and Q being equal resistances in the other arms, which also include H and K, the two sections of the secondary winding of the mutual inductometer, which are made identical in resistance and self-inductance. The inductometer scale is marked to read L directly, usually extending from −10 to +105 microhenries; the resistances P and Q can be simultaneously altered by a step-switch, giving a series of values, 3.162, 10, 31.62, 100, 316.2 and 1,000 ohms, which give scale ranges of 100$\mu\mu$F, 1,000$\mu\mu$F . . . up to 10 microfarads. Two fixed steps on the inductometer carry each range to three times the above, giving a total range from

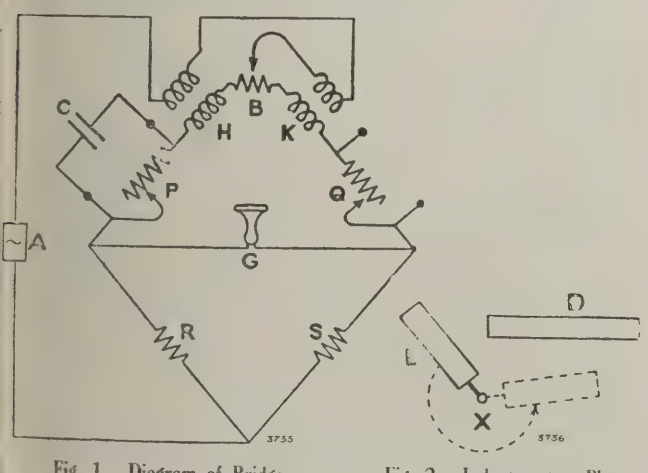

Fig. 1.—Diagram of Bridge.

Fig. 2.—Inductometer, Plan Diagram.

(say) 1$\mu\mu$F to 30μF. The rheostat B has its scale marked to read directly changes in P or Q and can be shunted so as to increase the accuracy of reading tenfold. To make a measurement, the range-setting switch is turned to give the desired range, and a balance (in the telephone or vibration galvanometer G) is obtained by setting B and a small zero-setting L-dial, the main L-dial reading zero. The condenser C is then put across P, and a new balance obtained by altering B and the main inductometer. Then the multiplied inductometer reading gives C, and the change in the rheostat reading gives $(P-P')$, and hence the power factor. Two condensers not very unequal can be compared by putting the larger across P and the smaller across Q.

The instrument, which is made by the Cambridge Instrument Co., is illustrated in fig. 3, and its accuracy of measurement has been greatly increased by the use of a new type of mutual inductometer designed by the author, the scale of

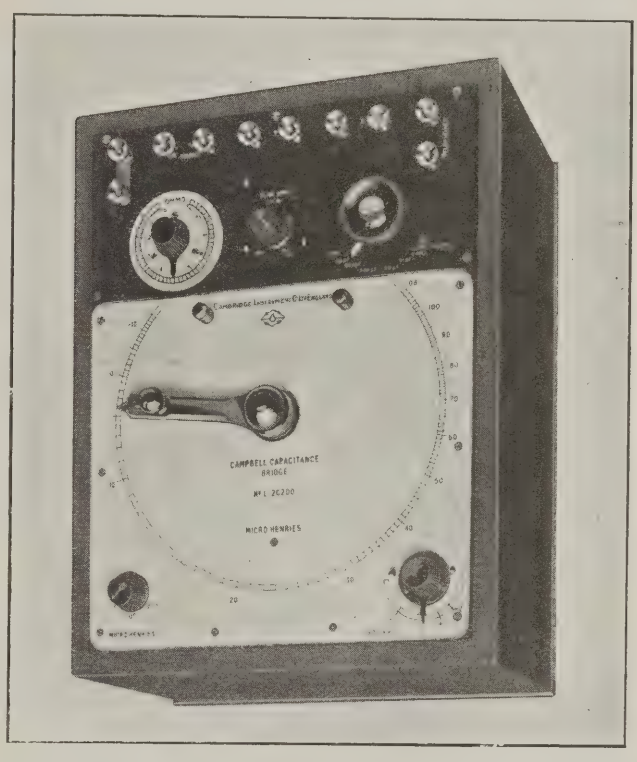

Fig. 3.—Campbell Capacitance Bridge.

which embodies two improvements:—(1) Its angular extent is very great, being about 260 deg., older types giving only about 160 deg. (2) The scale gradually opens out towards the zero, in such a way that over the greater part of the range the percentage accuracy of reading is nearly constant; a slight intentional opening towards the top prevents the divisions being too close there, the minimum length being 1.8 mm. per division.

The importance of constant percentage accuracy of reading does not seem to have been realised by many instrument makers and users, and it is very often difficult to attain. The equation for a scale of constant percentage accuracy is $M=\alpha\epsilon^{\theta}$, where M is the mutual inductance at angular reading θ, ϵ the base of natural logarithms, and α a constant; but such a scale could never get down to zero until $\theta=-\infty$. Therefore, a practical scale is closed in gradually at the lower end so as to reach zero and negative values. In the present instance, the ideal scale has been attained by constructing the inductometer as shown in plan in fig. 2, where the fixed and moving circuits are the vertical coils D and E respectively, E being mounted on a vertical axle X, carrying the pointer.

Except at the beginning of the very lowest range, the accuracy of reading of the capacitance bridge is within 2 parts in 1,000 throughout. With the two highest ranges (or for very large power factors) correction is sometimes required; for example, with a frequency of 800 cycles per second for C=1μF., the correction is about 2 in 1,000, and for C=30μF it becomes quite excessive. This difficulty with very large condensers can be avoided by making the tests at a lower frequency, such as 100 cycles per second. In conclusion, it may be remarked that the system of shunting used in the bridge involves considerable loss of sensitivity, but this disadvantage appears to be well outweighed by the convenience and ease of working of the instrument.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

THIS eagerly-looked-forward-to show was held as usual at the Imperial College of Science and Technology, South Kensington (January 4th, 5th and 6th). It was the seventeenth of the series of annual exhibitions arranged by the Physical Society of London, and the Optical Society, to indicate the year's developments in the design and manufacture of electrical, optical, and other physical apparatus, being accordingly hailed as one of the chief scientific events of the season.

The Councils of both Societies decided to again include this year, in addition to the well-established trade section in which some 74 exhibitors participated, a research and experimental section similar to that successfully initiated in 1926. The groups in this section comprised: (*a*) Exhibits illustrating the results of recent physical research and improvements in laboratory practice; (*b*) effective lecture experiments; and (*c*) repetitions of famous historical experiments, for which accommodation had been provided in rooms distinct from those devoted to the trade exhibits, and a section of the catalogue had been allotted for their description. In group (*a*) there were this season 19 exhibitors; in group (*b*), 11; and in group (c), two. The total was, therefore, 116, which figure is an indication of the size of the display.

Three discourses were delivered, one during each evening: Prof. E. N. da C. Andrade lectured on "Light and Electricity, as it might have been given in 1709," with the apparatus of the time. "Progress in Electrical Instrument Design and Construction" was the subject chosen by Dr. C. V. Drysdale; and Mr. John L. Baird spoke on "Television."

We commence below brief descriptions of some of the newer apparatus of an electrical nature which was exhibited in the trade section.

Eversheds & Vignoles, Ltd.

Chief amongst the new instruments and improved devices shown by this Company was the Midworth distant repeater, an electrically-operated system which enables movements as different in character as the motion of a sluice gate, lever arm, or instrument pointer, to be shown at any distance and at any number of points; it can also be used for the distant control of any power-driven apparatus, and any number of repeating instruments, either indicating, recording, integrating, or controlling can be used. The actual transmission is of an angular motion, and normally the repeating instruments also show a corresponding angular deflection. Where a movement in a straight line is to be repeated, it is therefore converted into angular motion; if, however, it is desired to repeat the original movement exactly, appropriate arrangements can be made at the repeating station.

The operation of the system imposes no load on the apparatus of which the movements or indications are to be indicated or recorded, a valuable feature where the readings of a delicate instrument have to be transmitted to a distance. It does not operate on the step-by-step principle, and the repeating instruments cannot get out of step with the transmitter, whilst for transmitting information by means of indicating or recording instruments, it requires two conductors only between transmitter and repeating instruments.

The apparatus automatically compensates for variations in the supply voltage and for changes in the resistance of the repeater circuit; the line connecting transmitter and repeating instruments may therefore be of any length desired, and the number of repeating instruments used may be varied at will without affecting the accuracy of the system. In the event of line breakage, the apparatus returns automatically to normal working without loss of accuracy when the break is repaired. The repeating instruments are milliammeters, which are inexpensive.

The principle underlying the system is the regulation, by the originating movement, of an electrical current which passes through the controlling and repeating instruments in series; below the main index, and mounted in axial alignment with it, is the pointer of the electrical control instrument, which floats between two contacts borne on the main index; when the latter moves in response to the originating movement with which it is connected, one of the contacts which it carries touches the pointer of the control instrument and completes the circuit of one of two field coils of the control motor. The field coil being energised, closes a switch in the armature circuit of the control motor, at the same time releasing a brake which normally prevents the armature from revolving; the armature then turns worm gearing which moves the contactor arm over the control rheostat (see fig. 1); the direction in which the arm is moved depends on which field coil has been energised. As the arm moves over the rheostat, the current passing through the repeater and control instrument circuit is altered until the pointer of the control instrument reaches a position at which it floats freely between the contacts carried by the main index, when the field-coil circuit is broken, the motor is switched off, and the armature is stopped instantaneously by the releasing of the brake. The control mechanism operates therefore to bring the current through the control instrument to such a value that its

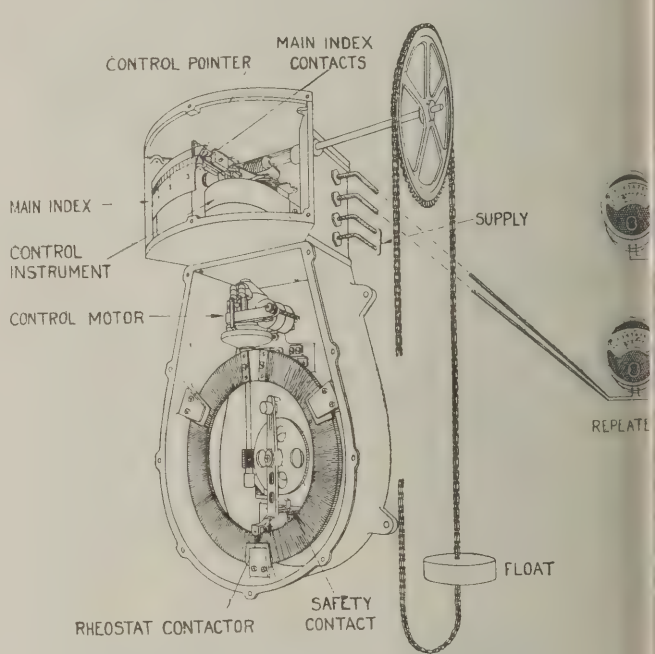

Fig. 1.—Midworth Distant Repeater.

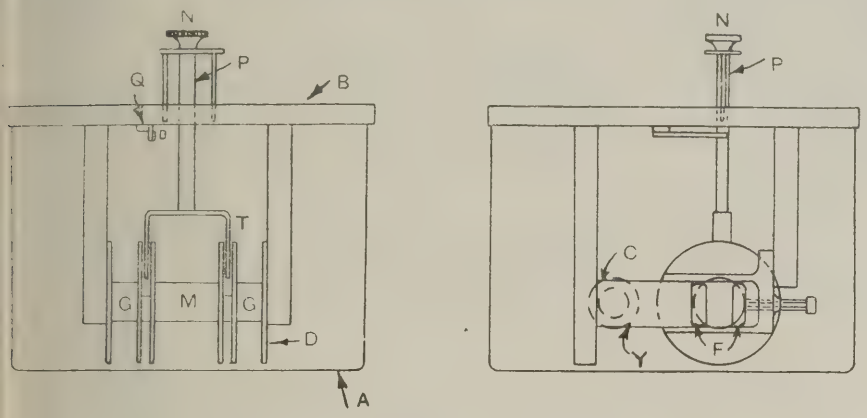
angular deflection corresponds with that of the main index and as the control and repeating instruments are in series the pointers of the repeaters will follow wherever the main index may be moved.



As the mechanism tends always to bring the system to a state of balance with the pointer of the control instrument and the main index in alignment and the motor at rest, it is evident that when equilibrium is attained there can be no load on the main index; hence the system can be used for repeating the indications of delicate instruments at a distance. Should the voltage of the repeater circuit vary, the current will fall and the control pointer will touch one of the contacts on the main index; the motor will rotate the rheostat contactor in the direction necessary to restore the current through the repeater circuit to its correct value until the pointer once more floats freely. Changes in the resistance are similarly compensated for, so the number of repeating instruments can be varied at will. In the event of a break in the line, the control motor will try to make up for the insertion of resistance of infinite value, and will rotate the rheostat until a safety contact is touched, when the system is closed down. The circuit through the other field coil, that which causes the motor to turn the contactor arm so as to reduce the current, is, however, left ready so that when the line is restored, the motor immediately starts, and the reading returns to its correct value.

Should the rheostat, or contactor, become corroded, the arm will oscillate until the dirt has been removed. The cor

tacts of the main index carry only the small current necessary to energise the field coils; they are therefore not subject to sparking or to rapid wear. The full line voltage is always across these contacts, and they are thus not susceptible to imperfect contact. All contacts are readily detachable, and the rheostat can be easily removed without undoing any wire. The motor is of simple design, and the power consumption for the entire installation is from 10 to 12 watts only. The system as at present designed works on direct current, and its varied possible applications indicate its wide range of usefulness.

Cambridge Instrument Co., Ltd.

Amongst a number of new instruments shown was the useful and simple Campbell capacitance bridge, which is described fully on page 31 in this issue. Another piece of apparatus was the Hughes permeameter for accurately determining the magnetisation curve and hysteresis loop of bars of magnetic material. The complete outfit consists of a bridge, resistance

Figs. 2 and 3.—A Simple Hughes Permeameter.

and switch unit, ballistic galvanometer, resistance box, and a multi-range ammeter. The main magnetising coil is so arranged that H equals 100 times the current in amperes, and it is designed to carry up to 4 A in air, or up to 10 A in oil; values of H from 1 to 1,000 c.g.s. units may be measured with tolerable accuracy. The bridge (figs. 2 and 3) consists of an aluminium tank A with an ebonite lid B supporting the yokes Y and the compensating and magnetising windings C M; the specimen is passed through the brass spool D and clamped across the two yokes by F. The spool D has a slot on each side of the magnetising winding to allow the test yoke T to approach the specimen. Two guard windings G maintain an even distribution of flux in the specimen, and provision is made so that the test yoke may be reversed in order to test for complete demagnetisation of the test yoke. A switch is arranged to automatically short circuit the resistance in the galvanometer circuit when testing for magnetic balance. The arrangement enables the windings of the specimen to be immersed in oil when working at the higher values of the magnetising force, by filling the aluminium case with oil. This simple form of apparatus enables commercial bar specimens of magnetic material to be tested by standard methods with a precision equal to that of the ring method, without necessitating the provision of a perfect magnetic joint at the ends of the specimen, and without winding any special coils on the specimen other than the search coil. The range of the apparatus may be readily extended to the measurement of permeability, and the determination of the hysteresis loop at high values of the magnetising force. The precision of the results obtained is such that for any but abnormally low values of H, the errors do not exceed 1 or 2 per cent., while for higher values of H (up to 1,000 c.g.s. units) the accuracy is proportionately increased.

An improved form of thermionic voltmeter is similar to the original model developed by Mr. E. B. Moullin, but is a multi-range pattern suitable for a wider range of measurement.

A simple form of thread recorder (fig. 4) for use with base metal thermo-couples is expected to have a large sale. It possesses the essential features of the standard Cambridge thread recorders, but can only be supplied as a single-point instrument and in one of the following ranges:—0 to 600 deg. C., or 0 to 800 deg. C. for use with iron-constantan thermo-couples, and 0 to 1,000 deg. C., or 0 to 1,200 deg. C. for use with "Titan" thermo-couples. The galvanometer is a robust pivoted-coil instrument and the record is traced on a 25-hour chart with a record space 95 millimetres wide; the mechanism is enclosed in a metal case.

A continuous film micro-indicator, which was made for the London & North-Eastern Railway, was shown by courtesy of the chief mechanical engineer. It is a modified form of the indicator designed by Mr. W. G. Collins, by which diagrams are obtained from high-speed engines by means of a stylus acting upon the surface of a celluloid disk; the continuous-film instrument has been designed primarily for use on locomotives, and the controlling switchgear may be fixed in any suitable position to enable the records to be obtained from a distance.

A new illuminated indicator has been designed to meet the demand for a large-dial instrument which can be easily read from a considerable distance, and the first model has been developed for use with CO_2 meters. One of these indicators is mounted on each boiler and connected to a katharometer in the ordinary way: the movement of the pointer is controlled from a galvanometer, which forms a separate unit, and is common to all the indicators (up to six) in an installation, being connected to each in turn through a master switch. The apparatus can be linked to an ordinary multi-point thread recorder installed in any convenient position. The indicator has a 13-in. dial with large figures, and contains no delicate mechanism; the scale is graduated in CO_2 percentage, the standard range being 0 to 18 per cent. A circular area on the portion of the scale to which the pointer is directed at any moment is illuminated by white light, while the pointer itself is illuminated by green light, if the percentage of the CO_2 is increasing, and by red light if it is decreasing. The operation may be briefly described as follows:—A pendulum contact-maker continually makes and breaks an electric circuit, and thus operates two electro-magnets: one operates the master switch, while the other operates a chopper-bar mechanism, which depresses the galvanometer pointer at regular intervals on to one of the two contacts, depending upon the direction of its deflection; by its rotation the master switch connects each CO_2 meter in turn (for a definite period) to the corresponding indicator and to the galvanometer. When there is a change in the CO_2 percentage in a flue, the galvanometer pointer will be deflected and, when it is depressed by the chopper bar, it will close an electric circuit which energises one of two electromagnetically-operated pawl and ratchet mechanisms in the indicator, and thus rotates the indicator pointer in the corresponding direction. As the pointer rotates, a contact arm is moved over a circular rheostat and so rebalances the Wheatstone bridge circuit. When the illuminated pointer moves up and down the scale, a green or red screen is automatically introduced into the path of the light which illuminates the pointer.

Marconiphone Co., Ltd.

Units for supplying high plate voltage for radio receivers and amplifiers from d.c. or a.c. mains were on view. They are designed to work on 100 to 120 or 200 to 250-volt mains, giving outputs at 120, 80, and 40 volts, so that any supply and any receiver may be suited. The U.5 full-wave rectifying valve is used in the a.c. unit, which has an output of 50 mA. The d.c. unit has a switching arrangement for reversing the smoothing circuit in cases where the positive main is earthed. This feature is not generally provided, and is a point worthy of note, as the efficiency of the smoothing effect may otherwise be seriously affected.

A new 2-volt power valve, the DEP.215, consumes only 0.15 ampere at 2 volts, and has the remarkably high

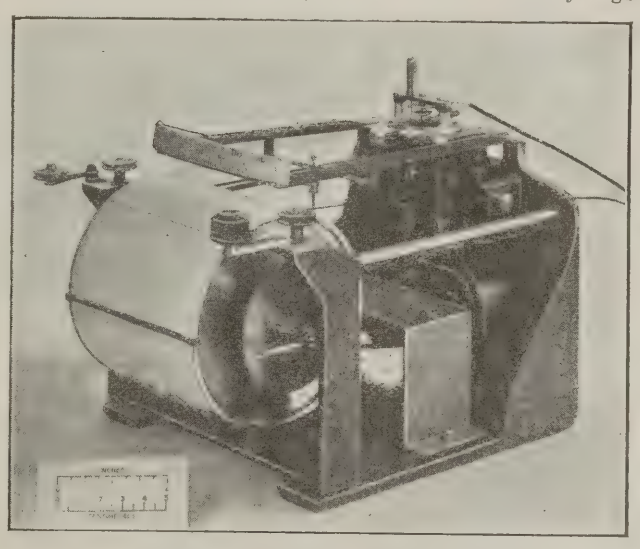


Fig. 4.—A "Cambridge" Thread Recorder.

mutual conductance of at least 1,000 micromhos. The amplification factor is 6.25, and the impedance is given as 6,250 ohms, but is generally below this figure. The maximum output is therefore very high, being 126 milliwatts of undistorted energy, at 120 volts h.p. The efficiency, expressed in microhms per watt of filament consumption, is 3,330.

The new supersonic transformer, with a natural wavelength of 6,500 metres, is worth attention. It is of the open iron-core type designed to give as sharp a cut-off as possible consistent with good amplification over a band of 5,000 cycles on either side of the fundamental frequency, with a step-up of about three and a half. The result is that reproduction is excellent, no filter is required, and two intermediate frequency stages are sufficient for all practical purposes.

(To be continued.)

Heavy-Oil-Engine Working Costs.

Diesel Engine Users' Association's Report for the Year 1925-26.—*Abstract.*

THE report of the General Committee of the Diesel Engine Users' Association on the working costs of Diesel engine and other heavy-oil-engine installations for 1925-26 has been published. In view of the interest which is being taken at present in the working costs of prime movers for the generation of electricity throughout the country, the figures and graphical representation of the results (fig. 1) which accompany the report are receiving particular attention. It should, of course, be noted that the average cost is obtained from undertakings in the majority of which the conditions of working are by no means favourable to securing the best results, and that the average figures do not represent the results obtainable when operating under reasonably favourable conditions. In some of the undertakings the heavy-oil-engine plant is only used as a stand-by, and in a large number of cases the annual plant load factor is less than 15 per cent.

In presenting the report, the Committee explains that the list of stations has been maintained practically intact and average figures over a period of four consecutive years' working are now available in many cases. Where plant has been run very little during the past year owing to the advent of bulk supplies of electricity, engineers in some cases have failed to send reports of their oil-engine working costs, under the impression that in such circumstances their figures would be of little interest; but the very reverse of this is true, as the Committee aims at collecting information under as great a variety of working conditions as possible.

Among the 46 undertakings listed (37 Home and 9 overseas) six new engines, varying in size from 250 to 1,125 b.h.p., were installed during the year, the average size having been 750 b.h.p.; the average size of engine installed during the previous year was 500 b.h.p.; the tendency to adopt larger engines therefore continues. There has naturally been an increase in the average plant capacity per station, and it is satisfactory to note that the average cost of repairs and maintenance per kilowatt installed is steadily falling in consequence. The average engine cost per unit generated among the home stations improved from 0.806d. to 0.799d., notwithstanding a slightly increased price for fuel oil and a slightly less favourable running-plant load factor. Among the overseas stations the corresponding figure increased from 0.746d. to 0.753d., the rise having corresponded exactly with the higher price paid for fuel oil; in this case also there was a slight diminution in the running-plant load factor.

Engine Costs.—Taking the 51 home stations, the average engine cost per unit generated in the year was 0.799d., see Table I.

TABLE I.—*Engine Cost per Unit Generated.*

	Pence.	Percentage of Total Engine Cost.
Fuel	0.387	48.40
Lubricating oil	0.057	7.13
Water (including treatment) ...	0.011	1.38
Stores	0.007	0.88
Wages (running staff)	0.200	25.10
Repairs and maintenance	0.137	17.11
	0.799	100.00

Output.—The total output reported upon has increased by 8,800,000 units, equivalent to 17.2 per cent. of the previous year's output.

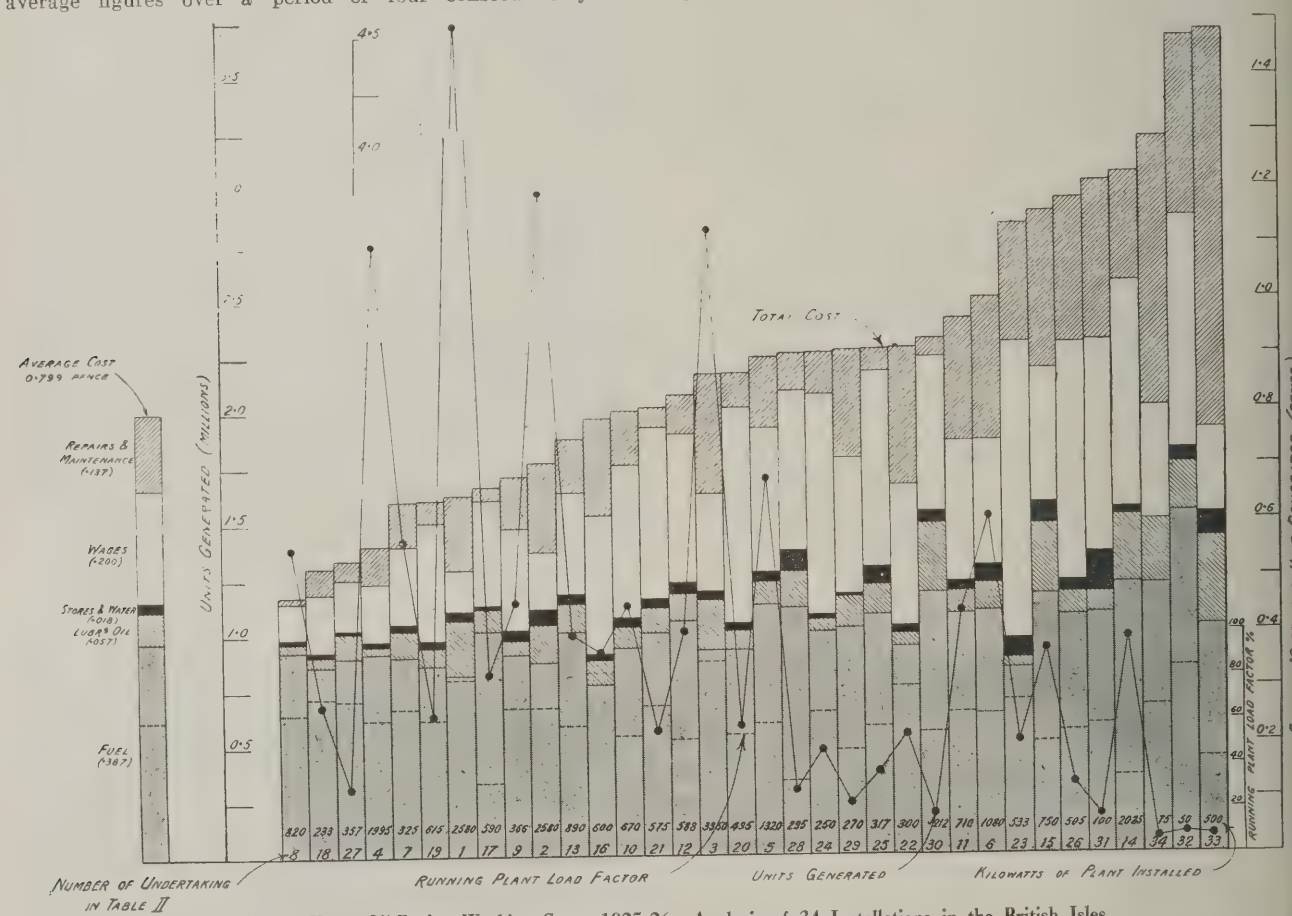

Fig. 1.—Heavy-Oil-Engine Working Costs, 1925-26; Analysis of 34 Installations in the British Isles.

Plant Installed.—The increase in plant installed during th year among the stations listed was 3,100 kW. The increase average plant capacity per station [Home 788 kW (703 kV previous year), overseas 1,510 kW (1,270); total engine capa city, Home 29,141 kW (25,363), overseas 13,550 kW (10,193) has a bearing on the reduction in the repairs and maintenanc cost per kilowatt installed and per unit generated.

Thermal Efficiency and Fuel Consumption.—Taking th average gross calorific value of the fuel oil used at 19,50 B.th.u. per lb., the overall thermal efficiency of the 46 station employing 177 engines (varying in size from 1,125 to 60 b.h.p run at an average running-plant load factor of 60.1 per cen was 24.15 per cent. This is a slightly better result, and at slightly lower running-plant load factor, than was obtaine in the previous year. The average fuel consumption per un generated, 0.725 lb., is about 7.8 per cent. above the corr sponding value on the standard curve; the excess recorded i the previous year was 9.1 per cent., while for 1923-24 th excess consumption was 10 per cent. Twenty-one undertakin returned fuel consumptions which fall on or below a lir drawn at 5 per cent. above the reference curve; the be results in this respect were obtained by the Chiswick Ele tricity Supply Corporation, the Maidenhead Corporation, Bir dale District Electric Supply Co., the Buxton Corporation, th Alderley and Wilmslow Electric Supply Co., the Bognor G

and Electric Co., the Electric Supply Corporation (Hitchin station), the Cookham and District Electricity Corporation, and the Kastoorchand Mills Co. (Bombay, India). These undertakings scored fuel consumptions below the reference curve, which several of them have done consistently during the last three years; from the last-mentioned fact arises the request for information to be supplied in future as to the brand of fuel oil used, and in view of the foregoing there seems to be no reason for altering the standard of reference.

Lubrication.—The average consumption of lubricating oil per unit generated, 0.00154 gallon, shows an improvement of about 9.4 per cent. The average improvement among the Home stations was about 4.5 per cent., and overseas 16 per cent.; the Home stations' average improvement does not reflect the economies which have been effected by a majority of the stations owing to the heavy consumptions of the Charing Cross and Southend undertakings, which bulk largely in the total lubricating oil used (accounting for 25,800 out of a total of 553,800 gallons). As a matter of fact, very much better results than formerly have been obtained by many Home stations; the average consumption of 33 of them was 0.00114 gallon per unit generated, at an average running-plant load factor of 57.8 per cent; this figure approaches fairly nearly to the working standard curve. A large number of stations have adopted centrifugal machines for oil cleaning with beneficial results.

Maintenance.—The average maintenance cost per unit generated, 0.137d. for Home stations, and 0.116d. overseas, shows a further substantial reduction in comparison with the corresponding figures for previous years, although a slight fall in the respective annual plant load factors has been recorded. Among the Home stations listed 127 engines (varying from 50 to 1,125 b.h.p.), and among the overseas stations 50 engines (varying from 100 to 1,050 b.h.p.) were in use during the year. The development of new types of engines of larger capacity than formerly usual necessitates the gradual solution of special problems in design, and a temporary set-back with regard to this item of working cost might have been experienced, but many examples of the newer engines have given such favourable service that there is no doubt that a definite advance in oil-engine development has been made. Maintenance costs which have been collected during the last four years are being scrutinised along new lines, and the Committee would welcome a free discussion and suggestions on this matter from the members. It is felt that the investigation into this item of cost has been really useful so far as it has gone, but a great deal of work and a combined effort on the part of all members is necessary for carrying it to complete success.

The Co-ordination of Urban Transport.*

The Desirability of Unified Management and Common Financial Interest.

By the Rt. Hon. LORD ASHFIELD,

(Chairman and Managing Director of Underground Electric Railways of London, and other Companies.)

URBAN transport is a complex subject. The means of travel required to conduct it satisfactorily are many and varied; the volume of traffic to be dealt with continually outstrips the capacity of the services provided, and the margin between receipts and expenses is always narrow in relation to the demands made upon it by reason of the large capital costs involved.

The underlying principles which may govern the operation of such undertakings are three, contrasted and opposed, namely, competition, co-ordination, and monopoly. "Laisser faire" and competition are but two aspects of the unrestricted freedom which the earliest economists deemed essential to the public welfare. The doctrine of the other extreme, of socialism as the negation of competition, found its dominant utterance later; out of evolution, however, the idea of co-ordination started, but there is still the same lip service by large sections of the community, the notion that competition alone is essential and beneficial and advantageous.

In 1860 the urban passenger movement in Greater London, using purely local means of transport, amounted to 40 millions of passengers. Twenty years later it had multiplied six-fold, and twenty years later still (in 1900) twenty-fold; it continued to advance with ever-accelerating speed, for in 1925 it amounted to 3,225 millions of passengers, or an accumulative increase of 8,000 per cent.; by 1930 it will be within reach of 10,000 per cent. Greater New York affords an almost parallel series of results, and one of the most illuminating comments on this record is that in a modern metropolis it is impossible to catch up with the demand for transport, because every addition to the means of transport creates fresh traffic and, therefore, fresh congestion. There is much truth in this which points, not to competition between the means of transport, but rather to competition between the users of the service of transport, a quite novel aspect of the blessed process. Apart from this radical change in the scale or magnitude of the problem, there has been the revolution wrought by electricity and the counter-revolution of the internal-combustion engine. It is time the new problems were approached as new problems, and not merely as overgrown old ones.

Transport consists in public service. The service may be measured statistically in seat-miles; the use of the service may be measured in passenger-miles: if the seat-miles are not used by passengers and so converted into passenger-miles, they are lost. The provision of service must be distinguished from the provision of commodities: if commodities are not sold one day, unless they are perishable, they may be sold the next; but service, once provided, is wasted unless it is used. The whole service must be paid for out of the proceeds of the part which is used, and a substantial proportion of the total service provided is wasted in any event by the operating conditions occasioned by the variable flow of the traffic. Whether railways, or tramways, or motor-omnibuses are considered, in Greater London the average use which is made of the facilities provided barely exceeds 33 per cent. In the cities of America it will not be greater; it may easily be worse. Only by unified management of all the means of transport and their co-ordination into a general system can such unavoidable waste as there is be reduced to the minimum compatible with adequate and efficient service to the public; but transport is not a simple service: express railways are required to connect outer suburbs with the centre; ordinary railways with high-speed stopping trains are required to connect the inner suburbs with the centre; the streets are filled with motor-cars and omnibuses; to cope with heavy short-distance traffic, street railways or tramways are needed upon which units of two or three coupled cars may rapidly clear away the in-flow and out-flow from factories, stores, and offices. The demands for service are varied, and the means of transport must become equally varied to meet the demands. Competition of one kind of service with another grows up which needs regulation and control, for the economic or profit-earning capacity of the different kinds of service is unequal.

In Greater London the average speed of the underground trains is 18 miles per hour, including stops, or 24 miles per hour where a limited number of stops only is made; of the tramways, the average speed is 9.6 miles per hour, but of the motor-omnibuses in the built-up areas it is only 8.6 miles per hour.

Average receipts per passenger upon the underground railways are 2.8d., upon the omnibuses 1.8d., and upon the tramways slightly less than 1.45d.; but the average cost of carrying a passenger upon the underground railways is 2.1d., upon the omnibuses 1.6d., and upon the tramways 1.3d., so that the margins (net receipts) are respectively 0.7d., 0.2d., and 0.15d. per passenger. Their relative net earning capacities (if the railways are taken as 100) are 29 in the case of the omnibuses and 21 in the case of the tramways, and the capital investment involved in the provision of these several forms of transport represents, per passenger carried in the year, 34d. in the case of the underground railways, 5d. in the case of tramways, and 1.4d. in the case of motor-omnibuses. Then, if the net receipts per passenger are brought into relation to the capital expenditure per passenger, it will be found that (motor-omnibuses being taken as 100) the economic capacity of the tramways is only 21, and of the underground railways (on account of their enormous capital expenditure) only 15.

Yet all these means of transport are necessary to a complete scheme of facilities. Under competition, free and unrestrained, the motor-omnibus must develop at the expense of tramway and railway, but this cannot be contemplated,

*Paper prepared for the Electric Railway Association Convention, Cleveland, Ohio, U.S.A., October, 1926.—*Abstract.*

so once more co-ordination must take the place of competition, and, added to unified management, there must be common financial interest which will permit of the strong aiding the weak, so that all may continue to expand and improve as may be necessary to give the public satisfaction. No form of transport dare confine itself to catering for one class, if by catering for several classes it could secure more passengers in the aggregate; tramways and omnibuses both seek the short-distance passenger and, in the main, give equivalent services at equivalent prices; railways cease to develop express services in favour of stopping services because they secure better loadings. In effect, competition is destroying the effectiveness of the transport facilities provided.

Developments since 1860 have proved that competition is no longer applicable to urban transport, but is the only alternative monopoly in one or another of its forms? It is suggested that co-ordination is a golden mean.

Those who manage and control joint stock companies have built up a technique of management which they must observe conscientiously. Undertakings now stand or fall by good management, and the weakness of the present economic situation is the absence of a sufficient supply of good managers. Finally, and may be most important than all else, publicity has entered into management. What is done in the office is shouted in the Press. The basis of prosperity in urban transport is not a few passengers at high fares, but many passengers at low fares.

What is meant by co-ordination? There is no one answer to such a question; each city must work out its own. It does not necessarily involve all transport agencies being in one ownership, or all transport agencies being under one management for the routine discharge of their operations, but there must be the power and authority to ensure that the operations of all the transport agencies are knit together into a systematic whole, to readjust the financial positions of conflicting agencies, to ensure that (whatever their ability to earn may be) all receive according to their needs, if their service is required. In some cities an independent board may be set up for the purpose, as in Boston; in others the transport agencies may be amalgamated and managed as one, under private auspices, as in Cleveland; in other cities a judicial body may decide between conflicting parties, and a semblance of direct competition remain, as in New York. In all cities the people have the right to exercise control, subject to the observance of certain principles. First, that those who control shall not be interested in one transport agency more than in another; secondly, that the transport agencies as a whole shall be self-supporting, or if that is not to be the case because cheap transport is held in such esteem as to warrant a tax or impost on the community in some other shape, such as a charge on landed estates, a rate on property, or a levy on industry at large, then a definite policy of subsidy out of such other resources shall be defined; thirdly, that those who invest their money in urban transport shall be entitled to a reasonable and proper return upon their capital. If, however, those who are engaged in the provision of urban transport are neglectful, or dilatory, or unreasonable, then the door should be opened and fresh agencies invited to take a share. Co-ordination is conditional protection depending upon deserts. The case for co-ordination has, since the war of 1914-1918, been reinforced by the tendency of events in almost all the great cities of the world. In Paris, Berlin, and New York there is a combination of public ownership with private operation. In Cleveland the celebrated plan of "service at cost" was instituted in 1910, and, with minor modifications, has been copied in many cities. This was a pioneer adventure in management on modern lines, and laid down a basis under which private ownership and public interests could be harmonised and the advantage of individual effort and skill placed at the disposal of the public and shareholders. The root plan is an agreement between the municipality and the transport undertakings which guarantees to the latter financial security in return for the best service possible, having regard to the economic conditions under which the transport facilities must be operated. The plan has been tested for years and still shows scarcely a flaw. Wherever search may be made, the tendency is always the same, yet London lags behind. However, a business influence is spreading, and it is hoped to establish common management of all transport undertakings in Greater London.

The Electricity (Supply) Act, 1926.

A Summary of its Provisions.

(*Continued from page* 1098.)

9.—(1) The Board may require any authorised undertakers or the owners of any selected station to amend or alter the frequency employed in their undertaking or station, if and so far as such amendment or alteration is required to effect the standardisation of frequency provided by a scheme, or to effect such standardisation of frequency as the Board, with the approval of the Electricity Commissioners, may think expedient, subject to the payment of any expenses incurred in carrying such requirements into effect (including the cost of altering or replacing plant belonging to consumers), and the Board shall, if required, advance free of interest such sums as may be necessary.

(2) The payment of any such expenses and the making of such advances shall be purposes for which the Board may borrow.

(3) The Board shall be entitled to be repaid by the Electricity Commissioners in each year the sums required to meet the interest and sinking fund charges in respect of money so borrowed.

(4) Any question regarding expenses shall, in default of agreement, be determined by the Electricity Commissioners or at the option of the authorised undertakers or owners be referred to arbitration.

(5) A railway company shall not be required to alter the frequency employed by them except by an Order made in accordance with the Railways Act, 1921.

10.—(1) As soon as the Board, as respects any area or part of an area, notify that they are in a position to supply electricity, they shall be under an obligation to supply it to any authorised undertakers in that area demanding such a supply.

Provided that the Board shall not supply electricity directly to authorised undertakers situated in the area of supply of a power company without the consent of the company unless the undertakers have an absolute right of veto on any right of the power company to supply electricity within the area of supply of those undertakers; or unless the power company are unable or unwilling to supply electricity to such authorised undertakers on reasonable terms and conditions, to be determined in case of dispute by the Electricity Commissioners.

(2) Where it appears to the Board that the outlay incurred in providing the transmission lines required would entail unreasonable expense, the Commissioners may authorise the Board to impose such terms and conditions as the Commissioners may think fit, on the giving of the supply.

(3) Where any authorised undertakers owning a generating station, not being a selected station, demand a supply of electricity, they shall take the whole quantity of electricity required for their undertaking, directly or indirectly, from the Board.

Provided that—

(*a*) The Board shall not impose such a condition unless satisfied that the cost per unit to the undertakers will for a period of not less than seven years be less than the cost at which electricity is then being produced at the generating station of the undertakers, and in determining such cost no account shall be taken of capital charges in respect of capital expended on the station; and

(*b*) Where the authorised undertakers feel aggrieved they may appeal to the Electricity Commissioners, who shall if so requested by the undertakers, refer that question to arbitration;

(*c*) Where the Board impose such a condition they shall take over the obligations of any such undertakers to receive supplies of electricity in bulk.

11.—(1) Subject to the provisions of this Act as to the sale of electricity to the owners of selected stations, the price to be charged by the Board for electricity supplied directly by them to authorised undertakers shall be in accordance with such tariff as may be fixed by the Board from time to time and the tariff shall be fixed so that over a term of years to be approved by the Electricity Commissioners the receipts on income account shall be sufficient to cover the expenditure on income account, including interest and sinking fund charges, with such margin as the Electricity Commissioners may allow.

(2) The tariff shall be so framed as to include as part of the charge and show separately—

(*a*) A fixed kilowatt charges component;

(*b*) A running charges component:

in accordance with such principles as may be approved by the Electricity Commissioners:

Provided that an order of the Electricity Commissioners under this subsection shall not come into force until it has been laid before each House of Parliament for thirty days.

(3) The tariff fixed under this section may be different for different areas.

12.—Where any authorised undertakers take a supply of electricity from the Board, the price charged by them for the supply of electricity in bulk to other authorised undertakers, or to a railway company, shall be on the same terms as those on which the undertakers receive the supply from the Board, together with charges in respect of any transmission line used for the purpose.

13.—Where the owners of a selected station, who take a supply of electricity from the Board, prove to the satisfaction of the Electricity Commissioners that the cost of taking that supply in any year exceeds the cost which they would have incurred, had this Act not been passed, in themselves generating the like quantity of electricity, then the charges by the Board to those undertakers shall be so adjusted that the amount charged in that year does not exceed the cost which, in the opinion of the Electricity Commissioners, the undertakers would have incurred.

14.—(1) Where the Board notify any authorised undertakers owing a generating station, not being a selected station, that the Board are in a position to supply them with such quantity of electricity as they would require if the station were closed, and undertake to give such a supply for a period of not less than seven years on specified terms, and are satisfied that the cost of the supply on those terms is below the then prevailing cost of generating electricity at the station, and those undertakers refuse to take such supply from the Board, then, if the Electricity Commissioners are satisfied as respects the next subsequent year that the cost of production of electricity at the station substantially exceeded the cost they would have incurred had they purchased the like quantity of electricity from the Board, the Commissioners may by order require the undertakers to take a supply of electricity in bulk from the Board and shut down the generating station as such.

(2) If any question arises under this section as to the cost of production it shall, if the undertakers so require, be referred to arbitration.

(3) In calculating for the purposes of this section the cost of production of electricity generated by the authorised undertakers, no account shall be taken of capital charges in respect of capital expended on the generating station.

(4) For the purposes of this section, any authorised undertakers owning a generating station (not being a selected station) shall, on being so required by the Electricity Commissioners, furnish them with a statement showing the cost of production of electricity at that station.

15.—Section sixteen of the Electricity (Supply) Act, 1919, as amended by section twenty-one of the Electricity (Supply) Act, 1922, shall, with the necessary adaptations, apply to any officer or servant of any authorised undertakers affected by the closing (permanent or temporary) or restrictions imposed by the Board or by or under a scheme on the working or use of or the acquisition of a generating station, or the acquisition of a main transmission line or any part thereof, under or in consequence of this Act, as set out in the Fourth Schedule to this Act.

16.—(1) Where under this Act the Board are authorised or required to enter into arrangements with authorised undertakers for any purpose it shall be lawful for the undertakers to enter into and carry out such arrangements.

(2) The carrying out of such arrangements shall be a purpose for which authorised undertakers, being a local authority or a joint electricity authority, may borrow.

(3) Where the carrying out of any such arrangement by authorised undertakers, being a company, involves capital expenditure, and the company cannot raise the necessary capital without the authority of an Act of Parliament, the company may submit to the High Court (or in Scotland the Court of Session), a scheme providing for increasing its loan or share capital; and if the scheme is approved by the Court, then the additional capital shall rank *pari passu* with the existing capital, or with the consent of the shareholders, before it.

17.—(1) Where a generating station, or a main transmission line acquired under this Act, is in the course of construction, extension, or repair, the rights and liabilities of the former owners thereof under contract shall be transferred to the acquiring authority.

(2) Plant which forms an essential part of the distribution system of the former owners of the generating station shall remain the property of such owners.

18.—(1) Where the consent of the Minister of Transport or the Electricity Commissioners would be necessary under the Electricity (Supply) Acts, nothing in this Act shall remove the necessity of obtaining such consent.

(2) Where an application is made by any authorised undertakers to the Minister of Transport or the Electricity Commissioners for their consent, the Minister or Commissioners shall have regard to the provisions of this Act and the effect of any scheme thereunder.

Subsidiary Provisions as to the Board.

19.—(1) The Board shall be deemed to be authorised undertakers within the meaning of the Electricity (Supply) Acts:

Provided that sections two and three of the Electric Lighting Act, 1888 (which relate to the purchase of undertakings by local authorities) shall not apply to the undertaking of the Board.

(2) Before any regulations come into force they shall be laid before Parliament for not less than thirty days.

(3) The Board shall not supply electricity directly to persons not being authorised undertakers, except that—

(*a*) They may supply the owners of selected stations, not being authorised undertakers;

(*b*) With the consent of the Electricity Commissioners, they may supply electricity to any company, body, or person requiring a supply for power purposes in any area not forming part of the area of supply of any authorised undertakers, and such supply may be used for lighting premises in which the power is utilised.

20.—(1) The Board may acquire land or any rights in or over land by agreement, or may be authorised to acquire land or any such right compulsorily, for the purpose of any of their powers and duties under this Act (including the construction of main transmission lines) like local authority undertakers under the Electricity (Supply) Acts; and the Board shall be deemed to be a public authority for the purposes of the Acquisition of Land (Assessment of Compensation) Act, 1919.

(2) Nothing in this section shall authorise the compulsory acquisition by the Board of land or rights over land held by the owners or lessees of any railway, canal, inland navigation, dock, or harbour for the purposes of their undertaking otherwise than in accordance with the provisions of the Electricity (Supply) Acts, 1919 and 1922.

21.—The Board may, by agreement, use any main transmission lines for such time and upon such terms as may be agreed.

22.—(1) The Board and any local authority, company, or person producing electricity by water power, waste heat, or otherwise, may enter into arrangements for the purchase by the Board of surplus electricity, and the Board may be authorised by order of the Electricity Commissioners to exercise such powers as may be necessary for the purpose of conveying the electricity so purchased.

(2) The provisions of sub-section (2) of section fifteen of the Electricity (Supply) Act, 1919, shall apply to the Board as to a joint electricity authority.

23.—(1) The Board shall annually make to the Minister of Transport a report of their proceedings under this Act during the preceding year, and such report shall be laid before Parliament.

(2) The Board shall furnish to the Electricity Commissioners such statistics and returns as they may require.

Financial Provisions.

24.—All sums received by the Board shall be paid into a separate fund, out of which the salaries, fees, and allowances of the members of the Board and the salaries, remuneration, pensions and gratuities of the secretary, officers, and servants of the Board, and all expenses incurred by the Board, shall be paid, including repayment to the Electricity Commissioners of any expenses incurred by them in the preparation of schemes under this Act, and payment to the Minister of Transport of any expenses and liabilities incurred by him before the commencement of this Act preliminary to the preparation of such schemes, with interest at the rate of 5 per cent. per annum.

25.—(1) For the purposes hereinafter mentioned the Board may, with the consent of the Electricity Commissioners, and subject to regulations to be made by the Minister of Transport with the approval of the Treasury, borrow money, and the regulations may empower the Board to borrow temporarily and to make arrangements with bankers, and may apply enactments relating to borrowing by local authorities.

(2) Such powers of borrowing may be exercised for—

(*a*) The construction or acquisition of main transmission lines, generating stations, and other works;

(*b*) Any other payment or any permanent work, the cost of which ought, in the opinion of the Electricity Commissioners, to be spread over a term of years;

(*c*) The provision of working capital;

(*d*) Any other purpose authorised under this Act.

(3) Any money borrowed under this section, and the interest thereon, may be charged on the undertaking and all the revenues of the Board, and shall be repaid within such period not exceeding sixty years as the Electricity Commissioners may determine.

(4) The maximum amount which may be borrowed by the Board under this section shall be thirty-three and a half million pounds, and the Board shall not have power to borrow any sums in excess of that amount, otherwise than for the purpose of paying off loans previously raised, unless authorised to do so by a special order under section twenty-six of the Electricity (Supply) Act, 1919.

(5) It shall be lawful for any annual provision for the repayment of borrowed money, to be suspended whilst the expenditure out of such moneys remains unremunerative, subject to such conditions as the Electricity Commissioners, after consultation with the Treasury, may determine:

Provided that such suspension shall not be for a longer period than five years from the commencement of the financial year next after that in which such expenditure is incurred.

(*To be concluded.*)

The Work of the Electricity Commissioners.

Report for the Year 1925-26. *(Abstract).*

(*Concluded from page* 1096.)

Consents to Subscriptions to Associations.

The Commissioners issued 24 consents in respect of the payment of subscriptions to and/or expenses of attendance at meetings of Associations, and authorised contributions to the expenses of District Joint Industrial Councils.

The British Electrical Development Association made an appeal for increased support, the suggested scale of contributions being at the rate of 20s. per thousand pounds of gross revenue of the electricity undertaking. The Commissioners approved in principle of the new scale, and were prepared to give their consent to the payment of contributions on that basis.

The attention of the Commissioners was drawn to the position of the British Electrical and Allied Industries Research Association Incorporated, the work of which was mainly financed by a contribution from the British Electrical and Allied Manufacturers' Association, and by an equal contribution from the Department of Scientific and Industrial Research; and to the possibility that the financial grant from the Department in question might cease. The work of the Research Association had already proved an asset of considerable value to the electricity supply industry, and the Commissioners informed the Incorporated Municipal Electrical Association that they were prepared to sanction the payment of reasonable subscriptions in that connection. The Commissioners also addressed communications to other representative Associations of the electricity supply industry with the view of enlisting their active support for the work of the Research Association.

Returns and Statistics.

In June, 1926, the Commissioners published a Statistical Return which embodied detailed engineering particulars for the three years 1920-3, and financial particulars for the two years 1921-23 in respect of all authorised electricity undertakings in Great Britain. Progress was made with the preparation of a second Return containing similar particulars for the two years 1923-25 [issued in November, 1926].

During the year the Commissioners received the usual monthly returns of fuel consumption, units generated, &c., in respect of the generating stations (numbering 483) belonging to authorised undertakers in Great Britain, 78 generating stations owned by railway and tramway authorities, and 23 stations owned by non-statutory undertakings.

Transfer of Undertakings.

Under the provisions of 11 Orders, the Commissioners approved of deeds transferring certain undertakings. The transfer of other authorised undertakings also took place during the year. The Corporation of Barnsley acquired part of the undertaking of the Electrical Distribution of Yorkshire, Ltd., and the Corporation of Scarborough acquired the undertaking of the Scarborough Electric Supply Co., Ltd.

By Section 13 of the Act of 1919, it is provided that where any right to purchase the whole or any part of the undertaking of an authorised distributor is vested in a local authority and becomes exercisable before the date of the constitution of a Joint Electricity Authority for the district, the right shall not be exercised without the consent of the Commissioners. During the year the Commissioners received intimations from local authorities in such areas that they had given formal notice of their intention to purchase the electricity undertakings. The legal aspects of the matter were considered, and the Commissioners were advised that their consent under the Section was necessary before the rights of purchase could be exercised; that in the absence of prior consent a formal notice of intention to purchase was not valid; and that a notice given in the absence of prior consent could not be validated by the subsequent issue of a consent under the Section. The local authorities concerned were notified accordingly.

During the year, the Commissioners issued four consents to the exercise by local authorities of their rights of purchase.

Appointment of Electric Inspectors.

During the year, the Commissioners appointed Electric Inspectors for the purposes of the undermentioned Order and Act, and prescribed the fees to be paid for services rendered: (1) Bromley (Kent) Electric Lighting Order, 1891, inspector, Dr. A. Russell; (2) Sheffield Corporation Act, 1918, inspector, Mr. A. E. Moore.

Advisory Committee on Domestic Supplies of Electricity.

In April, 1925, the Commissioners appointed an Advisory Committee to consider what steps could be taken to bring about an increased consumption of electricity for domestic purposes, and also the possibility of simplification and greater uniformity in tariffs and methods of charge adaptable for the object in view. At an early stage of its investigations, the Advisory Committee arrived at certain interim conclusions which were submitted to the Commissioners. Certain of the suggestions put forward by the Committee had already formed the subject of representations made by the Commissioners to the Minister of Transport.

[The Advisory Committee reported in July, 1926, and the Report has been published.]

Charges for Electricity.

The general tendency towards lowering the charges for electricity throughout the country was again reflected in the applications made to the Minister of Transport for Orders authorising a revision of maximum prices. In two cases, the authorised undertakers concerned were taking steps to establish electricity undertakings under Orders obtained in 1914 and 1915 respectively, and it was represented that the maximum prices originally prescribed by the Orders were not sufficient under post-war conditions to ensure a reasonable return on the expenditure incurred. The Commissioners recommended the Minister to grant the desired Orders. In addition, six applications, affecting 10 authorised undertakings, were made for a downward revision of maximum prices; in three cases the Commissioners recommended the Minister to grant Orders, the undertakers having agreed to reductions. In two other cases, where the rights of local authorities to take over the undertakings were approaching maturity, the Commissioners recommended that consideration of the applications should be deferred. In the case of the Twickenham and Teddington Electric Supply Co., Ltd., a joint application was made by all the local authorities concerned. The application formed the subject of a public inquiry, in the course of which the company indicated that the undertaking had reached a stage of development at which it would be prepared to apply the whole of any savings in the cost of working to the reduction of prices to consumers. After consideration of the evidence, the Commissioners recommended the Minister to grant Orders authorising a new maximum price of 9d. per unit and minimum quarterly charges on the usual basis, subject to the company furnishing a definite undertaking on the basis indicated.

Overhead Lines.

There was a substantial increase in the number of applications for consent to the erection of overhead lines, 194 applications being dealt with during the year, as compared with 162 applications during the preceding year. In 84 cases the applications were from local authority undertakers, in 51 cases from electric power companies, and in 59 cases from other company undertakers. The Commissioners were able, in the majority of the cases, to recommend the Minister of Transport to give his consent. In certain cases, however, objection was taken by the local authority to the placing of lines overhead, and the applications in question were referred to the Minister. At March 31st the Minister had given his consent in respect of 189 of the applications, the remaining cases still being under consideration.

During the past two or three years, undertakers have found it necessary in a number of instances to make application for an amending consent to permit of minor deviations from the line of route prescribed in a prior consent. Upon a review of the cases concerned, it appeared to be inexpedient that additional formalities should be invoked where the deviations were of a minor character. After consultation with the Postmaster-General, the Commissioners accordingly recommended the Minister to adopt, in appropriate cases, a modified form of consent, in respect of overhead lines over country of an open character in urban and rural areas, giving power to the undertakers to make minor deviations within certain defined limits if found necessary during the erection of the line. The Minister has since given his consent in the modified form when so advised by the Commissioners. A lateral deviation, even within the defined limit, which would involve the placing of any portion of the line within the district of a local authority other than the one concerned with the original application, would involve a further consent.

Wayleaves.

The Commissioners dealt with 24 applications for consent to wayleaves. In five cases the parties concerned arrived at a settlement. In seventeen cases the Minister of Transport caused local inquiries to be held.

With regard to fifteen cases in which the Minister gave his consent, the wayleave rentals prescribed are given in the Report; examples are as follows:—1s. for each 100 yards of cable laid underground; 1s. for each single pole; 2s. for each double pole; and 6d. for each stay. Where the poles impeded arable farming, 4s. or 5s. was fixed, and 2s. or 2s. 6d. for each pole which impeded the mowing of grass.

Revocation of Powers.

During the year the Commissioners had under review the circumstances in which statutory powers to supply electricity had not been brought into operation. They recommended the Minister of Transport to revoke the Tenby Corporation Electric Lighting Order, 1915; and to defer the question of revoking the Electricity Special Order. An application was made by the Corporation of Gravesend for the revocation of the powers of the Kent Electric Power Company, and the West Kent Electric Company, Ltd., in respect of certain parishes in the Rural Districts of Dartford and Strood. An application was also made by the Urban District Council of Shoreham-by-Sea for the revocation of the powers of the Shoreham and District Electric Lighting and Power Company, Ltd. In each case the Commissioners recommended the Minister not to accede to the application.

Abstraction of Water.

In the case of the application made by the North Metropolitan Electric Power Supply Company for an Order to authorise the abstraction of water from the King George Reservoir of the Metropolitan Water Board, proceedings took place in the High Court, and judgment was given to the effect that the reservoir was "a river, stream, canal, inland navigation or other source" within the meaning of Section 15 (1) of the Act of 1919. The application of the company was under consideration by the Minister at March 31st.

Borrowing Power Regulations.

The Electricity (Supply) Act, 1922, empowers Joint Electricity Authorities to borrow money for purposes specified therein, subject to regulations to be made by the Minister of Transport with the approval of the Treasury. At March 31st the regulations drafted by the Commissioners were under consideration [subsequently issued on August 30th, 1926].

Compensation for Loss of Office, &c.

An arrangement for mutual assistance was entered into by the Corporation of Portsmouth and the Fareham Urban District Council, and approved by the Commissioners. The Council ceased to generate electricity, and arising from the closing down of its generating station, claims for compensation were preferred by four employés. The total amount of the compensation awarded by the Referee was £565 10s.

The Grays Thurrock Urban District Council entered into an agreement for a bulk supply from the County of London Electric Supply Co., Ltd. The Council ceased to generate electricity, and, arising from the closing down of its generating station, claims for compensation were preferred by three employés. The Referee awarded a total sum of £123.

Organisation of the Electricity Commission.

The Commissioners received notice in the early part of the year that it would not be possible for them to continue the tenancy of offices in Gwydyr House. They decided to take the offices formerly occupied by the Metropolitan Water Board at Savoy Court, Strand, and entered into occupation on May 25th, 1925.

During the year the Commissioners found it necessary to make certain additional appointments to their staff to enable the increasing volume of work to be effectively dealt with. On March 31st, 1926, the staff of the Commission numbered 60 in all, and consisted of 30 established officers and 30 unestablished and temporary officers, inclusive of typists and messengers.

At the beginning of the financial year the Commissioners estimated the net cost of administration for the year at £54,700; after allowing for a reduction of £1,700 in the working balance, the total amount to be apportioned among authorised undertakers was £53,000. The certified returns submitted to the Commissioners showed that 4,997,963,253 units were sold by authorised undertakers in Great Britain during the year ended December 31st, 1924. The apportionments in June, 1925, the contributions by the electricity supply industry towards the expenses of the Commissioners for 1925-26 thus involving a payment by each authorised undertaker concerned amounting to about 2.54d. per 1,000 units sold.

The actual excess of expenditure over receipts was £44,098, and the working balance was increased by £8,901. The expenditure included £3,731 for a further report on the standardisation of frequency, and the work of Advisory Committees.

Returns submitted to the Commissioners showed that the "units of electricity sold" by all authorised undertakers during the year ended December 31st, 1925, amounted to 5,515,345,364, an increase of over 10 per cent. as compared with the preceding year; the estimate of expenses for the year 1926-27 approved by the Minister of Transport amounted to £51,000, and apportionments involving a payment of 2.23d. per 1,000 units "sold" were made on authorised undertakers in July, 1926.

The Commissioners record with regret the resignation, on June 30th, 1925, of their colleague, Mr. Archibald Page, from the office of Electricity Commissioner after more than five years of service in that capacity, to take up an appointment with the County of London Electric Supply Co., Ltd. Consequent upon this resignation, the Minister of Transport appointed Mr. S. L. Pearce, C.B.E., consulting and chief engineer and general manager of the Manchester Corporation Electricity Department, to the office of Electricity Commissioner.

Attached to the Report are 17 appendices, containing reports relating to eight Districts, details of consents to extensions of plant and to main transmission lines, lists of Special Orders applied for and made, and particulars of loans sanctioned, systems of supply, non-statutory undertakings, fringe orders, proceedings under the Trade Facilities Acts, and the Electricity Fund Account.

Electrical Development in Belgium.

THE Belgian National Commission on Production, which has just issued its final report, deals at length with the situation of the coal industry, the fuel problem and the economies to be realised, and the production and distribution of electricity. At the outset it is pointed out that the distribution of electricity permits of the concentration of production in large stations, the capital costs of which are low, and allows, moreover, of the use of coal which is otherwise unsaleable, and of the low-quality gas yielded by coke ovens and blast furnaces.

An example of what ought to be done, it is said, is afforded by the industrialists in the region of Liége, whose generating stations are interconnected and interchange the available energy, saving in this manner 60,000 tons of coal per annum. Similar organisations are in the course of being realised or are projected elsewhere. The interconnection of such networks will constitute further progress. But in order to allow of this parallel working of the generating stations throughout the country, it is necessary for the voltages and frequencies to be standardised and for the construction of main transmission lines to be undertaken.

Under the circumstances the Commission, addressing itself both to the public authorities and to industrialists, has reached the following conclusions:—(1) That the supply of cheap electrical energy is a matter of national interest; (2) That the economical production of electricity requires the maximum utilisation of energy obtained from by-products, the use of generating units of high power, the rational use of engines of different kinds, and the smallest installation of reserve plant which is not fully utilised; (3) That the organisation of groups of large stations, uniting the industrial stations fed by blast-furnace gas, coke-oven gas, and refuse fuel, at the same time as the central stations consume coal, is capable of ensuring the achievement of these objects and of bringing about a minimum consumption of fuel and a maximum of reliability; (4) That the results obtained in this sense by the Union des Centrales Electriques grouping the several generating stations in the basin of Liége, fully confirm the theoretical calculations which it is possible to make on this subject; (5) That various schemes have recently been prepared with a view to utilising sources of hydraulic energy; (6) That the general organisation of the production of electricity in Belgium, based upon the creation or development on a more or less extended scale of large central stations, as well as the running of the generating plant in parallel, would permit of the reduction of the annual consumption of fuel, as well as of the cost of labour, by at least 50 per cent. of their present amount for the whole of the generating stations. The Commission consequently recommends the development of efforts in these directions.

Concerning the utilisation of waterfalls, the Commission states that Belgium is not well provided with natural waterpower. It is not even certain that it would be possible to create artificial waterfalls with a good yield by the construction of dams so as to form reservoirs in the valleys situated in the Ardennes, or to harness the rivers. But if hydraulic installations considered exclusively as sources of electrical energy are not economical, they would be able to become so if they were utilised not only for the production of energy, but also for regulating the discharge of rivers and diminishing the effects of inundations, remedying the pollution of rivers, feeding the navigation canals, ensuring the navigability of rivers, and placing water at the disposal of industrial regions. Taking these matters into consideration and bearing in mind that projects have been prepared for the construction of large barrages in the Ardennes and for the regulation of certain watercourses, the Commission suggests that the Government should cause a general study to be made from the technical, economic, and financial standpoints of a part of the schemes for barrage reservoirs proposed for the Ardennes on the one hand, and the schemes for the organisation of the Meuse between Liége and Vise on the other.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

ABERDEEN.—1,000 houses, for Corporation; city architect.

ALLOA.—Motor engineering works; Wilson & Carmichael, solicitors.

AUCKLAND (NEW ZEALAND).—Development of a civic centre in Queen Street: Art Gallery, Town Hall Annexe, and other buildings, first instalment (£630,000), subsequent developments, £383,000; the City Council.

AUSTRALIA (MELBOURNE).—Installation of pneumatic tube service for the Commonwealth Postmaster-General. Supply Officer, Australia House, Strand, W.C.

AUSTRALIA (SYDNEY).—Rebuilding premises, for Messrs. Metters, stove and windmill makers (£135,000).

AYLESBURY.—Additional 60 houses, for the R.D.C.; surveyor.

AYR.—Ultra-violet treatment to be introduced at Heathfield Hospital; medical superintendent.

BAKEWELL.—Electric light installation, Haddon Joint Hospital; Charles Flint, architect, The Quadrant, Buxton.

BANDON (Co. CORK).—Cottage hospital for South Cork County Board of Public Assistance; D. Egan, secretary, County Home, Douglas Road, Cork.

BATLEY.—Extensions to Providence Street schools (£12,100), for the borough E.C.; the clerk.

BILLINGHAM.—Houses, for the U.D.C.; builders, J. G. Porteous, Ltd., Middlesbrough (52), T. Sweeting, Middlesbrough (52), J. McCreton, Ltd., North Ormesby (56), and G. Fordy, Stockton-on-Tees (56).

BIRKENSHAW (YORKSHIRE).—Elementary school; West Riding Education Department, County Hall, Wakefield.

BOMBAY.—Market, Dador Colony; municipal commissioner.

BO'NESS.—Extensions for Seaforth hosiery factory; J. Taylor, architect.

BRADFORD.—186 houses for Corporation, at Eccleshill No. 6 estate; city architect, Town Hall, Bradford (Jan. 11th). 340 houses for Corporation, at Wyke; city architect, Town Hall. Extensions to the Northbrook Brewery, for J. Hey & Co., Ltd.; W. Illingworth, architect, Sunbridge Road.

BRETBY.—Extensions to Bretby Hall tuberculosis institution and administrative quarters, for Derbyshire C.C.; Mr. Widdows, county architect, Derby.

CAMBRIDGE.—Ward, Fulbourn Mental Hospital; A. Paul Macalister, architect, 20, St. Andrew's Street.

CAPE TOWN.—Market extensions (£50,000); municipal engineer.

CREWE.—Additional housing scheme (150), for the T.C.; E. G. Timbrell, architect, Municipal Buildings.

CROYDON.—Additional 50 houses, Coulsdon, for the T.C.; Borough Engineer.

DAGENHAM.—School, March Green (£8,315), for Essex E.C.; J. Stuart, county architect, Springfield Old Court, Chelmsford.

DUMFRIES.—Water supply scheme (£101,345), for the Dumfries and Maxwelltown Water Commission; the clerk.

DUNDEE.—U.F. Church; Rev. J. Robbie, clerk of Presbytery. Western Esplanade extension (£70,000), extension of Dudhope Terrace (£10,000); city engineer. School for education authority in Perth Road; the clerk.

EASTLEIGH (HANTS.).—Houses (56), Stanley Road, for T. W. White, 111, Nutbeem Road.

GLASGOW.—53 houses at Netherlea (electric light); Mitchell and Sons, builders. 112 houses, Shettleston; housing director. 192 houses, Germiston; Brown, Fraser & Co. 2,000 Corporation houses at Carntyne; Director of Housing, City Chambers. 182 houses at Kelvinside; Mactaggart & Mickel, Ltd., 65, Bath Street. Scottish National Commercial College (£100,000); clerk, education authority. Kinema, Springburn; B. Frutin, 164, Argyll Street. Additions and alterations to Stobhill General Hospital, clerk, Parish Council.

GRAVESEND.—Schools, Whitehill Road (£10,840), for the E.C.; Friday & Sons, builders, Erith.

GRIMSBY.—Maternity home, Nunsthorpe; Steele & Goddard. 60 houses, Nunsthorpe; borough engineer.

GUILDFORD.—'Bus garage; L.G.O.C.

HEMSWORTH (YORKS.).—Housing scheme (40), Grove Lane, for the U.D.C.; surveyor.

HORBURY (YORKS.).—Blanket mills, Coxley Valley, Middlestown, for Messrs. Clayton.

HOVE.—100 houses, Knoll Housing Estate, Old Shoreham Road; borough architect.

KILMARNOCK.—Additional housing scheme (210), for the T.C.; borough surveyor.

LEICESTER.—Extensions to the Municipal College of Technology (£50,000).

LEITH.—Secondary school; clerk, Education Authority, Edinburgh. Public library; city architect, Edinburgh.

LONDON (BARKING E.).—160 houses, Cecil Estate; C. Gray. Electricity offices and showrooms, Ripple Road, for the U.D.C.; council architect.

(BARKING TOWN, E.).—32 houses, River Road; County of London Electric Supply Co., Ltd.

(E.C.).—Block of offices, St. Mary Axe; W. D. Caroe, architect, 3, St. College Street, S.W.1.

(MUSWELL HILL, N.).—Bank, shop and flats, Broadway; E. Maufe, 3, Raymond Buildings, W.C.1.

(CRICKLEWOOD, N.W.).—Factory, Oxgate Lane; E. Brown and Son, Ltd.

(HAMPSTEAD, N.W.).—Extensions, Westfield College for Women Students, Kidderpore Avenue; Thompson and Walford, architects, Leadenhall Street, E.C.

(REGENT'S PARK, N.W.).—Additions to Bedford College for Women; Sir J. W. Simpson and M. Ayrton, architects, 3, Verulam Buildings, Gray's Inn, W.C.

(WILLESDEN, N.W.).—1,400 houses, Walles Hill; Costain and Sons, Ltd.

(BRIXTON, S.W.3).—Stores, corner of Brixton Road and Stockwell Road, for Bon Marché, Ltd.; H. P. Wyatt, architect, 465, Brixton Road, S.W.

(CLAPHAM COMMON, S.W.).—Enlargement and rebuilding senior school, for the Governors, Royal Masonic Institute for Girls; A. B. Brown, Freemasons' Hall, Great Queen Street, W.C.2.

(LEICESTER SQUARE, W.).—Drapery emporium, corner of Leicester Square and Wardour Street; Whinney, Son and Austen Hall, 8, Old Jewry, E.C.

(PARK LANE, W.).—Block of flats on Grosvenor House site; Wimperis, Simpson & Guthrie, 61, South Molton Street, W.1.

(RED LION SQUARE, W.C.).—Premises to be called Conway Hall, for the South Place Ethical Society, South Place Institute, Moorgate, E.C.2.

MAIDSTONE.—Houses (118), for the T.C.; Corben & Sons, builders.

MALDON.—50 houses, Cross Road and Mundon Road, borough engineer.

MANCHESTER.—Rebuilding Winter Gardens Kinema, Peter Street; proprietors. Block of offices, 40, Cannon Street (£200,000); proprietors.

MIDDLESBROUGH.—Additional 100 houses, for the T.C.; borough surveyor.

RHYL.—Central school; Flintshire Education Committee.

RUGBY.—Additional 32 houses, for the R.D.C.; surveyor.

RUTHERGLEN.—Church, hall and offices at Burnside; convener, Home Mission Committee, Glasgow Presbytery.

SALFORD.—Schools, Tootal Drive, Weaste, for the borough E.C.; the clerk.

SHEFFIELD.—Development of Wey Manor Estate, New Haw (3,600 houses); G. Longden & Son.

SHIPLEY (YORKS.).—68 houses, Albert Road estate; H. Dawson, architect, Council Offices, Somerset House.

SITTINGBOURNE.—Stores (£7,936), for the Co-operative Society; E. Bishop & Sons, Ltd., builders.

SOUTHEND-ON-SEA.—Intermediate school (£24,500), for the borough E.C.; the clerk.

SOUTHERN RAILWAY.—£8,000,000 extension scheme (Southampton Docks extension, £3,000,000; new stations at Eastbourne and Epsom; cleaning sheds at Victoria, &c.).

STOCKBRIDGE (YORKS.).—School; Education Department, West Riding County Hall, Wakefield.

SWANSCOMBE (KENT).—Housing scheme (48), Milton Road site, for the U.D.C.; surveyor.

TONBRIDGE.—Public hall kinema, for Mr. Beaden.

TORQUAY.—Reinstatement of "Courtlands," Chelston, for F. Dobson, C.C. (£4,000).

UPMINSTER (ESSEX).—Roman Catholic Church and schools (£7,000); Rev. Father M. J. Healy.

WALLINGFORD.—Hospital (£8,500), for the committee; the secretary.

WALSALL.—182 houses; Richards, Smith & Co., Ltd.

WALTHAM ABBEY (HERTS.).—Development of Hayes Hill estate, with 250 houses; Bristow & Co., architects.

WATH-UPON-DEARNE.—Secondary schools (£11,050), for West Riding E.C. director of education, County Hall, Wakefield.

YORK.—42 Corporation houses, Tang Hall Estate, No. 2; F. W. Spurr, city engineer, Guildhall (January 17th).

The
Electrical Review

VOL. C. JANUARY 14, 1927. No. 2,564.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Materials for the Electrical Industry.

ALTHOUGH the consumption of copper during the year 1926 was on a very large scale, the market was not a very satisfactory one as regards prices. Standard copper at the end of 1925 was about £59 12s. 6d. per ton, whilst the value at the end of last month was only about £56 2s. 6d. In the same period "electro" dropped from £66 to £63 15s.

It was a matter of surprise to many that values should have shown such poor response to an excellent demand, but it has to be remembered that in recent years improved methods of metallurgy have resulted in a cheapening of the cost of output and, indeed, have made possible the working of ores which previously would not have been an economic proposition. However, with a view to stabilising prices, producers in America arranged an organisation entitled Copper Exporters Incorporated, to handle all sales of metal for overseas countries, the United States market being excluded. The association is not confined to American interests, although there is still a certain production which does not come within its scope. Naturally those interested in the metal apprehended a rise in price, and on the eve of the start of the new concern, substantial buying was done by both consumers and dealers, the latter being anxious to secure supplies in view of the expressed intention of the Incorporated Exporters to confine sales to the consuming industries so far as practicable. The result was that trading subsequently underwent a lull and, indeed, the new selling organisation experienced keen competition on the part of dealers. This resulted in anxiety on the part of American producers to secure orders in their own country, the combined effect of these two circumstances resulting in still lower prices. It has to be borne in mind, however, that as the quantities of copper in dealers' hands are limited, and as the stocks of metal which they purchased just prior to the formation of Copper Exporters, Inc., become reduced, the chance of that concern having a greater control over the market is increased.

Whilst there are hopes of improved consumption in Europe in the coming year, the prospects in regard to the United States are a little indefinite as yet, but what

one has to remember is that the price has had a fair fall, and is now at a reasonable level, and with the chance already indicated of the Copper Exporters securing greater control over the market, values should respond to any change for the better in general conditions.

The lead market was disturbed during the year by the incidence of the coal strike. In addition, however, the early part of the year saw the market in a weakening condition owing to the arrival of large supplies from Australia, where stocks had accumulated owing to a shipping strike at the close of 1925. As a result, supplies of the metal in this country have been ample, and whilst Continental consumption was good at one period, the rate of activity on the Continent has declined latterly, resulting in the bulk of the supply being diverted to the United Kingdom. The general result is that a surplus has accumulated here, but as the bulk of this is held in warehouses which do not furnish a return of their stocks, it is impossible to estimate what the total supplies here may be. In any case, however, they seem to be held in strong hands and are not pressed for sale. During last year prices dropped from about £35 10s. to £28 15s., and although a rather better sentiment is expressed, based on the belief that the arrivals here during the first month or two of the year may be on a slightly smaller scale, that the existing stocks will probably be carefully nursed, and that there are fair prospects of a revival in the rate of consumption, the market has nevertheless shown further weakness.

Spelter also saw a decline in values during 1926, prices coming down from about £38 12s. 6d. at the end of 1925 to £32 15s. at the end of last month. Consumption here was interfered with by the coal strike, but while the stoppage at our mines continued, a high rate of consumption was maintained on the Continent. Latterly, however, the rate of industrial activity on the Continent seems to have eased, whilst the consumption in this country has not increased to the extent anticipated. No doubt, however, this is partly on account of slack conditions in galvanised sheets, and a broadening in the demand on the part of galvanisers is to be expected when the inquiry for sheets shows signs of increasing. An important event was the dissolution of the German syndicate of spelter producers. Hitherto the leading smelters in that country had been acting in concert in selling their output, and the news of the break-up of the syndicate naturally had a somewhat depressing effect on the London market. So far, however, no selling pressure has developed on the part of the various concerns which formed component parts of the syndicate, producing interests in that country apparently preferring to hold their metal in the hope of a rally in the market. There is now talk of some further syndicate being formed, but nothing concrete has developed as yet so far as is known. In view of the change in conditions in Germany, it is difficult at present to take a definite view of the outlook. At around present levels, however, the metal market seems fairly moderately priced.

During the first seven months of 1926 rubber quotations fell fairly steadily, following the 1925 boom. However, for the greater part of the year the exportable quota from Malaya and Ceylon was 100 per cent., and with consumption in America considerably below expectations, stocks accumulated in London and in the United States, and rose to the extent of fully 60,000 tons during the year. The restriction scheme was considerably amended at the end of October, and the question of unused coupons was dealt with. The outlook for 1927 is very uncertain, for consumption in the United States, which in 1926 fell far below the estimates, is still most difficult to forecast. Motor-car production at the moment has fallen off, and although a good demand is anticipated in the spring, this may not materialise. Moreover, the powerful "Pool" recently formed in the United States may be strong enough to influence the course of the market. More rapid increase or curtailment of exports is now provided by the restriction scheme according to the price level, and with the reassessment of estates as yet uncompleted, estimates of output are most difficult. Generally speaking, it is anticipated that 1927 will see a larger consumption of rubber and with an impending reduction in the exportable quota to 70 per cent. of standard at the end of January, prices should be maintained at a reasonable level, in spite of the stocks held in London and America. Much, however, depends on whether consumers delay purchasing and so cause a further reduction in the exportable quota at the end of April.

The Location of Power Stations.

The lines on which electricity supply is developed to meet the electrical needs of a country are influenced very materially by the conditions obtaining in the particular country. What has proved to be an economic proposition in one country—or even in one district of a country—is not in itself a guarantee that similar methods will yield the best economic results elsewhere. Local conditions must always be taken into consideration. This country is fortunate and unique in that most of its electrical load centres are situated on, or closely adjacent to, coalfields. The fact is not always given its due weight when the electrical requirements of the country as a whole are under consideration, although it is really the dominating factor of the whole electricity supply situation. The moral of the old adage that "It does not pay to carry coals to Newcastle" is surely applicable to the problem of this country's electricity supply, for the source of electrical energy, in this country, is coal, and most of the main load centres have their own coalfields.

Other conditions being equal, the obvious location of a power station is at the centre of gravity of the load supplied therefrom, for thus capital and running costs of distribution are kept to the minimum value. From a distribution point of view this is the ideal location, and as the capital cost of distribution is usually more than half the total cost of an undertaking, and the ratio is tending to increase, it follows that before extra cost is incurred in distribution due to locating the station far away from its load centre, the gain due to decreased generation cost should outweigh the increased distribution cost. A school of thought has arisen in the electricity supply world which takes it for granted that the only right policy for generation is to concentrate it in relatively few stations on riverside sites. We have never agreed that that is the only possible policy, for in our opinion, if it were carried out in its entirety, the enhanced distribution costs would far outweigh the gains in generation costs. There are cases where the riverside capital station represents the optimum economic solution, but on the other hand, there are other cases where such a choice could not be justified.

There are many factors affecting the economic location of power stations. The values of some of the factors vary with every case, but the values of certain of the factors are capable of being determined for general application. In this issue we publish an article entitled "River Water—or Cooling Towers?" by Mr. J. N. Waite, M.I.E.E., in which the author examines the effect of using river water for condensing purposes on thermal efficiency, as compared with cooling towers; to this article we would direct special attention, as being a very timely and authoritative pronouncement on this important factor.

A study of the article shows quite clearly that the author, who has had a very extended experience of both classes of station, and has studied the subject exhaustively by actual tests under normal working conditions, holds no brief for either the riverside station or the cooling-tower station, but is solely concerned with arriving at a reasonably accurate estimate of the inherent thermal gain accruing from the use of river water for condensing purposes. The article examines the question in a judicial manner, giving the basic data, and the logical conclusions to be derived therefrom.

The results arrived at, as given in Table III, provide material for serious thought, for the inherent thermal gain due to the use of river water for condensing purposes is considerably smaller than has been generally accepted. It is obvious that the thermal gain alone is not sufficient to pay for locating a power station far from its load centre.

The recent decision of the Liverpool Corporation undertaking, with the approval of the Electricity Commissioners, to extend Lister Drive Station, which uses cooling towers, instead of building a new power station on a riverside site, caused considerable surprise in the supply world, and provoked some criticism. In this case, the cost of a riverside site and of the civil engineering work in connection therewith was the deciding factor. The results shown in the article by Mr. Waite give further support to the view that the decision arrived at was the correct one. The Liverpool undertaking is to be congratulated on thinking for itself and refusing to be led by fashion.

The fact that such undertakings as those at Birmingham, Sheffield, Bradford, and a number of others have pursued the course of locating their power stations as near to the load centres as possible and using cooling towers, in preference to going a long distance afield to obtain sites where river water is available, taken in conjunction with the generating costs of those undertakings, is reasonably satisfactory proof that capital stations can be erected and operated to give economic results without the use of river water for condensing purposes. For every given case there is an economic limit distance from the load centre. In this country, with its many coalfields, the economic distance limit must be relatively small in many cases.

We commend the article to the serious attention of supply engineers as being a lucid and well-reasoned examination of an important factor in the location of power stations.

The Electricity (Supply) Act Reviewed.

THE complete and final text of the Act was issued last week, and to-day we conclude a summary of its provisions; we also begin a critical review of its contents, mainly from the legal standpoint, written at our request by Mr. W. S. Kennedy, who is intimately acquainted with its provisions and, moreover, is a staunch advocate of the Government scheme. Whilst we opposed the Bill during its passage through Parliament, we accept the Act as a fact, and shall endeavour to look on the bright side and direct attention to its good points.

We strongly recommend all managers of electricity supply undertakings to obtain copies of the Act *in extenso*. Many of its provisions, it is clear, relate to the future and will have no direct bearing on the work of the industry for some years to come, but, on the other hand, a close examination of the clauses reveals a number of useful amendments to the previously existing Acts, from 1882 to 1922, which can be availed of at once. The outstanding clause which is of the most immediate importance is, of course, Section 48, "Sale of Fittings," which grants to all local authority undertakers the selling rights which they have so long sought to obtain, subject to agreed safeguards. We hope that no time will be lost in carrying this Section into effect, whilst the E.D.A.-E.L.M.A. campaign is in full swing, and that it will serve as a flywheel to carry on the good work of domestic electrification when the campaign itself has ended. There should be plenty of work for contractors in 1927.

Another useful Section is No. 34, "Power to lop Trees and Hedges," which will facilitate the erection of overhead lines in rural districts, though its provisions are sadly cumbersome, and may lead to tedious delay. Section 42, "Methods of Charge," will hasten the adoption of the two-part tariff which we have so long advocated; that system is fully endorsed by Sections 11 and 51 and the Seventh Schedule, which explicitly prescribe the division of the cost of production and of the price charged for bulk supply under two heads—the fixed kilowatt charges component and the running charges component.

Other amendments of immediate interest will be found in the Schedules by those who take the pains to compare them with the Acts and Schedules to which they refer; moreover, in some respects they are mandatory. The Fifth Schedule restricts the allocation of the net surplus in aid of the local rate in any year to a maximum of 1½ per cent. of the outstanding debt, and after March 31st, 1930, forbids any such allocation unless the reserve fund has been adequately built up. The statutory notice in respect of service lines is reduced from one month to seven days.

Lastly, the Fourth Schedule is of importance to members of the staffs of electricity supply undertakings who fear that the operation of the Act may prove detrimental to their interests.

The Brightness of Illuminating Glassware.

THE Fourth Technical Paper issued by the Illumination Research Committee on the brightness of glassware describes researches made at the request of the British Engineering Standards Association. Eighteen different types of hemispheres and bowls were examined, five being of pot opal, nine of cased opal glass, and the remainder of alabaster ware. In general, 300-watt lamps were used in the 16-in. diameter glassware, 200-watt lamps in the 12-in and 100-watt lamps in smaller sizes. The conditions thus agreed with usual practice, and it is interesting to observe that the brightnesses recorded are by no means excessive. The average brightness of the glassware is frequently below 1 candle per sq. in., and in only one case (a translucent sphere) did the brightness of any portion of the luminous surface exceed 2 candles per sq. in. The average brightness of the white sky has been commonly assumed as the brightness of objects that can be comfortably contemplated without glare; authorities have accordingly recommended that fittings within the direct range of view should preferably not exceed 3 candles per sq. in. in brightness. It would seem, therefore, that the consumer who utilises good modern diffusing glassware with gasfilled lamps is not likely to go far wrong; and that good modern opal and alabaster bowls in general afford ample protection against the glare from filaments. Another feature pointed out in the report is the even distribution of brightness over the surfaces of the bowls tested In all but four cases the variation in brightness per inch of surface was within 10 per cent. The Department of Scientific and Industrial Research has again done good service in presenting data on this subject.

Extra-High-Pressure at Bradford.

WE have received particulars of a notable departure from the conventional power-station practice which has been put in hand by the Corporation of Bradford, on the advice of the City Electrical Engineer, Mr. Thomas Roles, M.I.E.E. In brief, Mr. Roles has decided to install a boiler to work at 1,100 lb. gauge pressure, with an evaporation capacity of some 90,000 lb. per hour, the temperature of the steam being 800 deg. F.; this boiler will supply steam to a 2,500-kW turbine, which will exhaust directly into the main steam range of the Valley Road power station. It is anticipated that this combination will result in a saving of 12 per cent. of coal, and the proportions of the plant are such that the output of the alternator driven by this turbine, together with the electrical output derived from the steam handed over to the low-pressure plant, will cover the estimated future base load of the station.

The contract has been entrusted to the English Electric Co., Ltd., which has been conducting experiments on the use of high-pressure steam at its Rugby works for many years with successful results. The boiler will be made for that company by Messrs. Babcock & Wilcox.

We congratulate Mr. Roles and the contractors on their enterprise, which will be watched with interest.

"Creda" Heating and Cooking Appliances.

A recent visit to the New Factory of Credenda Conduits Co., Ltd., near Birmingham, showed how the standardised mass production of domestic electrical apparatus is facilitated by well-laid-out modern plant.

HAVING built up its business on quality rather than the production of cheap lines, the Credenda Conduit Co., Ltd., deserves the well-merited success of its enterprising policy of quantity production of domestic electric heating and cooking apparatus, which has brought its reward by permitting of the introduction of material improvements without involving increased manufacturing costs.

Fig. 1.—A General View of the Sheet-Metal Press Shop.

Commencing with the manufacture of conduit and associated fittings in the City of Birmingham about 1900, the production of electric heating and cooking appliances was later embarked upon in the original Scholefield Street premises, the business being eventually transferred to the Star Works at Aston, and in 1913 the concern became a limited liability company. In 1917 the Heating Department was lodged in separate premises in Avenue Road, where it grew at an embarrassing rate, due largely to the introduction of a new series of cookers, and the lack of extension facilities made a move imperative. A 5½-acre site was accordingly obtained at Oldbury, and the new factory commenced production in May, 1926; notwithstanding the generous allowance of space, however, present indications are that further bays will probably have to be added to certain shops in the near future. The new factory is laid out on modern lines, with north lights, adequate electric light, and central-heating plant: the accompanying illustrations convey some idea of the spaciousness of the principal shops, and it is worthy of note that the showroom and drawing and administrative offices are heated electrically throughout. Electricity is purchased from the Shropshire, Worcestershire, and Staffordshire Electric Power Co., at 5,500 volts, 3 phase, 25 cycles, and transformed in the works sub-station to 400 volts, some of the power being converted to d.c. for welding, electro-plating, and testing purposes.

From the rough stores sheet metal and rough castings, large stocks of which are maintained, are issued to the press and machine shops respectively; the former (fig. 1) is fully equipped with guillotines, both hand and power presses, and a battery of electric spot welders. A part of the well-equipped machine shop is shown in fig. 2; all tools are made on the premises, a large number often being required for the production of one article. The same shop also accommodates the lathes used for spinning copper kettles, a fascinating

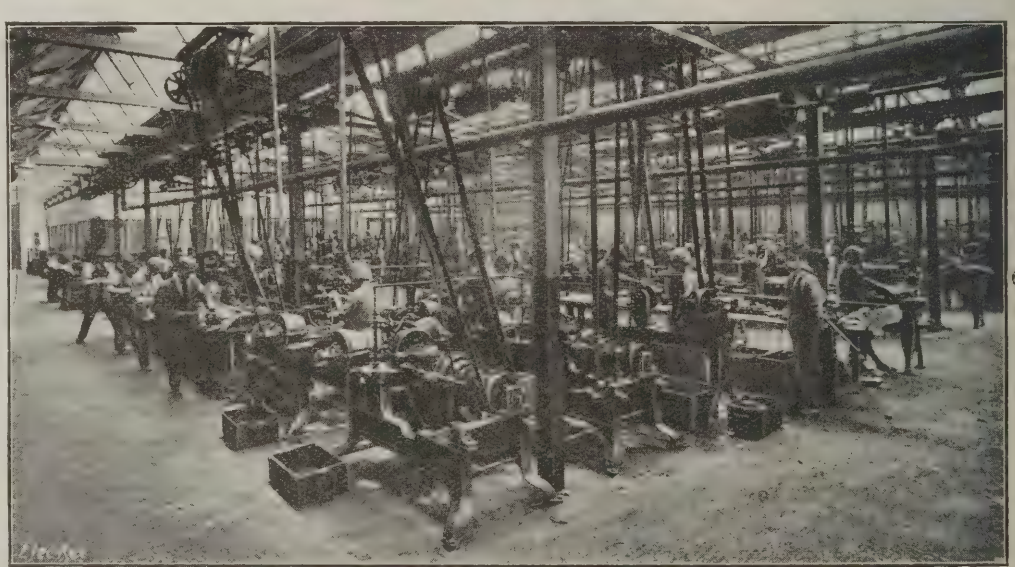

Fig. 2.—A Corner of the Extensive Machine-Tool Bay.

operation to watch. The majority of heating elements are wound by high-speed machines, but it is found desirable in some cases to hand-wind them; to allow for expansion and contraction, as the wire is wound it is passed through crimping rollers. The operatives work in gangs under section leaders, which facilitates the addition or withdrawal of sections as occasion demands. It will be noticed from fig. 3 that the larger cookers are assembled on platforms, while benches are provided in the case of the smaller appliances, their respective heights being so chosen as to prevent back strain and fatigue; the system in vogue is "one man one job," the aim of the management being quantity production, and the assembly process follows through from the finished components stores at one end of the shops to the test section and packing bay at the other end, which is adjacent to and on a level with the main road to facilitate dispatch. The test benches are fitted with conveniently arranged bus-bars, and besides the usual tests, all apparatus is "flashed": large cookers at 2,000 volts, and kettles, irons, and the smaller appliances at 1,000 V. The products of the works are finished in varied styles: a polishing shop, fitted with a system of exhaust fans to protect the workers from dust, is kept busy, and also a large electro-plating section. Extra-heavy-quality copper, nickel, and silver plating is employed, besides oxidised and antique finishes. A feature of the lacquering shop is the electrically-heated hot plates and cupboards for drying, warming and hot lacquering. Steel is "blued" in an oven; the first coats of enamel are applied by dipping and the final coats by spraying. Cookers of several sizes are made, perhaps the most popular model being that illustrated in fig. 4. All heating elements are 3-heat controlled, including the grill, and are of the plug-in variety and easily removable. The oven interior can be withdrawn in one piece for cleaning; it is heated from the sides and bottom, and loaded to 2,000 watts, but the bus-bar arrangement facilitates the addition of extra elements at any time. The grill is loaded to 1,500 watts, as are each of the two boiling plates, of the open pattern, arranged so that spilt liquids cannot harm them. Domestic grills and boiling and warming plates are also manufactured: also a "swing-gate" toaster, so named because the bread holder on each side is hinged to enable the bread to be reversed. The range of irons includes one specially useful when travelling; it is fitted with a special element connector to make it adjustable for any pressure between 100 and 250 volts. The Company's kettles can be provided with a protective device in the form of a tiny fuse, which is melted by excessive heat, and so releases a quick-break switch mechanism located in the false bottom, thus protecting the kettle in the event of its boiling dry.

Fig. 3.—Part of the Main Assembly Department; Large Electric Cookers.

Electric fires, including the bowl and imitation coal varieties, are manufactured in numerous styles and finishes. One of the most graceful in appearance is illustrated in fig. 6; an improved guard is now fitted and a cool, fall-down handle at the back, in addition to the cast ornamental one at the top. Influenced by its hard-wearing qualities, the "Crater" fire bar is fitted to the majority of the Company's fires, a different winding being available for every 10 volts. It is made of tough fireclay with a steel back to prevent breakage; the heavy-resistance spirals are easily renewable, no anchor wires or clips being necessary.

In recent years considerable progress has been made in the manufacture of standardised electric heating and cooking appliances, instead of special types and features, which in the past retarded the introduction of mass methods of production.

The Company's range of manufactures includes electric heating and cooking appliances for hotel and industrial uses, but space considerations do not permit of their description; neither did we have time to inspect the tube mills and conduit fittings department at the Aston Works. Our thanks are due to Mr. P. W. Davis, the managing director, and Mr. F. G. Nesbitt, the sales manager, for their courtesy in showing us over the works, and giving us information which filled our visit with interest.

River Water— or Cooling Towers?

The theoretical gain of thermal efficiency due to the use of river water at 50° F., as compared with water artificially cooled to 75° F., for condensing, is partly neutralised by the difficulty of dealing efficiently with the immense volume of steam at a pressure near 1 inch of mercury (absolute); instead of 10 per cent. the net gain in practice is about 4 or 5 per cent.

By J. N. WAITE, M.I.E.E.

IN view of the obvious trend of legislation regarding electricity supply, the present appears to be a particularly opportune time to review the effect of some of the salient factors affecting the economic location of generating stations. The object of this article is to consider the effect of using river water for condensing purposes on the coal consumption of power stations, compared with the use of cooling towers. This factor, of course, is only one out of many that govern the choice of site, but as it is the one which affects thermal efficiency, which at present seems to be looked upon as a universal panacea for all the more or less mythical ills that the electricity supply industry is deemed to be suffering from, it would appear desirable to attempt to delimit the effect of this factor first. In engineering, as in other walks of life, fashions arise, have their day, and decline. At the present time the leading fashion for power stations is the so-called super-power station, situated where a plentiful natural supply of water is available for condensing purposes. There is no doubt that a power station situated where river or sea water is available for condensing purposes will be able to achieve a higher thermal efficiency than a station using cooling towers, assuming equally efficient plant and operation in both cases. There is also no doubt that, in the majority of cases, the capital costs of a riverside station will be less than for a cooling-tower station. This last statement has a very necessary qualification, for it is conceivable that the exigencies of a riverside site might involve such relatively high costs for foundations, river works, &c., that the advantages of river water might be nullified.

It must always be borne in mind that it is the total cost of energy delivered to the consumers that is the criterion of economic power supply, and not merely the cost of generation. The ultra-efficient power station located at a great distance from its load centre may involve a higher total cost for energy delivered to the consumers than would be the case with a less efficient station located nearer to the load centre. It is obviously useless to reduce generating costs if the gain is to be outweighed by increase in transmission and other costs. For all given cases there is an economic distance limit to power transmission. Beyond this limit, in this country, it is cheaper to carry coal than to transmit electrical energy.

The problem of economic electricity supply in this country is not going to be solved solely by the creation of a relatively few large-sized super efficient riverside power stations. Most supply engineers will agree that there are too many small power stations operating now, but at the same time there is a solid body of opinion that the influential supporters of the large-size riverside station fashion, in their enthusiasm for the fashion, are proposing to go much further than is warranted at the present time by the economic facts. Doubtless the necessary antidote will be forthcoming before all the proposals take concrete shape. Before any great changes take place, it should be shown beyond reasonable doubt that not only will the yield be greater than the cost, but also that the ultimate gain will be greater than could be achieved by any other method or scheme.

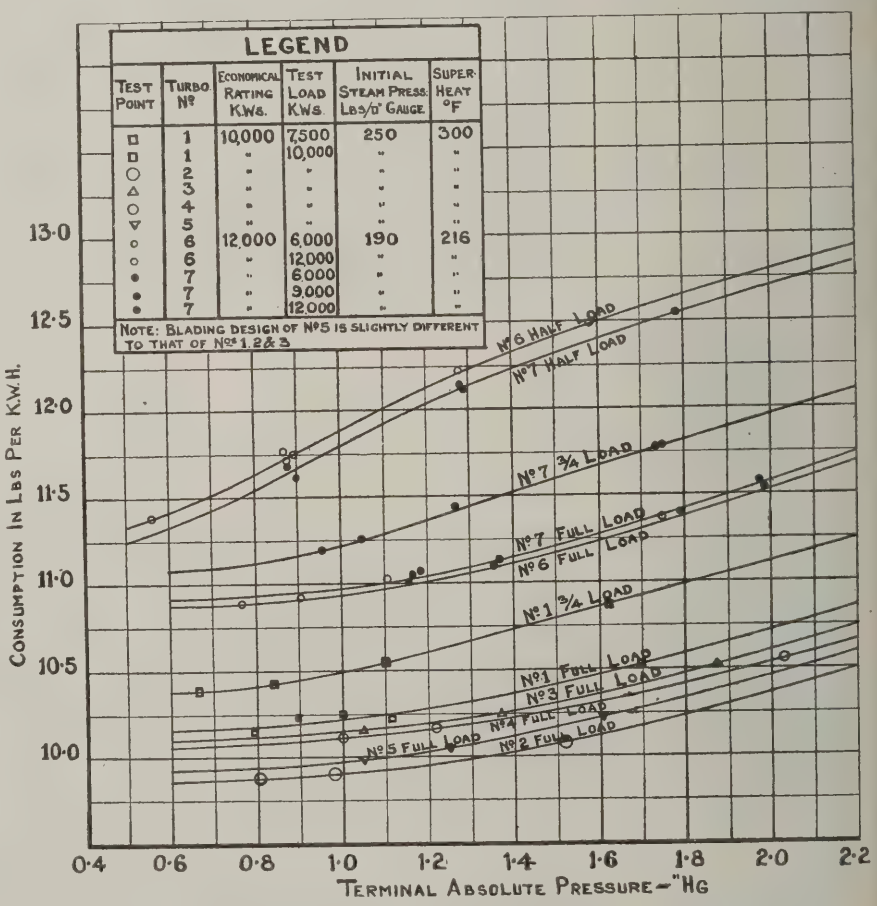

Fig. 1.

So far as the writer is aware, no detailed examination of this important question has been published. Many engineers hold definite opinions on this subject, but the majority of the opinions that have been seen or heard by the writer do not coincide with the ascertainable facts. It has been, and still is, often stated that by using river water for condensing purposes instead of cooling towers, the resultant gain is 10 per cent. or over on the coal consumption. The value assigned is far too high, as will appear later. The probable reason for this absurdly high value being assigned to the gain is that it has been calculated on the theoretical increase in adiabatic heat drop with decreased terminal pressure —or higher vacuum—and also to over-estimation of the difference in the vacua realisable under the two sets of conditions.

In well-designed commercial turbines, at full load, the actual gain due to decreased terminal pressure closely follows the theoretical down to about 1.6 inches Hg. absolute (28.4 in. Hg. vacuum). Below this pressure the rate of actual gain rapidly falls away, although the theoretical gain increases. This is illustrated in fig. 1, which gives the test results of seven large-sized modern turbines, all of which are of the two-cylinder type, having double-flow, low-pressure cylinders, which design enables efficient results to be obtained at the l.p. end, and represents about the best result to be expected at the present time. With turbines having a restricted low-pressure blade area, the falling-off will commence higher up the scale of pressure. It will be noted from fig. 1 that at half load the actual gain follows the theoretical much further down the pressure scale than is the case for full load, which is to be expected; but this does not affect the present investigation, for turbines are normally operated at their full economical load.

Before the advent of feed heating by turbine bleeding, there was a very appreciable debit against the gain due to decreased terminal pressure, from the fact that low terminal pressure could only be achieved in conjunction with a low condensate temperature, with the result that the total heat per lb. of steam to the turbine increased with decreased terminal pressure. This debit is practically negatived when bleeding for feed heating is employed, but should be taken into account when bleeding is not used.

Effect of River Water on Coal Consumption.

To arrive at an estimate of the effect of using river water for condensing purposes on coal consumption, the following data are necessary:—

(1) The average temperature of river water.
(2) The average atmospheric temperature.
(3) Cooling tower performance.
(4) Condenser performance.
(5) Actual value of terminal pressure on turbines.

All the foregoing are variables, but from a practical point of view no serious difficulty exists in arriving at representative values from which the effect of using river water on coal consumption can be deduced. Actual cases will probably have different values from those taken as the basis here, but it is contended that the variations met with in practice will not materially alter the main conclusion arrived at.

River water temperature will vary somewhat between different rivers, and also between different places on the same river, mainly according to whether close to the sea or remote therefrom. From records available it would appear that the average temperature of river water is round about 50 deg. F., probably slightly higher. In what follows, the average temperature of river water is taken as 50 deg. F. With this value, full justice will be done to the results from a riverside station.

Official meteorological records from a station in the Midlands give the average of daily *maximum* atmospheric temperatures over a period of 31 years as: dry bulb, 53.5 deg. F.; wet bulb, 49.5 deg. F. These values are the averages of maximum daily temperatures, so that the true average temperature will be appreciably lower. In what follows, the average atmospheric wet-bulb temperature is taken as 45 deg. F., and the average atmospheric humidity as 80 deg. These values do not in any way favour cooling towers.

The real criterion of cooling-tower performance is: how near to the atmospheric temperature can the circulating-water temperature be reduced? The most suitable atmospheric temperature for this purpose is that of the wet bulb, for this takes account of humidity. Cooling-tower performance is affected by design, loading rate, degree of cooling, situation, atmospheric temperature, and humidity. For the purpose in view, the performance required is that corresponding to what can be obtained from a modern well-designed cooling tower when operating at a normal loading rate and doing a normal degree of cooling, with the atmospheric temperature assigned. From a fairly extensive knowledge of cooling-tower performance, and a knowledge of what cooling-tower manufacturers are prepared to guarantee to-day, the writer would assign a value of 75 deg. F. to the temperature of re-cooled water leaving a cooling tower with an atmospheric wet-bulb tempearture of 45 deg. F., and with normal loading and degree of cooling, as representing a good average performance. Therefore, for cooling-tower stations the average circulating inlet-water temperature will be taken as 75 deg. F., as against an average circulating inlet-water temperature of 50 deg. F. for riverside stations.

Condenser performance varies with design, with the efficacy of the air extraction, with the velocity of the circulating water through the tubes, with the loading rate, with the ratio of water to steam, with the state of the tube surfaces, and with the temperature of the inlet circulating water. For the purpose in view, with the exception of the last, all these variables can be neglected, the performance required being the absolute pressure that can be produced with a modern condensing plant under normal conditions of loading and circulating-water quantity, with inlet temperatures of 50 deg. F. and 75 deg. F. respectively. From a fairly wide experience of condenser testing, the writer would assign the respective values to be:—

With 50 deg. F. inlet temperature, 0.9 in. Hg. abs.

With 75 deg. F. inlet temperature, 1.7 in. Hg. abs.

These values can be realised with modern commercial condensing plant, but as the ratio of circulating-water quantity to steam quantity is usually somewhat less with cooling towers than with river water, it is proposed to assign a value of 1.8 in. Hg. absolute as the average condenser absolute pressure in cooling-tower stations. Hence the assigned values for average absolute pressure for the two cases are:—

Average terminal pressure for river-side station, 0.9 in. Hg. abs.

Average terminal pressure for cooling-tower station, 1.8 in. Hg. abs.

The actual influence of terminal pressure on turbine steam consumption varies with design, with the initial steam conditions, and with the degree of terminal pressure. These variations do not affect the comparison to be made, for what is required is the best value that can be realised by a modern turbine over the assigned range of terminal pressure (1.8 to 0.9 in. Hg.). Before considering what is the actual gain to be realised, it may be advantageous to show the theoretical gain due to decreased terminal pressure over the assigned range. This is shown by Table I for a range of initial pressure with constant initial superheat. The result would not be materially affected if a constant initial top temperature were taken instead of constant initial superheat.

TABLE I.

Increase of Adiabatic Heat Drop due to Decreasing Terminal Pressure from 1.8 in. Hg. to 0.9 in. Hg. abs.
Initial Superheat Constant at 250 deg. F.

Initial steam pressure, lb. per sq. in. gauge	250	350	450
	Adiabatic heat. Drop in B.th.u./lb.		
Terminal pressure, 1.8 in. Hg. abs.	422.6	447.0	465.6
Terminal pressure, 0.9 in. Hg. abs.	456.8	480.7	498.8
Increase in heat drop	34.2	33.7	33.2
Theoretical decrease in steam consumption	8.1%	7.5%	7.1%

From Table I it will be noted that the gain due to decreased terminal pressure gets less as the initial pressure increases, ranging from 7.1 per cent. with 150 lb. initial pressure to 8.1 per cent. with 250 lb. pressure, so that if the value assigned to the actual gain is based upon turbine tests at relatively low initial pressure (as will be the case), it represents the best that can be expected.

Actual Gain Less than Theoretical.

As stated earlier, the actual gain for the assigned decrement of terminal pressure is considerably less than the theoretical gain; the reason for this is fairly well known, and may be briefly outlined as follows:—

The efficiency ratio of turbine blading varies with ratio of blade speed to steam speed. With other conditions constant, the volume of steam presented to the last stages of a turbine varies inversely with the terminal pressure (approximately); hence, the steam volume increases at the last stages as the terminal pressure is decreased, and unless the blade area at the exhaust end is increased to that necessary to maintain the maximum efficiency ratio, this ratio will decrease, and the actual gain will be less than the theoretical. With the low terminal pressures obtainable with modern condensing plant using relatively cold river water for circulating purposes, it is not commercially possible to provide a sufficiently large blade area at the turbine exhaust end to utilise efficiently the immense volume of steam presented at low absolute pressure. Therefore, after a certain degree of absolute pressure has been reached, the actual gain gets progressively smaller for each equal decrement of pressure, although the theoretical gain gets progressively larger. The actual degree at which this falling-off commences is a matter of design.

Very few test data are available on the actual influence of terminal pressure on turbine steam consumption. The writer has taken an active interest in this detail point for many years, and in pursuance of that interest has determined the actual value on a fairly large number of turbines of various designs and sizes. The difference between the actual value found and the manufacturers' estimate of it has been very striking indeed on occasions. It is admittedly difficult to determine accurately small differences by measuring large quantities, especially when several variables exist, as is the case with turbo-alternator tests, but given the necessary equipment and experience, it can be done. A number of such tests are given in fig. 1. These are the best results obtained by the writer, who has obtained many others giving much lower results.

The test results in fig. 1 show that the highest gain realised at full load by reducing the terminal pressure from 1.8 in. Hg. to 0.9 in. Hg. was just over 4 per cent. This was with an initial steam pressure of 190 lb. per sq. in. gauge, so that the actual gain is rather less than half the theoretical gain in steam consumption. It may be emphasised that the only value of terminal pressure considered is that pertaining to economic full load, for that will be the load at which turbines will—or at any rate should—operate for the major portion of their running hours. As will be seen from fig. 1, the value of terminal pressure, within the limits under consideration, is considerably higher at half load, showing that although the particular turbine was designed for 0.9 in. Hg. at full load, and was provided with a double-flow low-pressure cylinder, the last stages were over-run at full load and the designed vacuum.

As stated earlier, on a straight turbine, there is a debit against the gain due to decreased terminal pressure in the form of decrease of heat in the condensate. This can be best illustrated by a simple example. From fig. 1 a gain of steam consumption of 4.1 per cent. may be expected by reducing the terminal pressure from 1.8 in. Hg. to 0.9 in. Hg. absolute. On a modern condensing plant the temperature of the condensate leaving the condenser will be about 3 deg. F. lower than the temperature corresponding to the absolute pressure at the top of the condenser, when the plant is giving a good performance. The following Table II shows the thermal gain for a straight turbine—without feed heating by bleeding—for a representative case.

At the present time the practice of feed heating by bleeding is practically standard for all new plant, and then the loss of heat to the condensate due to lower terminal pressure can be made good by bleeding at low pressure, with practically no effect on the steam consumption. This apparent anomaly is due to the last stages of a turbine being normally over-run. Withdrawing a portion of the steam from the last stages has the effect of increasing the efficiency ratio of the last stages, utilising the steam that passes at a higher efficiency, and so causing the effect of bleeding at low pressure to have practically no effect on the turbine

TABLE II.—TURBINE THERMAL GAIN DUE TO DECREASING TERMINAL PRESSURE FROM 1·8" HG. to 0·9" HG. ABS.

Decrease in steam consumption = 4·1%.

Initial steam.			Terminal press: "Hg. abs.	Condensate tempre. °F.	Total heat to turbine B.t.u. per lb.	Steam consumption lb. per kWh.	Heat consumption B.t.u./kWh.	Thermal gain %
Press: Lb. p. sq. in. abs.	Superheat. °F.	Total heat per lb. from 32° F. B.t.u. per lb.						
250	250	1340	1·8	95	1277	10·70	13664	2·5
250	250	1340	0·9	73	1299	10·26	13328	

steam consumption. Hence this debit is to all intents and purposes negatived in modern plant, and need not be considered in the comparison being made, but it was considered advisable to point it out, as cases might arise where it was applicable.

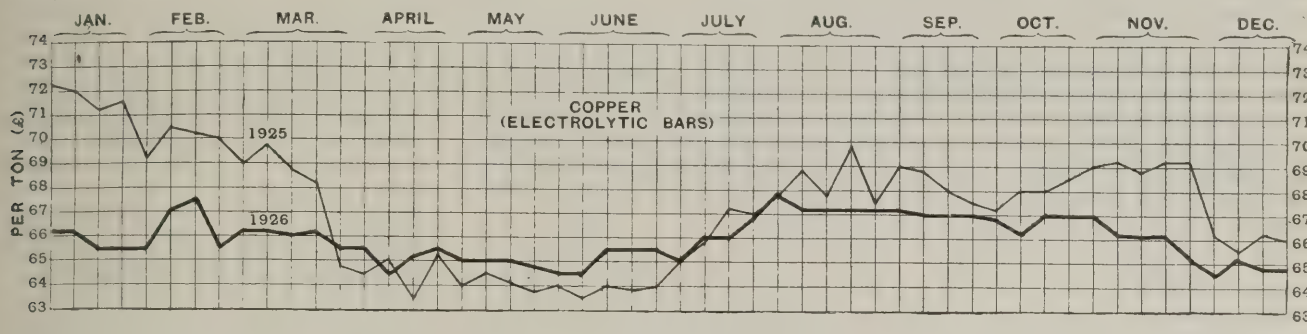
Conclusion.

The result of the foregoing examination of what is the inherent thermal gain to be expected from the use of river water for circulating purposes, as compared with cooling towers, is that the maximum thermal gain, assuming full economical load on turbines, is of the order of 4.0 per cent. The gain will vary with the average load on the turbines. In most cases the actual average load would probably be somewhat lower than the full economical rated load. The following Table III gives the thermal gain corresponding to given average loads.

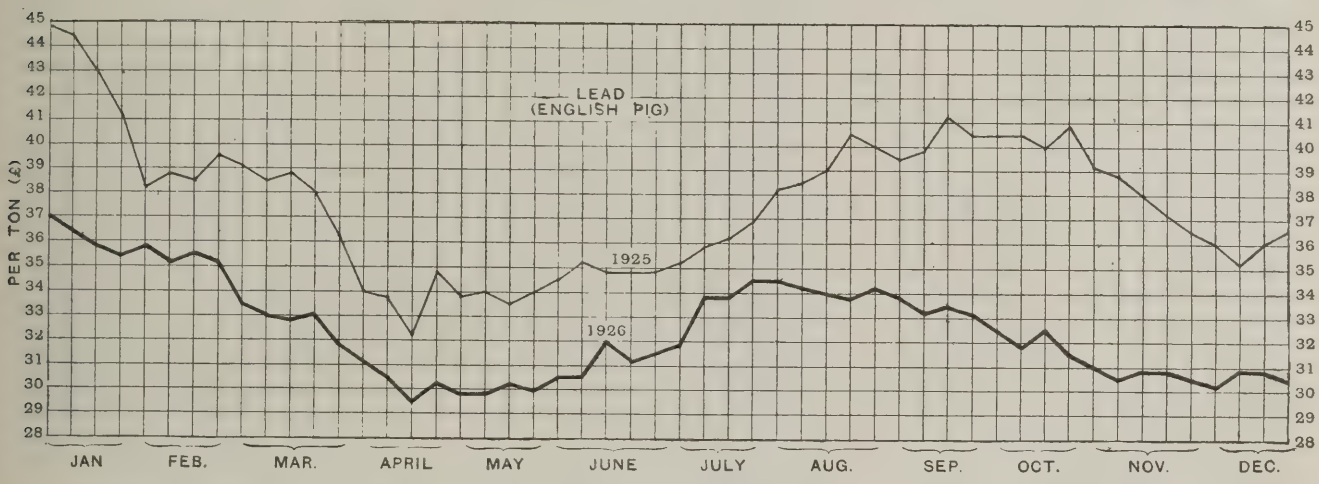
TABLE III.

Maximum thermal gain from the use of river water for condenser circulating water, compared with the use of cooling towers.

Data: Average atmospheric temperature (wet bulb) 45° F.
Average temperature of re-cooled water leaving cooling towers ... ... 75° F.
Average temperature of river water ... ... 50° F.
Average absolute pressure with:—
Inlet water temperature of 75° F. ... ... 1.8" Hg.
Inlet water temperature of 50° F. ... ... 0.9" Hg.
Value of terminal pressure deduced from fig. 1.



Average turbine load as fraction of full economical load.	Maximum thermal gain from the use of river water. %
1/1	4.0
7/8	4.8
3/4	5.6
5/8	6.4
1/2	7.1

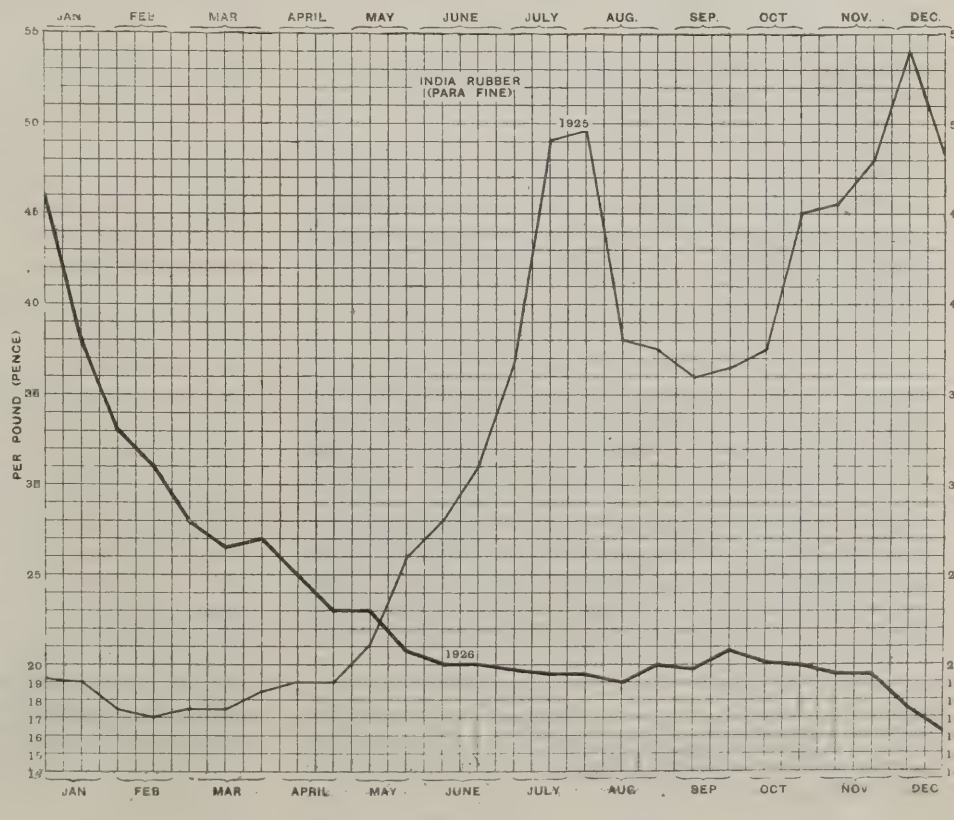


In view of the many variables involved, the examination has been made on broad lines, confined to the main essentials, and deals solely with the effect on thermal efficiency. It is contended that the result presented in Table III is substantially accurate, although it is at variance wtih many opinions on the subject. Special pleading leading to revision of values of the basic data either one way or the other could only alter the data within quite small limits, and the effect on the result would be negligible with the turbines available at the present time.

Copper, Lead and Rubber Prices.

The Past Two Years' Movements Compared.

THE curves showing the course of copper, lead, and rubber prices during 1926 which we publish in accordance with our usual practice, indicate greater stability and, generally speaking, lower levels than in 1925.



In the case of copper, the opening price was £6 lower than in 1925, and this feature continued until the end of March, when for three months the curve remained above that of the previous year. From August onward the 1926 prices continued lower in a gently-falling curve, and the end of the year found copper 25s. below the 1925 closing prices. Whereas in 1925 the price of electrolytic bars fluctuated between £63 10s. and £72 5s., last year the upper and lower levels were £67 15s. and £64 10s.

The 1926 lead prices were below those of 1925 throughout the whole of the year, and the general tendency was for the fall to continue. At no time did the price approach within £2 of the corresponding price of 1925, and in October there was a difference of £9 5s. The closing figure was well below the opening price.

In the first few months of the year rubber prices fell swiftly from the giddy heights attained in the preceding year, and during the whole period fell to just over a third of the opening price, with a tendency to fall still further. At one point in 1925 rubber reached the price of 4s. 6d.; at the end of 1926 it stood at 1s. 4¼d. Those whose business it is to buy rubber for manufacturing purposes will be thankful that rubber prices have lost their resiliency however much that quality is desirable in the material itself.

The Signs of Trade Revival.

Justified Optimism Manifesting Itself in all Sections of British Industry.

ALL branches of British industry appear to be agreed that 1927 is a year of great promise, and that it will mark an emergence from the slough of despond in which many of them rested during 1926. How much of this optimism is due to a feeling that things could not be much worse than they were last year, and how much to real, visible signs of improvement, it is difficult to say, but there are unquestionably many favourable indications. From all directions gleams of brightness are beginning to penetrate the industrial gloom, and many of them are very substantial gleams taking the shape of firm orders. Some of these orders have been carried over from last year, unfulfilled on account of the troubles of the year, but there are also many new ones.

There appears to be a dawning realisation that industrial disputes bring no lasting benefit to any party involved, but rather loss to the industry itself and to many others besides, eventually harming the nation as a whole. Frank discussion and a will to peace accomplish far more and lead further towards settled conditions without which no industry can hope to prosper. There are several shining examples of industries which have settled all their differences for many years by peaceful means, and consequently find themselves in a healthier state than others which have resorted to strikes and lock-outs.

With regard to the export position, which is a most important matter to many industries, there also appears to be ground for qualified optimism. While there are no indications of a lowering of the tariff walls which outsiders find so hard to scale, relief can be expected in the currency position which for some years has militated against British traders in foreign markets. In the countries of most of our competitors, the currency has appreciated and has been stabilised at a reasonable level. Unhappily, the restlessness of China, Russia, and Mexico are still features in the situation. This has a twofold advantage to the British trader. He not only finds it possible to compete on more level terms with the "stabilised" competitor in a third country, but it gives him a better chance in the "stabilised" country itself.

Another factor in improvement is efficient production. The growing consumption of electricity is an indication of a tendency in the right direction, and if the hopes of the Government from the Electricity (Supply) Act are realised, a further inducement to change over to electricity should be given to manufacturers who have not yet taken that step. Reports from some centres show that the industrial load lags behind.

Now to turn to concrete examples upon which the hopes of industry are based. We will first deal with the engineering industry, which was one of the most badly hit by the coal dispute. At no time during the year did unemployment in the industry fall below 10 per cent., and for five months it was well above 16 per cent. Being unable to obtain iron and steel in adequate quantities for over half of the past year, the heavy engineering section was especially affected. Now that the iron and steel industry is commencing to function in a normal way, this branch is bound to reap the benefit. Many of the larger companies report that they have sufficient orders in hand to keep them going for long periods without taking new ones. A representative body, the British Engineers' Association, says:—"It is only to be expected that the resumption of something approaching the normal output of coal, and of consequential activity in our basic industries in the execution of an accumulation of orders, placed either before or during the coal stoppage, will induce an all-round revival of trade. References have been made in the Press to a prospective boom, but it is to be hoped that there will be no such undesirable phenomenon, with its inevitable reactions. What is wanted now is steady progress, built up stage by stage on solid foundations, and all concerned in the restoration of real prosperity will discourage excessive optimism and the financing of too speculative enterprises, more especially if it be directed towards any increase in our already excessive productive capacity."

The revival of other industries will also have its effect upon the engineering industry. Textile authorities say that the world stocks are lower at present than they have been for many years past, and there must inevitably spring up a demand for cotton and woollen goods. In what may be anticipation of this revival, several large orders have been placed for textile machinery, and the outlook in that branch of engineering is said to be brighter than it has been for the last two or three years. The shipbuilding industry, which has been in a wretched state for a long time, is also looking up. Apart from the execution of held-up orders, work will be provided by a number of contracts received towards the close of last year. Here again the improvement will react upon the engineering industry, as the depression has already reacted.

During 1926 the electrical industry was looked upon as the "one bright spot," and all indications augur an intenser brightness during the coming year. Last year, in the face of the general strike and the coal dispute, the British electrical industry managed to increase its exports to a marked extent. This shows that without such restrictions it is capable of holding its own and more in the world's markets. Quite apart from foreign business, however, the electrical industry is assured of a prosperous year. Already we have learned of orders valued at millions of pounds being placed by customers in this country. The most important of these are the £1,460,000 contract awarded by the Birmingham Corporation to International Combustion, Ltd., for the construction of a new power station, in which the General Electric Co., Ltd., is a large participant; the electrification contract placed with the Metropolitan-Vickers Electrical Co., Ltd., by the Southern Railway Co., valued at over £600,000; and a very large cable order (over £100,000) given by the same company to Messrs. Johnson & Phillips, Ltd. In addition, there are numerous orders of a smaller nature for machinery and plant. This activity is bound to be reflected in the other electrical branches, and we look for increasing loads on the country's power stations brought along by the wiring and contracting industry. The organisers of the "Wiring the Homes of Britain" Campaign already report increased business in many districts, but the effect of six months' propaganda will continue to show itself for a long time to come.

One sign that our manufacturers intend to do their utmost to secure all the trade that is available is the increasing interest shown in the British Industries Fair. This year the display will surpass all previous fairs, both in magnitude and in its representative character. The electrical industry in particular is making an excellent effort, and we are convinced that it will not be in vain; its moral and psychological effects upon foreign buyers will not be the least of its advantages.

Transatlantic Radio-telephony.

The Inauguration of a Unique Service between London and New York with the Aid of British-made Apparatus is an Epoch-making Event.

A TRANSATLANTIC radio-telephone service between London (England) and New York (America) was formally inaugurated on January 7th, an achievement which reflects the greatest credit on all concerned, but it is perhaps not generally realised that the high-power transmitter used at the Rugby station (England) is almost entirely a British product.

By far the greater part of the work, *e.g.*, the power amplifier, the control table, &c., was carried out in London at the works of Standard Telephones and Cables, Ltd., in co-operation with the Engineering Department of the British Post Office. The power amplifiers used are capable of giving an amplication of the order of 500,000,000 times, with very great purity, by means of a relatively small number of water-cooled valves. Thirty-four valves are used, fig. 1, and thirty of them working in parallel constitute the final stage that handles the actual output of the transmitter. One thousand gallons of water per hour is required for cooling the valves in each of the two units into which the amplifier is divided; the water flows through 160 ft. of 2-in. hose so as to maintain the insulation of the valves, which are designed to operate with 10,000 volts on their plates, and these were also manufactured for the British Post Office at the New Southgate works of Standard Telephones and Cables, Ltd.

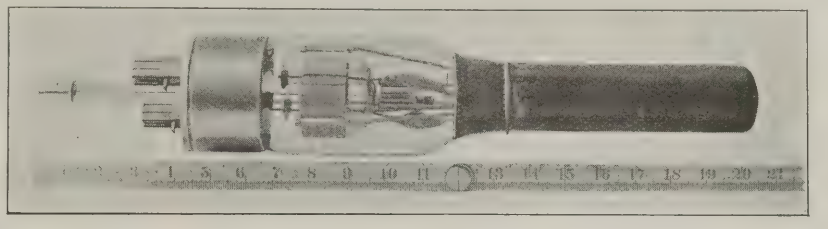


Fig. 1.—A 10-kW Water-Cooled Valve used at Rugby.

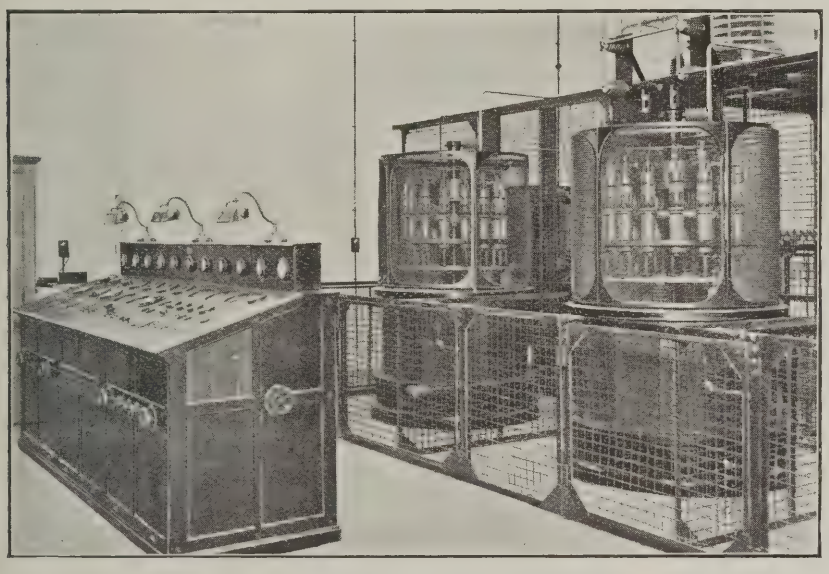

Fig. 2.—The Control Desk and Amplifier at Rugby.

Another extremely interesting part of the equipment is the control table, fig. 2, which is so placed in the station that from it the whole of the more important equipment can readily be seen. It carries all the controls for operating the equipment, and they are so grouped that the operator can follow and check the performance of the transmitter at each stage; for this purpose no less than 33 recording instruments are provided. The control table also carries devices for safeguarding the operating personnel, and others for protecting the valves, which are very costly owing to their intricate design and difficult manufacture. In the event of anything abnormal occurring in the apparatus, or of a person approaching dangerously near the high-voltage plant, the station is instantly shut down and an alarm given; the exact nature of the fault in such cases is indicated by lamps which light up on the control table.

Although the Rugby station is at present working satisfactorily, development work is still being carried on, and several ways of effecting immediate improvement are apparent to the Post Office engineers, who are negotiating with Standard Telephones and Cables, Ltd., for the manufacture of the necessary additional apparatus.

Messages are accepted in the usual way at the London Trunk Exchange, whence they go by land line to Rugby, then by wireless across the Atlantic Ocean to the Houlton receiving plant, and then by land line to New York; the return circuit is from New York to the Rocky Point transmitter, then to the Wroughton receiver (England) and finally to London. At the Trunk Exchange an operator controls the volume of sound emitted by the subscriber, so as to maintain it at the required standard. The American Telephone and Telegraph Co. co-operated in establishing the service.

The Electricity (Supply) Act, 1926.

An Explanatory Analysis of Provisions of the New Act, and a Critical Review of the Measure from the Legal Point of View.

By W. S. KENNEDY, Barrister-at-Law.

THE new Electricity Act may be considered from several points of view, and has been severely criticised from all. The political and social implications of the Act, though extremely important and, in the writer's opinion, likely to be of benefit to the country, are outside the scope of this article. With the technical aspect of any scheme which may be evolved under the Act, the writer is hardly competent to deal; his aim is to endeavour only to analyse the provisions of the Act and translate them, where necessary, into language more easily understood by the non-legal mind than the somewhat cumbrous phraseology necessarily employed by those whose object it is to provide for all possible contingencies.

The Act, as is well known, is based on the report of Lord Weir's Committee, and it is a legitimate surmise that the scheme which the Commissioners are to submit to the new Board will follow generally that which is outlined in the report. But it is important to note that the Act does not adopt the report, and indeed differs from it in important particulars; and, further, that the Act does not contain or give legal sanction to any of the technical details of that document. It is premature to criticise a scheme which has not yet been published, and must be subjected to a searching examination by impartial tribunals before it can become effective. We are here concerned only with the administrative frame and machinery which was recommended by the Weir Report, amended in the Bill as introduced, and further altered in Parliament to become the present Act.

The end to which this machinery is established is the development and cheapening of the supply of electrical energy in the country by co-ordination of generation, interconnection of supply systems, and, to such degree as is necessary, standardisation of frequency. With this end and, generally speaking, with the means suggested for its achievement, no one is likely to quarrel. It is, in effect, a development and wider application of the general principles put before the Commissioners during the London Inquiry in 1921. A scheme on those lines proved to be impossible because certain of the supply authorities were unwilling to allow the control of their generating stations to pass in any degree out of their own hands, and the Commissioners had no powers of compulsion. It will be remembered that such powers were given in the original Bill of 1919, but struck out in its passage through Parliament. They are restored in another form in the present Act, and are, in the writer's opinion, a regrettable necessity. If agreement could have been reached between the divergent interests represented before the Commissioners in the various inquiries they have held, compulsory powers would probably have been unnecessary. As it is, it may be hoped that their existence will make their use improbable.

The Act consists of 52 sections and seven schedules. It is divided into seven parts, dealing with the following matters: Sections 1-3, Constitution and general powers of the Board; Sections 4-19, Provisions as to scheme; Sections 20-25, Subsidiary provisions as to Board; Sections 26-30, Financial provisions; Sections 31-35, Miscellaneous; Sections 36-50, Amendments of earlier Acts; and Section 51, Interpretation. It is convenient to deal with these groups separately, although a certain amount of overlapping is inevitable.

1. The Board.

The first thing perhaps to note is that the Board, which has very large powers, is not a Government Department. In some ways the Commissioners, who are part of the Ministry of Transport, have been deprived of authority which has been given to the Board. This fact should at least give pause to those who, in delight or disgust, proclaim the Act to be a socialistic measure. The second important point is that the Board will not be a technical body. The Minister of Transport, before appointing the members, is to consult not only representatives of the electrical industry, but those of local government, commerce, industry (whatever this may mean—presumably any business which is not included under other heads), transport, agriculture, and labour. The minister is not bound to accept suggestions made to him by these bodies, but the Government's intention is obviously that the Board should not be composed of electrical experts. It will be comparable rather to the Board which has charge of broadcasting, if the comparison be not derogatory, than to the Commissioners. The Chairman and some other members are to devote their whole time to the work, but apparently the majority of the Board will act as directors and simply attend regular meetings. From the fact that three, out of the eight, constitutes a quorum, we may if so inclined deduce that possibly half the Board will be whole-time members. They are to be paid such salaries as the Minister may determine, and the enormous figures suggested in some daily papers exist only in the sub-editorial imagination. No member of the House of Commons may be a member of the Board—a very wise provision—and presumably the Board will be answerable for its proceedings to the whole House and not, except where the Act expressly provides, to the Minister of Transport. An opportunity is given to the House to discuss the Board's work when its annual report is laid before Parliament (Section. 25).

The general duty of the Board is to supply electricity to authorised undertakers, but not to generate itself, save in very exceptional cases. The Board will not become a competitor of existing undertakers. There are in Section 2 important provisions as to the Board's power of delegation. Any powers which the Board thinks may be more conveniently exercised locally may be delegated to authorised undertakers, except that the Board may not delegate its powers with regard to selected stations. This provision is of special interest to London, for it allays the fear which has been expressed that the Board might select the most efficient of the companies' stations and hand the management of them over to the J.E.A.—a course which would not be consistent with the spirit of the London and Home Counties Order. The Board must also retain in its own hands the power of fixing tariffs.

2. Provisions as to Scheme.

The scheme—or schemes—for development and reorganisation are to be prepared by the Commissioners and submitted to the Board as soon as possible. It is common knowledge that work on certain areas is already well advanced, but it is premature to criticise schemes which have not yet been published. The Weir Committee's Report gave certain figures, but these cannot

be taken as the Commissioners' final word, for much detailed investigation has been carried out since its publication. The Act itself contains no figures, but lays down the general lines which the Commissioners are to follow. The scheme is to relate to a definite area—there is no reason to suppose that the country is to be dealt with in one scheme as a whole, though general interconnection is certainly ultimately desirable. For that area the Commissioners select certain existing stations as being suitable—with possible alterations and extensions either immediate or future—for supply in the area generally. They are also to indicate what new stations should be built to provide for future developments; these are also known as selected stations. It is from these selected stations that eventually the whole supply will be given. A scheme is further to provide for the interconnection of selected stations, which is obviously necessary for economical working and for the interconnection of the system in the area with the system in any other area (presumably this means a contiguous area) where a scheme is in operation or may come into force.

(*To be continued.*)

Legal.

Colassi v. Smith.

IN the Mayor's and City of London Court, before Mr. Registrar Dell, on January 4th, a claim was made by Mr. W. L. Colassi, Fenchurch Street, E.C., against Mr. A. C. Smith, Fulham, for £3 7s. 6d., the value of wireless goods supplied as samples. The plaintiff said that in response to an advertisement which he inserted for a traveller to sell loud speakers, the defendant called and was given a sample, as well as batteries and valves, for the purpose of securing business. No business came, and he (plaintiff) wrote to the defendant asking for the return of the samples, but received no reply. The defendant admitted that he was in the wrong in not returning the samples, but he was willing to do so. He had carried the samples for a month without any remuneration. The plaintiff, in answer to the Registrar, said that there was no arrangement for defendant to have anything on account of expenses. The Registrar made an order for the return of the samples, and judgment was given for the plaintiff accordingly, with costs.

The Transporter Co. v. Johnson.

IN the Mayor's and City of London Court, last week, the plaintiffs, of Cannon Street, E.C.4, claimed £1 8s. 2d. from Mr. R. F. Johnson, Luton, for freight and charges. It was stated that a consignment of batteries was sent from Berlin to the defendant. Upon delivery, the batteries were found to be damaged; the defendant accordingly sold them for what they would fetch and remitted the proceeds to the plaintiffs. Defendant corroborated this, and said that the plaintiffs should have deducted their costs from the amount sent them before passing it on to Berlin. Mr. Registrar DELL considered that the plaintiffs had not proved their claim, and struck the case out of the list.

Heren v. Babcock & Wilcox, Ltd.

BEFORE Judge Shewell Cooper, in the Mayor's and City of London Court, on January 3rd, Mr. C. C. Heren, Plaistow, sued the defendant company for £468 in respect of damages under the Employers' Liability Act, 1880. In his evidence the plaintiff said that he was an acetylene operator and was employed at the Islington power station in the dismantling of a boiler. While working there some piping fell and struck his head; he sustained a compound fracture and septic scalp wounds, and was in hospital for nearly a fortnight. Since the accident he had suffered from severe headaches, and claimed that he was permanently incapacitated from following his employment. He admitted in cross-examination that he knew there was a possibility that the piping would fall. Evidence was given that it was the usual practice in dismantling boilers to support any parts which might fall. The foreman in charge of the work said that the piping did not actually fall; it merely turned in a bracket which supported it.

Judge SHEWELL COOPER absolved the foreman from all blame, and said that the methods adopted by the defendants were perfectly satisfactory. The plaintiff also knew of the risk which attached to the position in which he was working. The claim must therefore be dismissed with costs. Considering the matter under the Workmen's Compensation Act, his Honour said that from the medical evidence he was satisfied that the plaintiff was totally incapacitated from work since the date of the accident and at present. He therefore awarded him 30s. a week, and gave instructions that £10 of the amount due should be deducted towards the payment of the defendants' costs in the action. Leave was given to the defendants to make any application that they thought desirable.

The Sale of Batteries on Closing Day.

AN interesting case recently came before the magistrates at Grimsby when a local trader was summoned under the Shops Closing Order for selling radio batteries on closing day. The defence submitted was that the renewal of exhausted batteries represented a repair of the set and consequently was a public service. The case was therefore dismissed.

Rating Appeal by Aberdeen Corporation.

IN the Valuation Appeal Court, Edinburgh, on January 7th, before Lords Hunter, Sands, and Morison, counsel were heard in an appeal by the Electricity Department of the Corporation of Aberdeen against the decision of the Valuation Committee of the city entering the value of the undertaking for the year 1926-27 at £68,185. Counsel stated that he was supported by the other Scottish municipalities with similar undertakings. The appellants objected on the ground that deduction had not been allowed in respect of sinking fund and interest on capital expenditure on buildings and plant before they were completed and became revenue-producing subjects. They claimed that sums of £6,971 and 419 should have been deducted.

The Assessor maintained that the expenditure of which deduction was claimed was an application of net revenue and not a valid charge against revenue. An annual sum properly raised by the appellants by means of charges made under their statutory powers could not be excluded from computation for purposes of the revenue principle merely because the present owners chose to spend that portion of their revenue in a particular way. In the event of the deduction being allowed, the Assessor submitted that the calculation for fixing the annual value should be three years instead of five years. The Court reserved judgment.

Sentence.

AT Bow Street Police Court, on January 7th, Willoughby L. Brooks, accountant, was found guilty of stealing money from his employers, the Tudor Accumulator Co., Ltd., and was sentenced to six months' imprisonment in the second division.

Manslaughter Charge Against a Colliery Company.

AT the Bridgend Police Court on January 10th, Messrs. Cory Bros. & Co., Ltd., and three of their electrical engineers were summoned upon a charge of manslaughter. It was alleged that the defendants had set or caused to be set a man-trap, *viz.*, an electrified fence, by which a youth named Brynmor Edward John was killed in August last. The secretary of the defendant company appeared and entered a plea of "not guilty."

Mr. ARTEMUS JONES, for the prosecution (undertaken by the brother of the deceased youth through the South Wales Miners' Federation), stated that the company was troubled by the theft of coal, and to put a stop to it a fence was erected, consisting of three copper wires supported by insulators on pit props. Between certain hours the fence was electrified, and notices were erected warning trespassers of the fact. On the day he met his death, John and some companions were chasing a rat with a dog, and got through the fence unscathed. While they were on the colliery premises a whistle was blown, and upon his return through the fence John received an electric shock and collapsed. The pressure was stated to be 110 V.

The brother of the deceased said that John was in good health at the time, and he did not know of deaths from heart failure in the family. A number of witnesses deposed that they heard the whistle, and a shopkeeper repeated a conversation which he heard between two of the engineers who were charged with the company, in which they mentioned the erection of the fence. Sir E. MARSHALL HALL, K.C., for the defence, suggested that there was no foundation for the statement, but witness maintained that it was true. Medical evidence was given that death was due to shock; the witness could not state whether or not there was a bruise on the dead youth's skull. Sir E. Marshall Hall suggested that the pressure on the fence was only 60 V and asked witness if he had known of any previous death from a shock at that pressure. The witness said that he had not.

The hearing was adjourned until January 11th, when Sir Bernard Spilsbury was called as a witness for the prosecution. He said that death was caused by heart failure due to the passage of an electric current. Death from such a low voltage was rare, but the conditions were apparently favourable. The defendants were committed for trial, bail being allowed.

Theft of Electricity.

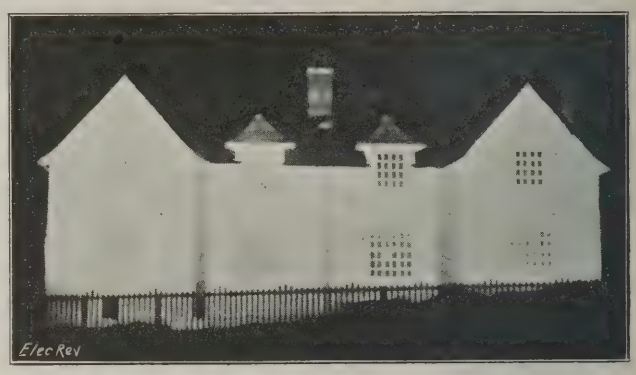
AT the Dukinfield Police Court last week penalties amounting to £8 10s. were imposed upon Charles Burton, a motor engineer, who was found guilty of fraudulently abstracting electricity from the mains of the Stalybridge and Hyde Joint Electricity Board. It was stated that the supply had been cut off from the defendant's premises owing to the non-payment of an account. The seal of the meter had been broken and a connection made.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The official report for the week ended January 8th, states that new electric demonstration houses were opened at Denton (Manchester), Bishop Auckland, Doncaster, Bradford and West Bridgford (Nottingham). The Bradford house was organised by Mr. H. Wilson, a local electrical contractor. It has been decided to open the Denton house on Sunday afternoons. Campaign "revival" meetings have been held in several places in response to the organisers' call for increased efforts. Great activity is reported from Cardiff, where more successful houses have been run. Arrangements have been made for a large model to be displayed for a week in the window of one of the principal stores. During the week sandwichmen will distribute cheque-coupons. Works meetings are being held in the Lancashire area and other areas are urged to follow this example. The opening of the Aberdeen house has been deferred until the end of January. The first of Glasgow's three houses is to be opened next week; 100,000 descriptive leaflets have been printed for distribution, and a local advertising campaign is being launched. Exhibitions in lieu of houses are being run at Dewsbury, Dudley, Hagley, Halesowen and Wolverhampton. An exhibition is to be held



Campaign Display at the Greenock Exhibition.

at Falkirk from February 7th to 11th, and exhibits have been arranged by five manufacturers and five local contractors. Immediately after this exhibition another will be held at Dumfries.

We have already reported that the Greenock Corporation recently held an electrical exhibition. This was designed to convey an excellent idea of the many domestic uses of electricity. Two of the principal sections were a nicely-furnished sitting room and a kitchen. In the latter apartment demonstrations of electric cooking were given by a capable operator and half-hour film programmes were presented at intervals. A special display was arranged to draw attention to the campaign and this is illustrated herewith.

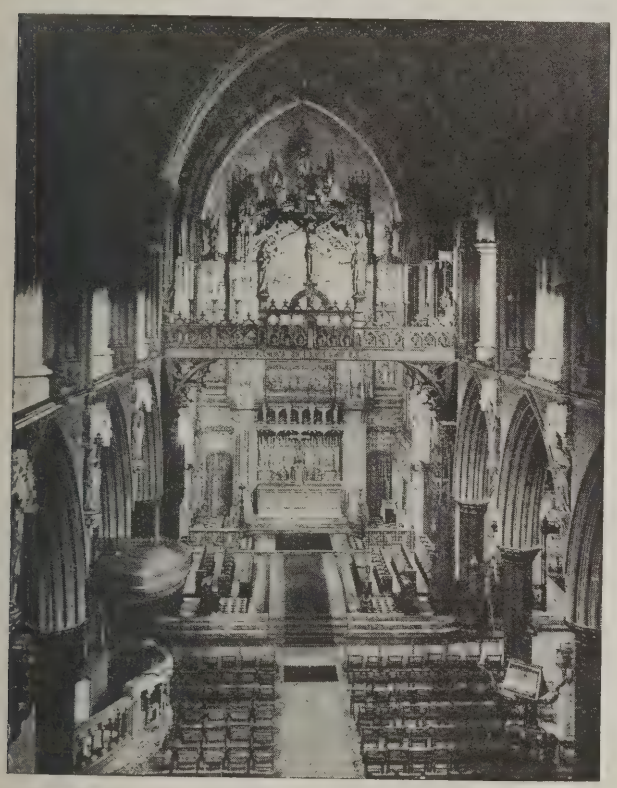
In our last issue we reported the opening of the demonstration house at Denton, Manchester. From the illustration of the building, which is reproduced herewith, it will be seen that the house is similar to many thousands in this country, and can be taken as a fair example of the type of dwelling to which supply authorities and contractors should pay particular attention. Such houses form the backbone of the domestic load.

The Dundee demonstration house which was open to the public from November 20th to December 18th, is depicted herewith. The Dundee circle reports that the premises were visited by about 5,300 persons and 500 competition booklets were distributed. The house was designed for educational purposes primarily and no great efforts were made to effect direct sales or to secure new consumers.

The Dundee Electric House.

With the object of reviving interest in the campaign a mass meeting of supply engineers and chairmen of local Electricity Committees was held at the Lighting Service Bureau, Manchester, on January 6th. The meeting, which was rather poorly attended, was presided over by Mr. P. P. Wheelwright, Blackburn, the chairman of the North-Western Campaign Committee, and the principal speaker was Mr. W. E. Bush (E.L.M.A.). After a few preliminary remarks, Mr. Bush said that although 106 local circles had been formed, only one of them, *viz.*, that at Liverpool, was in the North-Western area. The circles were the main inspiration of the campaign and the Central Committee had hoped that as the national adver-

The All-Electric Home at Denton, Manchester.



tising campaign was reduced in intensity, so would the circle activities increase and the matter become more and more localised. The circles in various parts of the country had done really beneficial work, but in nothing more perhaps than in bringing the various sections of the trade together. One of the most pleasing features was the determination of most of the circles not to disband at the end of the campaign but to keep together ready for future work. In booklets the

North-Western area had not done so badly; out of 800,000 issued, the area had taken 116,000, but the committee did not think the total sufficient, and it had decided that as from February 12th, the trade should be asked to circulate the booklets direct to the public. A proportion of the extra cost would be borne by the National Committee.

In a subsequent discussion Mr. H. C. Lamb, the Manchester City Electrical Engineer, said that a circle was being formed to include Manchester, Salford and Stretford and a feeling of co-operation had been established amongst all parties. Complaints were made by other speakers as to the lack of interest shown by contractors and in some particular cases by their local Associations who had been invited to discuss the matter but had done nothing further. The apathy, and to some extent suspicion, of the public was referred to, and in one case quoted, out of 14,000 circulars sent out, not more than 200 applications for booklets had been received. The advantages derived from a well-got-up campaign window display were extolled by Mr. Wheelwright.

A Flood-lighted Church.

The accompanying picture is a view of the interior of St. Cuthbert's Church, Philbeach Gardens, S.W.5, and was taken solely by the light from a new installation carried out by Mr. W. J. Adams, 205, Tolling Road, Hammersmith. Ten "Gecoray" floodlight projectors, each equipped with 200-W "White Osram" gasfilled lamps, illuminate the nave, being fixed at clerestory level about 40 ft. from the floor. The chancel, reredos, and Lady Chapel are similarly illuminated. The aisle is lighted by ten smaller units, in which 100-W lamps are employed. All the projectors point towards the chancel, and thus there is no glare in the eyes of the congregation. Each unit is separately plugged. Readings taken on a horizontal plane 2 ft. 6 in. above floor level gave the following average intensities of illumination:—Nave, 3 ft.-candles; chancel, 5.5 ft.-candles; and aisles, 2.5 ft.-candles. The General Electric Co., Ltd., prepared the scheme in collaboration with Mr. S. T. Puzey, P.A.S.I.

St. Cuthbert's Church, S.W.

Hungarian Electrical Contracts.

According to Hungarian Press reports, the Hungarian Ministry of Commerce has invited the interested branches of industry to bring forward competitive offers for the construction of a great electric power station. Two offers were received, one from the English "Talbot" group and another from a Swiss and Hungarian group. The offer of the "Talbot" group includes, besides the supply of electricity for all the needs of Budapest, the electrification of the State Railways. It is proposed to erect a great super-power station in the coal fields of Tata in agreement with the Hungarian General Coal Mining Co., Ltd. The group is represented to have come to an agreement with Ganz & Co. concerning the supply of electric locomotives.—*Reuter.*

Telephone Manufacturing in Spain.

The National Telephone Company of Spain intends to enlarge its plant so as to be able not only to supply the needs of the Spanish telephone system, but also to export telephone material to South America.—*Reuter's Trade Service* (Madrid).

New Tricity Restaurant.

On Monday last Mr. A. F. Berry presided over a luncheon attended by a large number of representatives of the newspaper and technical Press, held at the new Tricity Restaurant in the Strand, at the corner of Savoy Street. This is an all-electric restaurant of the first class, which has now taken the place of the original Tricity House restaurant which has rendered such excellent electrical propaganda and publicity service during the past fourteen years. Mr. Berry described the objects of the new restaurant, which was duly formally opened. We shall deal fully with the matter in our next issue.

A New Public Clock.

A large turret clock has recently been made and erected by Messrs. Gent & Co., Ltd., Leicester, in the water tower of Messrs. Terry & Co.'s chocolate factory at York. A peculiar feature of the installation is that a large water tank occupies the space immediately behind the dial openings, there being only a few inches between the inside wall and the tank, as it occupies the space which should, in the ordinary way, be available for the usual mechanism and the radial connecting rods for the four dials which are each 8 ft. in diameter and arranged for internal illumination. The problem, therefore, was to drive the hands of the clock from a mechanism fixed many feet below the tank and 16 ft. below the dials. The difficulty was surmounted by designing special gear which could be fixed from the front of the dials through detachable portions thereof, and by providing a mechanical connection with the waiting-train movement fixed below the tank by means of four lengths of ordinary bicycle chain. In order to illuminate the dials internally, the electric lamps have had to be lowered from the top of the tank to the desired positions behind the dials, there being no other means of access. In the same circuit as the large clock, there are a number of wall clocks distributed throughout the works, as well as a system of "start" and "cease work" sound signals. The whole is controlled from the same prime transmitter or master clock, so uniform time is shown throughout. The clock is depicted in the accompanying illustration.

A Turret Clock at York.

Russia Pays for Machinery.

The *Financial Times* says that orders received from Russia enabled some of the leading textile machinery concerns to run practically full time for a good part of last year. Our exports of this class of machinery to Russia during the first eleven months of the year aggregated 12,672 tons, as compared with 1,661 tons during the corresponding period of 1925. It is expected that further contracts will be negotiated within the next few weeks. Careful inquiries show that in every instance the Russians have honoured their financial obligations with great promptitude.

Calendars and Diaries.

We again have to acknowledge and reciprocate the season's greetings from a number of our friends, and thank them for calendars, &c., which we have received from them.

Messrs. James Armstrong & Co., of Manchester, ask us to state that their supply of diaries has been exhausted, and they regret their inability to meet all requests.

From the B.E.N. Patents, Ltd., 96-98, Victoria Street, London, S.W.1, we have received a desk pad calendar with ample space for daily memoranda.

A New Year greeting card has been sent to all its domestic consumers (about 12,000) by the ELECTRICAL DISTRIBUTION OF YORKSHIRE, LTD. This depicts in warm colours an "all-electric" sitting-room; explains a number of common electrical terms; and gives details of the various tasks which a unit of electricity will perform.

From the COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD., we have received the usual telephone wall-card. The picture extols the virtues of the electric motor.

A pocket diary ("Cromwell" series), containing an insurance coupon, useful general information, &c., has come to hand from the LONDON MAGNETO REPAIRING & WINDING CO., LTD., of 78, Hampstead Road, London, N.W.1.

MESSRS. MATHER BROS., 36, Farringdon Street, E.C.4, have retained the usual style for their calendar, *i.e.*, large monthly sheets with a date-marking device.

From MESSRS. MAWDSLEYS, LTD., of Dursley, Glos., we have received a wall calendar with unobtrusive monthly slips below a charming coloured view "In Sunny Algeria."

The SHROPSHIRE, WORCESTERSHIRE & STAFFORDSHIRE ELECTRIC POWER CO. has sent us a large wall calendar in which the business note is very inconspicuous. The subject is a lady in eighteenth-century costume, and both the subject and the treatment are admirable.

Once again the DUSSEK BITUMEN CO., LTD., of Bromley-by-Bow, has prepared a handsome pocket case and diary, with ample engagement and memoranda spaces and insurance coupon.

MESSRS. WM. SANDERS & CO., of Falcon Electrical Works, Wednesbury, have sent us a telephone scribbling pad on a metal base.

MR. S. BAXTER, 102, Greyhound Road, W.6, has sent us a businesslike wall calendar with plainly-printed monthly sheets.

Trade Announcements.

The business lately carried on under the style of Coughlan and Tyrrell, Ltd., has been purchased by TRELLEBORG EBONITE WORKS, LTD., from the liquidator, Mr. A. T. Keene, and will be carried on by them.

MESSRS. SANTON, LTD., have removed from 34, Bridge Street, to 149-150, Dock Street, Newport, Mon.

The offices of MESSRS. A. W. BEUTELL, LTD., have been removed to the company's works at Christopher Place, Chalton Street, Euston Road, N.W.1.

MESSRS. THOMAS BROADBENT & SONS, LTD., have now opened an office of their own at 65, Bath Street, Glasgow, under the management of Mr. Eden Field. (Telephone: Douglas 2459; telegrams: "Broadbent, Glasgow.")

Mr. J. SCRIVENER, who has been associated with the sale of vacuum cleaners for many years, has formed a new company, VOLTA, LTD., to sell "Volta" suction cleaners and other labour-saving devices, exclusively to the trade. Offices and showrooms have been taken at Kern House, 36-38, Kingsway, W.C.2 (telephone: Holborn 0188 and 0189), to which address all communications for Mr. Scrivener should be sent.

The Cardiff address of the MACINTOSH CABLE CO., LTD., has been changed to 98, St. Mary's Street. Telephone No.: "Cardiff 2224."

New Catalogues and Lists.

MESSRS. LANDIS & GYR, LTD., Elgee Works, Windmill Road, Hampton Hill.—An illustrated pamphlet dealing with the company's instrument transformers.

THE JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, S.W.1.—January calendar-blotter advertising the "No. 554" electric fire, which is of an ornamental pattern.

MESSRS. L. MCMICHAEL, LTD., Wexham Road, Slough.—A pictorial blotter advertising the company's "Unimic" and "Dimic" coils.

THE CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham.—An abridged price list of "Credenda" conduits, fittings, cables and flexibles.

MESSRS. G. COHEN, SONS & CO., LTD., 600, Commercial Road, E.14.—A catalogue of power plant for disposal, including coal-handling plant, pumps, boilers, generating sets, motors, &c.

The NEW PELAPONE ENGINE CO., LTD., 41, Baker Street, W.1.—Leaflet No. 156, an illustrated pamphlet dealing with the new "Pelapone Simplex" range of country-house electric lighting sets.

MESSRS. MAVOR & COULSON, LTD., 47, Broad Street, Mile End, Glasgow.—A well-illustrated brochure describing in detail the "Samson" 1927 model chain coal-cutting machine for electrical or pneumatic operation.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38 and 39, Upper Thames Street, E.C.4.—Monthly price sheet (January) containing illustrations and prices of electrical appliances, accessories and materials.

THE BRITANNIA MANUFACTURING CO., LTD., 22-26, Britannia Street, City Road, N.1.—An illustrated pamphlet dealing with electric cranes, hoists and winches; and a postcard advertising second-hand motors and dynamos.

MESSRS. DORMAN & SMITH, LTD., Ordsal Electrical Works, Salford.—Catalogue No. 100, a 230-page publication in strong binding containing illustrations and prices of fuse-gear of all kinds, battery switchboards, motor controllers, switchgear, cable-jointing equipment, industrial lighting fittings, &c.

THE ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, W.C.2.—Publication No. 802, an attractively-produced brochure upon automatic sub-stations, giving fully-illustrated particulars.

MESSRS. FREDK. J. GORDON & CO., LTD., 92, Charlotte Street, W.1.—A priced and illustrated catalogue of battery-charging equipment, including motor-generators, switchboards, lead moulds, and all kinds of tools.

HOPKINSON INDUCTION MOTORS, Willesden Lane, North Acton, W.3.—January stock list of a.c. motors, ranging in size from 0.5 to 30 h.p.

Bankruptcy Proceedings.

R. L. BROCK, electrical engineer, trading as R. L. Brock and Co., Bedford Row, Plymouth.—The public examination of this debtor took place at the Plymouth Bankruptcy Court on January 4th. The statement of affairs showed liabilities estimated at £1,723, and assets of £355, leaving a deficiency of £1,368. Debtor stated that he started business in 1919 with £120, which he received as an Army gratuity. This venture cost him about £300. When the "boom" in the wireless trade came he took a wireless expert into partnership. In 1925 the partnership was dissolved, and matters went so unfavourably that he had to sell his premises, and the bulk of the proceeds went to the first mortgagee. His failure was contributed to by the fact that much of the work undertaken by the firm had been under-estimated, and that, owing to incompetent workmen, some of it had to be done over again. The Official Receiver questioned him regarding an apprentice, from whom he obtained a £50 premium for a three-year indenture shortly before his bankruptcy. Debtor said that he acted in good faith; he had suffered from lack of capital ever since he had been in business. The examination was adjourned until February 18th.

A. A. WATMOUGH, carrying on business in co-partnership with W. Hurworth (Hurworth, Watmough & Co.) as electrical engineers, 41, Town Street, Horsforth, and 1, Back James Street, Harrogate.—Supplemental dividend of 2s. 1½d. in the £, payable January 20th, at the Official Receiver's office, 24, Lower Bond Street, Leeds.

G. TURNER (Radio Supply Co.), electrician and wireless dealer), 34, Mesnes Street, Wigan.—Last day for proofs for dividend January 22nd. Trustee, Mr. E. D. Symond, Official Receiver, 11, Dale Street, Liverpool.

Company Liquidations.

KENYON & TORRANCE, LTD., electrical and automobile engineers, Manchester.—A meeting of creditors was held last week, at the offices of Messrs. Whittaker & Provis, C.A., Mount Street, Manchester, when it was reported that the liabilities were £336 and the net assets £103, leaving a deficiency of £233. The issued capital of the company was £202, making a total deficiency of £435. In addition to the liabilities shown in the statement there were cash claims for £1,128, representing money advanced to the directors and their friends, but those claims were being withdrawn. The business had been closed down. The company was formed in February, 1924, and since its inception there had been a gross profit of £1,589, but after allowing for all the expenses there had been a net loss. A resolution was passed confirming the voluntary liquidation of the company with Mr. G. Whittaker as liquidator.

MINING REQUIREMENTS CO., LTD., Wombwell, near Barnsley.—A meeting of creditors was held recently, at the Law Society's Rooms, Sheffield, when a statement of affairs was presented which showed ranking liabilities of £1,313, all of which were due to the trade. The net assets were £819, leaving a deficiency of £494. It appeared that there was uncalled capital to the extent of 10s. a share on 1,200 shares. A resolution was passed confirming the voluntary liquidation of the company, with Mr. T. C. Parkin, 36, Bank Street, Sheffield, as liquidator, whilst a committee was also appointed consisting of the representatives of the British Thomson-Houston Co., Ltd., Callender's Cable and Construction Co., Ltd., and the Hallamshire Electric Co., Ltd. The following are creditors:—

	£		£
Angus, Geo., & Co., Ltd.	57	Henley's (W. T.) Telegraph Works Co., Ltd.	23
British Thomson-Houston Co., Ltd.	200	Metro-Vick Supplies, Ltd.	94
Callender's Cable and Construction Co., Ltd.	59	Middlesbrough Steel Tube and Conduit Co., Ltd.	20
Earle, G. & T. (1925), Ltd.	40	Peck, J. H., & Co., Ltd.	155
Edison Swan Electric Co., Ltd.	66	Premier Accumulator Co., Ltd.	55
Electrical Components, Ltd.	69	Saxonia Electrical Wire Co., Ltd.	55
Electrical Conduits, Ltd.	35	Walsall Hardware Manufacturing Co., Ltd. ...	48
General Electric Co., Ltd.	47	Warren Bros	26
Hallamshire Electric Co., Ltd.	103	Webber, J. M., & Co., Ltd.	55

KNIVETOWN ELECTRIC WIRE CO., LTD.—Winding up voluntarily. Liquidator, Mr. S. W. Tubbs, 24, Basinghall Street, E.C.—A meeting of creditors was held at the Institute of Chartered Accountants, Moorgate Place, E.C., on January 10th.

Capital Issues in 1926.

Statistics compiled by the Midland Bank show that new issues of capital totalling £253,266,414 were made during last year as compared with £219,986,630 in 1925. Of this, electric light and power issues accounted for £11,523,092, as against £7,242,534; telegraph and telephone issues for £1,220,890, against £2,136,000; and tramway and omnibus issues for £2,355,152, as compared with £409,916 in 1925.

Social Events.

For their annual pantomime which they give to audiences largely composed of poor children of the city, the children of employés of the Birmingham Electric Supply Department this year chose "Dick Whittington," the chief performance of which was given on January 3rd, at the Temperance Hall, Birmingham. The Lord Mayor of Birmingham, Alderman A. H. James, and Mr. R. A. Chattock, the city electrical engineer, were present, and both warmly commended Mr. Joseph H. Fletcher, who directed the performance, and those who assisted him. Excellent electrical effects were provided by the Department's engineers.

On New Year's Day the football team of the Walsall Hardware Manufacturing Co., Ltd., had the pleasure of beating the M.E.M. team by two goals to *nil* after a hardly fought game. After the match, the rival teams, with representatives of the management of the two companies, dined together. A return match is to be played.

The A.T.M. Orchestral Society, numbering 35 performers, in conjunction with the Barnabas Singers, a talented vocal quartette party, gave a concert at Picton Hall, Liverpool, on December 23rd in aid of the local Goodfellow Fund. In the course of the evening Mr. G. W. Moore, general manager of the Automatic Telephone Manufacturing Co., Ltd., formally presented a conductor's baton to Mr. C. Brandreth as a mark of appreciation of his efforts in raising the orchestra to such a commendable pitch of efficiency.

On January 1st, the G.E.C. Sports Club put four football elevens into the field, two matches being won and two lost. The first eleven played Parkside and won by 9 to 2; the second played Selfridge's and won by 5 to 1; the third played British Petroleum and lost by 0 to 6; and the fourth played Clesco and lost by 1 to 6. Preston, of the first eleven, scored seven goals against Parkside.

On January 5th the Electric Art Shades, of Kelvedon, Essex, gave their annual dance at the Parish Hall to their employés numbering nearly 200. Mr. H. A. Chard, the sales manager, acted as M.C.

Last week the Dewsbury Corporation tramways football and billiards teams, and their supporters, entertained the corresponding teams and supporters of the Halifax Corporation tramways. In the afternoon a football match in the Yorkshire Tramways League competition was won by Dewsbury by four goals to three. After tea there was a billiards match, Dewsbury again winning. The remainder of the evening was devoted to a social and concert.

On January 7th, Mr. and Mrs. R. E. Robson entertained the employés of Messrs. Robson & Coleman, Newcastle, and their friends, at their annual whist drive, supper and dance. About 120 people took part and spent a very enjoyable evening. Music for dancing was provided by Mr. J. B. Anderson's orchestra. At the close of the evening, Mr. Robson presented Mrs. Meikle, caretaker of the firm's premises, with an armchair and a gift of money, in appreciation of her 50 years' service.

The Edinburgh Electrical Society held its annual whist drive and dance in the Albyn Rooms last week, when a representative gathering of the electrical trade of Edinburgh was present. Whist prizes were given by the leading electrical manufacturers and suppliers. Special lighting effects were arranged, and a thoroughly enjoyable evening was spent.

Book Notices.

MESSRS. BRUNTONS, Musselburgh, have issued a small book, intended for the use of the shop foreman, defining the various uses of wire rope slings for the hoisting of heavy machines and structures. Special consideration is given to the application of slings with reference to the inclination of the sling and the safe load limits.

"Stresses in Space Frames," by Wilfred W. Padfield. Pp. 35; illustrated. Issued by the Association of Engineering and Shipbuilding Draughtsmen. Price 2s.—This book treats on the work of simplifying the methods of finding the stresses in three-dimensional constructions.

"High Vacua," by G. W. C. Kaye. Pp. xi+175; figs. 91. London: Longmans, Green & Co., Ltd. Price 10s. 6d. net.

Miscellaneous Publications of the U.S.A. Bureau of Standards. No. 75, June, 1926, "Annual Report of the Director of the Bureau of Standards" for the year ended June 30th, 1926. Price 5 cents.

"Edison: The Man and His Work," by G. S. Bryan. Pp. xi+350; illustrated. London: A. A. Knopf. Price 18s.

Scientific Papers of the U.S.A. Bureau of Standards. No. 536, Vol. 21, "A Portable Radio Direction Finder" for from 90 to 7,700 kilocycles. Price 10 cents.

Unemployment.

There was an increase of 41,260 in the unemployment total during the week ended December 24th. At that date the total was 1,351,000, as compared with 1,309,740 on December 20th.

Free Gifts with Vacuum Cleaners.

During January MESSRS. L. G. HAWKINS & CO., LTD., 30-35, Drury Lane, W.C.2, are carrying on an intensive campaign for the sale of "Universal" vacuum cleaners. As an inducement they are giving *gratis* an electric iron, a curling iron, a toaster or a table stove to every purchaser of a vacuum cleaner. Some attractive publicity matter, illustrating both the principal appliance and the free gifts, is being sent to retailers by Messrs. Hawkins. Free home demonstrations and "easy terms" are offered.

Recent Contracts.

Besides the Birmingham contract mentioned below, INTERNATIONAL COMBUSTION, LTD., has recently secured other important work. The company is the main contractor for the 12,000-kW hydro-electric station which is to be erected at Perak, Malaya. The Anglo-Persian Oil Co. has awarded the company a contract for the extension of the boiler-house at the Abadan Refineries, Persia, and a large steel works in the North of England has ordered "Raymond" pulverising and transporting equipment from the company for the firing of a continuous billet-reheating furnace.

As reported in our "Contracts Closed" section to-day, the Liverpool Corporation has awarded a contract for a 25,000-kW turbo-generator set to the METROPOLITAN-VICKERS ELECTRICAL CO., LTD. This is for the new Lister Drive No. 3 power station, and will be the second unit of the same size supplied for this station by the Metropolitan-Vickers Co. The station is designed to accommodate five such sets. The contract includes the supply of the necessary condensing plant and auxiliary apparatus. The new set is expected to be ready for service by the latter part of the year.

The PULSOMETER ENGINEERING CO., LTD., has received an important order for pumping plant to be installed at one of the pumping stations of the London & North-Eastern Railway at Hull. It covers four double-unit turbine centrifugal pumps, two rated at 800 g.p.m. and two at 600 g.p.m., against a head of 1,960 ft.; and two return water pumps to deliver 3,000 g.p.m. against a head of 44 ft. All these pumps are to be electrically driven, and the plant will be operated by air-break automatic control gear.

The Birmingham Power Station Contract.

We reported in our last issue that the Birmingham Electric Supply Committee had awarded a contract valued at £1,450,000 to INTERNATIONAL COMBUSTION, LTD., for the erection of a new power station at Hams Hall. The company sends us the following additional information. The station is one of the new capital power stations under the Government's electricity scheme. The civil engineering work covers the preparation of site, levelling, piling, mass concrete foundations, steel framed buildings for switch house, turbine house and boiler house; it also covers workmen's dwellings, reservoirs, railway sidings, locomotive sheds and levelling of the coal storage site, and this, together with the cooling towers and coal and ash handling plants, has been sub-contracted to the Mitchell Conveyor and Transporter Co., Ltd. The two turbo-alternators, each of 30,000-kW capacity, the two house generators of 1,500-kW capacity, also all switchgear, transformers and motor generators, as well as the condensing equipment, will be supplied by the GENERAL ELECTRIC CO., LTD., to whom the whole of this section has been sub-contracted The General Electric Co. has already supplied five large generating sets to the Corporation. In the boiler house, five of the largest water-tube boilers yet constructed in this country are to be installed, each having an evaporative capacity of 200,000 lb. per hour. The working pressure of the boilers will be 375 lb. per sq. in., and they will be operated with "Lopulco" pulverised fuel firing equipment. The water-cooled furnaces will form an important feature of the steam generating equipment, and air heating by means of the "Usco" plate type air preheater will be used throughout. The ultimate capacity of Hams Hall will be 210,000 kW. The whole of the specifications were prepared by Mr. R. A. Chattock, city electrical engineer.

Liverpool to Join the B.E.A.I.R.A.

Subject to the consent of the Electricity Commissioners, the Liverpool Corporation has accepted associate membership of the British Electrical and Allied Industries Research Association, at a subscription of £100 per annum.

For Sale.

Messrs. Edwards, Son & Bigwood will sell by auction on February 2nd, by direction of the Electric and Ordnance Accessories Co., Ltd., the freehold manufacturing premises, "Blic Works," Cheston Road, Aston, Birmingham. (See our advertisement pages to-day.)

Proposed Electricity Showrooms at Leeds.

On January 5th a recommendation by the Leeds Electricity Committee for the establishment of showrooms came before the City Council. The proposal was opposed by the Conservative members on the ground that it was undesirable that the Council should compete with its ratepayers. Liberal and Labour members supported the recommendation and it was carried by 38 votes to 26.

Indian Electrical Imports.

An official return just to hand shows that the imports of electrical equipment into India during October last attained a value of 3,700,000 rupees, as compared with 1,853,000 rupees in the corresponding month of 1925.

German Rubber-Selling Combine.

The Fulda Rubber Works Co., of Fulda, and the Deka Pneumatic Co., of Berlin, a subsidiary of the German Cable Works Co., have combined their sales organisations.—*Financial Times.*

Commercial Secretary at Hungary.

The *Board of Trade Journal* announces that Mr. H. N. Sturrock, formerly Commercial Secretary at Berlin, has been appointed Commercial Secretary at Budapest, in succession to Mr. F. H. Duke, C.B.E., who resigned recently. Mr. Sturrock will assume his duties on or about February 1st.

London Electricity Supply Changes.

Mr. F. J. Walker, general manager and secretary of the Central Electric Supply Co., Ltd., has issued a notice to the effect that, in accordance with the agreement scheduled to the London Electricity (No. 2) Act, 1925, the generating station of the company at Grove Road, has been transferred to the London Power Co., Ltd., of 6, Eccleston Place, London, S.W. The Central Company will discharge liabilities for goods supplied to December 31st, 1926, on contracts placed by them.

Chinese Notes.

A concession to install and operate electric lighting and tramways in Harbin was granted to a Chinese syndicate in 1919. This syndicate formed the Harbin Electric Light and Tramways Co. with an authorised capital of $10,000,000. Later the Government acquired an interest in the company. The concession called for a 10,000-kW generating plant and 22 miles of tramways. The first part of the programme, consisting of the erection of the power station and the laying of 8½ miles of tramways, is now in hand, a contract for $2,520,000 having been awarded to the Siemens China Co. Consignments of machinery have already arrived in Harbin. The company has applied for an extension of the term of the concession, and also for the extension of its working scope, 22 miles of tramways being considered too short for successful working. A prospectus recently issued by the company states that an annual profit of $2,700,000 gold roubles is anticipated.

Electric irrigation is being employed in parts of China. The Foochow Electricity Supply Co. recently installed special electrically-driven pumps for the purpose capable of delivering 525,000 gal. of water per hour. The pumps can be used either for pumping water to the fields or extracting it from them. The benefit derived by the owners of upland fields using electric irrigation apparatus in the Changchow (Kiangsu) district during a recent drought has led to large sales of such apparatus. The Cheng Kwa Electric Power Co. has been unable to meet the demand fully.

Hungary's Foreign Electrical Trade.

During the first six months of 1926 Hungary imported electrical equipment valued at approximately £174,000, and exported similar goods to the value of £313,000. The corresponding figures for the first half of the previous year were £93,000 and £232,000.

Electrical Employés Help Hospitals.

The employés of Messrs. A. Reyrolle & Co., Ltd., of Hebburn-on-Tyne, contributed through their Hospitals and Charities Committee during the year 1926 the sum of £969. Out of this total, £275 went to the Newcastle R.V. Infirmary, £275 to the Hebburn Infirmary, £75 to the Newcastle Eye Infirmary, £85 to the Employés' Benevolent Association, and smaller amounts to a large number of other deserving institutions and funds.

Increased Australian Copper Consumption.

The Australian Tariff Board recently considered an application for a bounty in connection with copper mining. The manager of an Australian electrolytic copper refining and smelting company gave evidence in support of the claim, and said that the proportion of his company's production consumed in Australia had increased to a remarkable extent in the past few years. In 1914, when the production was 16,401 tons, the proportion sold in Australia was 5.27 per cent. Last year the company produced 11,090 tons, and no less than 86.42 per cent. of this was taken by Australian industries. It was claimed that the production of copper in the Commonwealth had saved Australian firms very large sums of money, and should be encouraged. For some time past the cost of the production of copper in Australia generally had been higher than that of the finished product owing to the fall in the price brought about by increased world production. The Board later heard an application from Australian manufacturers for the imposition of increased import duties upon copper products and alloys of copper. This was opposed by the Australian representative of Elliott's Metal Co., Ltd., Birmingham, on behalf of the Australian Association of British Manufacturers.

Jackson Cooker Contracts.

It is interesting to record that figures recently received by the Jackson Electric Stove Co., Ltd., show that in eight towns alone there is an aggregate of 8,000 of its electric cookers installed on hire. The company has received orders from the Manchester Corporation Electricity Department for 680 cookers since the commencement of the yearly contract last September, and there are now 2,300 Jackson cookers on hire on the Manchester mains. The company has also received a contract for the supply of cookers, during one year, to the Dublin Corporation Electricity Department.

Proposed Buenos Aires Subways.

Major O. Sumner, O.B.E., has sent us a letter upon this matter, in which he states that the scheme for the construction of subways in Buenos Aires, with which he is associated, has not been rejected, as had been reported. The project is said to have strong Argentine support and to be suspended on account of one or two articles of the concession being *ultra vires* the Municipality. Major Sumner emphasises that it is the intention of his group, if the concession is granted, to place orders for equipment in England.

The Brazilian Radio Market.

Owing to adverse economic conditions, radio equipment is not selling well in Brazil at present. Importers are not only curtailing orders, but in some instances countermanding them. Complaint is made of the large amount of obsolete material still being offered at so heavy a discount as seriously to interfere with the importation of up-to-date apparatus.—*Reuter's Trade Service* (Rio de Janeiro).

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections can be entered against any of the proposed marks within one month from the dates mentioned:—

December 29th, 1926.—Roc. No. 472,446. Class 8. Instruments and apparatus and parts and accessories thereof for use in connection with radio-telephonic and telegraphic receiving and transmitting sets. Jurassia, Société Fabrique de Machines Parlantes, Ste. Croix, Switzerland. (British representatives: Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

January 5th, 1927.—Central (lettering and design). No. 472,481. Class 6. Hand-propelled electric vacuum cleaning machines for domestic use. C.C.A. (Central Cables & Accessories), Ltd., 83, Queen Street, E.C.4.

Sterling. No. 473,157. Class 8. Telephones and radio-telephone and signalling apparatus. Sterling Telephone and Electric Co., Ltd., Marconi House, Strand, W.C.2.

Ansil. No. 473,827. Class 8. Radio-telephonic and telegraphic instruments and apparatus. N. Garnett, 482, Bury New Road, Kersal Bar, Manchester.

Colvern. No. 475,344. Class 8. Instruments and apparatus for use in radio-telephony and telegraphy. Collinson's Precision Screw Co., Ltd., Macdonald Road, Walthamstow, E.17.

Premier. No. 468,285. Class 18. Electric welding plant. Premier Electric Welding Co., Ltd., Harrow Manorway, Abbey Wood, S.E.2.

Lamp Manufacture in Belgium.

The Société Belge de la Lampe Philips recently acquired works at Lemnis, Belgium, where electric lamps are now being manufactured for the Belgian market.

Tradesmen Using the Royal Arms.

The *London Gazette* for January 4th contains lists of tradesmen in London and elsewhere who hold appointments to Royalty with authority to use the Royal Arms.

Electrical Development in Singapore.

United States trade officials at Singapore report remarkable electrical progress during the past five years. The municipal power plant has been steadily extended, and the public demand has kept pace with the development. One of the largest stations in the Far East is to be erected by the Municipality, and this will provide a cheaper supply, which, in turn, will create a large demand for consuming devices. Since the introduction of electricity has been comparatively slow the market has not actively developed. It is considered that a progressive sales campaign for the marketing of electrical goods would produce excellent results.

Chinese Electrical Machinery Imports.

According to *Commerce Reports* the imports of electric power station machinery into Shanghai during the first half of last year were valued at 97,501 Haikwan taels, as compared with 178,220 taels in the first six months of 1925. The corresponding figures for imports into Dairen were 176,032 taels and 179,472 taels respectively.

European Copper Sales Agreement.

In order to deal with the situation resulting from the international agreements in the copper markets, a group comprising the Anaconda Copper Mines, the Société Minière Calumet, the Hecla and the United Verde Companies on the one hand, and the Union Minière du Haut Katanga and the Société Générale Métallurgique de Hoboken, on the other, have decided that their sales in Europe shall be entrusted to the same firms.—*Reuter* (Brussels).

Proposed Scottish Textile Machinery Exhibition.

The manager of the Textile and Industrial Exhibitions, Ltd., Manchester, has applied for the use of a portion of Kelvin Hall, Glasgow, for about three weeks in November next for the purpose of holding an exhibition of textile machinery, &c.; the application has been remitted to a committee.

United States Electrical Exports.

The official statistics of exports from the United States during October last give a total for the electrical section of $8,035,710, as compared with $7,512,642 in October, 1925, an increase of $523,068. The battery class showed the greatest increase—83 per cent. in the case of primary batteries and 36 per cent. in storage batteries. In general the lighter classes showed important gains, while the heavier apparatus registered losses. The export value of a.c. generators fell from $193,961 to $17,004, and d.c. generators also showed a substantial decline. Self-contained lighting outfits rose from 331, valued at $93,996 in October, 1925, to 538 ($153,414) in October last. Other large advances were made by electric lamps, telegraph and telephone apparatus, railway motors, and electric locomotives. Radio apparatus showed a fall from $1,317,846 to $1,108,442, but October, 1925, was a record month in this direction.

British Participation in International Steel Trust.

The Berlin correspondent of *The Times* says:—"According to information received here, the representative body of the British steel industry has announced its readiness in principle to join the International Steel Trust. It is stated that British representatives are to be invited to attend the meeting of the trust, which has been provisionally fixed for the first week in February. The *Börsen Courier* states that for some time the principal difficulty has not been one of willingness on the part of the British steel industry to join the trust, but arises out of a difference of opinion as to what should be the British quota. The total originally demanded by the British industry lay between ten and twelve million tons, while the amount the trust would be prepared to concede is less than nine million tons."

Salford and a Dutch Cable Tender.

In our "Contracts Closed" section last week we mentioned that the Salford Electricity Committee had recommended the acceptance of a Dutch tender for cable. At its last week's meeting the City Council adopted the recommendation by 28 votes to 7. During a discussion of the matter it was stated that the tender was 36 per cent. below the lowest British offer. Members who opposed the acceptance of the tender said that British manufacturers had to bear higher national and local burdens, which increased their costs. The chairman of the Electricity Committee quoted information prepared by the International Labour Bureau showing that Dutch manufacturers paid high wages and sustained heavy social burdens. Another councillor said that by means of rings the British cable-making companies were stifling competition and paying "enormous" dividends.

American Capital for Brazil.

The Rio correspondent of *The Times* states that American industrial enterprise is making considerable investments of capital in Brazil. The General Electric Company has announced a $28,000,000 investment project relating to Brazilian public utilities, and states that it has already purchased for 94,000 contos (£2,350,000) the Companhia Brasileira de Energia Elettrica, in the State of Rio, and other concerns in the Guinle interests. The General Electric Company's activities are stated to be due to a desire to control these and other enterprises for the purpose of selling material manufactured by the parent company, but opinion in Brazil does not doubt that its pretensions are more ambitious. The zones of the service companies purchased are only of secondary importance, and sweeping reforms and Government concessions will probably be necessary before the venture can be profitable.

Unemployment in Germany.

The official figures of unemployment in Germany show that at December 15th there were 1,464,000 people in receipt of relief, as compared with 1,369,000 on December 1st.

Threatened Strike Averted at Poplar.

Last week the members of the Electrical Trades Union employed in the erection of the new municipal generating station at Poplar threatened to cease work, alleging that the contractors were not observing the agreed conditions. It was announced later that the contractors had agreed to the men's demands, thus averting a cessation of work.

Timber Trade Report.

Our timber trade correspondent reports that the softwood market is steady with a firm tendency. Stocks in London docks are of slightly smaller volume than those of a year ago, which were large, but with the general improvement in trade which is anticipated, the demand is expected to show considerable expansion between now and May next, when navigation is resumed at North European ports. Sales to date for next season's delivery constitute a record for European wood exporters, and show clearly the confidence amongst operators in the British Isles and on the Continent that considerable progress will be made in industry this year, which will cause large quantities of timber to be taken into consumption. In the British Isles especially there is expected to be a good demand for house-building work. All the hardwoods, especially mahogany and teak, are strong in value, with stocks in first hands light, and little expected to come forward during the next few months. American woods are in good supply, but shippers' quotations have risen, restricting early future transactions with this country. This in itself tends to keep the spot market for American lumber firm whilst stocks are ample. The revival expected early in the furniture and cabinet trades, however, will do much to bring stocks to a lower level, which will be all to the benefit of the spot selling market.

Proposed Increase of Railway Rates.

The report of the Railway Rates Tribunal was issued last week. So far as goods traffic is concerned, the result of the Tribunal's decisions will be a slight increase in charges in most cases. Apart from this, the railway companies have decided to institute an increase of about 6½ per cent. in goods traffic charges at an early date on account of their grave financial position. This increase follows upon reductions made voluntarily by the companies in the hope of increasing traffic, a policy which was justified by an increase, but one that was unremunerative.

Peruvian Duty Increased.

As from January 1st the basic import duty on electric lighting fixtures imported into Peru has been increased by one-half.

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

CHEMICALS, &c.		Price Jan. 11th.	Fortnight's inc. or dec.
a Acid, Oxalic	per lb.	5¾d.	...
a Ammoniac, Sal	per ton.	£60	...
a Ammonia, Muriate (large crystal)	,,	£52	...
a Bisulphide of Carbon	,,	...	...
a Borax	,,	£25	...
a Copper Sulphate	,,	£25 10s.	...
a Potash, Chlorate	per lb.	4d. to 4¼d.	...
a ,, Perchlorate	,,	5½d.	...
a Shellac	per cwt.	£13 10s.	...
a Sulphur, Commercial	,,	£9 10s.	...
a ,, Roll	,,	£9 10s.	...
a Soda, Chlorate	per lb.	3¼d. to 3½d.	...
a ,, Crystals	per ton.	£5 to £5 5s.	...
a Sodium Bichromate, casks ...	per lb.	4d.	...
METALS, &c.			
b Aluminium, Ingots...	per ton.	£107 to £112	...
b ,, Wire	per lb.	1/6 to 2/-	...
b ,, Sheet	,,	1/3 to 2.9	...
p Babbitt's Metal and Anti-friction Metal—			...
Grade I	per ton net.	£262	£1 dec.
Grade II	,, ,,	£184	£2 dec.
Grade III...	,, ,,	£98	£1 dec.
c Brass (rolled metal 2" to 12" basis)	per lb.	9⅝d.	...
c ,, Tubes (solid drawn) ...	,,	1/0 to 1/0½d.	...
c ,, Wire, basis	,,	10⅛d.	...
c Copper Tubes (solid drawn) ...	,,	1/1	...
c ,, Bars (best selected) ...	per ton.	£92	...
c ,, Sheet	,,	£92	...
c ,, Rod	,,	£92	...
d ,, (Electrolytic) Bars ...	,,	£62 10s.	45s. dec.
d ,, ,, Sheets ...	,,	£144 10s.	...
d ,, ,, Wire Rods	,,	£74 15s.	...
d ,, ,, H.C. Wire	per lb.	9⅜d.	¼d. dec.
f Ebonite Rod	,,	2/3 to 2/6	...
f ,, Sheet	,,	2/3 to 2/6	...
n German Silver Wire	,,	2/2	...
h Gutta-percha, fine	,,	8/-	...
h India-rubber, Para fine	,,	1/4¾	¼d. to ⅜d. dec.

p C. Clifford & Son, Ltd.
r W. F. Dennis & Co.

Reporting on the lead position on January 8th, Messrs. James Forster & Co. stated:—"At the moment there seems nothing for it but still lower prices, but it must be borne in mind that lead at £27 per ton is no encouragement, but rather a deterrent to production. The trade prospect, particularly in the electrical industry, is much brighter than it has been for several months past, and the lower price for lead will undoubtedly stimulate consumption of the metal. We look for temporarily lower prices followed by a sharp recovery which, assisted by better trade, will probably be maintained throughout the year."

New French Company.

La Caisse Bearnaise Auxiliare d'Electrification is the name of a new undertaking which has lately been formed at Pau with a capital of six million francs to finance syndicates organised for the distribution of electricity in the Lower Pyrenees.

A French Lighting Service Bureau.

The French Society for the Improvement of Lighting has opened a demonstration salon at 134, Boulevard Haussmann, Paris, where the public are being invited to inspect the latest developments in electric lighting equipment.

German Capital Issues in 1926.

As in the previous year, little activity took place in 1926 in the direction of new capital issues in the electrical and gas industries in Germany, which are grouped together for this purpose. The number of applications for increases of capital was 20 in each year, but the amount offered for subscription rose from £1,295,000 in 1925 to £2,064,000 last year. The number of new joint stock companies formed declined from 10 in 1925 to four last year, but the capital offered increased from £159,000 to £465,000.

Selling Appliances at Manchester.

At last week's meeting of the Manchester City Council, the Electricity Committee submitted a report by the chief engineer and manager (Mr. H. C. Lamb) upon the question of the sale of apparatus from the St. Ann Street showrooms. Mr. Lamb said that it would only be possible in the existing premises to carry this out on a small scale. A stock of the more-frequently required appliances could be maintained and others could be ordered direct from the manufacturers. He suggested that a hire-purchase scheme should be adopted for radiators and wash boilers. The following articles could be sold:—Cooking apparatus, water heaters, radiators, irons, kettles, wash boilers, suction cleaners, fans, and other small motor-driven domestic appliances. It was estimated that within a year or two a revenue of £10,000 a year would be derived from this business.

A member of the Council moved an amendment deleting the matter from the Committee's minutes as it "opened the door to extreme Socialism." The amendment was rejected and the report agreed to.

Lighting and Power Notes.

Aire and Calder District.—The Electricity Act.—At Bradford Town Hall, on January 5th, a private meeting was held of representatives of the Conference of Local Authorities in connection with the West Riding (Aire and Calder) Electricity District. Alderman Wilfred Turner, chairman of the Bradford Corporation Electricity Committee, presided. Discussion was on the situation created by the passing of the Electricity (Supply) Act, 1926, and the meeting decided that the conference should remain in existence. A special committee was appointed to consider what steps should be taken to afford assistance to the authorities concerned in carrying the provisions of the new Act into effect.

Barrhead (Renfrewshire).—Street Lighting.—A committee of the Town Council is to consider the question of lighting the streets by electricity instead of gas.

Barrow.—Loan.—The borough electrical engineer has submitted a report to the Corporation on sub-station extensions, and has recommended that application be made for sanction to a loan of £14,560 with a view to providing for the increased load at North and South Vickerstown, and for future extensions at the Abbey and locomotive works sub-stations. The Council has approved the recommendation.

Bath.—Loan.—The Town Council has applied for sanction to a loan of £15,178 for mains and services.

Beckenham.—Electricity Charges.—The Urban District Council has adopted the following scale of charges for electricity consumed by the tenants of the Shortlands houses:—Five-roomed houses, a fixed weekly charge of 1s. 6d.; four-roomed houses, 1s. 4d.; three-roomed houses, 1s. 3d.; all energy consumed is to be charged at 2d. per kWh or, if a cooker is installed, 1½d. per kWh.

Bristol.—Electricity Supply.—To meet the demand for electricity in the East district the Electricity Committee has decided to lay two additional cables at a cost of £31,000.

Bury.—Electricity Extensions.—Proposals by the Electricity Committee for extensions at the power station, estimated to cost £116,540, have been approved by the General Purposes Committee. The scheme provides for the immediate installation of a new boiler, mechanical stoker, &c., at an estimated cost of £17,450, and also for the replacement of obsolete plant, at an outlay, for the first section, of £99,000. In the latter, provision is made for two 60,000-lb. boilers and a 10,000-kW turbo-alternator.

Canada.—Hydro-Electric Development.—The Department of the Interior has issued a bulletin confirming the estimate made twelve months ago that new hydro-electric installations during 1926 would exceed 250,000 h.p. New installations during the year totalled 266,000 h.p., bringing the total for the installations in Canada to 4,556,000 h.p. The new installations represent a direct capital investment exceeding $25,000,000, irrespective of the further capital required in the application of power to industrial purposes. New installations initiated but not completed during the year will add a further 1,700,000 h.p.—*Reuter's Trade Service* (Ottawa).

Chelmsford.—Price Reduction.—The Electric Supply Corporation, Ltd., has decided to reduce its charges for the supply of electricity for power and heating purposes so that the maximum charge shall not exceed 2½d. per kWh.

Continental. — Switzerland. — The Bundner Kraftwerke Gesellschaft has recently put in operation a new hydro-electric power station, known as the Klosters, which utilises the water power of Lake Davos. The initial plant has a capacity of 10,000 h.p., but the buildings have been so constructed that the capacity may eventually be extended to 30,000 h.p. The Klosters plant is being worked in parallel with the Kublis station, the electricity generated being transmitted to the distribution system of the North-East Switzerland Power Co., and the municipal authorities of Zurich.

Luxemburg.—A Bill which has recently been placed before the Luxemburg Parliament relative to the general electrification of the Grand Duchy includes the scheme submitted by the Société des Centrales Electriques des Flandres, of Brussels. The Government has been in negotiation with the Belgian company, and has drawn up an agreement which now only awaits the sanction of Parliament.

Crediton.—Electricity Supply.—The Urban District Council on January 4th decided to press the Electricity Commissioners for a reply within 14 days with regard to proceeding with the scheme for providing the town with an electricity supply from Exeter.

Eastbourne.—Loans Sanctioned.—The Electricity Committee has received sanction to the borrowing of £20,000 for the installation of boiler plant at the electricity works, and £52,671 for sub-station buildings.

Guildford.—Loan Sanctioned.—The Town Council has received sanction to a loan of £125,000 in connection with the erection of a new power station.

Hants.—Proposed New Power Station.—A joint committee has been formed to consider a proposal to provide a central power station for the supply of electricity over a large area, including Aldershot, Farnborough, Fleet, Frimley, Farnham, and Hartley Wintney.

Liverpool.—Loan Sanctioned.—The Electricity Committee has received sanction to the borrowing of £20,000 for the provision of rotary convertors.

Electricity Supply.—The city electrical engineer has reported as to the change over to a.c. supply in an outer district, and the provision of a sub-station and equipment at an estimated cost of £2,000, structural alterations at an approximate cost of £300, and the provision of the necessary h.p. and l.p. mains at an estimated cost of £5,653. He has been authorised to carry out the work forthwith.

"All-Electric" Houses.—The Corporation has now completed 186 "all-electric" houses. Between 3,000 and 4,000 houses are now electrically equipped.

London.—Electricity Charges.—The North Metropolitan Electric Power Supply Co. has notified consumers that, although the increased cost of coal, due to the coal dispute, has caused heavy expense to the company, it is not intended to make any increase in the charges for supply.

Manchester.—Progress during November.—During the month of November the Corporation electricity undertaking showed an increase in connections of 3,027 kW, bringing the total to 296,889 kW; and the number of applications received for supply, including consumers for additional supplies, was 1,275, representing a total of 3,542 kW. The number of hired cookers connected increased by 176, bringing the total actually on circuit to 2,499. Applications for the hire of cookers totalled 189. Three new sub-stations were put into commission during the month and two 750-kW motor convertors were installed at Chorlton-cum-Hardy and Cheetham Hill sub-stations.

Supply to Housing Estate.—An application has been received from the Phormium Co., of London, for a supply of electricity to be furnished to 400 houses which are to be erected at Burnage.

Monks Kirby.—Electricity Supply.—The Leicestershire and Warwickshire Electric Power Co. has asked the Rural District Council for its consent to a Special Order to supply electricity in its area. The Council objects to the use of overhead mains across fields, and the question of supporting the application has been deferred pending inquiries into the probable results of the use of overhead lines.

Ossett.—ELECTRICITY IN BULK.—The Housing Committee is inquiring as to the possibility of obtaining a bulk supply of electricity for lighting the houses on the Council's estate.

Peterborough.—NEW PLANT.—The electrical engineer (Mr. H. A. Nevill) has submitted a report to the Town Council in which he recommends additions to the new power station by the installation of a further turbo-generator of 10,000 kW, which will raise the total capacity of the plant to 18,500 kW. The contracts already entered into in connection with the new power station amount to £176,620, and the expenditure on the proposed extension is estimated at £63,551, making a total of £240,171. The report was adopted at a recent meeting of the Council.

LOAN.—Application is being made for sanction to a loan of £1,637 for laying a main to provide an electricity supply to the Central Sugar Company's factory at Woodston.

Preston.—SUPPLY TO DOCKS.—On the recommendation of the Ribble Committee the Town Council has decided to light the offices and workshops at the Dock by electricity.

South Africa.—PAARL (CAPE PROVINCE).—The electricity supply for this town was until recently obtained from water power derived from the catchment area of the Paarl mountain. The water supply proved to be insufficient for the increasing demand, and it was first proposed to build a new power station operated by steam, gas, or oil, which would have involved a capital outlay of £50,000. It was decided eventually to take a supply from the Electricity Commission's new power station at Salt River, near Cape Town, and the Commission has erected a transmission line 34 miles in length to convey the energy at a pressure of 33,000 V to Paarl, where it will be stepped down to 3,300 V before it is delivered to the municipal switchboard. As the Salt River station will not be completed for some months, a temporary supply is being obtained from the Cape Town Dock road station.

SWELLENDAM (CAPE PROVINCE).—At a recent poll of ratepayers, the Municipal Council was authorised to raise a loan of £15,000 for an electricity scheme for the town.

Special Orders.—Application has been made to the Electricity Commissioners by Colchester Corporation for a Special Order authorising it to supply electricity in the urban districts of Brightlingsea, West Mersea, and Wivenhoe, and parts of the rural districts of Lexden and Winstree, Maldon and Tendring, and Samford.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the East Dereham Urban District Council to supply electricity in its area.

Stourport.—NEW POWER STATION.—The new power station of the Shropshire, Worcestershire, and Staffordshire Electric Power Co. is nearing completion, and it is hoped that it will be formally inaugurated early in the spring.

Torquay. — ELECTRICITY SUPPLY. — The Electricity Committee has adopted a recommendation of the engineer to change over and improve the system of supply at Knowles Hill from a.c. to d.c. by the erection and equipment of a new sub-station and the provision of new l.p. mains, at a total estimated cost of £890.

Wakefield.—LOAN.—The Electricity Committee is applying for sanction to the borrowing of £15,000 for mains and services.

Wessex.—ELECTRICITY SCHEME.—The *Financial Times* reports that a Bill to confer Parliamentary powers on a new electricity company operating in six counties has been deposited for next session in the Private Bill Office of the House of Commons. It is proposed to incorporate the Wessex Electricity Company for the purpose of supplying electricity within certain areas in the counties of Oxford, Buckingham, Berks., Southampton, Wiltshire, and Gloucester.

Wimbledon.—NEW SUB-STATION EQUIPMENT.—The Electricity Committee has prepared a scheme for enlarging and re-equipping the sub-station and constructing 17 new transformer stations, at a total cost of £25,000.

Winchester.—WIRING OF SMALL HOUSES.—The Rural District Council has consented to the municipal houses in the villages of Itchen Abbas and Easton being wired for electricity, which will be supplied by Sir John Shelley-Rolls, Bart., at a charge similar to that at Winchester. The wiring of the houses is being carried out by A. W. Sclater & Son, of London, and the cost per house for wiring and meter is about £25.

Wirral.—ELECTRICITY SUPPLY.—The supply of electricity in the rural area, in accordance with the agreement between the Birkenhead Corporation and the Wirral Rural Council, will be carried a step further as the result of the recommendation of the Birkenhead Electricity Committee for the immediate expenditure of £7,338 for cables and the laying of a h.p. feeder from Upton to the proposed Moreton sub-station.

Yarmouth. — ELECTRICITY EXTENSIONS. — The Corporation Electricity Committee is to proceed with an electricity extension scheme involving an outlay of over £60,000.

Tramway and Railway Notes.

Belgian Congo.—RAILWAY ELECTRIFICATION.—Although the Matadi-Leopoldville railway in the Belgian Congo is at present being worked by steam, it is proposed when the traffic attains a total of 1,200,000 tons a year to electrify the line. The question of utilising the water power resources of the Lower Congo, and in particular the Inkissi and M'Poso falls, for the generation of the necessary electricity, is being inquired into.

Bradford.—FARES.—According to the *Manchester Guardian*, important alterations in tramway fares on the Corporation system are recommended by the Tramways Committee. They include raising all 1½d. fares to 2d., the reduction of 2½d. and 3d. fares to 2d., fixing the maximum fare at 3d. instead of 6d., and the issue of six-day non-transferable passes for the 2d. stages at 2s. 6d. Revision of 'bus fares is also recommended. Mr. R. H. Wilkinson, the tramway manager, states that the net result of the changes would be an increase in income of £20,000 a year.

NEW TRAMCAR DESIGN.—A tramcar, designed by Mr. R. H. Wilkinson, city tramway general manager, which has been under construction at the Corporation depôt at Thornbury, is to be given a trial in February. It is a single-deck car, with seating for 60 passengers, and capable of travelling 25 per cent. faster than the present double-deck cars. The car is divided into smoking and non-smoking compartments, the entrance being in the centre.

Burnley.—NEW ROUTE.—The Town Council has considered a proposal for laying a tramway track at The Centre. The scheme entails an expenditure of £8,600, of which £5,000 will be expended on the track and £3,600 for road works.

India.—RAILWAY POWER STATION.—The Great Indian Peninsula Railway has decided to construct an independent power station in connection with its scheme for electrifying the lines between Bombay and Igatpuri and Bombay and Poona. A site has been chosen in Kalyan, about 20 miles from Bombay. The estimated cost of building and equipping the station is Rs.100 lakhs, of which Rs.90 lakhs will be spent on generating plant and transmission lines. The order for these will be placed in England through the High Commissioner for India. —*Reuter's Trade Service* (Bombay).

Leeds.—NEW TRAMWAY DEPOT.—In the face of substantial opposition, the City Council on January 5th approved a Tramways Committee recommendation that a scheme to apply for sanction to borrow £137,500 for building and equipping an extension to the central tramway depôt in Swinegate be referred to the Finance and Parliamentary Committee. It was pointed out by the Tramways Committee that the scheme was to provide accommodation for 200 cars at a depôt now housing only 50.

London.—NEW TUBE SCHEME.—A scheme to improve communication between the western districts of London and the City will shortly be put in hand by the Underground companies, and will probably take about two years to complete. It provides for the duplication of the lines between Hammersmith and Acton Town and the provision of a junction, by means of a tunnel under Hammersmith Broadway, with the Piccadilly Tube, so that trains on this system may run through to stations west of Hammersmith.

Middlesex.—'BUS OWNERS' PROPOSAL.—The *Financial News* reports that in view of the expiry in 1930 of the lease by the Middlesex County Council of the North London tramways to the Metropolitan Tramways Co., the Association of London Omnibus Proprietors has put forward a proposal to provide an omnibus service should the lease not be renewed. The suggestion is made in a letter to the Minister of Transport and the Middlesex County Council by Sir Charles Cleveland, secretary of the Association which represents the non-combine 'bus owners. In this letter he states that the Association is ready and desirous to take part in any scheme for dealing with the passenger traffic now carried by the trams. The letter states that the Association would be prepared to participate in a reasonable scheme of compensation by annual tax or donation to the County Council for loss of revenue due to non-renewal of the lease to the tramways company.

Middlesbrough.—TRAMWAY IMPROVEMENTS.—The Tramways Committee has decided to relay the tramway track in Linthorpe Road, and also to purchase, at an estimated cost of £18,000, 18 one-man-controlled 'buses to link up other parts of the town.

United States.—RAILWAY ELECTRIFICATION.—The *Electric Railway Journal* states that engineers who have been preparing plans for the electrification of some of the lines of the Reading Company at Philadelphia are expected to have their report completed early this year. Before the survey is submitted, officials at the Reading Terminal anticipate, the preliminary plans for replacing steam by electricity will be completed, covering the electrification of approximately 40 miles of line on the Chestnut Hill, Bethlehem, and New York branches of the Reading system. The new service will be introduced on the New York branch to Trevose, Pa., a distance of 20 miles from Philadelphia.

Telegraph and Telephone Notes.

Austria.—LINK IN ENGLAND-INDIA CHAIN.—The opening of the Vienna-Nuremberg telephone line on January 4th connected Austria with the main telephone systems of Western Europe. The new line will form an important link in the extension of the telephone from Great Britain across the Continent to the Black Sea, Persia, and India. It is hoped to open a direct service between Vienna and London in April; next year the Austrian system will be connected with those of Hungary, Yugo-Slavia, Italy, Switzerland, and Czecho-Slovakia.—*Reuter* (Vienna).

RADIO-TELEGRAPHY.—The Radio-Austria Gesellschaft, which maintains the foreign wireless-telegraph service in Austria, continues to make good progress. During the past year a third transmitter (25-kW Marconi) was installed at the Deutsch-Altenburg transmitting station. The receiving station at Laaer Berg was reconstructed and connected to the local municipal electricity supply mains. A short-wave transmitter has also been installed for experimental purposes. The average number of messages dealt with increased from 939 per day in 1924 to 1,708 in 1925.

Belgium.—TELEGRAPH BILL.—The Ministry of Posts and Telegraphs is preparing the draft of a Bill, which will probably be placed before Parliament about the end of this month, for the creation of a separate and autonomous administration of telegraph and telephone services, says *The Times*. The measure would provide the services with an accounts department on an industrial basis, and would empower the administration to borrow for extension purposes. Five companies have offered to provide the State with the necessary credit for the development of its plant, two of which would supply apparatus and the other three the cables required for extending the system. Payments would be spread over a period of five years, the first instalment becoming due six months after the completion of the works, and subsequent instalments every six months thereafter. This arrangement would enable the State to defray the cost of the new installations with the additional receipts which they would yield.

Borneo.—TELEPHONE EXTENSION.—A telephone system is planned to connect Bandjermasin (the principal port and city of south Borneo) with the interior towns of Martapoera Rantau, Kandangan, Barabai, Berajang, and Amoentai.

Hull.—TELEPHONE LOAN.—The Ministry of Health was to hold an inquiry on January 11th into the application to borrow £38,700 for the extension of the telephone system, the only municipal service in this country.

Mexico.—TELEGRAPH CONSTRUCTION.—The Telegraph and Postal Department of the Mexican Government will shortly call for tenders for the modernising of the entire telegraph and radio-telegraph systems of Mexico. Fourteen additional radio-telegraph stations will be installed, or acquired, and a considerable amount of equipment, including repair tubes, transmitters, and receivers, will be ordered.—*Reuter's Trade Service* (Mexico City).

Radio-Telegraphy.—"BEAM" STATIONS READY.—The short-wave "beam" telegraph stations which have been built by Marconi's Wireless Telegraph Co. on behalf of the General Post Office at Grimsby and Skegness for communication with Australia are now ready for handing over to the authorities for a seven-days' official test.

Radio-Telephony.—"BEAM" TESTS.—The first link in a possible Empire wireless-telephone "chain" was forged at noon on January 10th, when Commander C. P. Edwards, chief of the Canadian Radio Telegraph Service, talked to Mr. R. N. Vyvyan, chief engineer of the British Marconi Co., at Bridgwater, Somerset. The stations used in this demonstration were apparently those built by Marconi's Wireless Telegraph Co., Ltd., for the British Post Office "beam" radio-telegraph service between England and Canada, which service was successfully inaugurated last month.

The Telephone Service.—NEW AUTOMATIC EXCHANGE.—Although Middlesbrough itself still relies upon the services of operators for local telephone service, the neighbouring village of Marton-in-Cleveland, three miles south, has enjoyed the advantages of an automatic service since 1922, when a Strowger exchange was installed there for the Post Office by Automatic Telephone Manufacturing Co., Ltd., to serve about 80 subscribers, and comprised a Keith line-switch unit equipped with final selectors on the reverse side, the system being then 2-digit. The new equipment, which has also been supplied and installed for the Post Office by Automatic Telephone Manufacturing Co., embodies modern rotary line switches and has a present capacity of 245 lines, consisting of 150 regular subscribers, 90 p.b.x., and five coin-box lines. Moreover, in anticipation of the future conversion of Middlesbrough, provision has been made in the new Marton equipment for 5-digit calling.

CONTINENTAL SERVICE.—Work on the new Anglo-German telephone cables has been completed, and the service is now available between this country (both London and the provinces) and all parts of Germany.

Radio Notes.

Australia.—NO COMMISSION OF INQUIRY.—In the opinion of the P.M.G., Mr. Gibson, there is no necessity for the appointment of a Royal Commission to inquire into wireless matters in Australia, as was advocated by the Association for the Development of Wireless. "There is no need for any more Government control than what is provided for under present regulations," he added.

RESEARCH.—Important proposals were agreed to at a conference called by the Council of Scientific and Industrial Research recently. It was agreed to recommend that immediate steps be taken in Australia to form a Wireless Research Board, attached to the Council.

Denmark.—LICENCES.—Over 92,000 licensed receiving sets, about 44,660 of which are valve sets, are now operating in Denmark, according to a recent announcement made by the Government Control Board. Practically 90 per cent. of all the sets are in Copenhagen and its suburbs, says *Commerce Reports*, most of them being of the crystal type. It is expected that with a more strict enforcement of the licence law the figures for receiving sets in Jutland will show a great increase.

RELAY STATION.—The present station in Copenhagen, which broadcasts on a wave-length of 337 m., will in the near future use a new transmitter built by Danish firms. The energy will be 1 kW, and it will act as relay for Copenhagen and its suburbs in co-operation with the new high-power station now under construction near Kalundborg, which will be working next autumn with 7.5 kW aerial power. *World Radio* says that the provision of other relay stations will not be discussed until the Radio Council has experience to what extent the new high-power station will give satisfactory reception in the different parts of Denmark.

France.—NEW STATION.—It is reported that a 5-kW radio broadcasting station is to be constructed at Nice, and it is expected that the station will be in operation early in 1927.

Hungary.—DEVELOPMENTS.—Great improvements are being made in the Budapest station, which celebrated its first birthday on December 1st. The aerials are being raised, literally, and their capacity increased to 3 kW. By October the new transmitter, with a capacity of 20 kW, will be ready. The Post Office and Telephone Administration controls all broadcasting in Hungary, and according to *World Radio* the Minister of Education has ordered receivers to be supplied to all schools if funds permit, and the Minister of the Interior that all hospitals shall be supplied with equipment, including loud-speakers, at the State's expense. All Budapest municipal blocks of dwellings are also to be furnished with radio sets.

Reality in Reception.—BIRMINGHAM DEMONSTRATION.—Interesting and somewhat novel demonstrations are to accompany a short series of talks on "Reality in Broadcast Reception," which Mr. Colin H. Gardner, of Midland Radio-Telephone Manufacturers, Ltd., commenced from the Birmingham broadcasting station on January 13th, and is to continue on January 27th and February 10th. The demonstrations are to be given for the purpose of enabling listeners to ascertain what distortion is being caused in their receivers, where it is located, and how to remedy it, and, further, to enable listeners to measure the musical range of their sets. The tests will be of an ingenious nature, and should be of material assistance to listeners anxious to get the best possible results from their receivers. In the first tests, distortion will be deliberately introduced in the studio; there will be a preliminary transmission with the transmitter working at its best, sending out evenly-balanced and full-bodied music; the same piece will then be transmitted again, but with a certain proportion of the bass diminished. If the listener notices no appreciable difference, the test will tend to prove that the particular proportion of bass was never reproduced by the receiving apparatus. The more obvious causes of frequency distortion, such as may be due to the over-loading of valves, resonance in loud-speakers or 'phones, and the use of wrong voltages or excessive reaction, will then be dealt with. Gramophone records will be used for the demonstrations, made by the new electrical recording process, and in order to overcome machine noises a Marconiphone magnetic pick-up device will be substituted for the ordinary sound-box. This actually constitutes a minute electric generator, the output of which is varied by the vibrations of the gramophone needle as it passes over the record. The modulated current from this device is passed into a special amplifier, with resistance-capacity coupling, volume control at the input, and a series of filter circuits which enable the operator to vary the balance of tone at will by diminishing or strengthening any particular set of musical frequencies. The music, thus controlled, will be passed into any one of a row of loud-speakers of different types, the reproduction of which is received in the usual way by the studio microphone, and broadcast. It is of interest to note that the output characteristic curve of the Birmingham station's transmitting apparatus shows a straight portion between 50 and 10,000 cycles, which means an even degree of amplification over practically the whole of the fundamental audible-frequency range.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—MELBOURNE.—February 28th. City Council. Two 2,500-kW motor-convertors and accessories, or two 2,500-kW rotary convertors, with transformers and accessories. (B.X. 3124.)*

March 14th. 6,600-V, 3-phase switchgear. (B.X. 3138.)* Postmaster-General's Department.

March 8th. Induction coils and registers (B.X. 3136), testing instruments (B.X. 3132.)* State Electricity Commission of Victoria.

March 7th. Paper-insulated, lead-covered control cable. (B.X. 3137.)*

March 14th. D.c. switchgear and accessories. (B.X. 3131.)*

Argentina.—BUENOS AIRES.—February 24th. Department of Navigation and Ports. Three 10-ton electric shunting locomotives (Diesel type). (A.X. 4016.)*

March 24th. Electric cranes, pumps, &c. (A.X. 4087.)*

March 15th. Ministry of Marine. Electrical machinery in connection with the extension of electrical generation (involving the enlargement of two existing power stations and the construction of two new ones) at the Naval Base, Puerto Belgrano. (B.X. 3140.)*

Askern (near Doncaster.—January 18th. Electric lighting installation at Sutton Road new school. Education Department, West Riding County Hall, Wakefield.

Barnes.—February 8th. Electricity Department. One 1,000-kW rotary or motor convertor with transformer, l.p. switchgear and connections. (January 7th.)

Bootle.—January 18th. Corporation. Electrician's work required in erection of 16 lock-up shops, with 16 flats above, Bailey Drive. Particulars from Borough Engineer, Town Hall.

Burnley.—January 27th. Tramways and Omnibus Department. General stores for 12 months. Schedules from the General Manager, Queensgate Depôt, Burnley.

Bury.—Bury District Co-operative Society. Power and lighting installation at new dairy, Georgiana Street. Mr. C. R. Cooper, architect, 20, Market Street, Bury.

Canada.—GREAT FALLS.—January 17th. Manitoba Power Co., Ltd. Three 7,000-kVA single-phase oil-insulated indoor-type transformers for Lac du Bonnet, Manitoba. (B.X. 3118.)*

Clacton.—February 2nd. Electricity Department. Two 1,125-b.h.p. Diesel oil engines, direct coupled to 750-kW, 3-phase alternators; two 750-kW alternators, two rotary-converters, and e.h.p. switchgear. (See this issue.)

Dundee.—January 21st. Electricity Department. E.h.p. and l.p. cable. (See this issue.)

Ecuador.—QUITO.—Municipal Council. 3,000-h.p. hydro-electric plant for which water power with a fall of 42 metres is available, to be owned and worked by the city authorities. A second installation of similar capacity, for the port and city of Guayaquil, is also contemplated.

Edinburgh.—January 25th. Edinburgh District Board of Control. Electric lighting installation at Bangour Mental Hospital. Mr. J. D. Gibson, surveyor, 60, Frederick Street, Edinburgh.

February 14th. Electricity Supply Department. E.h.p. and l.p. switchgear, e.h.p. and pilot cables. (See this issue.)

Greenock.—January 20th. Corporation. Electric lighting installation in 36 houses. Office of Public Works, Municipal Buildings.

India.—India Store Department. January 25th. Overhead electric travelling cranes. Specifications (5s.) from 15, Belvedere Road, Lambeth, S.E.

10 miles dry core telephone cable. (See this issue.)

Liverpool.—January 27th. Electricity Supply Department. Twelve months' supply of materials, including cables and accessories, insulated cables, meters, lamps, &c. (January 7th.)

London.—STEPNEY.—January 18th. Board of Guardians. Electric goods lift at the St. George's-in-the-East Hospital. (December 31st.)

Manchester.—January 31st. Electricity Department. Two electrically-driven circulating-water pumps, piping, &c. (See this issue.)

Newport (Mon.).—February 5th. Electricity Department. Two water-tube boilers, steam and feed-water piping, economisers, air heaters, induced- and forced-draught plant, steel stack and grit catcher, coal and ash conveyors, extension of boiler house, including structural steelwork and foundations. (January 7th.)

New Zealand.—DUNEDIN.—February 19th. City Corporation Gas Department. One motor-generator with control board and accessories. (B.X. 3095.)*

Salford.—January 22nd. Corporation. Electric lighting installation at Wash-house and Slipper Baths, Hodge Lane. Mr. Chas. Swain, architect, 12, Exchange Street, Manchester.

Sleaford.—Electricity Works. 50 tons Diesel oil fuel. (See this issue.)

South Africa. — PRETORIA. — February 3rd. Municipal Council. E.h.p. cable and accessories, switches and cut-outs. (B.X. 3097.)*

JOHANNESBURG.—January 20th. Municipal Council. Supply of electric lamps. (B.X. 3112.)*

February 10th. Electric cable. (B.X. 3130.)*

Stoke-on-Trent.—February 8th. Stoke and Wolstanton Union. Alterations and additions to the central-heating and hot-water services at the London Road Institution. The work includes large calorifiers, two electric generating sets, pumps, &c. Specification from Mr. T. Wood, clerk to the Guardians, Union Offices, Stoke-on-Trent.

February 9th. Electricity Department. Steam and water piping, valves, &c., constructional steel work, platforms, crane gantries, &c. (January 7th.)

Uruguay.—MONTEVIDEO.—February 18th. State Electricity Works. 65,000 kg. unvarnished black iron wire and 10,000 kg. g.i. wire. (A.X. 4019.)*

February 11th. 37,500 electric filament lamps. (B.X. 3117.)*

February 15th. 55,500 iron pieces (angles, ties, bolts, &c.) for overhead lines. (A.X. 4018.)*

Beckenham.—Electric signs and lamps at the Public Hall. U.D.C. Surveyor.

---

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Australia.—SYDNEY.—Electricity Supply Committee. Recommended:—

L.p. underground cables (Spec. 1064) (£27,236).—Enfield Cable Works (Aust.), Ltd.

10,000-V cables for 33,000/10,000-V sub-stations (items 2, 3, 4 (£3,461).—British Insulated Cables, Ltd.

33,000-V cables (items 5 and 6) (£1,234).—British General Electric Co., Ltd.—*Tenders.*

Birkenhead.—Electricity Committee. Accepted:—

"Ironclad Exide" battery (£192).—Chloride Electrical Storage Co., Ltd.

H.p. feeder from Upton to Moreton sub-station (£1,150).—W. T. Henley's Telegraph Works Co., Ltd.

Cable.—W. T. Henley's Telegraph Works Co., Ltd. (£7,289); Hackbridge Cable Co., Ltd. (£1,732).

Bradford.—Tramways Committee. Accepted:—

30 tons Peckham hand-brake shoes, and 30 tons track-brake blocks (£600).—Yorkshire Repetition Castings Company.

140 steel tramway poles (£2,332).—British Mannesmann Tube Co., Ltd.

36 tramcar split gear wheels (£214).—British Hele-Shaw Patent Clutch Co., Ltd.

Evesham.—Town Council. Accepted:—

Installing electric lighting at the Public Hall.—Abell and Smith, Ltd.

Finchley.—Electricity Committee. Accepted:—

Motor balancer.—Electric Construction Co., Ltd.

Glasgow.—Health Committee. Accepted:—

Heating installation at Mearnskirk Sanatorium—

Turbines and generators.—W. H. Allen, Sons & Co.

Switchboard.—William McGeoch & Co.

Hull.—Electricity Committee. Accepted:—
Intercommunication telephone system at Sculcoates (£634).—Relay Automatic Telephone Co.

Baths Committee. Accepted:—
Heating fittings and pipes for electrical vapour baths at Beverley Road (£791).—J. V. Coonan & Co.

Telephones Committee. Accepted:—
Cable (£126).—W. F. Dennis & Co.

Leeds.—Tramways Committee. Accepted:—
Conduits (£1,391).—Leeds Fireclay Co., Ltd.
Tram bolts (£645).—Stewarts & Lloyds, Ltd.
Grooved cadmium-copper trolley wire (£105).—Richard Johnson & Nephew, Ltd.

Electricity Committee. Accepted:—
Cable.—W. T. Henley's Telegraph Works Co., Ltd. (£2,016); Enfield Cable Works, Ltd. (1,599); Macintosh Cable Co., Ltd. (£4,602).

Sewage Committee. Accepted:—
Extension of electric lighting at Knostrop.—Wilson Hartnell Installation, Ltd.

Museums Committee. Accepted:—
Electric lighting improvements at Museum.—R. F. Winder, Ltd.

London.—London Power Co., Ltd. Accepted:—
Ten 4,000-kVA single-phase transformers, with switchgear for tap changing on load.—Ferranti, Ltd.

ADMIRALTY.
Night-sight lamps.—Edison Swan Electric Co., Ltd.

BOOTH STEAMSHIP CO.
Twelve months' contract for "Osram" metal-filament vacuum and gasfilled lamps and "Robertson" carbon-filament lamps.—General Electric Co., Ltd.

SOUTHWARK.—Electricity Committee. Accepted:—
Repairs to cooling tower (£360).—Davenport Engineering Co., Ltd.

HACKNEY.—Electricity Committee.
One 10-ton overhead travelling crane (£203).—Herbert Morris, Ltd.

The Metropolitan Asylums Board has decided to install six electrically-driven sewing machines at the Brook Hospital, at £170.

Liverpool.—Tramways Committee. Recommended:—
25,000-kW turbo-alternator, with condenser (£110,575).—Metropolitan-Vickers Electrical Co., Ltd.
Two cooling towers (£21,289).—J. Henshaw & Co.

Manchester.—Tramways Committee. Accepted:—
Telescoper pit bogie for handling tramcar motors.—Equipment & Engineering Co.
Steel girder tram rails.—Cargo Fleet Iron Co., Ltd.; Bolckow, Vaughan & Co., Ltd.
Special trackwork.—Titan Trackwork Co., Ltd.

Education Committee. Accepted:—
Electric lighting installation at Gorton Mount Municipal School.—E. Crossley.

Housing Committee. Accepted:—
Electrical installation at houses on Broadway housing estate.—J. V. Pyatt.

Mold.—Urban Council. Accepted:—
Installing electric light at the Town Hall, Market Hall, and public lavatories.—Mr. Alfred Jones (Caergwrle).

Oldham.—Electricity Committee. Accepted:—
Earthenware conduit.—Doulton & Co., Ltd.
A.c. motors.—English Electric Co., Ltd.

Reigate.—Town Council. Accepted:—
Wiring houses on the metal-sheathed system at 15s. per point (12 months' contract).—T. S. Marriage & Co.

Stoke.—Electricity Committee. Accepted:—
Overhead wiring and services to 120 houses on Abbey Hulton Bay Estate (£422).—Barnett & Soans.

Electricity Supply Charges.

Electricity supply authorities, who have already been urged here to bring down their charges again as soon as possible so as to facilitate the progress of domestic business, will have noted that the Gas Light & Coke Co. has just announced that 1.4d. of the 2.2d. per therm added to the price of gas since the coal stoppage began, is to be taken off as from the reading of the indices in March next. The company describes this as the first step in the return to normal prices.

Forthcoming Events.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, January 14th. Literary and Philosophical Society, Newcastle-on-Tyne. 6 p.m. "Progress in Economy of Turbine Machinery on Land and Sea." Sir Chas. A. Parsons and Mr. R. J. Walker.

Junior Institution of Engineers.—Friday, January 14th. 39, Victoria Street, S.W. 7.30 p.m. "The Thermionic Valve and its Characteristics." Mr. R. L. Kirlew.
Friday, January 21st. 6 p.m. Exhibition of Scientific Instruments and Apparatus.

Women's Engineering Society (Inc.).—Friday, January 14th. 41, Cadogan Square, S.W.1. 6.15 p.m. "Measuring Stress by Aid of Polarised Light." Prof. E. G. Coker, F.R.S.

Institution of Automobile Engineers.—Monday, January 17th. Royal Technical College, Glasgow. "Electric Lighting for Public Service Vehicles." Mr. G. E. McCaw.

Paisley Association of Electrical Engineers.—Tuesday, January 18th. Town Hall, Paisley. 7.30 p.m. "Electrical Industry in U.S.A." Mr. R. Hardie.

Institute of Wireless Technology.—Wednesday, January 19th. Engineers' Club, W. 7 p.m. "Some Absurdities of Wireless Nomenclature." Dr. F. T. Fawcett.

Electrical Power Engineers' Association (North-West Midland Section).—Wednesday, January 19th. Engineering and Scientific Club, Wolverhampton. 8 p.m. "Overhead Distribution." Mr. T. A. G. Margary.

Institution of Electrical Engineers.—Thursday, January 20th. London. 6 p.m. "33,000-V Cables with Metal-sheathed Cores, with Special Reference to the S.L. Type." Mr. P. Dunsheath.

(North-Eastern Centre).—Monday, January 17th. Armstrong College, Newcastle-on-Tyne. 7 p.m. Faraday Lecture, "What is Electricity?" Prof. W. M. Thornton.

(North-Western Centre).—Tuesday, January 18th. Midland Hotel, Manchester. 6.45 for 7.15 p.m. Annual dinner.

(South-Midland Centre).—Wednesday, January 19th. University, Birmingham. 7 p.m. "Electrical Equipment of Track on the Underground Railways of London." Mr. A. R. Cooper.

(East-Midland Sub-Centre).—Tuesday, January 18th. Technical College, Derby. 6.45 p.m. "Telephone Repeaters." Mr. R. M. Chamney.

(Sheffield Sub-Centre).—Wednesday, January 19th. Royal Victoria Hotel, Sheffield. 7.30 p.m. "The Electricity Bill." Mr. H. E. Yerbury.

(Tees-Side Sub-Centre).—Monday, January 17th. Cleveland Technical Institute, Middlesbrough. 7 p.m. "Wired Wireless." Mr. L. C. Grant.

(South-Midland Students' Section).—Tuesday, January 18th. Temperance Hall, Temple Street, Birmingham. 7 p.m. Annual film exhibition.

(London Students' Section).—Friday, January 21st. 6.15 p.m. "Automatic Voltage Regulators," Mr. E. B. Watton.

Edinburgh Electrical Society.—Thursday, January 20th. Royal Scottish Society of Art, 117, George Street. 8 p.m. "Electric Lifts." Mr. J. H. Ross.

Meter Engineers' Technical Association.—Friday, January 21st. Lighting Service Bureau, 15, Savoy Street, W.C. 7 p.m. "The Testing of Large-Capacity Meters *in situ*." Mr. W. Casson.

British Electrical Development Association.—Friday, January 21st. Royal Society of Arts. 7.30 p.m. "Industrial Heating." Mr. S. E. Monkhouse.

Institution of Mechanical Engineers.—Friday, January 21st. London. 6 p.m. "The Use and Economy of High-Pressure Steam Plants." Prof. A. L. Mellanby and Prof. W. Kerr.

Association of Mining Electrical Engineers (North of England Branch).—Saturday, January 22nd. Neville Hall, Newcastle-on-Tyne. 3 p.m. "Static Transformers for Collieries." Mr. J. W. Rodger.

(Western Sub-Branch).—Saturday, January 22nd. 60, Wind Street, Swansea. "The Working of Thin Seams with Electrical Power." Mr. D. P. Jones.

Notes.

An Apology.

On page 963 of the ELECTRICAL REVIEW of December 10th last, under the heading of "Meters Sensitive to Music," we quoted a statement alleged to have been made by Mr. J. H. Canning, the engineer and manager of the Newport (Mon.) Gas Company, which we now find was not made by him. We very much regret the annoyance which has been caused to Mr. Canning through the unfortunate error which was made in attributing to him remarks made by another speaker.

Accident Prevention.

In a recent broadcast talk in America, Mr. A. Williams, president of the American Museum of Safety, said that organised safety effort, whether on the railways or in the industrial life of the country, when conducted under the direction of trained men and women, would eliminate by mechanical protection and human training two-thirds of the average number of accidents, with a corresponding percentage in those resulting in fatalities. It was asserted that only 10 per cent. of all the recent accidents could have been prevented by mechanical means, so completely guarded were most industrial processes to-day, and that in almost all other cases accidents were due to the carelessness either of the persons injured or others. From 1907, when safety work in America was begun, to 1925, over 95,000 casualties had been prevented, a reduction of more than 81 per cent., as a result of the organised safety effort in the operation of the American railroads. During the period 1921 to 1924 the saving in money as a result of the decrease of accidents amounted to $116,500,000.

Inventions in 1926.

Messrs. Hughes & Young, patent agents, of London, state that the number of patent applications filed by the end of the year shows only a slight increase over the previous year, but there is a considerable change in the nature of current inventions, as the modern inventor is setting out on entirely different lines from the normal procedure. There has been a large number of patents granted during 1926 for domestic utility appliances, many of which are for inventions by women with a view to minimising and facilitating housework. It is probable that the largest proportion in inventions relate to electrical and wireless appliances, great attention having been given to electric incandescent lamps, cables, and automatic telephone systems.

Accidents.

An accident occurred on January 7th at new works of the London Electric Supply Corporation at Deptford Dry Dock resulting in the death of four workmen and injuries to two others. An official explanation states:—"A shaft was being sunk in compressed air when there was a blow or the entry of a burst of water into the shaft; the four men down below were trapped, and they are believed to be dead. They are buried in mud and water. The tunnel was to have communicated with the river, and water was to have been drawn through the shaft for the power station. The two men who were brought out alive were not so far down as the others." One of the injured men subsequently died.

Three workmen employed at a sub-station of the Southern Railway Co., at Lewisham, received injuries on January 5th as the result of an explosion. Two of the men were taken to Lewisham Hospital suffering from burns on the face and arms. The train services were not affected.

Appointments Vacant.

Junior technical officer (£175+) for the Admiralty experimental establishment; electrical and mechanical foreman (Rs. 700 per month) for the Karachi Port Trust; working foreman (£200) and general assistant (£325) for the Cheadley and Gatley U.D.C. electricity department; senior and junior draughtsmen for the West Midlands Joint Electricity Authority; shift charge engineer for the United Alkali Co., Ltd.; engineer to act as clerk of works and canvasser (£271) for the Prestatyn U.D.C. Shift charge engineer for the Corporation of Dover Electricity Department. (See our advertisement pages to-day.)

B.E.S.A. Publication.

A recent specification, issued by the British Engineering Standards Association, No. 97, 1926, for Watertight Fittings and Incandescent Electric Lamps, is a revision of the 1920 edition, and applies to fittings of the bulkhead and well-glass types for use in conjunction with British Standard Lamps, Specification No. 161, having overall lengths not exceeding 150 mm. and 140 mm., respectively. The general clauses deal with the material and its finish, wire entry, earthing screw and lampholder, whereas the sectional clauses deal mostly with dimensions, packing rings and gauging. The dimensions standardised are those essential for interchangeability, but the full details of the design of the fittings are not standardised. It is mainly in the latter feature that the present specification differs from the old edition, wherein the details of the design were very minutely specified. An important item is the standardisation of the screw-thread on the guard and in the body of screw-guard fittings, this being of Whitworth form with 16 threads per inch. In the past great inconvenience has been experienced owing to the existence of an alternative screw-thread having 19 threads per inch, and the universal adoption of the present standard will be to the benefit of both users and manufacturers. Copies of this new specification may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, S.W.1, price 2s. 2d., post free.

Midland Students' Ball.

On Tuesday, February 22nd, at 8 p.m., the First Midland Student Engineers' Ball will be held at the Grosvenor Rooms, Grand Hotel, Birmingham. It is being organised for students of the Institutions of Civil, Electrical, and Mechanical Engineers; tickets are 5s. single and 9s. double, and the surplus proceeds will be handed over to the I.E.E. Benevolent Fund. The ticket requirements of the electrical students are being cared for by Mr. S. B. Warder, X Est. Dept., General Electric Co., Ltd., Witton, to whom application should be made immediately in order to prevent disappointment. The music will be by Jack Venables's Band, and the proceedings will continue until 2 a.m.

A Large Battery Locomotive.

The Christmas number of the "Chloride Chronicle" contained a picture of what is believed to be the largest storage-battery locomotive in existence. It is in service on the Chicago and North-Western Railway, and weighs 110 tons. The locomotive is capable of hauling a 1,500-ton train at a speed of from 8 to 10 miles an hour. It is propelled by an "Exide Ironclad" battery weighing nearly 40 tons.

N.A.S.E. Premiums.

The Examining Board of the National Association of Supervising Electricians for the "Economic Premiums" Competition, 1926, has awarded prizes as follows:—Members' section: First prize, £10, Mr. D. Williams, Pontllanfraith, for paper on "Distribution and Supply Economics"; second prize, £5, Mr. R. W. Whitley, London, "Economics at a Premium"; Associates' section: First prize, £5, Mr. J. Mulcaster, Darlington, "Reduction of Unit Costs"; second prize, £2 10s., Mr. H. J. Kimber, London, "Industrial Relations Between Employed and Employer." The examiners report that the papers received were of a very high standard and showed great appreciation of the difficulties facing the electrical industry generally.

Train Collision Report.

We have received a copy of the report of the official inquiry into the causes of the collision between a passenger train and an empty churn train which occurred on November 4th last between Farnborough and Fleet on the Southern Railway. It appears that the sudden stopping and starting of the milk train, as a result of the operation of the signal in front of the train from danger to clear as soon as the train had pulled up, resulted in a break-away of the rear trucks. Apparently the driver of the passenger train, who was killed in the accident, failed to observe or act upon the danger indication of the signals just in the rear of the goods train, and the distant signal had been in the clear position when he passed it. It is suggested that the accident would have been prevented if automatic train control had been in use in connection with the distant signal.

Institution Notes.

Institution of Electrical Engineers.

A.M.I.E.E. EXAMINATION.—The next examination will be held on March 30th and 31st and April 1st, 1927. Candidates must be either Students or Graduates of the Institution, or have lodged with the secretary a duly-completed form "E" for election as Associate Member. Entry forms for the examination, which must be completed and returned by February 1st, and particulars regarding election to membership of the Institution, may be had on application to the secretary.

WESTERN CENTRE.—An Monday last the annual dinner of the Centre was held at the Royal Hotel, Bristol. A report of the proceedings will appear in our next issue.

Royal Institution.

On Tuesday next (January 18th), at 5.15 p.m., Professor R. Whytlaw-Gray begins a course of two lectures on "Smokes as Aerial Disperse Systems." The Friday evening discourse on January 21st will be delivered by Sir William Bragg on "Tyndall's Experiments on Magne-Crystallic Action."

Institute of Metals.

At the annual general meeting, to be held in London on March 9th and 10th, seventeen papers are to be submitted. In the evening of March 9th the annual dinner of the Institute will take place at the Trocadero Restaurant, followed by a dance. The annual autumn meeting of the Institute will be held at Derby in September. The membership on December 31st was 1,801, as compared with 1,692 a year previously.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Recent changes of appointment in the staff of Metro-Vick Supplies, Ltd., are as follows:—Mr. N. V. EVERTON, secretary of the company, has, in addition to his previous responsibilities, taken up the duties of district manager, London area, Mr. E. MYHRE having been transferred to the sales management department, head office. Mr. H. A. NORMAN WHITE, who has been for some time sales engineer on the North London territory for the company, has been appointed to take charge of the Manchester office of Metro-Vick Supplies, Ltd. Mr. H. FILDES has been appointed to the domestic appliance department, specially handling the sale of electric cookers for the North of England.

Mr. J. G. MCLEAN, who has joined Industrial Combustion Engineers, Ltd., of 31-37, Wybert Street, Munster Square, N.W.1, was from 1900 to 1911 chief engineer and general manager of the Woking Electric Supply Co., Ltd.

Mr. A. H. DARKER, A.M.I.M.E., A.M.I.E.E., chief electrical engineer of Messrs. J. Stone & Co., Ltd., who, as already stated here, has been making a world tour, has now returned to London.

Mr. CHARLES VERNIER, of the Newcastle-upon-Tyne Electric Supply Co., Ltd., is joining the staff of the Macintosh Cable Co., Ltd., as chief engineer, on February 1st.

Messrs. F. COATES and H. W. MILLER have been invited to join the board of Messrs. A. Reyrolle & Co., Ltd. Mr. Coates, who has been with the company from its inception over 25 years ago, has been for many years the head of the drawing and design offices. Mr. Miller, who joined the company in 1920, has for the last few years been acting as general manager.

MR. ALEXANDER FARQUHARSON, of Tayport, Dundee, has been appointed tunnel engineer in the Punjab Public Works Department (hydro-electric branch) under the Indian Government. He served through the whole of the war, and during his service in Egypt he attended college, qualifying in electrical engineering.

The Workington Town Council has increased the salary of Mr. W. A. PARKER, distribution electrical engineer, to £300 per annum, with two annual increments of £25 to a maximum of £350.

ALD. A. HUNTSMAN, of Nottingham, was last week elected for the eighth year in succession chairman of the Joint District Council for the Electricity Supply Industry (No. 7 Area). He was also re-elected chairman of the District Joint Board for the staff.

The Accrington Electricity Committee has appointed Mr. ARTHUR BARLOW manager of the new electricity showroom.

MR. J. H. OSBORNE, of the staff of the British Thomson-Houston Co., Ltd., was recently presented by the staff with a canteen of cutlery upon the occasion of his marriage to Miss W. D. BRINKWORTH.

The Glasgow Corporation Tramways Committee is interviewing Mr. LACHLAN MACKINNON, the present deputy general manager, with reference to the appointment of a successor to Mr. Dalrymple.

Lord MONTAGU OF BEAULIEU has been elected president of the Electromobile Association.

Obituary.—MR. J. C. ROOTHAAN.—Mr. Jan Cornelis Roothaan, whose death was briefly reported here on December 31st, was born at Nymegen, Holland, in 1876. After serving with several Continental firms, among others, Brown, Boveri and the Ateliers de Constructions Electriques de Charleroi generally on switchgear design, he joined Messrs. Ferranti Ltd., in 1903, as chief draughtsman of their switchgear department, a few years later becoming chief engineer of their switchgear, transformer, and instrument departments. In September, 1916, when returning from a business trip from Amsterdam, he was taken prisoner by the Germans. The severe privations endured probably laid the foundations of the disease which ultimately caused his death at the early age of fifty years. After his return to England early in 1919, he joined the British Electric Transformer Co., Ltd., where he devoted himself to the development of transformers of core type construction. Mr. Roothaan's death leaves a distinct gap among his friends and colleagues of the British Electric Transformer Co., Ltd., where he held an important position as one of the company's chief designers.

SIR FRANCIS FOX.—We regret to record that Sir Francis Fox, M.Inst.C.E., Hon. Assoc. R.I.B.A., the well-known engineer, brother of Sir Douglas Fox, and a member of the firm of Sir Douglas Fox & Partners, passed away on Friday last at Wimbledon at the age of 82 years. Sir Francis was responsible, as engineer or in a special expert capacity, for large railway schemes and many other great works, including the boring of the Simplon Tunnel, the Mersey Tunnel, and the Liverpool Overhead Railway, also the Great Northern and City and the Charing Cross and Hampstead tube lines.

MR. H. T. FOWLER.—We regret to record the death of Councillor H. T. Fowler, who was recently appointed vice-chairman of the Basingstoke Electricity Committee. Mr. Fowler was machine-shop superintendent at the Basingstoke works of Messrs. John I. Thornycroft & Co., Ltd.

MR. A. C. LOXLEY.—We regret to learn that Mr. A. C. Loxley, the Leeds branch manager for the London Electric Wire Co. and Smiths, Ltd., passed away suddenly last week. Management of the branch has been taken over temporarily by Mr. S. A. Pearce.

MR. G. P. VARLEY.—The death occurred on December 29th, of Mr. George Pilkington Varley, J.P., managing director of John Varley, Ltd., electrical and general engineers, of the Waterloo Foundry, St. Helens.

MR. S. L. KILPIN.—The death took place on January 6th, at the age of 72 years, of Mr. Samuel Leach Kilpin, of Kilpin and Billson, electricians, of High Street, Bedford. He served for many years on the Town Council and acted as Mayor in 1907.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Index Lamp Co., Ltd.—Private company. Registered January 6th. Capital, £2,500 in 1,500 10 per cent. preference shares of £1 each and 4,000 ordinary shares of 5s. each. Objects: To acquire the business of an electrical equipment and motor accessories manufacturer, now carried on by T. W. Bennett, of 83, Grove Hill Road, Camberwell, S.E.5, as the "Index Lamp Company." The first directors are:—T. W. Bennett (managing director), 83, Grove Hill Road, Denmark Park, S.E.5; H. Weinbaum, 4, Morgan Street, Bow, E.3.

Electrical Coils, Ltd.—Private company. Registered January 8th. Capital, £100 in £1 shares. Objects:—To carry on the business of coil-winding specialists, electrical, mechanical, and wireless engineers, manufacturers of, and dealers in all kinds of scientific instruments, &c. The first directors are:—F. de Soiza, 4, Felsberg Road, S.W.2; Mrs. Annie E. de Soiza, same address; R. Jones, 18, St. Werburgh Street, Chester. Qualification, 1 share. Registered office: Calders Row, Brixton Hill, S.W.2.

J. Dyson & Co., Ltd.—Private company. Registered January 4th. Capital £20,000 in £1 shares. Objects: To adopt an agreement with J. Dyson, and to carry on the business of manufacturers of and dealers in electrical and wireless equipment, formerly carried on by him at 5 & 7, Godwin Street, Bradford, and that of manufacturers of and dealers in kinematograph apparatus, &c. The subscribers (each with one share) are:—J. Dyson, 289, Toller Lane, Bradford, engineer; and Mrs. W. Dyson, of the same address. J. Dyson is managing director and chairman for five years. Qualification of directors, £1,000. Secretary: L. Hodgkinson, 48, Sunbridge Road, Bradford. Solicitors: Howe, Denby & Bairstow, 38, Piccadilly, Bradford. Registered office: 7, Godwin Street, Bradford.

Millerphones, Ltd.—Private company. Registered January 5th. Capital, £200 in £1 shares. Objects: To carry on the business of motor and electrical engineers, manufacturers of electrical appliances and equipment, petrol and oil engines, telephones, radio apparatus, &c. The first directors are: P. A. Gooding, 16, Cambridge Road, Hammersmith, W.6, engineer; W. T. Miller, company manager, and Mrs. Ida L. Miller, 48, Park Road, Dulwich, S.E.21. Secretary, S. J. Pomeroy, 20, Coverdale Road, W.12. Registered office, 18, Coleman Street, E.C.2.

Accurate Recording Instrument Co., Ltd.—Private company. Registered January 3rd. Capital, £5,000 in £1 shares. Objects: To invent, manufacture and deal in gauges, valves, indicators, instruments and tools of all kinds, engines, motors and all kinds of machinery. The first directors are: W. M. F. Corry, 114, Eaton Square, S.W.1 (director of Cunard Steam Ship Co., Ltd.); R. T. Johnstone, 27, Catherine Street, Westminster; R. N. Reid, 72, Gloucester Road, Hampton-on-Thames, engineer; H. M. Hopwood, 53, Marloes Road, W.8. Qualification, 1 ordinary share. Solicitors, Samuel Price, Sons and Robertson, 3, Bond Court, Walbrook, E.C. Registered office, 23, Old Queen Street, Westminster, S.W.1.

Official Returns of Electrical Companies.

Highfield Electrical Co., Ltd.—Debenture charged on deeds and documents relating to premises in Holbrooks Lane, Coventry, and the company's undertaking and property, present and future, including uncalled capital, dated December 22nd, 1926, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd.

London Power Co., Ltd.—Trust deed dated November 19th (supplemental to trust deed dated April 15th, 1926), to secure £7,000,000 debenture stock, inclusive of £3,000,000 debenture stock secured by the original deed already registered, charged on the assets and revenues of the company, present and future. Trustees: Law Debenture Corporation, Ltd., Gresham House, Old Broad Street, E.C.

Cleartron Radio, Ltd.—J. H. Stephens, 6, Clements Lane, E.C., C.A., was appointed receiver on December 28th, under powers contained in debenture dated October 25th, 1926.

K.H.E. Ignition Co., Ltd.—P. W. Ardran, of 41, Castle Street, Liverpool (acting on behalf of the late A. A. Whittingham Jones) ceased to act as a receiver or manager on November 25th, 1926.

Charles Fitz-Hugh, Ltd.—H. Brown, of 71, Temple Row, Birmingham, ceased to act as receiver or manager on December 30th, 1926.

Ackroyd & Best, Ltd.—Mortgage on various properties at Morley, dated December 13th, 1926, to secure all moneys due or to become due from the company to the Midland Bank, Ltd.

British Di-Electric Co., Ltd.—Issue on December 4th, of £200, on December 18th, of £250, and on December 22nd, 1926, of £50 debentures, parts of a series already registered.

Teignmouth Electric Lighting Co., Ltd.—Satisfaction (1) to the extent of £3,500 on November 11th, 1926, of debentures dated February 19th, 1923, securing £4,000; (2) to the extent of £500 on March 13th, and to the extent of £300 on November 11th, 1926, of debentures dated March 13th, 1923, securing £800; and (3) in full on November 11th, 1926, of debenture dated April 16th, 1923, securing £100.

Thompson Manufacturing Co., Ltd.—Satisfaction in full on December 11th, 1926, of debenture dated March 12th, 1925, securing £500.

Express Cable Engineering Co., Ltd.—Particulars filed of £200 debentures authorised November 16th, 1926, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

H. E. Davis, Ltd.—W. A. J. Osborne, of Balfour House, Finsbury Pavement, E.C.2, ceased to act as receiver and manager on December 21st, 1926.

Godfrey Salmon, Ltd.—W. A. J. Osborne, of Balfour House, Finsbury Pavement, E.C.2, ceased to act as receiver on December 20th, 1926.

City Notes.

Perak River Hydro-Electric Power Co., Ltd.

A circular dealing with the progress which has been made by the company was circulated to shareholders this week. In this it was stated that the organisation for the London administration had been established, and Messrs. Topham, Jones & Railton (1926), Ltd., had been appointed contractors for the civil engineering work. This company had already sent out a party of engineers to study the dam site, and the construction work would be carried out to the designs of Messrs. Rendell, Palmer & Tritton. It was expected that the excavation of the dam site would be well in hand in the course of three or four months. In the meantime, orders had been placed in Great Britain for the electrical plant and machinery and other requirements for the generation and transmission of electricity. The site for the steam station was being selected by Capt. A. C. Sparks. That station would be capable of giving a continuous output of 6,000 kW, and to ensure continuity of supply two 6,000-kW generating sets were being installed, one of which would be held in reserve. From that station it should be possible to give a supply within 18 months to mines within reasonable distance, as well as to the town of Batu Gajah. When the hydro-electric plant was in service, the steam station would act in a stand-by or supplementary capacity. Mr. J. Ferguson, M.B.E., had been appointed general manager in Malaya, and he would settle the question of the prices to be charged to consumers when he had had an opportunity of studying local conditions. It was the belief of the board that the provision of cheap supplies of electricity would considerably extend the magnitude and the life of the tin-mining industry in the Federated Malay States. That was borne out by the interest which tin-mining companies were taking in the company's work.

Adelaide Electric Supply Co., Ltd.

The report for the year ended August 31st last shows a revenue of £670,877 gross and £374,895 net, the latter figure showing an increase of 22 per cent. over the net profit of the previous year. After meeting debenture interest, &c., a balance of £280,035 is available. The directors have transferred £80,000 to general reserve and £10,000 to dividend equalisation fund. A final dividend of 6 per cent. is being paid on the ordinary shares, making 12 per cent. for the year, as in 1924-25. A balance of £10,553 is carried forward with £8,116 from the last account. The dismantling of the Grenfell Street power station has been completed and the plant sold at scrap prices. The balance of the cost of the plant, £321,737, has been written off against general reserve, leaving the latter at £13,263. The board proposes to offer 250,000 6½ per cent. "C" preference shares of £1 each to shareholders at par.

New Issue.

Cia. de Electricidad de la Provincia de Buenos Aires, Ltd.—Last week the company offered to its shareholders one new £1 eight per cent. non-cumulative participating preference share for each preference or ordinary share held. These were part of an issue of £350,000, and they were offered to shareholders at £1 less a commission of 2s. 6d. per share payable by the Italo-Belgian Bank, London Agency.

Sir W. G. Armstrong, Whitworth & Co., Ltd.

On January 10th an extraordinary general meeting of shareholders was held for the purpose of confirming certain alterations in the company's articles which will be necessary if the scheme of arrangement drawn up is approved by the Court. The business was purely formal, and the necessary resolution was carried unanimously.

British Columbia Electric Railway Co. Ltd.

The directors have declared the usual half-yearly dividend upon the 5 per cent. cumulative perpetual preference stock.

At an extraordinary meeting held on January 6th, the resolutions passed at the annual meeting on December 16th, increasing the capital to £5,320,000 and giving the directors further powers, were confirmed.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Telephone Co. of Pernambuco, Ltd.—100,000 ordinary shares of £1 each, fully paid, Nos. 1 to 100,000. £150,000 8 per cent. registered debentures of £100 each, Nos. 1 to 1,500.

The undermentioned securities have been ordered to be officially quoted:—

Ever-Ready Co. (Great Britain).—71,200 ordinary shares of £1 each, fully paid, Nos. 498,801 to 570,000.

Hellenic Electric Railways.—£200,000 7 per cent. sterling bonds, series "A," Nos. A1 to 1,000 (£100) and A1,001 to 1,200 (£500); and £200,000 7 per cent. (convertible) sterling bonds, series "B," Nos. B1,201 to 2,200 (£100) and B2,201 to 2,400 (£500).

Castner-Kellner Alkali Co., Ltd.

The company is paying a final dividend of 14 per cent. (making 22 per cent. for the year 1925-26) out of a net profit of £210,928.

American Loan for Italy.

The Genoa correspondent of the *Financial Times* reports that the Unione Esercizi Elettrici has arranged a $10,000,000 loan in New York.

Edmundson's Electricity Corporation, Ltd.

An interim dividend of 3 per cent. has been declared on the ordinary shares.

Stocks and Shares.

MONDAY EVENING.

FURTHER progress in the upward direction has taken place amongst investment stocks and shares, for the reasons noted in our first article of the New Year. These are, the Government's courage in offering new 4 per cent. Consols at the relatively high price of 85 and, secondly, the hope of money becoming cheaper. Capital in plenty is available for investment, and speculative new issues are being readily taken. Stock Exchange business is reasonably active. A revival in rubber shares followed with promptitude upon an advance in the price of raw rubber.

This last consideration weighs but little with the buyers who have come forward to take cable and electrical equipment

shares on the impression that big business is at hand. Several of the companies have published details of important contracts secured recently. The programme of electrical extension contemplated by the Southern Railway will mean, in itself, a very substantial accession of business to manufacturing companies. The Government's avowed policy of cheaper bulk electricity is expected to provide work for a year or two, at least. The re-conditioning of colliery plant, as one sequel to the conclusion of the coal stoppage, is regarded as another potent element in the electrical industry. The remarkable stimulus given to telephony by the linking of London and New York by air, is prayed in aid by those who foresee a time of profitable activity ahead, and the admission of Sir George Sutton, Henley's chairman, that conversations have taken place between some of the cable-manufacturing undertakings is another bull point.

Rises have occurred in Siemens, British Insulated, Henleys, General Electrics, Enfield Cables, Callenders, British Aluminiums, and Telephone Manufacturing. Johnson & Phillips remain somewhat dull, and Edisons have failed to rally from the decline caused by the falling-off in profits shown by the recent report. Ever Ready shares have come to life again, the ordinary spurting to 79s., on expectations of another bumper profit being recorded when the accounts come out in April next. The preference shares look reasonably-valued at 28s. 6d.: entitled to 7 per cent. dividend, they participate up to 10 per cent., and are receiving the latter rate, which gives a yield of 7 per cent. on the money, at the price just quoted.

Metropolitans and Districts have rallied after a drop of ½ apiece, and Underground £1 shares are better at 13s., and Central London Assented ordinary strengthened to 70. A feature in the Home Railway market is the ready absorption of the pre-ordinary stocks. A number of debenture and guaranteed stocks, and a few preferences are almost impossible to buy.

County of London Electric ordinary gained 1s. 6d. to 27s. 6d., upon the circulation of a tip to buy the shares. The dividend is due for declaration next month. No other changes have occurred in the list of London electricity supply issues. City of Londons are the only shares in the group not yet quoted ex rights. The increases which are now added to the previous ordinary share capitals of the London companies, as from January 1st this year, can be usefully set out in a table, as follows:—

COMPANY.	Ordinary share capital at 31st Dec., 1925.	Amount of capitalised reserves.	Bonus proportions.	Present ordinary share capital, including capitalised reserves.
Brompton & Kensington ...	£292,330	£58,466	20% (1 for 5)	£350,796
Charing Cross	£576,000	£460,800	80% (4 for 5)	£1,03*,800
Chelsea	£247,180	£148,308	60% (3 for 5)	£395,488
City of London	£800,000	£400,000	50% (1 for 2)	£1,200.000
County of London	£1,330.000	£1,77 ,834	133⅓%(4 for 3)	£3,103,834
Kensington &Knightsbridge	£105.000	£189,0 0	180% (9 for 5)	£294,000
London	£499,500	£199,800	40% (2 for 5)	£699,300
Metropolitan	£1,000,000	£500,000	50% (1 for 2)	£1,500,000
St. James' & Pall Mall ...	£200, 00	£440,000	20%(11 for 5)	£640,000
South London	£260,000	£234,000	90%(9 for 10)	£494,000
South Metropolitan ...	£250,000	£350,000	140% (7 for 5)	£6*0,000
Westminster	£755,620	£5*3.746	66⅔% (2 for 3)	£1,259,366

The Notting Hill Company has still to announce the amount of free reserves available for capitalisation.

United River Plate Telephones are 10s. better at 8⅜. It is contended that the price has been under-valued of late, and that the rise of the past fortnight is no more than a recognition of the shares' previous cheapness. There are, also, vague rumours as to the possibility of a bonus of some kind. Automatic Telephones are better at 55s., and so are International Automatic "B" at 2⅛, while American Telephone and Telegraph capital stock has gone up sharply in New York by reason of the inter-continental telephone service. The prices of cable stocks and shares are unaffected by this new departure. Globe ordinary are even 5s. higher. From this steadiness, it seems reasonable to conclude that cable stockholders have become shock-proof against wireless competition. Marconis are quiet at 13s. 9d., and Canadians at 3s. 4¼d. It is officially stated that the long-expected Marconi report will be out by the end of this month. Telephone of Pernambuco shares are attracting a little speculative attention at 12s. 6d.

Brazilian Tractions fell back to 107 before recovering to 110. The Mexican Utilities show irregular movements. Mexican Electric Light fives are lower at 58, and Mexican Light and Power seconds at 86¼, although the common shares of the latter have hardened to 32¼. British Columbia Electric Railway stocks are buoyant, the preferred and deferred both gaining 3 points. The Anglo-Argentine Tramways trio is somewhat better. Amongst the home industrials, Babcocks are a good market at 53s. 9d., and a disposition to buy low-priced iron and steel shares is evidence of a public willingness to speculate in this section.

Share List of Electrical Companies.

Minor African Markets.

Electrical Import Figures of Nigeria, the Gold Coast, Kenya and Uganda, and Tanganyika.

THERE are now markets for electrical goods in the Gold Coast, Nigeria, and Sierra Leone on the West Coast of Africa, and in Kenya, Uganda, and Tanganyika on the East Coast, that are well worth consideration. It will be seen from the following statistics, which are compiled from official sources, that there were healthy increases in the imports of electrical machinery and apparatus and telegraph material into Nigeria in 1925, compared with 1924. Imports of similar goods in those years are also given below for the markets mentioned, together with notes of increases or decreases.

Imports into Nigeria.

	1924. £	1925. £	Inc. or dec. £
Machinery, electrical—			
Total	3,600	19,600	+16,000
From United Kingdom	2,000	5,700	+ 3,700
,, U.K. Government	1,300	12,000	+10,700
,, United States	140	50	− 90
,, Germany	120	1,900	+ 1,780
Electrical and telegraphic apparatus—

,, United States	900	2,200	+ 1,300
,, Germany	2,000	4,800	+ 2,800

Lighting Business in Portugal.

A foreign official report states that the bulk of the table and floor electric light standards, pendants, &c., used in Portugal are imported. Local manufacture of such goods is not well developed, and is therefore not in a position to compete strongly. At Lisbon and Oporto there are about a dozen firms manufacturing such goods, but their products are mainly of cast iron, copper and bronze. Everything else required is imported. Glass lustres come from Czecho-Slovakia and Germany, alabaster bowls from Italy, and pendants and standards in wrought iron, copper, and bronze from Italy and France. French exporters find it a difficult matter to obtain much of the business owing to the relatively high prices of their products. The Portuguese buyer exhibits a preference for the highly decorative type of fitting, and there has been a very large sale of coloured glass and alabaster bowls, which are used in all the larger shops and dwelling houses. Payment is usually made by importing houses at 30 days with discount, or 60 or 90 days net, from the arrival of the goods. Where the customer is known to be financially sound, documents should be sent through a bank to be exchanged for acceptance. It is not advisable to send small goods by parcel post, as the service is very slow, and as much as three months' time may be occupied in the journey. Particular attention should be paid to packing, and very strong cases should be used.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Continued from page* 33.)

Cambridge Instrument Co., Ltd.

A new recorder for measuring the percentage of dissolved oxygen in boiler feed-water was shown working. An outfit has been on test in the Deptford power station of the London Electric Supply Corporation, Ltd., for some months, and has aroused considerable interest. Illustrated in fig. 5, the outfit is a robust boiler-house instrument, which records the percentage of oxygen on a chart calibrated in cubic centimetres per litre of water, and thus enables defects in the feed-water system to be instantly detected; the full-scale deflection corresponds to one cubic centimetre of oxygen per litre, and the apparatus may be arranged to operate an electric alarm. The principle upon which it works is as follows:—Water from the boiler feed system is passed at a constant rate through a tower filled with extractor rings, where it is "scrubbed" by a constant flow of pure hydrogen generated electrolytically. The hydrogen mechanically displaces the dissolved oxygen in the feed water, and the relative rates of flow of hydrogen and water are so arranged that the displaced gas forms a considerable percentage of the total gas issuing from the top of the scrubber; this percentage is measured by a katharometer, and is shown on the chart of the recorder. The katharometer contains two identical spirals of platinum wire, enclosed in separate cells in a metal block, forming two arms of a Wheatstone bridge; when an electric current flows in the circuit, the spirals become heated and lose heat to the walls of the cells, their temperatures (resistance) depending on the thermal conductivity of the gases surrounding them. One of the cells is exposed to the pure hydrogen passing from the electrolytic supply, the other to the gas after passing through the scrubber tower. Owing to the presence of the oxygen from the feed water, the thermal conductivity of the gas in the second cell is different from that of the first, and the Wheatstone bridge circuit is thrown out of balance, causing a deflection of the galvanometer, the extent of which is an indication of the amount of oxygen present in the second cell. Fig. 6 is a diagrammatic arrangement of the complete outfit. The feed water is led through a needle valve and inlet cock A into B, arranged to keep the water supply constant, without exposure to the air, by the overflow C. The flow through the scrubber is regulated by the cock D to about 500 cc. per minute. The hydrogen is generated in M by about 1.4 amperes, and passes across one cell L_1 of the katharometer K, and then through the tube J to the bottom of the scrubber tower F. On leaving the top of the scrubber it passes across the second cell L_2 and out to the air. The katharometer is connected by 4-way leads to the recorder shown on the left in fig. 5; it is a standard thread recorder, may be placed a considerable distance away, is entirely clock driven, and consists of a moving-coil galvanometer, the pointer of which is automatically depressed once a minute on to an inked thread, which it presses into contact with a moving chart.

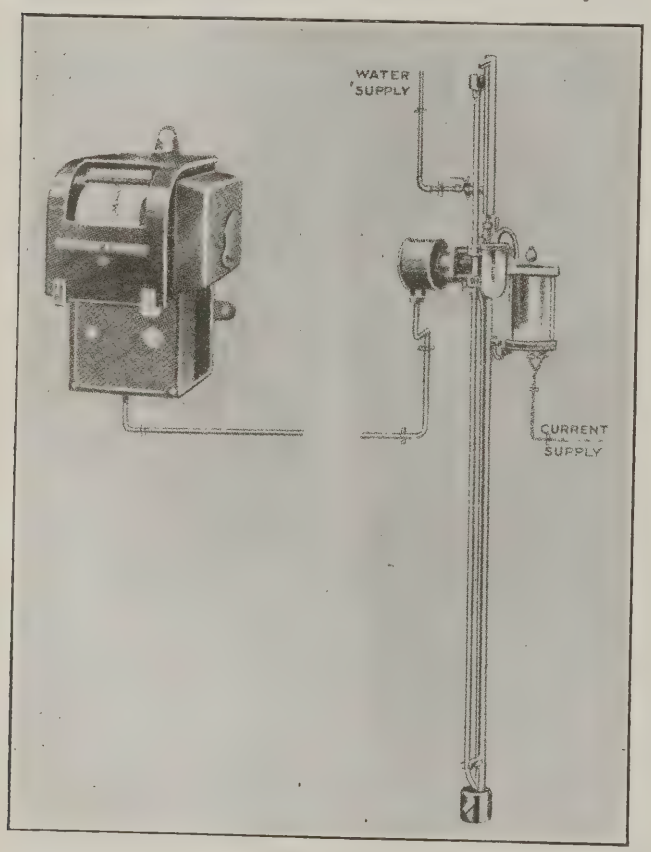

Fig. 5.—Boiler Feed-water Oxygen Recorder.

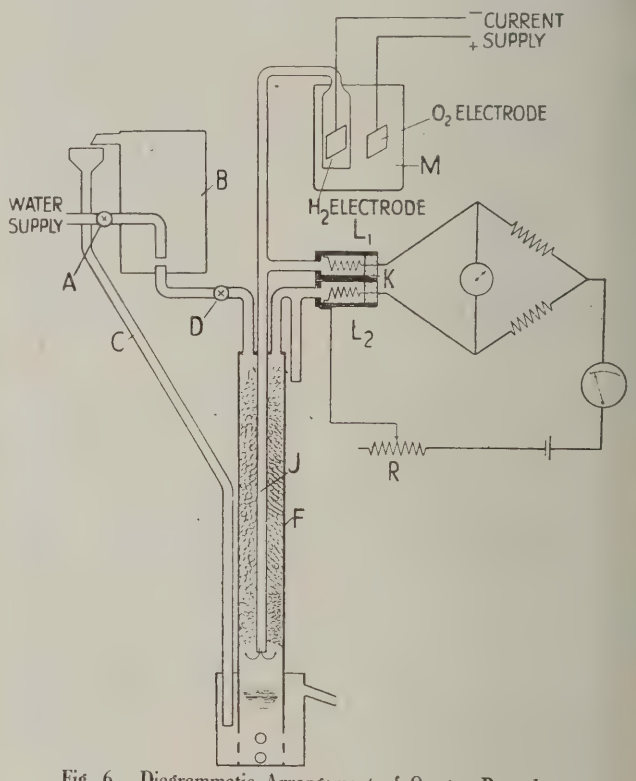

Fig. 6.—Diagrammatic Arrangement of Oxygen Recorder.

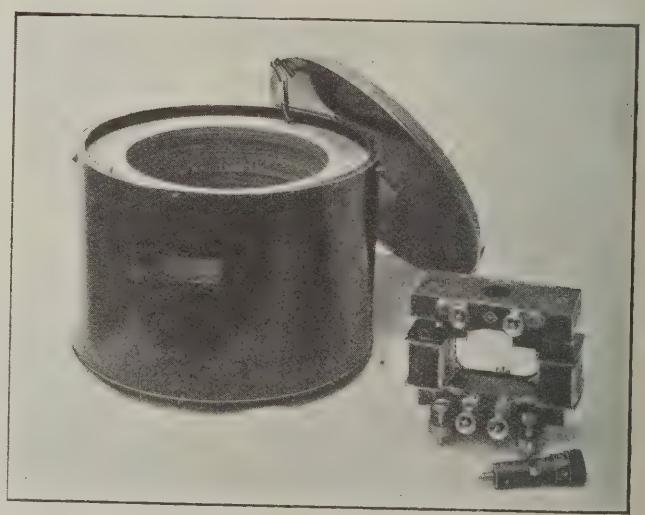

Fig. 7.—Vibration Galvanometer.

A compact outfit was shown for determining the hydrogen-ion

concentration of solutions by the glass-electrode method developed by Mrs. P. M. Tookey-Kerridge, of the Department of Physiology and Biochemistry, University College, London. A thin glass membrane separates the solution whose concentration is to be determined from a buffer solution of known pH, and the difference of electrical potential between the solutions is measured by means of a direct-reading potentiometer, a Lindemann electrometer being used as a null-point indicator in the electrode circuit. The glass electrode enables the pH value of small quantities (0.5 cc. or less) of liquids (clean, coloured, or turbid) easily reducible or unstable in air, and of semi-solids (such as minced tissues) to be rapidly and accurately measured, without the serious technical difficulties which have previously been associated with these measurements.

A vibration galvanometer exhibited (fig. 7), of the type originally evolved by Schering & Schmidt, and manufactured by the Cambridge Co. in accordance with designs furnished by the National Physical Laboratory, is particularly suitable for use in conjunction with the Schering bridge method of measuring power losses in dielectrics and for precision measurements on standard condensers. The instrument is tuned by varying a small d.c. polarising current which can be supplied by two or three small accumulators; if required, the instrument, battery, and adjusting resistance can be at a high potential above earth, the resistances being operated by an insulating handle. Since the alternating-current circuit of the galvanometer is fixed, and is not limited as to size and inertia, as it is in the case of a moving-coil vibration galvanometer, a large number of turns of fine wire may be used, which is an advantage when measurements on circuits of high impedance are to be made. The galvanometer can be used for frequencies between 25 and 120 periods per second, and consists of a small U-shaped magnet, made up of three pieces for providing the polarising field, and two other magnets, the pole tips of which are made to form radial arms about the vibrating system; the polarising flux passes through the two latter magnets. The polarising winding is wound on the two main limbs of the uprights, forming the arms of the "U" magnet, and the measuring windings, which consist of four small bobbins, are mounted, one each, on the limbs of the two small magnets. An alternating current flowing in the latter distorts the field by moving it through an angle, first in one direction and then in the other on either side of the neutral position. The vibrating system consists of a small piece of thin soft iron, suspended by a light phosphor-bronze strip which is anchored at both extremities and carries a plane mirror. The vibrating system is contained in a metal case, in which is fitted a lens of about one metre focal length, and a beam of light focused on to the needle mirror is reflected on to a ground-glass plate with graduated divisions. Provision is made whereby the earth capacity of the instrument is reduced to a low figure, and the galvanometer is protected from magnetic fields by means of a heavily-laminated shield.

Foster Instrument Co.

An example of automatic temperature-control apparatus (general particulars of which recently appeared in our pages)

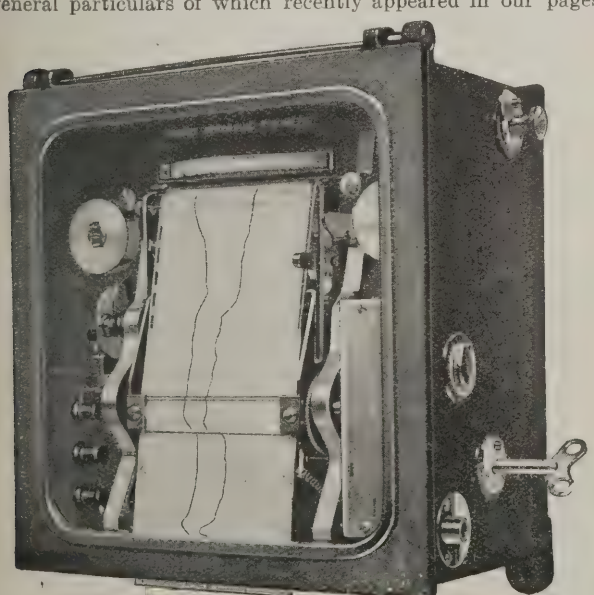

Fig. 8.—A Strip Recorder.

was exhibited: points worthy of notice are the following:—The actual mechanism for making the primary contacts inside the case of the pyrometer indicator is necessarily delicate, compared with the other parts of the apparatus. In order that these delicate parts shall not be subject to undue forces by misuse, or interference with other parts of the apparatus, they are so arranged that only a limited force, due to gravity, can be applied to the contacts. The motor-driven mechanism for producing these contacts is made heavy and capable of running continuously for many years, but its action on the delicate parts is only in a permissive sense; that is to say, it only permits the force of gravity to act inside the indicator. No adjustment, or maladjustment, by the user can put any extra force upon those parts.

The cylinder temperature pyrometer enables measurement to be made of the mean gas temperature inside the cylinder of an internal-combustion engine. Hitherto the chief difficulty of obtaining this information has been to provide facility for inserting a thermo-couple into the cylinder in such a position that it would attain the temperature of the gases. In the Foster instrument an ignition plug, while performing its normal function, serves also as a thermo-couple, its junction being at the tip of the centre electrode of the plug. The latest development of the strip recorder (illustrated in fig. 8) is also shown, in which six records of distinguishable colours are produced on one chart from six different thermo-couples.

Elliott Brothers (London), Ltd.

A sample of the many instruments on this company's stand is illustrated in fig. 9, being a portable frequency indicator of convenient pattern. A piece of apparatus which has not been exhibited before is shown in fig. 10; it is a new form of portable galvanometer made up in a metal case, and has a knife-edge pointer, anti-parallax mirror, and evenly-divided

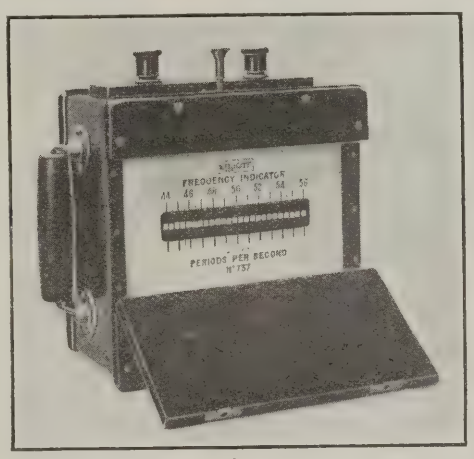

Fig. 9.—Portable Frequency Indicator.

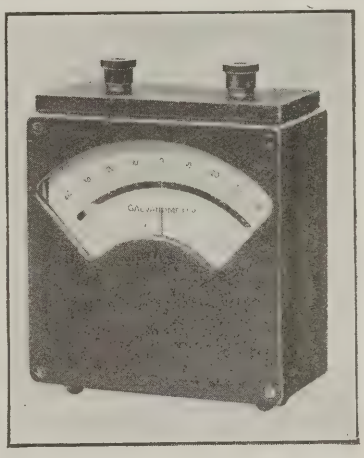

Fig. 10.—A Portable Galvanometer.

scale. It is of the moving-coil pattern, and can be used as a milliammeter, galvanometer, and micro-ammeter, its standard sensitivities being as follows:—

Scale length ...	80 m/m	80 m/m
Coil resistance	300 ohms.	50 ohms.
As a galvanometer:—		
Sensitivity ...	$0{\cdot}25 \times 10^{-6}$ amp. per div.	$1{\cdot}0 \times 10^{-6}$ amp. per div.
Scale (m/m divs.)	40—0—40 m/m	40—0—40 m/m
Periodic time	3 secs.	3 secs.
As a microammeter:—		
Range	0—10 and up.	0—100 and up.
Damping ...	Partially damped.	Partially damped.
Time to rest ...	3 secs.	3¼ secs.

Other devices which have recently been placed on the market are mentioned below, namely, a live-cable core temperature indicator (Fawssetts patent) which gives the core temperature of any cable, either low-tension or e.h.p., under working conditions. It consists of a combination of thermo-couples with millivoltmeter so arranged that the reading of the instrument gives directly the temperature of the core of the cable. It can be employed for indicating the temperature of cables working at any voltage. An averaging recorder for bulk power supplies gives the total consumption, and also the maximum demand averaged over a definite time interval. It can be calibrated as a kVA meter if desired. The particular sample shown was a 3-phase, 3-wire recording wattmeter for unbalanced or balanced loads. A pressure indicator consists of an electrically-operated valve and step-by-step contact mechanism, whereby pressure curves, such as are obtained in explosion engines, &c., may be plotted to any scale desired. The apparatus may be used to obtain, say, the pressure variation in the "scavenging" stroke of a Diesel engine, and also the "explosion" stroke. The curves are plotted in a manner similar to the wave-form curves of an alternator. The valve is pressure-tight against pressures of 1,500 lb. to the square inch; and the apparatus is suitable for speeds up to about 250 r.p.m.; by suitable modification speeds up to 500 r.p.m. can be dealt with.

(To be continued.)

The British Industries Fair.

Lists of Birmingham and London Exhibitors.

WE are now in a position to publish complete lists of exhibitors at this year's British Industries Fair whose goods are of interest to our readers. The London Section catalogue has actually been produced, although the Fair does not open until February 21st; it is a substantial volume, containing particulars relating to over 900 exhibitors, and the goods are very well classified and indexed. The Birmingham exhibits, which are generally on a larger scale than those at the White City, number over 500.

One feature of this year's Fair is the endeavour which British manufacturers have made to conform to overseas customers' requirements. Many of them took advantage of the slack months of 1926 to make a study of Dominion and foreign markets with a view to gauging their needs. As a result, first-hand information of a valuable nature has been obtained, suggesting new methods of production and design to meet special requirements. The organisers of the Birmingham Fair (the Birmingham Chamber of Commerce) have prepared a list giving a number of lines in which British manufacturers are making a definite challenge to foreign competitors. The list includes electric washing machines, electrical accessories, household appliances, water heaters, motors, electric vehicles, vacuum cleaners, power pumps, elevators and trucks, electric drills, welding machines, and flexible cords and cables. The following are the names of companies, firms and individuals who are taking part in the Fair:—

Birmingham.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A New Outdoor Circuit Breaker.

We have received some particulars of a new ("K") type of oil circuit breaker which has been introduced by MESSRS. JOHNSON & PHILLIPS, LTD., Charlton, London, S.E.7. It is designed for outdoor working on 15,000 V, and is claimed to be completely weatherproof and constructed so as to prevent the ingress of rain, sleet or snow. The operating mechanism embodies the loose-handle feature, so that it is impossible to hold the breaker closed under heavy-overload or short-circuit conditions. It is constructed about a cast-iron base plate and surmounted by a sheet-steel cover. The apparatus is designed for chain operation, but if desired an alternative method can be supplied in the form of an operating lever. The tripping of the breaker is effected by operating the chains in the reverse direction; once the opening operation has been started the mechanism releases the switch, which then opens automatically at high speed. The contacts are of the double-break pattern, suitable for 200-A loading. For automatic operation series trip coils are mounted beneath the oil level. A delay action is obtained on the trip coils by means of a small oil dashpot which prevents the breaker from being opened unnecessarily by sudden kicks on the line. The h.p. leads are brought out from the fixed contacts through the top plate and thence through porcelain bushes to the exterior. Standard 2-ft. cable tails are provided. The insulation is of porcelain and bakelite material throughout. The oil tank is built up of welded sheet-steel, provided with strengthening straps, and is fitted with lifting handles and a filling plug and drain cock. Special precautions have been taken to prevent damage due to rust and corrosion; all the working parts are of non-ferrous metal, stainless steel, or treated with a special non-rusting process which permeates the metal. The weight of the switch, including the fixing straps, is approximately 420 lb., and 14 gallons of oil are required for the first filling of the oil tank. A suitable disk "on" and "off" indicator is provided. Fig. 1 shows the switch with the tank lowered and the lid cover removed.

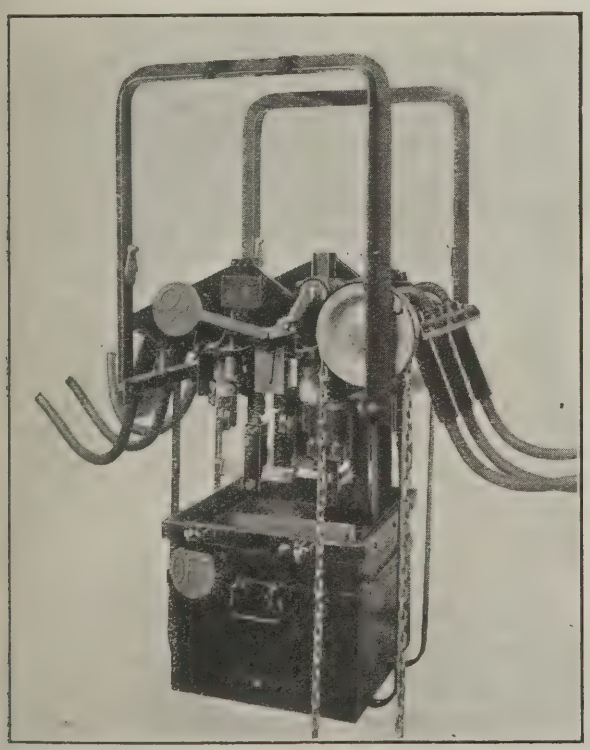

Fig. 1.—Outdoor Circuit Breaker.

A Light Shielding Fitting.

For providing sufficient illumination for theatre aisles and at the same time shielding the light so that it is not objectionable to the spectators or performers, is the purpose of the LA series of aisle light condulets, fig. 2, which are being marketed by the CROUSE-HINDS COMPANY, Syracuse, New York. These fittings, some particulars of which are given in *Electrical Merchandising*, are very narrow, and when installed at the end of a row of seats do not obstruct the aisle. The front of the condulet is easily removed, facilitating the renewal of lamps. No glass is used. If desired, coloured lamps can be used.

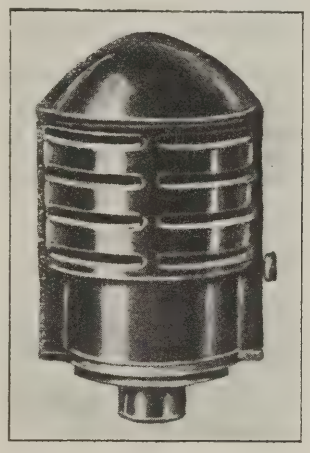

Fig. 2.—Theatre-Aisle Fitting.

Fig. 3.—Electric Floor Machine.

A Heavy-Duty Floor Machine.

A new floor machine for heavy work, described in *Electrical Merchandising*, has been introduced by the FAY COMPANY, 11, East 31st Street, New York. The machine, "Jumbo," fig. 3, is of the rotary type, weighs 125 lb., and is equipped with a ½-h.p. motor. The diameter of the base is 15½ in. The attachments provided for the machine are 14 in. in diameter, and include a bassine fibre scrubbing brush for scrubbing, such as wood, linoleum, rubber and composition floors; a steel-wire brush for scrubbing concrete, marble, and very dirty floors; a bassine fibre waxing brush for rubbing wax into wood, linoleum, &c.; a tampico polishing bush; a steel wire brush; and a sandpaper disk which is used for sanding floors.

An Electric Cable Vehicle.

A specially designed electric vehicle for transporting drums of cable has recently been introduced by Messrs. WINGROVE AND ROGERS, LTD., Mill Lane, Liverpool. It comprises a B.E.V. electric truck fitted with special lifting and conveying gear suitable for dealing with drums weighing up to 6 tons. The truck is so constructed that the chest containing the accumulators acts as a counterpoise to the load, thus reducing to a minimum the effort required to lift the drum clear of the ground, and enabling this task to be carried out by a motor of comparatively small size. The weight of the drum is carried immediately over the back wheels. The driving platform is arranged so that the truck can be driven in either direction. The vehicle is equipped with two brakes of the internal-expanding pattern, one hand and one foot operated, both being interlocked with the controller by the makers' special electric trip gear. The truck can also be used, it is claimed, for the laying of cables.

A New Electric Fire.

A recent addition to the products of THE BASTIAN METER CO., LTD., 58, Haymarket, London, S.W.1, is the "Super Imp" electric fire, which has been designed so that the reflectors throw the heat not only straight forward, but also in a downward direction to the floor. Two Quartzalite elements, each consuming 1 kWh per hour, glow at a bright red heat, giving a cheerful effect and a near approach to a hot coal fire. A further advantage is that a kettle can be boiled readily, and if by chance it boils over, the water falling on the elements, it is claimed, will not damage them in any way.

Electric Railway Track Equipment.

A Comparative Review of the Electrical Apparatus installed on the London Underground Lines, and Experience Gained in their Operation.

By ARTHUR R. COOPER, M.I.E.E.

(Abstract of a paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

THE paper describes generally the lay-out of the electrical track equipment of the London Underground Railways, including the District, London Electric, Central London, and the City and South London Railways, and deals particularly with the adoption of the insulated-return system, the conductor rails, insulators, h.p. cables, and other parts of the equipment.

The earlier tube railways adopted the earthed-return system, the track rails being used for conveying the current back to the sub-station. The electrification of the District and Metropolitan Railways was carried out with an insulated return, a fourth rail being provided. Undoubtedly the chief feature determining the decision to adopt this system was the possible injurious effect on the apparatus of public supply undertakings and, in particular, the Government observatories, from earth currents.

The decision to have an insulated return was influenced by the situation and construction of the District Railway. The tracks were near to the surface, and therefore to such outside interests as cables and pipes. The railway was not surrounded by a cast-iron lining as on the tube railways, and track-circuit signalling, employing d.c., was to be installed, making it difficult to use the track rails for the return traction current; it was also claimed that the insulated return allowed the railways to continue working if one pole became earthed due to failure of its insulation, and cases have occurred where for many hours the system has operated with the positive conductor earthed. The general supposition that the use of track rails for return traction current is much cheaper than the installation of a fourth rail for the insulated return is not necessarily correct where track circuits are employed for signalling purposes, and where the signalling installed has to provide for a very close headway of trains. The use of track rails for both traction and signalling current renders impedance bonds necessary for the separation of the a.c. signalling sections. The cost of the electrical equipment of the track with an earthed return and track circuits is about the same as the cost of the electrical track equipment for an insulated return system where the track has to deal with a close headway of trains, necessitating nine signalling sections per mile.

It is improbable that there will be any further adoption of the insulated return except for extensions to existing lines. In working the railways with an insulated return, certain effects have been encountered which were not anticipated when the system was adopted. It will be realised that if there is a short-circuit between the positive side of the low-pressure system and earth, the potential of the negative side of the system becomes 600 volts below earth. The amount of current that can flow through the positive short-circuit is limited by the leakage of the whole of the negative side of the system, and in consequence, although the current flowing through the positive short-circuit may be appreciable, it will probably not be sufficient to open the circuit breakers in the sub-stations, and the fusing at the positive fault will continue until either the cause is removed or a breakdown occurs on the negative side. This form of failure usually accompanied, or had the result of causing, breakdowns of the insulation at other parts of the system, such as the earthing of a train equipment, not infrequently at a distance of several miles from the original positive short-circuit.

It was difficult to account for the failures resulting from the original positive short-circuits, but investigation went to show that pressures above 600 volts must be present, apparently due to the sudden interruption of heavy currents flowing over considerable distances. A series of tests was made on the District Railway during non-traffic hours on the effect of the sudden interruption of large currents flowing along considerable lengths of conductor and track rails, and also on the use of various protective devices installed to prevent rises of pressure.

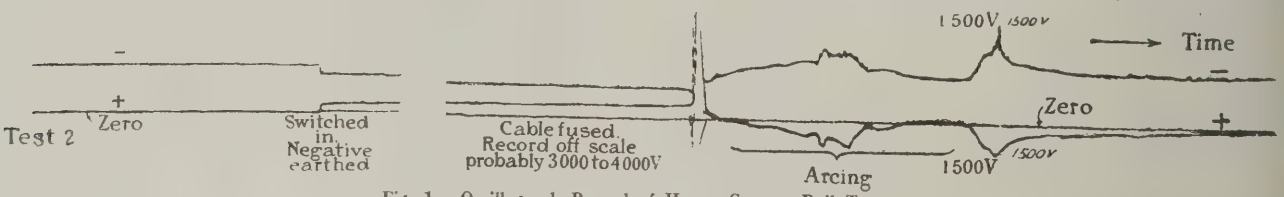

Fig. 1.—Oscillograph Record of Heavy Current Rail Test.

An oscillograph was connected between each conductor rail and earth, the connections being made to the positive and negative bus-bars at the East Ham sub-station. The iron framework of the sub-station building was used as the earth, and the resistance of each of the oscillograph circuits was 10,000 ohms; and they thus constituted a leak of this value between each of the conductor rails and earth. The sensibility of the oscillograph was adjusted so that 1 mm.= 60 volts. The records were made on kinematograph film travelling at approximately 6 in. per second. Three sub-stations, South Kensington, Victoria, and East Ham, each had one rotary connected. The positive conductor was earthed at Sloane Square and the records were made at East Ham.

In one test the positive conductor rail was joined to the track at Sloane Square; the negative conductor rail was joined to the track rails at East Ham in the train section with two 7/22 wires. Victoria, South Kensington, and East Ham sub-stations were on the line. The train section was switched in, causing an earth on the lighting circuit at East Ham, which brought out the lighting circuit breaker.

The commencement of the record, fig. 1, shows the positive conductor rail at earth potential and the negative at full-line voltage above earth. At the moment of switching on, the negative potential dropped and the positive rose slightly. As the resistance of the two wires increased, the negative voltage dropped and the positive rose until the cable suddenly fused, causing both lines to shoot right off the film. Following this, arcing appears to have taken place, after which the conditions settled to normal again. It is impossible to say exactly what the maximum voltage obtained may have been, but judging from the appearance of the lines on the film, I should think it could not have been

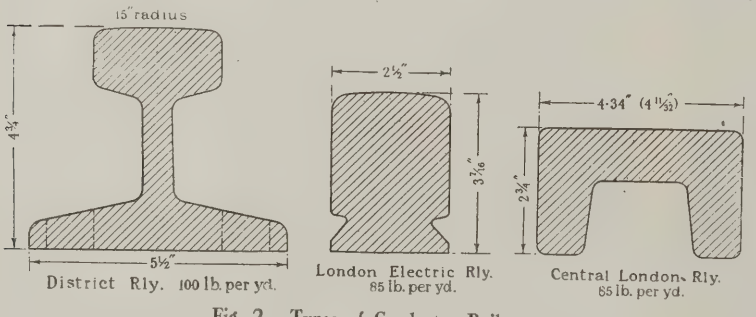

Fig. 2.—Types of Conductor Rail.

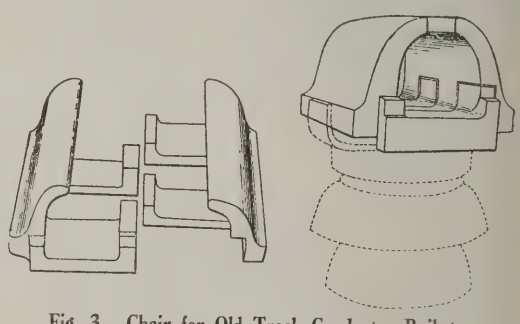

Fig. 3.—Chair for Old Track Conductor Rail.

less than 3,000 or 4,000 V at the moment of the fusing of the cable, and it was in the neighbourhood of 1,500 V at the point where the arc went out.

Certain steps have been taken to deal with this particular class of breakdown, in the first place by sectionalising the l.p. network, so as to lessen the likelihood of failure, and secondly by providing means whereby the current can be removed from the defective section at a moment's notice. As a first step, the District Railway was separated from the tube lines by dividing the sub-station bus-bars in joint sub-stations. Later the tube lines were divided. A series of lamps with the middle point earthed is provided in the traffic controller's office for each of the lines, and the presence of an earth on either the positive or negative side of the system is indicated by a change in the brilliancy of the lamps. Recording voltmeters are installed at a few places to record the voltage between the negative and earth, and are placed in such positions as to be frequently under observation. The types of conductor rail installed on three of the railways are shown in fig. 2. One of the reasons for the adoption of the rectangular rail on the London Electric Railways is the small amount of space available for the positive rail

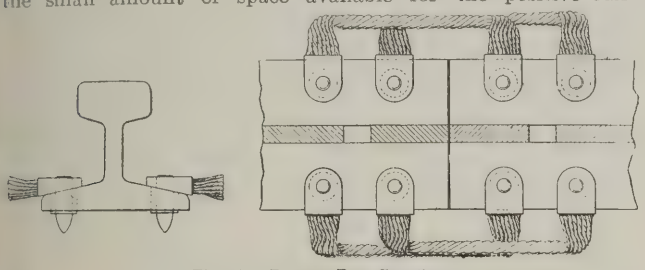

Fig. 4.—Present-Day Bonding.

in the tubes. Special soft steel containing about 0.08 per cent. of carbon is used for conductor rails, this having a resistance about seven times that of copper of equal cross-sectional area, or approximately 0.03 ohm per mile for the 100-lb. rail. A low manganese content in the steel is also necessary; in fact, it can be said that a maximum of iron and a minimum of the other constituents is required to obtain high conductivity.

The necessity for good conductivity deserves more attention than has been given to it. The resistance of individual rails in a consignment varies not infrequently from 6½ to 7½ times the resistance of copper by volume. It is difficult to explain what brings about such variation of the resistance, and chemical analysis has not made the reason clear. It is probable that the exercise of special care in the manufacture of the material, *e.g.*, in the temperature of rolling, would enable a better conductivity to be obtained. Commercial pure iron can be obtained having a resistance of about 6.2 times that of copper. This improvement of some 15 per cent. in conductivity, however, involves 30 per cent. extra cost, so that in situations where only conductivity is concerned, it is clearly cheaper to obtain greater conductivity by the adoption of heavier ordinary rails.

The flat-bottom rail allows of a better alignment at the joint, due to the provision of fishing angles, and is less liable to overturn; the bonding is also easier to arrange. On the other hand, it exposes a large surface for corrosion. The rectangular section would at first sight appear to be easier to roll, but the groove provided for fishing purposes does away with the otherwise simple section. The channel-section rail is more stable in position than the rectangular one, but its supports and connections are not so readily inspected, and bending is more difficult.

Old running rails, bull-head section, have been used as current rails in sidings and other places, where conductivity is of little account, with the object of lessening the cost. The rails are held in position by a special cast-iron chair, fig. 3, made in two sections, which rests upon an ordinary negative or short insulator for the positive rail, a specially low insulator being used for the negative. The two halves clamp over the two sides of the rail and automatically interlock when in position. The rail is placed head downwards, as the bottom of an old track rail provides a better surface for the shoe. The conductivity of the current rails is measured annually between the sub-stations by connecting through the adjoining tracks at those points and passing a test current through the rails. Tests on the track are carried out on any section length where the conductivity is less than 95 per cent. of that of a continuous rail, due allowance being made for the reduction of the cross-section of the rail by corrosion and wear. The tests on the track are first carried out by sectionalising the rail at cross-overs and other convenient gaps, and finally at individual bonded joints.

The instrument used for testing individual joints is arranged to measure the voltage-drop along a yard length of conductor rail containing the joint, and in comparison at the same instant the drop along an adjoining yard of rail, which naturally does not contain a joint; this comparison forms a measure of the efficiency of the bonded joint. In some cases the bond conductivity has been found to be as low as 80 to 85 per cent. of that of a continuous rail, but a figure less than 95 per cent. is now exceptional.

Pin bonds are used throughout the Underground Railways, the head being drop-forged to the cable connection, and a steel pin being driven in to expand the head in the hole of the rail. Originally two short bonds and two long ones per joint were installed, but the breakages of short bonds were very heavy. Bonds of the same length are used now, arranged as shown in fig. 4. To prevent the collector shoes bridging across the gap between a live and dead rail, a short piece of track, "train section," is provided between the two sections; this is a little longer than the longest train and separately fed from the sub-station bus-bars. The "train section" is switched off from the sub-stations whenever the adjoining section is made dead for any purpose. The present practice on new lines is to fit a special "gap" indicator a few feet in the rear of the actual section gap, the latter consisting of a piece of hard-wood, 2 ft. long. The indicator is a light signal of a special type, normally being extinguished; but when the section ahead is for any reason dead, three small red lights are automatically shown, notifying the driver that it is dead.

Protection against accidental contact with the conductor rails was originally provided by means of wooden creosoted planks secured on each side of the rail. After a time it was decided to remove the inside protection plank, and later still permission was obtained to remove the whole of the protection planking, except at certain places where an outside plank only is now provided.

Separate ramps, 4 ft. long, are provided at the rail-ends where the rails are not continuous, as opposed to turning down the ends of the conductor rails. The cast-iron ramp, fig. 5, whilst introducing another joint, has the distinct advantage, in that it has a wide top surface, of the possibility of the narrow shoes getting down by the side of the rail being materially lessened. The ramps are secured to the conductor rail by fishplates, but are not bonded. They serve for both facing and trailing positions, having a slope of about 1 in 20. Cases have occurred of rails being overturned, due either to atmospheric action pushing the rails out of position, or to defective train shoes getting down by the side of the rail. In several places hard-wood blocks of stout construction have been installed at rail ends, fixed to the sleeper, to break away hanging shoes.

(To be concluded.)

Discussion.

Mr. ROGER T. SMITH pointed out that the Admiralty clause in connection with the adoption of the third and fourth rails referred to private apparatus at the Greenwich observatory which had since been shifted to the wilds of Kent. He thought that the practice of putting the jumper cables above ground would have the approval of all engineers. The Underground Railways had taken advantage of the unique opportunity of comparing the abrasion in the tubes and in the open. He was particularly interested in the conclusions arrived at to neither clean the insulators nor paint the rails. It was a pity

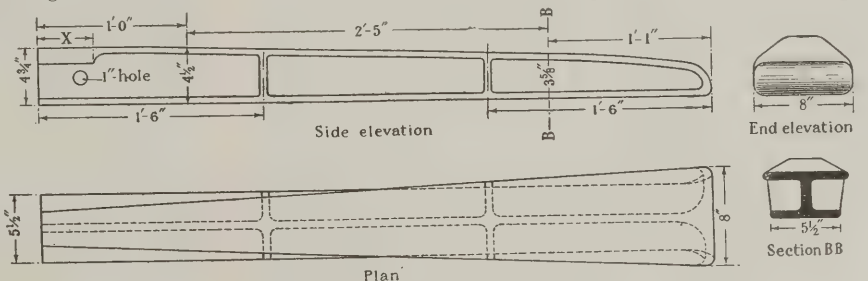

Fig. 5.—Details of Rail-End Ramp.

that no illustration was given in the paper of the method of fixing the insulators on the sleepers. Security and ease of maintenance were of the greatest importance on railways, and it would be generally agreed as more important to run the supply cables above ground than buried; but it must be remembered that about 15 per cent. of the carrying capacity of the cables was lost in the former case. Arising out of the 600-V choice was the question of a standard voltage; the arrangement of two current tracks was ideal in many ways, but it must be possible, when main-line electrification came along, to run the trains on all the lines.

Sir JOHN ASPINALL referred to the work of the committee on vibration which laid the blame for vibration on unsprung cars and on the rails. He thought the rails had nothing to do with it. He did not understand the suggestion that vibration accelerated corrosion. He had found that the third rail did not corrode as rapidly as the fourth, due probably to the vibration of the shoe, or perhaps because the third rail threw off the moisture. He suggested that vibration preserved the rails from corrosion. On the Liverpool and Southport railway, which was electrified in 1904, snow cars were sent out each morning in snowy weather, and they had had no trouble. On the Manchester and Bury railway, which was electrified in

1916, they were using 1,200 V, and it was necessary to protect the conductor rail more carefully; a special shoe was employed which fitted over the side of the rail, and no trouble had been encountered with snow. They also had first put the cables in the ground, but had after a few years took them up and put them on posts above ground. He suggested that by employing special rails and tires the Underground Railways could have got over the difficulty of the sharp curves, although this would have been costly. He had found that the effect was worse with the lighter cars.

Mr. G. BROUGHALL said that one reason in support of the third- and fourth-rails system was that it facilitated interconnection. With regard to the voltage surge trouble, he had found it most marked in dry weather. On his undertaking the trouble had been got over by installing electrolytic arrestors in the sub-stations. He had had no difficulty in getting rails of higher conductivity than those referred to by Mr. Cooper. He had found the use of the short bonds quite satisfactory if proper attention was given to the rail joints. The practice on his line was to anchor the rails every 100 ft. He favoured the use of ramps, which could be made of scraps of conductor rail.

Mr. R. A. MACMAHON saw a possible objection to arc bonding of the rails if Mr. Cooper's suggestion as to the weakening effect of burns was correct. It was the Swiss practice to arc bond the head of the rail at the side. The conditions on the Geneva-Lausanne line were similar to those on the Underground Railways, but no trouble had arisen from the arc bonding. He had difficulty in understanding the time lag between the faults which arose as a result of the pressure surges. Perhaps the subsequent faults caused secondary surges. Testing for similar conditions on a Paris system had been effected by flashing over on the sub-station rotaries, and the results were in opposition to the suggestion of condenser effect; oscillations did not occur.

Mr. P. BOULTON thought that the surge troubles might be due to the tendency to regard the negative conductor as unimportant. Tests he had carried out on conductor rail showed a resistance of 6.5 times that of copper, and the carbon and manganese contents were only 0.05 and 0.13 respectively. Commercial iron could be obtained at present with a resistance of only 6.2 times that of copper; it would be advantageous to use iron, due to its greater resistance to corrosion. There were also alloy-steels at present available with higher conductivities than those given. The wear on the third rail might be due to the fact that the positive repelled moisture.

Mr. COOPER, in reply, said that the fixing of the insulators to the sleepers was effected by malleable-iron clips secured to the sleepers by galvanised-iron screws. The square composition insulators afforded easier fixing. With regard to vibration, the surface of the track rails was never true, and it had been found that the amount of vibration depended on the speed. Manganese rails gave the best results. There was little wear on the track rails in the early days, due to the soft material which was used for the brake shoes. The discharge devices referred to by Mr. Broughall had been tried, and it had been decided that nothing was to be gained by their introduction. He strongly favoured the use of the giant strain insulator; it was simple and inexpensive. With regard to the suggestion *re* arc bonding, he thought that two important points ought to be considered—the intensive nature of the arc, and the favourable position on the rail at which it was applied. The end of the rail was not subjected to very heavy stresses. He thought that the possible flickering of the shoes on the negative rail on the curves might be the cause of some of the short circuiting.

The Electricity (Supply) Act, 1926.

A Summary of its Provisions.

(*Concluded from page* 37.)

* 28.—(1) The Board may issue stock (to be called Central Electricity Stock).

(2) All such stock, and interest thereon, shall be charged on the undertaking and revenues of the Board.

(3) Any stock created by the Board shall be dealt with according to regulations made by the Minister of Transport with the approval of the Treasury.

29.—(1) The Treasury may guarantee the payment of the interest and principal of any loan proposed to be raised by the Board: provided that the aggregate amount of the loans so guaranteed shall not exceed thirty-three and a half million pounds.

(2) Such sums as may be required by the Treasury for fulfilling any guarantees under this section shall be charged on the Consolidated Fund.

(3) The repayment of any sums so issued out of the Consolidated Fund, together with interest thereon, shall be a charge on the undertaking and revenues of the Board next after the principal and interest of the guaranteed loan, and any sinking fund payments for the repayment of the principal thereof.

(5) The Treasury shall so long as any such guarantees are in force, lay before Parliament every year a statement of the guarantees given, and an account of the total sums issued or paid in.

30.—The Board shall prepare an annual statement of accounts, which shall be audited by auditors appointed by the Minister of Transport, and shall be published at a price not exceeding one shilling a copy.

Miscellaneous Provisions.

31.—(1) On a power company commencing to receive a supply of electricity from the Board, the Minister of Transport may revise the maximum prices authorised under the special Act of the company to be charged by the company for supplies, other than supplies in bulk to authorised undertakers, and may revise the standard prices fixed by such Act; on such revision regard shall be had to any change in the cost of electricity to the company attributable to this Act.

(2) Where a special Act authorises such a power company to make good any deficiency in any previous dividends which have fallen below the prescribed standard rate of dividends, the Electricity Commissioners may, by special Order, make provision for the repeal or limitation of any such authorisation.

32.—(1) Where any company, being authorised undertakers and not being a power company, receive a supply of electricity from the Board, the Electricity Commissioners may, having regard to any change in the cost of electricity to the company attributable to this Act, by special order make provision as to the relation between the charges to be made for electricity and the dividends to be paid by the company.

(2) The provisions of this section shall not apply to any London company.

33.—The Board and any Joint Electricity Authority may adopt the provisions of the Local Government and Other Officers' Superannuation Act, 1922.

34.—(1) Where any tree or hedge obstructs the construction, maintenance, or working of any electric line, the authorised undertakers may give notice to the owner or occupier of the land requiring him to lop or cut it, subject to the payment of expenses reasonably incurred.

(2) If within twenty-one days the requirements of the notice are not complied with, the authorised undertakers may cause the tree or hedge to be lopped.

(3) If, within twenty-one days, the owner or occupier gives a counter notice, objecting to the requirements of the notice, the matter shall be referred to the Minister of Transport, who may make such order as he thinks just.

(4) The authorised undertakers shall issue instructions that trees and hedges shall be lopped or cut in a woodmanlike manner, and shall make good any damage done to the land.

(6) Where it is necessary to fell any trees, this section shall apply.

35.—(1) Unless otherwise agreed, nothing in this Act shall affect the powers of a county council to rebuild or repair any bridge upon which any work by this Act authorised shall be constructed. If the county council requires to carry out such works, and it is necessary temporarily to remove mains and other electrical appliances belonging to the Board from a bridge, the Board shall do the work at their own expense. Any dispute shall be determined by an arbitrator.

Amendments of the Electricity Supply Acts.

36.—For section five of the Electricity (Supply) Act, 1919, an amended section is substituted authorising the Electricity Commissioners to constitute electricity districts, to formulate

* The Act, in its final form, was issued last week, and contains two new clauses, numbered 19 and 24. The Sections on p. 37 of our last issue should therefore be renumbered as follows:—For 19 to 22 read 20 to 23; for 23 to 25 read 25 to 27. EDS.

improvement schemes, and to establish joint electricity authorities; and to hold local inquiries and hear representations with regard to the schemes.

37.—A scheme constituting a joint electricity authority may contain provisions for the carrying-out by the authority of any works for the development of the supply of electricity within the district; and for the subsequent alteration of the constitution of the authority.

38.—The power under the Act of 1919 to make orders altering previous orders shall include power by such subsequent order to constitute a joint electricity authority.

39.—Where a special order is made authorising a company to supply electricity, and the area of supply includes the whole of the districts of two or more local authorities:

(*a*) The purchasing authority may within six months after the expiration of a period of fifty years from the date of the confirmation of the special order, or such shorter period as may be specified, and within six months after the expiration of every subsequent period of ten years, by notice in writing require the company to sell their undertaking upon the payment of a sum equal to the capital properly expended on land, buildings, works, material, and plant in use or available at the time, less depreciation according to such scale as may be determined by special order:

(*b*) The Minister of Transport shall determine any questions which may arise.

(*c*) The purchasing authority—

(i) where the area of supply is situate wholly or mainly within the district of a joint electricity authority, shall be the authority: Provided that, if the area is situate partly within the district of one joint electricity authority any partly in that of another, the right of purchase shall be exerciseable by one of those authorities, or shall be divisible between them, as the Electricity Commissioners may determine;

(ii) in any other case, shall be the local authorities for the districts in which any part of the area of supply is situate, acting through a joint committee or joint board.

(*d*) Sections two and three of the Electric Lighting Act, 1888, shall not apply.

40.—Where a company, being authorised undertakers, have ceased to generate electricity, and are taking a supply in bulk from the Board, or from any other source, and the undertaking of the company is purchased by a local authority, in addition to the sum payable to the company under the Act of 1888, or any local Act or Order, there shall be paid a sum representing the capital properly expended upon plant rendered unsuitable for use by reason of the taking of bulk supply, after deducting such amount as the company, in the opinion of the Electricity Commissioners, ought properly to have written off. Any question arising under this provision shall be determined by the Electricity Commissioners, whose decision shall be final.

41.—Where any right to purchase the whole or any part of an undertaking is vested in a local authority (including a joint electricity authority), the authorised undertakers may at any time within ten years before the date of purchase enter into a contract with the local authority to alter the terms of purchase upon conditions to be agreed between the parties with the approval of the Electricity Commissioners.

42.—(1) The charge made to any ordinary consumer may consist of a periodical fixed or service charge and in addition a charge for the actual quantity of energy supplied, or for the electrical quantity contained in the supply. The fixed charge may include rent in respect of any meter and any electric lines, fittings, apparatus and appliances provided by the undertakers on the premises of the consumer, whether let on hire or hire-purchase terms to the consumer or otherwise.

43.—(1) The Schedule to the Electric Lighting (Clauses) Act, 1899, and similar provisions, shall have effect subject to the amendments specified in the Fifth Schedule to this Act.

44.—(1) Where applications for consent to the placing of an electric line above ground and wayleaves have not been agreed with the owners or occupiers of any land proposed to be crossed, the undertakers may serve notice of their proposal, and the Minister of Transport may proceed concurrently, under sections twenty-one and twenty-two of the Electricity (Supply) Act, 1919.

(3) Where an application has been made for consent to the placing of an electric line above ground, and representations are made that the line will prejudicially affect any ancient monument, shall take into consideration any recommendations made to him by the Commissioners of Works.

45.—Expenses reasonably incurred by authorised undertakers in reconnecting any electric line which may have been lawfully cut off by default of the consumer may be recovered by the authorised undertakers.

46.—The owners of any railway generating station may supply electricity therefrom to the owners of any other railway generating station upon agreed terms and conditions, with the consent of the Electricity Commissioners, who may authorise the breaking-up of roads, &c. The provisions of the Electricity (Supply) Acts, so far as they relate to the protection of the Postmaster-General, shall apply to any works for the supply of electricity under this section.

47.—Authorised undertakers may supply electricity for traction to the owners or lessees of a railway, dock, harbour, or canal undertaking situate partly within and partly without their district, subject to the consent of the Minister of Transport, for any purposes of such undertaking, whether within or without the district or area of supply.

48.—(1) Subject to the provisions of this section, a joint electricity authority and any local authority authorised by special Act or by Order to supply electricity may sell electric lines, fittings, apparatus, and appliances for lighting, heating, and motive power, and for all other purposes for which electricity can or may be used (in this section called "electric fittings"), and may install, connect, repair, maintain, and remove the same, and with respect thereto may demand and take such remuneration or rents and charges, and may make such terms and conditions as may be agreed upon.

(2) The exercise of the powers of this section shall be subject to the following restrictions:—

(*a*) The joint electricity authority or local authority shall not manufacture electric fittings unless expressly authorised to do so by special Act or Order;

(*b*) The joint electricity authority or local authority shall not sell electric fittings except—

(i) to a consumer or a person who intends to be a consumer of electricity supplied by them; or

(ii) to a contractor who requires such fittings to enable him to supply them to a person who is, or intends to be, a consumer of electricity supplied by the joint electricity authority or local authority;

(*c*) The prices charged by a joint electricity authority or a local authority for the sale of any electric fittings shall not be less than the recognised retail prices, unless the sale is to a contractor, in which case the prices shall not be less than the recognised trade prices, and if any question shall arise as to what are the recognised retail or trade prices of any electric fittings, that question shall be determined by the committee appointed as hereinafter provided;

(*d*) Every such joint electricity authority or local authority shall so adjust the charges to be made by them under this section as to meet any expenditure incurred by them in the exercise of the powers of this section (including interest upon and sinking fund charges in respect of money borrowed for the purposes of this section);

(*e*) The total sums received and expended by any such joint electricity authority or local authority under this section in each year, including interest upon and sinking fund charges in respect of money borrowed for the purposes of this section, shall be shown separately in the published accounts of the electricity undertaking of such joint electricity authority or local authority.

(3) The Electricity Commissioners shall appoint a committee comprising representatives of associations representing local authorities who are authorised undertakers, contractors, and persons engaged in the business of making and persons engaged in the business of selling electric fittings, such committee to be appointed after consultation with those associations, and that committee shall determine any question which may be raised under this section as to the recognised retail or trade prices of any electric fittings and shall advise and assist the persons concerned as to the method of giving effect to the provisions of this section.

(4) The purposes of this section shall be deemed to be purposes for which the joint electricity authority or the local authority may borrow money.

(5) In this section the expression "contractor" means a person engaged in the business of selling and installing electric fittings.

49.—Where the owners of a gas undertaking apply for a Special Order, and the Electricity Commissioners are unable or unwilling to make the Order, the Commissioners shall refer the matter to the Minister of Transport, and thereupon the Minister may, if he thinks fit, make the Order.

50.—Minor amendments.

General.

51.—(1) For the purposes of this Act, unless the context otherwise requires—

The expression "generating station" has the meaning given thereto by section thirty-six of the Electricity (Supply) Act, 1919, and not the meaning given thereto by section twenty-five of the Electric Lighting Act, 1909.

The expression "transmission line," when used with reference to a line which is a main transmission line within the meaning of the Electricity (Supply) Act, 1919, shall include all such works as are mentioned in that definition, and, when used with reference to a line which is not such a main transmission line, shall include any works necessary to and used for the control of the transmission line and the transmission of electricity thereby and the buildings or such part thereof as may be required to accommodate those works.

The expression "owners" in relation to a generating station includes lessees or occupiers of the station operating the station.

(3) If the price for a supply of electricity is under this Act to be the cost of production adjusted according to the load factor, the adjusted price shall be the sum of the following items:—

(*a*) the number of kilowatts of maximum demand in each month of the year of account multiplied by the fixed kilowatt charges component;

(*b*) the number of units supplied to the undertakers during the year of account multiplied by the running charges component.

For the purposes of this sub-section—

The number of kilowatts of maximum demand for any month shall be deemed to be twice the largest number of units of electricity supplied to the undertakers during any consecutive thirty minutes in that month: provided that, if the number of kilowatts of maximum demand so ascertained shall be less than the number of kilowatts of maximum demand in any previous month of the same year of account, payment shall be made on the higher number; and

The "fixed kilowatt charges component" and "running charges component" shall be ascertained in accordance with the rules contained in the Seventh Schedule to this Act.

(4) If the price for a supply of electricity is under this Act to be adjusted according to power factor or otherwise ascertained, such adjustment or ascertainment shall be made in accordance with regulations to be prescribed by the Electricity Commissioners.

(5) Where for the purposes of this Act it is necessary to calculate what the cost of taking a supply of electricity from the Board over a number of years will be, in making the calculation it shall be assumed that the price of fuel and the rates of wages remain constant.

Schedules.

The First Schedule provides that the price of a generating station or main transmission line shall be the amount expended, less depreciation on a scale fixed by special order, and shall be subject to arbitration.

The Second Schedule gives rules for determining the cost of production of electricity at selected stations.

The Third Schedule specifies the authorised charges and allowances in respect of transmission lines used for giving bulk supply to authorised undertakers.

The Fourth Schedule is an adaptation of Section 16 of the Electricity (Supply) Act, 1919, as amended by Section 21 of the Electricity (Supply) Act, 1922, relating to compensation of employés for loss of employment or other injury due to the working of this Act.

The Fifth Schedule contains amendments of the schedule to the Electric Lighting (Clauses) Act, 1899, regarding the disposal of surplus funds, and provides that the amount which may be applied in aid of the local rate in any year shall not exceed one and a-half per cent. of the outstanding debt of the undertaking; and after March 31st, 1930, no sum shall be paid in aid of the local rate unless the reserve fund amounts to more than one-twentieth of the aggregate capital expenditure on the undertaking.

The period of notice of works in streets is reduced, in the case of service lines, to seven days.

The Sixth Schedule contains minor amendments of the Electricity (Supply) Acts, 1882-1922.

The Seventh Schedule gives rules for determining the fixed kilowatt charges component, and the running charges component; the cost of production, ascertained in accordance with the second schedule to the Act, is to be allocated as between fixed costs and running costs in accordance with regulations prescribed by the Electricity Commissioners.

Correspondence.

The "H" Type of Cable.

We are glad Mr. G. H. Nisbett has at last experienced some amusement out of such a subject as super-tension cables. He is apparently anxious to reciprocate and be amusing by indicating to all and sundry that his company has said-from its pedestal the last word on this subject. Of course, he is not serious, but the position in which the authorities who have the responsibility of developing electricity supply under the Electricity Act are placed is quite serious, and it must be a matter of some satisfaction to them that there is now available in this country the supply of a super-tension cable which has been proved in many countries on the Continent the most satisfactory three-core super-tension cable to install.

To-day the "H"-type cable holds the field, and one is almost tempted to suggest that some of its detractors are a little bit influenced by "political reasons."

The last word is always with the user, and there is ample evidence that he is by no means convinced that the three-core belted-type super-tension cable supplied in the past, even by such an eminent firm as Mr. Nisbett represents, is a satisfactory job, either electrically or mechanically.

To deal with some of Mr. Nisbett's criticisms of the "H"-type cable from a manufacturing point of view, he says: "If a cable is faulty in manufacture and consequently contains air or vacuous spaces in the insulation" . . . This is evidently written for the benefit of those who are not intimately conversant with cable making. In a properly organised factory, and given the right materials and equipment, with intelligent workpeople, vacuous spaces are hardly possible in the insulated cores. It is on the outside of the cores that these vacuous spaces occur. With the "H"-type cable they can be neglected, but in the case of the belted type they constitute a very serious danger, and even in the case of a perfectly manufactured belted type of cable such spaces would be created by handling during the process of laying. It has been proved beyond doubt that the weakness of the belted-type cable lies between the insulated cores, the belt, and the packings.

The statement that the three-core "H"-type cable is essentially unmechanical because of the absence of a paper binding belt is sheer nonsense, but, in any case, an efficient egg-shaped cable is to be preferred to an inefficient circular product.

Further, the suggestion that the compound used for impregnation will leave the cores to fill vacuous spaces, depends entirely upon the compound used, and the reproduction of the conditions under which impregnation takes place, the latter a very unlikely event; on this point it is interesting to note that the metallised paper used for "H"-type cables admits the impregnating compound through minute apertures under external pressure, and is in itself an important preventive measure against leakage.

We do not share Mr. Nisbett's opinion that "H"-type cable is more costly to manufacture. On the contrary, and in spite of the quite reasonable royalty, we state that its cost is no greater than that of the belted type.

The Macintosh Cable Co. has not decided upon the adoption of the Hochstadter specification without considerable investigation, experiment, and thought for the future.

The Macintosh Cable Co., Ltd.
T. MARTIN-HARVEY, *Managing Director.*

London, *January 3rd*, 1927.

The letter in your issue of the 31st ult. from Mr. G. H. Nisbett, of British Insulated Cables, Ltd., scarcely does justice to the "H" type of cable.

In comparing the respective diameters of the two types of cable, *viz.*, "H" type and belted type, your correspondent assumes that for the belted type the insulation between cores for a 33,000-volt cable is 0.60 inch and 0.35 to earth, whereas the "H"-type cable is to have 0.7 inch insulation between cores, giving also 0.35 inch to earth.

It is not fair to assume that the insulation to earth should be the same for each type of cable, for the insulation in the case of the "H" type is much more evenly stressed and strictly radially, whereas the belted type is subjected to a rotating electrostatic field. Further, with the thickness of insulation given for the belted type, the outer belt is only 0.05 inch in thickness, which one would scarcely describe as "a substantial binding belt," and which would not withstand bending without having torn papers, a few of which would render it useless.

The main fact which the critics of the "H"-type cable are usually pleased to ignore is that whatever the maximum voltage gradient one cares to work to for a belted-type cable, a higher maximum gradient can be worked to for an "H"-type or single-core-type cable with equal safety, entirely on the ground of the even and radial distribution of stress, always assuming, of course, equally good quality of insulation.

I do not agree that the metal screening in the "H"-type cable does nothing to help ionisation troubles. It is well established by experience that single-core cables, although not perfectly impregnated or free from air or vacuous spaces, do not suffer so much as 3-core, belted-type cables from this cause, and that even with the latter type of cable the effects of ionisation are seldom seen in the core insulation, but almost entirely at the boundary of the centre filler where tangential stress is present.

While it is true that the "H"-type cable is a very old device, the reason for its present vogue is not far to seek, and must be well known to your correspondent.

C. Vernier.

Newcastle-on-Tyne, *January 5th*, 1927.

Cablon, Limited, the owners of the "H"-type patent in this country, have, as you are aware, so far made no public announcement of the claims in regard to the merits of this type of cable. The following leading cable makers in this country, namely:—

Callender's Cable and Construction Co., Ltd.
The Enfield Cable Works, Ltd.,
W. T. Henley's Telegraph Works Co., Ltd.,
The Macintosh Cable Co., Ltd.,
Pirelli-General Cable Works, Ltd.,
Siemens Bros. & Co., Ltd.,
Standard Telephones and Cables, Ltd.,

have, after careful research and consideration, applied for and obtained licences from Cablon, Limited, and others have advised us that they are considering applying for licences.

We feel, therefore, that it is incumbent upon us to reply to the criticisms Mr. G. H. Nisbett has made in his letters in your issue of December 31st, and in the issue of the *Electrical Times* of December 23rd.

(1) Mr. Nisbett alleges that the diameter of the "H"-type cable is greater than that of the belt type. This is incorrect. Owing to the better distribution of the electric stress much thinner insulating walls can be used in "H" cables than in belted cables, and as the foil coating only occupies a negligible amount of space any increase of diameter is avoided.

(2) The higher carrying capacity of "H"-type cables is due to their lower thermal resistance. This is brought about partly by the presence of metal paths from the centre of the cable to the lead and partly by the reduced thickness of the insulating walls. The actual superiority of this cable from the current-carrying point of view depends naturally on the thermal resistance of the soil, but in normal ground the figure mentioned, *viz.*, 8 per cent., is a conservative figure.

(3) The "H"-type design (including royalties) does not increase the cost of the cable over that of an ordinary super-tension type, and there are no increased difficulties in drying and impregnating, over and above those ordinarily encountered. On the contrary, the smaller dielectric thickness is more easily penetrated than a thick layer would be.

(4) With regard to Mr. Nisbett's statement that experience has shown that the ratio of power factor relative to voltage is an unreliable index of the dependability of a cable, Mr. Nisbett appears to have overlooked the fact that, apart from the difficulty of producing an approximate constancy of power factor at different voltages in belted-type cables, belted-type cable, after repeated heating and cooling, rapidly loses this property. On the other hand, it is an established fact that "H"-type cables, when built with no more than ordinary care, have initially a closely constant power factor at different voltages, and retain this after repeated heating and cooling.

(5) It has never been contended that "H"-type cable removes all possible difficulties incidental to the use of super-tenson underground transmission. It is, however, proved that the absence of tangential stresses and the lack of need for maintaining anything like perfect homogeneity in the filling spaces constitutes a great advance in the hitherto generally accepted type of cable.

The fact that 26 leading cable makers on the Continent of Europe, in America, and Japan have acquired licences and are successfully making "H"-type cables, and the rapidly increasing demand for "H"-type cable, based on the satisfactory performance of those laid during the past three to four years, are conclusive proof of the merits of the "H"-type cable.

Cablon, Ltd.
W. L. Smith, *Secretary.*

London, *January 4th*, 1927.

It would seem that some reply is due from us to the three communications in your last issue, in which comment is made on our letter in your issue of December 31st, and we therefore venture again to trespass on your space.

Mr. C. E. Watson accuses us of attempting to silence opposition by making a loud noise, but surely this is an inversion of the facts. Our letter was a mere whisper compared with the trumpeting that the Press has lately allowed to the advocates of the "H"-type cable.

These gentlemen write in such a way as to lead your readers to believe by inference that all the super-tension cable hitherto made has been a failure, and that it is only when they start to manufacture "H"-type cable that the millennium will be reached. Such an impression left unchallenged would do harm to the British cable industry, which has hitherto held such a deservedly high reputation.

Now there are many miles of the belted-type cable that have been at work successfully at 33,000 volts for years, both at home and abroad, and only comparatively insignificant quantities of the screened type have recently been put into service. Such trouble as has occurred with the belted cable has (so far as we know) been confined to abnormal cases of laying or handling, and there is no evidence that the "H"-type cable would have behaved any better under similar circumstances.

Mr. Watson questions our statement that the screened cable is necessarily more costly than the belted, but may we point out that the stresses on the insulation at the point of minimum thickness between any conductor and lead in a three-core cable are practically radial and the same in the two types, so that, making no allowance for the better impregnation of the belted-type cable, and assuming like qualities of material, both types need the same thickness of insulation to earth. The screened type *must* have twice this thickness between conductors, whereas the belted type *may* and does have less, so that the screened type must be the more costly to manufacture.

As to the mechanical weakness of a type of cable involving the use of three heavy insulated cores, necessarily laid up with a long lay and only lightly bound together, then sheathed with a ductile metal such as lead, your readers will be able to judge. Surely if it is a first essential, as seems to be admitted by all parties, that the lead covering shall be as completely filled as possible, it is desirable to see that there is no possibility of the stretching of the lead after it has once been applied.

In answer to our statement that the curves shown in your issue of December 17th are unfair to the belted-type cable, Mr. Watson points out that they do show the comparative values of the two methods of construction. Here we are in some measure of agreement because we readily admit that, with a badly-constructed cable, the use of a core screen will improve the p.f. tests, although we deny that such use will necessarily turn a bad cable into a good one. However, the point we wished to make was that a well-made belted-type cable does not need a screen, at least for working pressures up to 33,000 volts.

In the matter of relative carrying capacity, Mr. Watson claims for the screened-type cable increased heat conduction due to thinner walls, the impossibility of which we have already pointed out; others have claimed the same thing for the metal sheathing, and still others for the absence of ionisation losses. We can only say that all these causes put together only result in a small percentage difference, if the comparison is made between a *good* belted cable and a *good* screened cable.

Mr. G. H. Nash is much more modest in his claims for the "H" cable than are some other advocates, and we are glad to see that he deprecates over-enthusiasm and the claiming of too much. He agrees that the screened cable is more difficult to dry and impregnate, but says the difficulty can be overcome. He admits that the tangential stresses are within the capabilities of a belted cable on first manufacture, but says that they do not remain so in service.

Any deterioration that may occur in a cable after leaving the factory, and during handling, can only come about because of mechanical causes, and certainly a cable with a heavy belt must be less liable to distortion than a screened cable, necessarily practically without one.

Mr. Nash says that the belted-type cable shows a sharp rise in power factor on cooling after a heat run and the "H" type shows practically no change; this is no doubt true for some makes of belted cable, and conversely untrue for some makes of screened cable.

Mr. F. Richardson asks us why we criticise the relative power-factor and voltage curves as published in the Electrical Review of December 17th, in view of our statement in the *Electrical Times* that power factor relative to voltage is an unreliable index of the dependability of a cable. The answer is obvious, namely, that we were criticising a comparison made by someone else, and, in order to do so, had perforce to accept his premises.

For the rest of his letter, Mr. Richardson contents himself with a general statement somewhat to the effect that anybody who is anybody is making the "H"-type cable, that it has been successfully used for years past, &c.—quite in the best advertising style.

But the facts are: that throughout the world a much greater length of the belt-type 33,000-volt cable is working successfully to-day than there is of the "H" type; that there are in this country belted cables of our manufacture that have been continuously alive for the past five years without a single cable fault; and that many of the more experienced makers of super-tension cables are still manufacturing cables of this type.

We hope the subject matter of our letter will excuse its length.

British Insulated Cables, Ltd.
G. H. Nisbett, *Director and Engineer.*

Prescot, *January 10th*, 1927.

Electric Ovens.

Some little time ago the gas journals announced that electric ovens were being given up in Switzerland, owing to the fact that they generated ozone, which damages bread and pastry. It will be very interesting to hear if any of your readers have information on this subject, as I find that it is of great importance to large users of electric ovens.

Oven.

January 4th, 1927.

The Necessity for Higher Voltages.

I was particularly pleased to have it publicly emphasised at the I.E.E. meeting of December 16th, by an engineer of such reputation as Mr. J. S. Highfield, that higher voltages were bound to come, because the number of cables required to conduct great powers away from the generating station was too serious to contemplate if this were not done.

This is the more gratifying because, about two years ago, I went to the trouble of writing to several of the leading engineers of the country in order to bring home to them that higher voltages were not only necessary when extremely long distances had to be covered, *but also when very large bulks of power had to be transmitted* over what would be considered *short distances.*

The consulting engineers, it would appear, are waiting for the cable makers, and the cable makers hesitate to worry themselves about anything over 66,000 volts so long as they can carry out the great bulk of the distribution work at 66,000 volts.

Now that I have secured such eminent supporters as Mr. Highfield and (I was pleased to note, about a year ago) Mr. Gregory of Newcastle, I feel that I am no longer quite "a voice crying in the wilderness."

A. M. Taylor,
Major, S.O.2.

Birmingham, *January 7th*, 1927.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

ALDERSHOT.—Additional 104 houses, for the T.C.; borough surveyor.

AUSTRALIA (PERTH, W.A.).—Group of buildings for the Administration of Perth University (£150,000).

AYRSHIRE.—Extension of Prestwick Higher Grade School (electric light and central heating); W. Reid, Master of Works, Education Offices, Ayr.

BILSTON.—Kinema, High Street; W. Hurley Robinson (A. Wood's Picture Halls, Ltd.).

BIRMINGHAM.—Year's school programme (£234,000); Education Committee.

BOLTON.—Electric driving plant for screening and salvage plant; Cleansing Committee.

BRAZIL.—Press reports state that Platt Bros., of Oldham, and John Hetherington & Sons, of Manchester, have received orders for 100 looms and spinning and other machinery for a new mill in Brazil.

BRANSTON (NEAR BURTON-ON-TRENT).—Artificial silk factory; Rock Investment Co., Salisbury House, London Wall, London, E.C.2.

BRECHIN.—Cinema for Brechin Cinema, Ltd. (heating and ventilation); secretary, 5, Swan Street, Brechin.

BRISTOL.—Palais de Danse, Queen's Road, Clifton; C. F. W. Dening, architect.

BROWNHILLS (STAFFS.).—Isolation hospital, for the U.D.C.; surveyor.

BURNLEY.—Housing scheme (88), Stoops Farm Estate; borough engineer.

CANADA (ALBERTA).—New wing at the Banff Springs Hotel (£300,000).

CARDIFF.—350 houses; city engineer.

CHELMSFORD.—Electricity pumping scheme at swimming baths; borough engineer. Electricity for power at Mills; T. D. Ridley & Sons, Ltd.

CHELTENHAM.—Eighty houses, Hanks Estate; borough engineer.

CHORLEY.—Works, Bolton Road (£40,000), for Leyland Motors, Ltd.

CROMPTON.—Housing scheme (78), Twingates and Smallbrook sites; F. T. Jones, engineer, Town Hall.

DALTON-IN-FURNESS.—Central school; director of education, County Education Offices, Preston.

DERBY.—Large extensions to works for the Combustion Engineering Co. Extensions to Little Chester Sanatorium, for the T.C.; C. A. Clews, borough surveyor, Babington Lane.

DEVIZES.—Additional housing scheme (40), for the R.D.C.; surveyor.

DUDLEY.—Fifty-six houses, Watsons Green; Eadie, Towers and Co.

DUNDEE.—Dispensary for Royal Infirmary (£10,000); R. Still, chairman of directors.

DURHAM.—Boys' central school (£18,000); director of education, City Education Committee.

ECCLES.—Housing scheme (78), Gaskell Road Estate; T. Elce, borough engineer.

EDINBURGH.—Sanatorium for Edinburgh District Board of Control at Bangour (electrical work); J. D. Gibson, surveyor, 60, Frederick Street.

FULBOURN.—Enlargement, Mental Hospital, Cambridgeshire C.C.

GLASGOW.—Electric and steam heating, New Kelvin Hall; city engineer. Garage at Govan (£25,000); city engineer. Extensions Royal Glasgow Asylum for the Blind, Possilpark; governors.

GRAVESEND.—Extension main works; W. T. Henley's Telegraph Works Co., Ltd.

GRAYS.—Cement factory (electrically equipped); particulars from Edgar Allen & Co., Ltd., Sheffield.

GRIMSBY.—Housing scheme (64); borough surveyor.

GUILDFORD.—Houses (100), Curling Vale, for Onslow Village, Ltd.

HALIFAX.—One hundred and seventy-six Corporation houses at Bracewell Farm site, and 116 houses at Nursery Lane; borough engineer, Crossley Street.

HEATH TOWN (WOLVERHAMPTON).—Additional 86 houses, Brickfield Estate, for the U.D.C.; surveyor.

HEMSWORTH.—Forty houses, Grove Lane; U.D.C. surveyor.

HOYLAND NETHER (YORKS).—Housing schemes (88), Hawshaw Lane and Platts Common, for the U.D.C.; surveyor.

HULL.—Two hundred and eighty-two houses, East Hull; 1 Bilton. Two hundred and seventy-six houses, Nort Hull Estate; Fettlewell, Son & Co., Ltd. Isolation ho pital, Callingham; city architect. X-ray installatior Sanatorium; medical officer.

INDIA (BOMBAY).—Transmitting station, near Race Course Indian Broadcasting Co.

IRISH FREE STATE (DUBLIN).—Five hundred and thirty-fou houses in Drumcondra and Glasnevin, and 500 in th Kilmainham area; city commissioners. Two school and church, Fairview (£70,000); city engineer.

(DUNDALK).—Improvements to the port (£50,000) for th Harbour Board.

(LIMERICK).—Docks and wharfages on the River Shannon secretary, Minister for Industry and Commerce, Dublin

KINGSBRIDGE.—Cottage hospital; C. E. Ware & Son Exeter.

KING'S LYNN.—Contract for the erection of beet sugar fac tory at once has been placed with Fawcett, Preston and Co., sugar machinery manufacturing engineers, Liverpool.

LEEDS.—Electricity for heating and lighting at Killingbeck Sanatorium; medical officer. Tram depôt extensions Swinegate (£125,000); H. S. Chorley, architect. Eight hundred houses, Tait Estate, and 150 at Mearwood; city architect.

LEICESTER.—Premises, Campbell Street, for W. H. Smith and Sons, wholesale stationers, Strand, London (£10,000 to £15,000).

LONDON (GREENWICH, S.E.).—Concert hall, for the Enginemen and Firemen's Club; E.C. Kelly, secretary, 32, London Street. Heating system at infirmary (£17,000); Board of Guardians.

(BRIXTON, S.W).—Motor coach station, Effra Road; Keith and Boyle (London), Ltd.

(WIMBLEDON, S.W.).—Training college, Belmont Hall; G. E. Withers, architect for Wesleyan Church trustees.

Station (£250,000), for the Southern Railway.

(WALTHAMSTOW, E.).—Heating the isolation hospital; U.D.C. medical officer of health.

(EALING, W.).—168 houses; John Laing & Son, Ltd.

MANCHESTER.—Four hundred houses at Burnage for The Phormium Co., of London; city engineer. Boys' municipal high school, Chain Bar, Moston (£60,000); S. Hey, director of education, Education Offices, Deansgate.

MANSFIELD WOODHOUSE.—Sixty-eight houses, Clipstone Road, and Slant Lane; U.D.C. surveyor.

MARKET HARBOROUGH.—Refuse destructor; U.D.C. surveyor.

MORECAMBE.—One hundred and twenty-seven houses; Wm. Gardner & Co., Ltd., builders, Morecambe.

MOTHERWELL.—Re-erection of Dalziel Engineering Works (electrically equipped), for Chambers, Scott & Co., Ltd.

NOTTINGHAM.—Five hundred houses; city engineer.

NORTHOLT (MIDDLESEX).—Estate development (1,000 houses); Northolt Manor Estates, Ltd.

ORSETT.—School (£13,500); Essex county architect.

PLYMOUTH.—Hospital extension (£260,000); Thornley and Rooke, architects.

PRESTON. — Extensions, Smallpox Hospital; borough engineer.

ROTHERHAM.—200 houses, Meadow estate; borough engineer.

ROWLEY REGIS.—Housing scheme (700), Stile House and Church Farms estates, for the U.D.C.; surveyor.

SCARBOROUGH.—Conversion of Londesborough Lodge into medical baths (cost not exceeding £10,000); borough engineer, Town Hall.

SCULCOATES.—Motive power and stand-by lighting supply; Board of Guardians.

SHEFFIELD.—Kinema, Manor estate; city architect.

SHIPLEY (YORKS.).—68 Council houses at Saltaire; surveyor, Council Offices, Shipley.

SOUTHPORT.—Kinema, Liverpool Road, Ainsdale; Southport Coliseum Co., Ltd.

STOKE-ON-TRENT.—Housing scheme (2,000); city engineer.

SUNDERLAND.—Port development; borough engineer.

WATFORD.—Housing scheme (200), Beeches Estate, Boreham Wood, for the R.D.C.; surveyor.

WILMINGTON.—Forty houses; Dartford R.D.C. surveyor.

The

Electrical Review

VOL. C. JANUARY 21, 1927. No. 2,565.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Fuel Research.

THE growing importance of the more economical use of fuel was recently emphasised by the action of the Parliamentary Secretary of the Ministry of Transport, Lt.-Col. J. T. C. Moore-Brabazon, who has deserted the political arena in order to take an active interest in a process for the low-temperature carbonisation of coal. He had previously displayed exceptional enthusiasm for reform in our methods of utilising coal, in his public speeches, and his sacrifice of a political career of more than ordinary promise is proof positive of a sincerity which is not always at the back of politicians' fervid utterances.

Almost simultaneously the Report of the Fuel Research Board for 1925 has been issued by the Department of Scientific and Industrial Research (H.M. Stationery Office, price 1s. 3d. net). It lays stress on the increasing tendency to buy coal to specification—especially on the part of foreign buyers—and in this connection draws attention to the work of the Physical and Chemical Survey of the National Coal Resources, which includes the difficult question of sampling large consignments, and the preparation of analyses; for this reason a memorandum reviewing the history and work of the Survey is appended to the Report. The Fuel Research Board itself came into existence in consequence of a recommendation of the Coal Conservation Committee in 1916, dealing with the subject of a chemical survey, but it was not until 1922 that the Survey was put in hand. The importance of buying coal to specification is not fully realised by electrical engineers, partly, perhaps, because from time to time—through wars and strikes—they are compelled to buy anything that will burn, regardless of its calorific value; but we have no doubt that in more settled times they will devote more attention to the subject. The presence of an excessive proportion of ash and moisture in their fuel imposes upon them financial burdens which commence at the pit's mouth and continue to exercise their baleful influence to the ash tip itself, increasing the cost of freightage, storage, boiler plant capital and maintenance, labour, and cartage, besides reducing the efficiency of the boiler plant and in some cases causing a nuisance to neighbours.

Much of the work of the Board, of course, relates to gas manufacture, but experimental research in connection with low-temperature carbonisation is constantly in

progress, and has a direct bearing on the future of electricity supply. Not only may the coke and gas be used in power stations, but also the fuel oil derived from the tar will be of the greatest service to internal-combustion engine plant when low-temperature carbonisation becomes a commercially practicable proposition. But that time is not yet, though a very few processes show signs of ultimate success.

The Board has also published two reports on domestic heating, and will co-operate with the Building Research Board of the Department in further work on this important subject at the new research station near Watford. From figures contained in a valuable appendix to the Report, it is interesting to note that in 1924, 22.4 per cent. of all coal consumed in this country was used for domestic purposes; colliery engine power absorbed 9.2 per cent., railway locomotives 7.5 per cent., gasworks 8.5 per cent., and electricity works only 4.3 per cent.

The Central Electricity Board.

Considerable interest and speculation have been evidenced of late as to the composition of this Board. This is natural, for upon a wise selection a very great deal will depend. We understand that some 200 names have been submitted to the Minister of Transport as being suitable candidates for membership of the Board. It appears that a selection will first be made of the chairman, who will then be consulted as to the composition of his Board. It is understood that the Electricity Commissioners are not eligible for these positions, as the Electricity Commissioners are the technical advisers to the Board. The indication is that preference will be given to commercial men, though it will not be a disability to have technical knowledge. At present, it is presumed that the Board will include two members who have electrical qualifications, two who have legal experience, one who is an agricultural expert (preferably also with some knowledge of the various aspects of rural electrification), one Scotsman (north of the Border interests are pressing strongly for this) and other men who have made their mark in the commercial world, including probably an accountant. The chairman and two or three of the members will probably be required to devote their whole time to the business of the Board. Their salaries have not been definitely decided upon, but they are not likely to be anything like as high as those mentioned in the daily Press. The chairman will probably receive £5,000 and the full-time members will be paid on the same salary basis as the Electricity Commissioners, while the part-time members will not exceed the £1,000 a year mark.

The Minister of Transport has duly invited suggestions for names from various associations. Apparently the names put forward by each such organisation were of men who represented their own particular interests, rather than recommendations designed to secure the best composition of the whole Board. This has resulted in the submission of the names of elderly men (as they generally comprise the ex-presidents), more noted for their technical ability than for their business capacity.

The names already mentioned in the Press, as suitable for chairman, have been considerably discounted. Nothing definite is known, or will be known, until the fate of the Ministry of Transport is settled. Even then, though the Board is not a Government department, political influence will probably carry a certain weight in the final selection; already ropes are being worked, and wires pulled in support of various candidates.

More Big Contracts.

Telephone development throughout the world produces a constant flow of remunerative business. The possibilities and the prospects both at home and in various parts of the British Empire are very encouraging. Like electricity supply, it is a section of the industry in which there cannot be mere stationary existence—there must be progress, and progress of a kind which means financial outlay, contracts and employment. The latest substantial orders to be placed in this country have been booked by Messrs. Siemens Bros. & Co., Ltd., of Woolwich, after competitive tendering, and the value is £200,000. The work is for the Commonwealth of Australia (Postmaster General's Department) and includes six automatic telephone exchanges in the Brisbane area, comprising Central 9,400 lines, with a satellite exchange at Paddington, 1,000 lines, and four other satellites—Yeronga 700 lines, Bulimber 800 lines, Sherwood 700 lines, Nundah 600 lines. The installation of these exchanges will provide Brisbane practically throughout with automatic telephones. Three exchanges, South, Albion and Newmarket, also of Siemens Brothers' manufacture, are already in operation. The equipment in all exchanges is Siemens Brothers' automatic equipment No. 16, which is also in use in Edinburgh, and, we understand, will soon be put into service in Sheffield, Brighton and other areas in this country. Another very gratifying contract that it is our pleasure to record this week (see our "Business and Industrial Notes") is that received by the Metropolitan-Vickers Electrical Co., Ltd., for 104 motors of 230 h.p. each for railway electrification work in Spain—the main-line sections of the Norte Railway near Barcelona. The mechanical parts for the motor coaches will be made at the Bilbao works of a Spanish company with which the Metropolitan-Vickers Company is associated.

The Spinning Electron.

In our issue of March 5th, 1926, we drew attention to the suggestion that the electron was not a mere passive particle revolving round the nucleus of an atom (or otherwise engaged) but might itself be actively spinning on its own axis—an hypothesis which, it was claimed, disposed of a number of difficulties that had been met with in electronic theory. An article by Mr. R. H. Fowler, F.R.S., in the issue of *Nature* for January 15th, explains why "the importance of the spinning model of the electron can scarcely be overestimated," though it is "as yet scarcely appreciated at its full value." The first serious suggestion that the electron should be regarded as something more complex than a mere particle with an external electrostatic field is attributed to Mr. A. Compton, who surmised that it might possess also a magnetic field, such as would arise from the spinning of its charge about an axis. Goudsmit and Uhlenbeck, whose work was the subject of our previous reference, are credited with finally establishing the value of the spinning electron.

The author then shows how this conception elucidates five paradoxical difficulties which arose when the electron was regarded merely as a point charge. These paradoxes are connected with atomic spectra, the Zeeman effect, X-rays, the behaviour of spectra in strong magnetic fields, and diamagnetism. Thus, says the author, the spinning electron has brought order out of chaos in the broad outlines of atomic theory; and another triumph must be laid to the credit of the physicists, who, though they have never seen an electron, are yet able mentally to picture it so vividly that they can assert with conviction that it is not at rest, but is endowed with rapid rotation about its own axis, as well as about the nucleus to which it may be bound. As we have pointed out, each step in electronic theory seems to increase the resemblance of the atom to an infinitesimally minute model of the solar system. Moreover, the spinning electron is not remotely related to the vortex-atom imagined by Lord Kelvin, who suggested that the ultimate particles of matter were vortices in the ether. But vortices possess a different mode of rotation.

As long ago as the nineties of last century Sir Joseph Larmor put forward a theory on similar lines, and definitely suggested that if the atom were regarded as containing electrons, the phenomenon of magnetism should be explained as a rotation of the electrons.

The New Tricity Restaurant.

A Complete Installation at the New All-Electric Restaurant, Strand, London, of Electric Lighting, Heating, and Cooking for a Seating Accommodation of 300 Persons.

THAT the all-electric restaurant is not a distant dream, and that the installation of electrical equipment for dealing with the large cooking requirements of hotels and restaurants is a practical and commercial proposition is evidenced by the establishment of the new Tricity Restaurant at the top of Savoy Street, Strand, London, the opening of which we referred to in our last issue. This new enterprise is the outcome of the restaurant conducted as Tricity House in Oxford Street for the past 14 years, the history of which is bound up with that of the British Electric Transformer Co., Ltd.

Fig. 1.—Pompeian Room, Tricity Restaurant.

Tricity Restaurant, which is capable of seating some 300 persons in two rooms, on the ground and basement floors, may be described as a rest house, for its design throughout is of quiet beauty, in sharp contrast to the whirl of the traffic and business in that part of the City. The rooms are artistically lighted, the "Sun Ray" lighting of the parent company playing no unimportant part in this connection. A well-lit entrance hall affords an inviting approach to a cheerful lounge through which the patrons pass in making for the restaurant.

The lounge is lighted, in addition to "Sun Ray" lamps fixed round the skirtings, by four specially designed semi-indirect wall fittings. These are particularly effective and are constructed of wood and silk.

The lighting of the ground-floor restaurant is probably unique in its variety of methods, although the result is pleasingly uniform. Two artificially-lighted windows of artistic design are equipped with Sun Ray lamps, and at the Savoy Street end of the west wing a large street window is flooded with light from similar lamps arranged internally over the windows. Wall fittings, also equipped with lamps of this type, are so constructed that, by means of swivelled reflectors, the flooding can be arranged upwards or downwards. Two large inverted silk fittings and semi-shell pattern inverted wall fittings provide the main lighting.

The basement or Pompeian room, of similar design to that on the ground floor, is provided with a well-sprung dance floor. The lighting here is duplicated, so that either white or red lamps will serve the room, or a combination of both. Inverted silk fittings, similar to those in the upper room, are provided, and 25 wall fittings of the wood and silk pattern are suitably spaced round the restaurant. A small alcove at one end of the room, shown in fig. 1, is effectively lighted by means of concealed cornice lamps.

While the Sun Ray lamps in the restaurants and other rooms provide very effective lighting, they serve also, of course, as very efficient heating apparatus. An elaborately designed ventilating system also serves the rooms; clean air is provided and the foul air extracted electrically through ducts.

Fig. 2.—One End of the Main Electric Kitchen.

A feature of the premises is a wine bar, very cleverly panelled and plastered after the style of an old-time tavern. This is electrically lighted by means of old Dutch pendant and bracket candle fittings.

The kitchens demonstrate clearly the great saving of space which can be effected when electrical apparatus is installed. They cover a floor space of some 520 sq. ft., and accommodate the whole of the equipment necessary to provide a continuous service for the maximum seating of the restaurant, in addition to the necessary working room for the chefs and their staff. At one end of the main kitchen, fig. 2, is a large hot cupboard covered with a hot serving top. This is arranged with two circuits and the total loading is 10 kW. The cupboard is provided with sliding doors. Part of the top of the cupboard accommodates a bain-marie, while suitably placed above the apparatus is a hot shelf. The main cooking operations are carried out by means of two banks of cookers, figs. 2 and 3, each comprising two complete stoves with ovens and hot plates. One cooker in each case is equipped with four open-type and two enclosed boiling plates, each about 8 in. square, and the second cooker is provided with one large enclosed plate about 2 ft. square. The total loading for each bank is 24.4 kW. The elements of the open-type boiling plates are particularly robust and, it is claimed, are unaffected by liquids and foodstuffs being directly spilled on them. They consist of steatite rods on which are mounted specially prepared spirals. The pastry cooking is provided for by means of a bank of four pastry ovens, the total loading being 9.6 kW. Each oven is controlled separately, and is provided with top and bottom heating. The remaining equipment in the kitchen includes two large 3-kW grills and a 3-kW fish fryer.

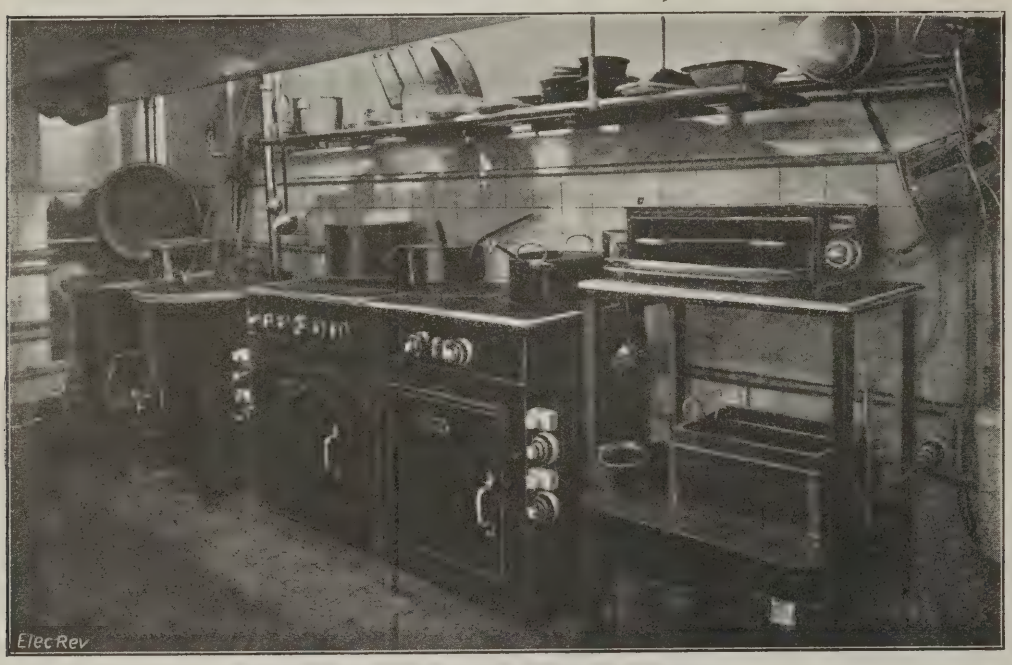

Fig. 3.—Some of the Electric Cooking Equipment.

Two identically equipped still rooms, fig. 4, accommodate the equipment necessary for the preparation of the lighter requirements of the restaurant, such as tea and coffee, and the service necessities. Each of these rooms is equipped with the following:—Two urns, one 1.5 kW and one 0.75 kW; two hot cupboards, one 6.5 and one 3.5 kW; two 2-kW water boilers; and a 1.6-kW boiling plate. One of the hot cupboards is fitted with a small grill and the other with a bain-marie.

Two distribution rooms, one on each floor, house the necessary control equipment for the restaurants and the bar. The supply to the apparatus in the kitchen and still rooms is controlled by specially designed ironclad distribution boards. Each circuit is governed by a d.p. fuse and a s.p. knife-switch, and a lamp indicates when the circuit is "on" or "off" and the apparatus which is supplied by that particular circuit. In order to limit the loading on each distributing board, a sliding-shutter arrangement, fig. 2, prevents more than a given number of switches being put "on" at one time.

The supply for the whole installation is received from the Metropolitan Electric Supply Co. at 6,600 V, 3-phase, and is converted to a 2-phase supply at 200 V by means of a bank of two 75-kW Scott-connected transformers. The whole of the wiring throughout the premises is run in screwed tubing, which is entirely concealed in the restaurants. In addition to most of the lighting equipment, the entire cooking apparatus was supplied by the British Electric Transformer Co.

A lift serves the kitchen and the ground-floor still room, and is used to convey the cooked food to the upper department, from which it is served. The ventilating system, already referred to, also aerates the kitchen and still rooms.

Fig. 4.—Still-Room Apparatus.

The architects responsible for the design of the premises were Messrs. Imrie & Angell, who are to be congratulated on having so successfully overcome the considerable structural difficulties. The electrical work was carried out by The Electric Shop of Chiswick.

The Electricity (Supply) Act, 1926.

An Explanatory Analysis of the Provisions of the New Act, and a Critical Review of the Measure from the Legal Point of View.

By W. S. KENNEDY, Barrister-at-Law.

(*Concluded from page* 53.)

IF standardisation of frequency is essential to the carrying out of the proposals for interconnection, the scheme is to provide for it. It should be noted that there is no provision for general standardisation, but only such as is necessary for carrying out the proposals of a particular scheme. When the Commissioners have submitted their scheme to the Board, the latter is to publish it and may, and almost certainly will, hold an inquiry at which all interested parties may be heard. The Board then adopts it with necessary modifications and proceeds to carry it out—that is, in effect, it proceeds to do three things: To arrange with owners of selected stations how they are to be worked; to arrange with some existing undertaker to build any required new stations; and to erect itself the necessary transmission lines. If in the scheme obligations are imposed on any undertakers which they think are prejudicial to them, they may appeal to an arbitrator selected by the Minister from a panel set up by the Lord Chancellor. The idea of the Act is that owners of selected stations, whether local authorities or companies, shall continue to operate their stations and shall themselves carry out any extensions or alterations which are provided for in the scheme or subsequently become necessary. If the owners refuse, which it is hoped is an improbable contingency, the Minister may, on the application of the Board, transfer the station to the J.E.A., if there is one, in the district, and failing a J.E.A., to any approved undertaker. The price to be paid is, roughly speaking, cost properly incurred less depreciation, to be certified by an auditor with an appeal to the arbitrator if the owners disagree. The Board has no right of appeal. The Minister's order transferring the station is not to be enforced until both Houses of Parliament have had an opportunity of discussing it, and if either House presents an address against it, it becomes of no effect. This is one of the most important provisions of the Act, and its existence should go far to make its use unnecessary. But without it the whole idea of co-ordinated generation and the economies to be obtained from it might go for nought.

Where new stations are to be built the Board is to arrange with the most suitable undertaker in the area to build them—not necessarily with a J.E.A., even should one exist. It will be possible, for example, for the Board to arrange with the London Power Company to build one station and the London J.E.A. another in the Home Counties District, if this seems advisable. It will be remembered that, as passed by the House of Commons, the Bill provided that the option of building new stations was given to a J.E.A. where one existed. Since there are only three such authorities, of which London is the most important, the amendment in the House of Lords may almost be regarded as for the protection of the London companies, and it brings the Act more into line with the provision in the Home Counties order that the companies should enjoy a large measure of autonomy.

All selected stations are to be operated under the Board's directions—naturally in consultation with their engineers, who may be appointed as a consultative committee. The electricity generated is to be sold to the Board at cost price, and the 2nd Schedule provides rules for ascertaining this which seem to cover all items which can properly be included. Such amount as the owners require will then be sold back to them by the Board at this cost price, plus a proper proportion of the Board's expenses, less an adjustment to the load and power factor of the station. Or if the general tariff of the Board (what is commonly called the "grid price") is lower, the owners pay the lower price. But it is further provided (Section 13) that if the owners show that they could, if the Act had not been passed, have generated the same quantity of electricity at a lower price, they are not to be charged more than this. This seems adequate protection—it is difficult to see what more could be given, assuming that the Act is to be worked at all.

If a scheme provides for standardisation, or if the Board thinks any further standardisation necessary, it may require it to be done, but must pay the undertakers the expense incurred and advance them the money required, free of interest. A railway company cannot be required under this Act to alter the frequency employed by it, nor can an undertaker supplying current to the railway.

The Board is under an obligation to give a supply to all undertakers in the area when a scheme is in operation—the energy required being obtained from the selected stations: but may not supply (with certain exceptions) to potential customers of power companies, nor in the districts of joint authorities. Other provisions protect the Board against being called on to give a peak load supply only or to incur undue expense in providing transmission lines. Where the Board is satisfied that the price at which it can supply energy is less than the generating costs of the undertakers who ask for a supply, it may require the undertakers to take their whole supply from the Board. Here, again, a difference may be referred by the undertakers to the arbitrator.

The "grid price"—the tariff for authorised undertakers other than owners of selected stations—is, in effect, to be fixed so as to enable the Board to balance its accounts, and is to show fixed and running charges separately. So far as sales to owners of selected stations are concerned, the Board's price is limited by the cost of generation at such stations, and theoretically, at least, this provision might result in the grid tariff being unduly high. Practically this depends on whether the estimates of cost and output prepared by the Commissioners are accurate or not. This is an engineering question on which opinion is, and will probably remain, divided until time decides the issue. If the spirit of co-operation recommended by the ELECTRICAL REVIEW, now that the Act is law, is happily adopted by the electrical profession and industry, the results looked to by the Commissioners and those assisting them will, of course, be far more speedily and surely realised. If this is to be—and in any case if the industry in this country is to progress as it should—it is essential that the smaller and less economical generating stations should be closed down as soon as a supply can be given from a better source. It is the fault of the legislature

rather than the industry that they exist: they are relics of the parochial system. Yet various reasons, not all unworthy, militate against their supersession by agreement, and Parliament has till now been loth to give any body compulsory powers over them. Section 14 of the Act confers this power, carefully guarded from misuse, on the Commissioners.

The Board must first be in a position to supply such energy as the undertakers will require if their station is closed down: it must undertake to give the supply for not less than seven years on specified terms and must satisfy itself that the cost of its supply is below the prevailing generating costs of the undertakers. It then notifies the undertakers that it is prepared to give a bulk supply on those terms, and the undertakers are given a period of three months to consider and to accept or refuse the offer. Should they refuse, the matter is referred to the Commissioners.

The Commissioners, if satified "as regards the next subsequent year that the cost of production . . . . substantially exceeded the cost the undertakers would have incurred had they purchased the like quantity of electricity from the Board," may if they also think "it is expedient that the station should cease to be used as a generating station," require it to be shut down as such and a supply to be taken from the Board. A difference as to whether the cost was substantially in excess of the Board's offer is to be referred to the arbitrator. It must be noted (1) that the cost must not be merely greater, but substantially greater, and though the term is not very definite, it obviously prevents quibbles over ten pounds when the total is many thousands—and (2) even if the Board's price is substantially lower, the Commissioners may consider it inexpedient for other reasons that the station should be closed. In other words, comparative cost is not to be the sole criterion. This compulsory power, from the point of view of those who have brought small stations to a creditable state of efficiency, will be regretted, but in the interests of the community sentimental considerations must give way.

In this group of sections only one more point can be noticed in a summary review. Section 19 provides that if any scheme made under this Act conflicts with any obligation laid on a J.E.A., local authority, or other undertaker or company under the London and Home Counties Order, the scheme made under the Act is to prevail. This is a distinct limitation on the powers of the London J.E.A., although it is, of course, competent for the Board to frame a scheme in accord with the wishes of that authority, and its views will be heard with respect. Yet the Board may override them should it appear expedient.

3. Subsidiary Provisions as to Board.

These are less important provisions. Sec. 20 (*inter alia*) prohibits the Board from supplying directly to persons who are not authorised undertakers, except to owners of selected stations who are not authorised undertakers (which will be very unusual) or to companies or others for power purposes, in an area which is not part of the area of an authorised undertaker. Persons or companies taking such a supply may use it for lighting any premises where the energy is used for power. This provision enables the main transmission lines of the Board to be tapped where they cross unoccupied territory, so to speak, if the operation is feasible. There is no obligation on the Board to give such a supply. Should a line be available in any place where a fairly substantial amount of energy might be employed, it is, of course, open to any company or body to become an authorised undertaker, when the Board will be under an obligation to supply on the terms of Sec. 10; that is, a reasonable return on the outlay required to give the supply. A subsidiary but important provision is contained in Sec. 21, which gives the Board power to acquire land or easements compulsorily for main transmission lines if the acquisition of a wayleave under the Act of 1919 does not meet the case efficiently and economically. With the extended erection of main transmission lines contemplated by the Act, the question of wayleaves becomes of great importance. Where owners are unreasonable, this provision may be valuable.

4. Financial Provisions.

These provisions of the Act have been much more abused than understood. The Board is not to receive large grants of public money with which to erect superstations and compete with existing undertakers. As has been shown, the Board is not to build or generate at all—save in very exceptional cases—and no question of competition can arise. A cursory reading of Secs. 26-30 will reassure those who had any idea that the Board is to be largely subsidised at the expense of the taxpayer. For certain specified purposes the Board is authorised to borrow money, and this it will do by the issue of stock in the ordinary way to the public. The Treasury comes in only to "guarantee in such manner as they think fit the payment of the interest and principal . . . or of either the interest or the principal." The public have shown no reluctance lately to put up money for electrical schemes without demanding an unreasonable return, and there is little doubt that the Treasury guarantee will enable the Board to raise its money without unduly burdening its undertaking. If this proves correct, the mere existence of the guarantee will ensure its not being called upon. The purposes for which the Board may borrow are given in Sec. 27, and are as follows:—(*a*) The construction or acquisition of generating stations, main transmission lines, and other works; (*b*) any other payment or permanent work, the cost of which the Commissioners think should be spread over a number of years, including payment of interest out of capital for such period as the Commissioners and the Treasury may determine; (*c*) working capital; (*d*) any other purpose for which it is authorised to borrow. The total maximum amount which may be borrowed is £33,500,000, and the Board may not borrow more without a Special Order under Sec. 26 of the Act of 1919. This sum of 33½ million pounds is not allocated in any way in the Act to any specific purpose, and it is not an optimistic engineering estimate which may be exceeded by actual cost. The figure, however, is obviously derived from estimates put before Lord Weir's Committee, and may be taken roughly to represent £24,000,000 for transmission (including necessary gear) and 9,500,000 pounds for standardisation of frequency. A slight digression may be pardoned here in view of the great importance of this matter. The full effect of the capital expended, both in revenue and in capital charges, &c., may be expected to be realised about 1937. The capital charges (interest and sinking fund) on the £24,000,000 expended on transmission may amount possibly—if interest is paid out of capital during the earlier years—to anything from 10 to 15 per cent. Taking an intermediate figure of 12 per cent., the annual charge would be 2.88 million pounds. It does not seem unduly optimistic to assume that in ten years' time the total units sold will be in the neighbourhood of 16,000 millions. If this figure is reached, the additional cost due to the grid system will be .04d. per unit sold. Against this has to be set off the saving due to interconnection, co-ordination of generation, and the closing down of uneconomical stations. If only the last of these be considered, and in reference to coal costs alone this additional cost can, it seems, be easily offset. The coal costs at the Barton station of the Manchester Corporation, for instance, are given as .142d. per unit sold, while Leeds and Glasgow, both of which are efficient and modern undertakings, have coal costs of .19d. and .2d. per unit sold respectively. The possible saving thus on economical undertakings in this one particular is sufficient to pay for the grid. Taking the average costs of all generating stations and the other factors which will make for economy, the result is, of course, even more favourable.

All borrowed money is to be repaid within 60 years,

and the Treasury is to report annually to Parliament the amount of guarantees, if any, which have been issued. So far as the Act goes, these financial provisions are simple. The Commissioners' estimates when issued in the scheme will, of course, receive and necessitate much more detailed examination.

5. Miscellaneous Provisions.

These sections contain two provisions of importance. Sec. 31 gives power to the Minister to revise a power company's maximum prices when the company begins to take a supply from the Board (except the price for bulk supply to authorised undertakers), and in such revision the saving of cost to the company attributable to the Act is, naturally, to be considered. This is simply an extension of the existing power to revise maximum prices, and only comes into operation when the company is getting supplies at a lower cost. It is one of the methods devised to ensure that the consumer gets the benefit of the Board's working. Power is also given to the Commissioners after due inquiry to abolish the authorisation to make up back dividends which some power companies possess. This has never been done, and if the power companies' position is unchanged is not likely to be operative. It would obviously be unfair to the consumer if the company utilised savings, which were in fact rendered possible by the Board's working, for this purpose. Sec. 32 authorises the Commissioners to impose a sliding scale, if they think it expedient, on other authorised undertakers taking a supply from the Board. The London companies, having such a scale already under the London Acts of 1925, do not come under this section. Other miscellaneous provisions deal with superannuation, lopping of trees, and protection of bridges: they require no special notice here.

6. Amendments of Electricity Supply Acts.

The first amendment is of Sec. 5 of the Act of 1919, and provides that the Commissioners and not "interested parties" are to prepare the scheme for the reorganisation of supply in a delimited district. In view of the larger schemes of the Board, schemes under the earlier Acts are not likely to be numerous. But should any such schemes be necessary, it is a more convenient procedure that one scheme should be drawn up by the Commissioners and criticised by the interested undertakers and others, than that rival schemes should be subjected to the prolonged examination necessary to discover their respective merits. The Commissioners are to consult with the authorised undertakers in the district before drawing up their scheme, so that their views and objections may be considered before the formal inquiry.

Secs. 39-40 deal with purchase rights. After December 15th, 1926 (the date of the Act), if a company is authorised to supply in an area covered by two or more local authorities, the purchasing authority is to be the J.E.A. for the district, if there be one, and if not, a joint committee of the local authorities concerned. This does away with the absurdity of the purchase of part of an undertaking. The purchase price is to be a sum equal to the capital properly expended, less depreciation, on a scale to be fixed by the Special Order authorising the supply. And the company's tenure is to be fifty years. Where a company has ceased to generate for itself and is taking a bulk supply, its generating plant no longer being used, would not be purchaseable under the 1888 Act. It is now provided (Sec. 40) that the purchase price is to include a sum representing the capital properly expended on the disused plant after deducting the amount which, the Commissioners think, should properly have been written off. This provision will make it much easier for a company to take a bulk supply and so assist the general scheme, while it prevents an unfair advantage being taken by the purchasing authority. Power is given to undertakers and local authorities having purchase rights to alter the purchase terms by agreement, with the approval of the Commissioners. Sec. 43 is important. Its intention and, it is to be hoped, its effect is to ensure that local authority undertakers should pass on any benefits received in the way of a cheaper supply by the operations of the Board to their consumers. It is sought to achieve this, in a somewhat roundabout way, by diminishing the amount which the authority may apply to reducing rates. In the case of companies, it may again be noted, this result is to be obtained by the imposition of a sliding scale under Sec. 32. Secs. 46 and 47 introduce some needed amendments with regard to railway supplies. The first provides that, with the consent of the Commissioners, any one railway generating station may supply to any other, and the Commissioners may authorise the breaking-up of streets, &c., necessary to carry out this supply.

Sec. 47 merits closer attention. It provides generally that where any authorised undertakers are supplying energy for haulage or traction to a railway, dock, harbour, or canal, they may supply the energy for any purpose and to be used in any part of the undertaking, and the company taking the energy may use it for any purpose for which it is authorised to use electricity. It should be remembered that this will not enable a railway company to undertake the lighting of houses not part of its premises, nor will this section override any protection given in other Acts to particular undertakers, *e.g.*, to Poplar, in the London Act of 1925.

The sale of fittings is dealt with in Sec. 48, and this vexed question is put on a more satisfactory footing. A general power is here given to joint authorities and local authority undertakers to sell (but not to manufacture) fittings, and provides that they are not to undersell the usual providers of such things. The Commissioners are to appoint a representative committee to determine prices and advise generally on the methods of carrying on the business. If it can be properly developed, a large increase in consumption, and therefore a reduction in price, may be hoped for in this direction.

The seven schedules to the Act are largely technical, and for that reason, if for no other, are outside the scope of this article.

Opinions differ greatly about the Act, and its provisions being arrived at by discussion and compromise, it is not a logical whole, and defects are bound to become apparent in its working. In the writer's opinion, it is, however, a great step forward, and if the various interests can follow the advice disinterestedly given now by many of their leaders who were opposed to the Bill, and co-operate to make it a success, it will prove a measure of benefit to the industry and to the country as a whole.

The Central Electricity Board.

According to the *Westminster Gazette*, the name of Sir Duncan Watson, the first chairman of the London and Home Counties Joint Electricity Authority, has been put forward to the Minister of Transport by some of the bodies that he has consulted with regard to the chairmanship of the Central Electricity Board.

The *Manchester Guardian* states that the National Joint Industrial Council for Electricity Supply has nominated some of its own members for membership of the Board, the employers having chosen the chairman, Ald W. Walker, and Ald. Huntsman, whilst the employés' side has nominated Mr. J. Rowan, vice-chairman and general secretary of the Council, and Mr. G. P. Dean.

It is rumoured that the name of Mr. Ll. B. Atkinson, director of the Cable Makers' Association, has been put forward for the chairmanship of the Board; and those of Mr. R. Borlase Matthews and Mr. J. W. Beauchamp, of E.D.A., have been mentioned for membership.

We refer to the position of affairs in our leading columns to-day.

Our Overseas Electrical Markets.

The Trend of Trade with Australia, New Zealand, India, and Africa. Factors Affecting Purchasing Power.

THERE is a growing realisation on the part of manufacturers and exporters in this country of the importance of keeping themselves acquainted with trade movements not only in the markets in which they may be especially interested, but also throughout the world in general. It is fairly well known how large a number of organisations—official, semi-official and private—in the United States are engaged in compiling and circulating statistics and other useful data regarding international trade exchanges and business conditions. Although a great deal has been done in the same direction in this country, it is probable that intelligence of an economic nature is available in greater detail and more widely disseminated in the United States, than in Great Britain. There is little doubt that more money for such purposes is available across the Atlantic than here.

The policy of the Electrical Review has always been to devote as much space to statistical information as could be spared, having regard to other demands made upon its columns. Manufacturers and exporters have been made aware, as soon as official returns were available, of the annual trend of the import trade in electrical and allied material of practically all the most important consuming countries. Similarly, they have been enabled to watch the activities of competitors, through the comparative tables published from time to time of the exports of the chief electrical manufacturing countries. That manufacturers' representatives and other readers have found these figures of value is certain. On occasions when, owing to exigencies of space or other reasons, some of this information has been curtailed, there have been requests to supplement the details and we have been pleased to meet the demand.

In this article we develop these statistical features and show, by means of charts, the trend of the electrical import trade of certain of Great Britain's most valuable markets during the month. At the same time a brief review is given of the principal factors affecting the purchasing power of the countries in question. By glancing at the charts, firms will be able to see how business has been varying from month to month, and, if a rise in imports has not been accompanied by an increase in their own orders from the market in question, they may consider it desirable to investigate the reasons.

Australia.

Although Australia experienced an unfavourable season last year for the products of her sheep, cattle, fruit-growing and farming industries generally, resulting in an adverse balance of over £20,000,000 during the first quarter of the 1926-27 fiscal year, traders towards the close of 1926 were optimistic as to the outlook. Prospects for the realisation of the wool clip, for the wheat harvest and butter production were considered satisfactory. In the course of a recent review by the Canadian Trade Commissioner at Melbourne, it is stated that trade has generally been well maintained, although some distributing houses report that tight finance, particularly in country districts, has had a depressing influence. The textile mills, metal works, and rubber factories are showing increased outputs, while manufacturers generally are working full time. The recently-published balance sheets of large trading and manufacturing companies show improved

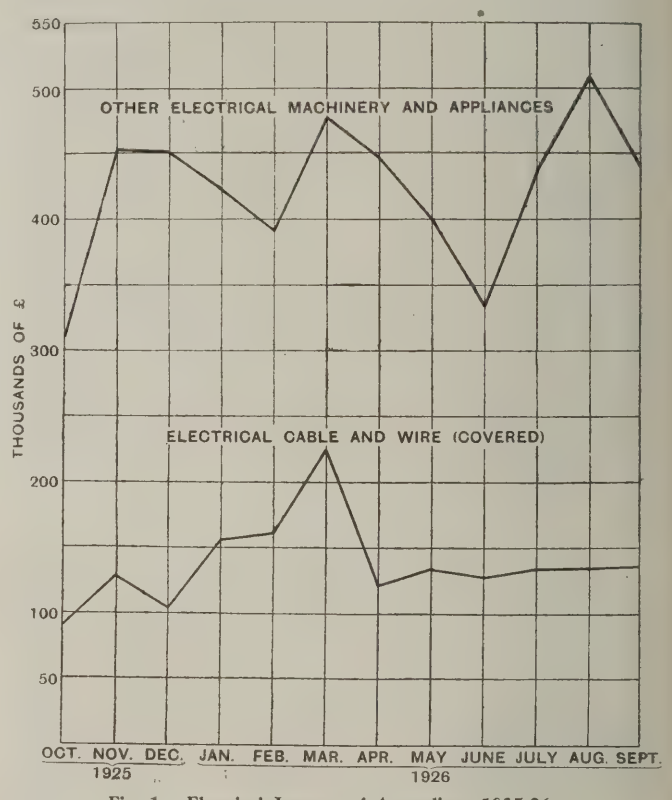

Fig. 1.—Electrical Imports of Australia, 1925-26.

results, while new issues of companies' shares have been readily absorbed by investors. Electrical imports for 12 months are shown in fig. 1.

New Zealand.

Although the value of New Zealand's exports during the first nine months of 1926 showed a decline of nearly £7,000,000 compared with 1925, the excess of imports was but £57,000. The fall in exports was due to lower prices, particularly of wool. The area under wheat and oats during the 1926-27 season is likely to be greater than in the previous season.

Building activity in the Dominion, as measured by the permits issued in the larger towns, well maintains its level. The total value of these permits for September, 1926, was again over £1,000,000 as in June, 1926, and October, 1925. In the intervening months it averaged £750,000.

At the end of the last financial year (March 31st, 1926) the total amount to the credit of depositors in the New Zealand Post Office Savings Banks was £47,911,322, as compared with £46,948,628 during the previous twelve months. During the first six months of the current financial year the excess of deposits over withdrawals was £56,000.

Imports generally into New Zealand fell off directly the effect of the British coal strike began to be felt, and for a time most buyers continued to operate cautiously. Now, however, it is anticipated that import business will revive for a spell. According to the

Canadian Trade Commissioner at Auckland, while conditions in New Zealand in November were not so bright as is usual at that time of the year, there was little cause for alarm.

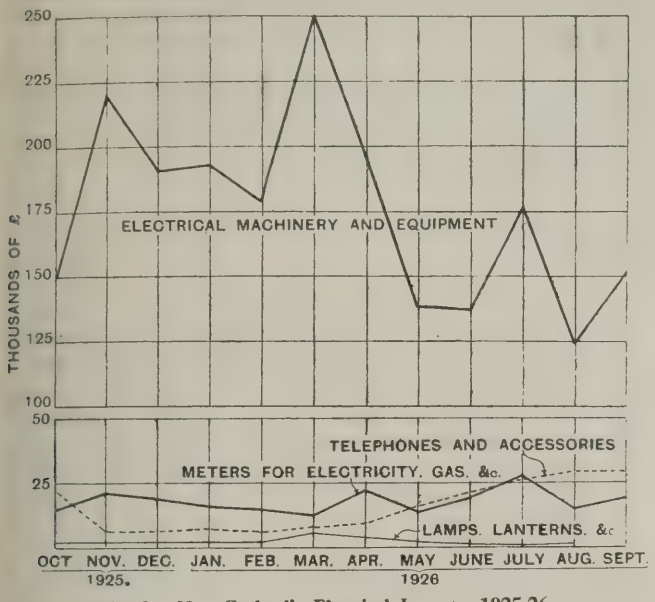

Fig. 2.—New Zealand's Electrical Imports, 1925-26.

The advent of the Christmas trade was expected to help the employment situation. Fig. 2 shows twelve months' electrical imports.

India.

The favourable monsoon and the good condition of the various crops are favourable factors that will have their influence, sooner or later, on Indian business in

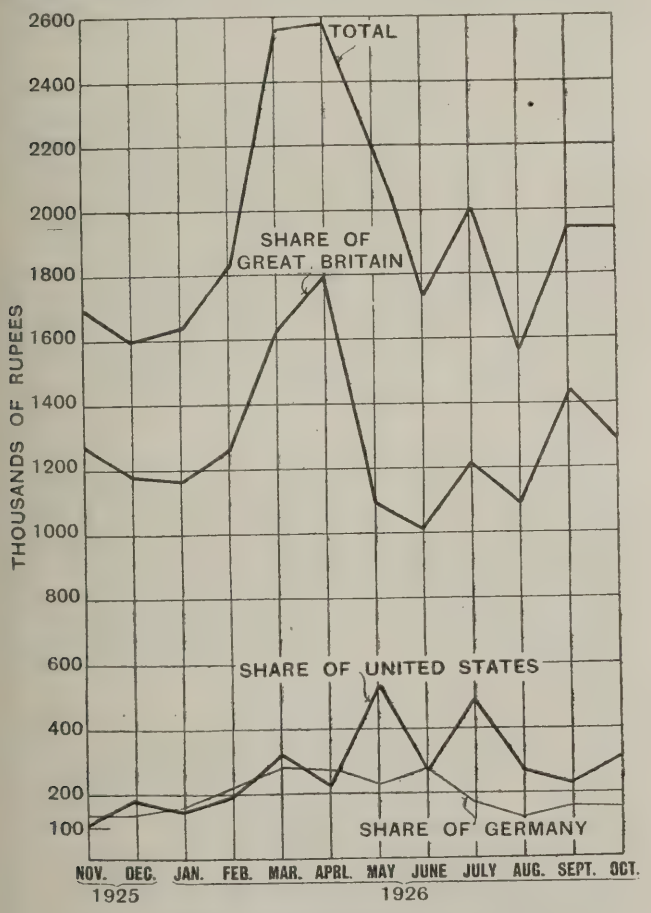

Fig. 3.—Indian Electrical Apparatus Imports, 1925-26.

general, but neither trade generally nor that in metal goods and engineering products has been helped by the situation in cotton piece goods. The steady decline in textile prices has placed dealers in a difficult position, for their stocks are large.

The engineering trades are likely to continue to benefit in many ways from the programme of railway and port work, to which the Viceroy referred at the recent meeting of the Associated Chambers of Commerce of India. India, he said, was on the eve of a great expansion of communications. A web of cross lines between the

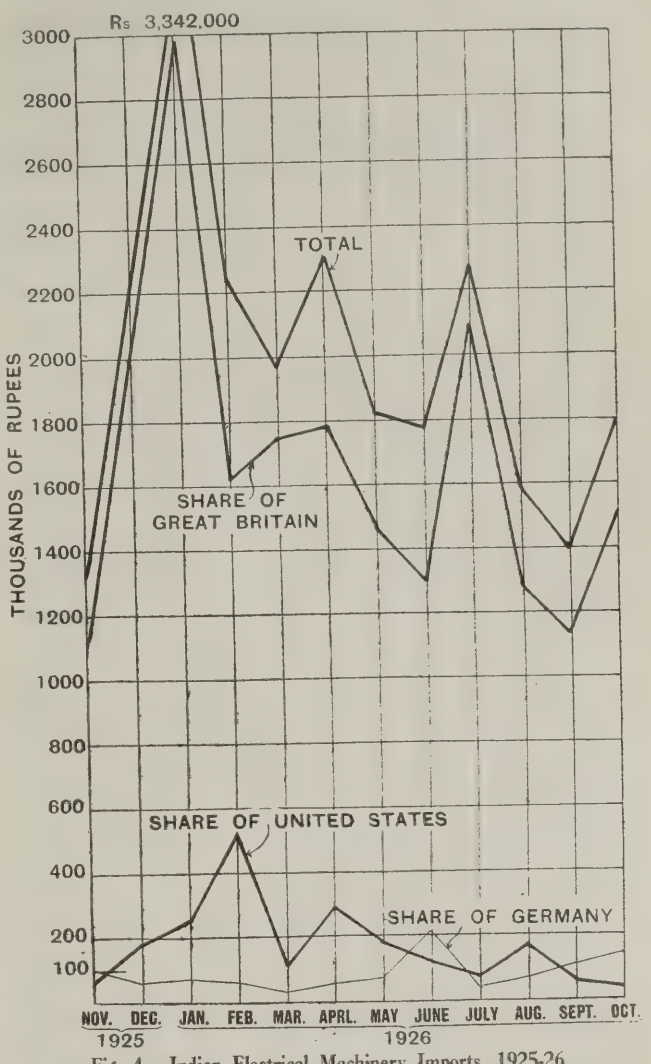

Fig. 4.—Indian Electrical Machinery Imports, 1925-26.

main trunk railways was being built, the smaller ports were to be developed and roads improved. Figs. 3 and 4 show the Indian electrical imports for 12 months.

South Africa.

The mineral production of the Union of South Africa in October was about £600,000 more than in the same month of 1925, *viz.*, £5,279,000, as compared with £4,665,000. The index number of European employment in manufacturing industries in August showed a

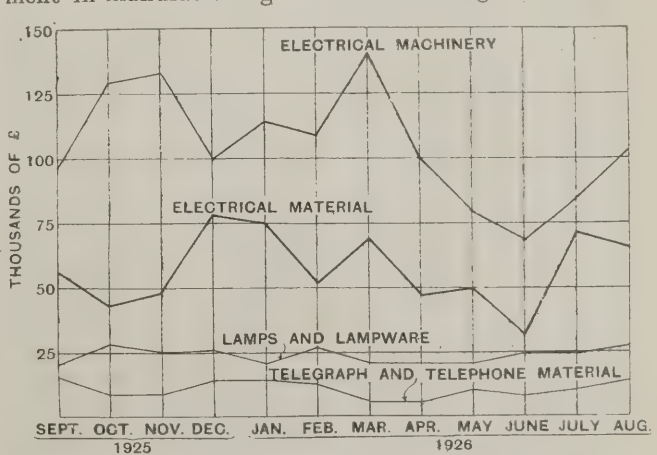

Fig. 5.—South African Electrical Imports, 1925-26.

general improvement, and the total number of Europeans placed in employment, apart from relief and public works, by the Government employment exchanges increased from 440 in September to 600 in October. The number of persons on relief and Government works decreased from 4,047 in September to 3,700 in October. The 1925-26 electrical imports are shown in fig. 5.

Electrical Insulation.

Recent Developments in the Varying Uses of Different Materials: Brief Definitions of their Composition and some of their Characteristics; to the Synthetic Resins, in particular, a wider Field of Usefulness is open than has been allotted to them hitherto.

By ANTONY SETON.

THE time has gone when there were available only a very few substances which acted as insulating agents for electrical conductors. With the advance of electrical science chemical science has kept pace, and there are nowadays very many insulating mediums that were never thought of a few years ago.

An insulator is a substance which impedes the passage of an electric current, and it is difficult to say when a substance ceases to be a bad conductor and begins to be an insulator. Generally speaking, substances which allow the passage of high-pressure currents, but impede low-pressure ones are spoken of as bad conductors, and those which prevent both high- and low-pressure currents are spoken of as good insulators. Insulators may be solid, liquid, or gaseous. Most fall into the first class, but there are several in the second, and a few in the third. Dry air forms one of the best insulators known, but it is apt to break down under very high pressure. Under the heading of liquid insulators are classed all non-electrolytes, and some electrolytes also, when dissolved in an inert solvent which prevents ionisation. Hydrochloric acid gas, for example, is a conductor, and remains one when dissolved in water; when dissolved in an inert solvent such as chloroform, however, it becomes practically a non-conductor. Absolutely pure water is an insulator, but the salts dissolved in it ordinarily give it good conductivity. Pure mineral oils are insulators, but fatty oils are not. Mineral oils find application in transformers and switchgear more particularly. Solid insulators include substances like paper, rubber, gutta-percha, mica, and the synthetic resins and gums made by the condensation of aldehydes and phenols. Gaseous insulators are not used in practical work, except in so far as bare overhead conductors are insulated by the air round them, and do not spark to earth except under very unusual conditions.

Liquid insulators find considerable use in power-station work in transformers and switches, for which their high specific heat renders them particularly suitable in preventing the rise in temperature of the apparatus beyond safe limits. In switches they are used mainly to prevent arcing when making and breaking contact. The oils used must be pure mineral oils, entirely free from moisture, sediment, and sulphur and sulphur compounds. They must be neutral in reaction and must remain stable at high temperatures. A moderately low viscosity is desirable, as the dispersal of heat generated depends to a large extent on this, but as a high flash point is also necessary, a mean must be struck, for low viscosity is usually accompanied by a low flash point. On the other hand, the more viscous the oil the lower is the break-down voltage, and a high dielectric strength is also required. The voltage required to break down a gap of $\frac{1}{8}$ in. between point and plane in a well-dried oil (traces of moisture makes a big difference) is between 15,000 and 30,000 volts. In transformer work it is found that after a period of use a sludge forms which, in the early stages, is a hydrocarbon simply, but later assumes the character of an oxidised compound, and is acid in reaction.

Varnishes may be divided into two classes, *viz.*: those in which oil is the vehicle, and those in which a volatile solvent is used. They are used to provide a protective coating for wires, especially cotton-covered ones, for impregnating paper and tape, and in the preparation of mica cloth. For windings a varnish of linseed oil, with a base of copal or fossil gum, is used. Windings which may be affected by oil should be treated with this kind of varnish. A solution of asphaltum in oil furnishes another varnish, but one that is not so oil-resisting as a copal varnish, and which, moreover, has a lower dielectric strength. For papers a linseed oil varnish with a gum base is used, to which is added a small quantity of lead or manganese driers, the whole being thinned, if necessary, with benzine or turpentine. Shellac varnish is made by dissolving shellac in methylated spirits until the specific gravity is from .84 to .89. Gum lac or garnet lac can be used in place of shellac. Windings can be protected also by solid impregnating materials, such as asphalt and paraffin wax. It is necessary that the composition, whatever it is, shall be fluid enough to permeate the windings at a temperature not exceeding 125 C., and it must not be brittle at ordinary temperatures.

Paper and tape are frequently used. Paper is cheap, but its use is limited by its moisture content, and its insulating value normally is low owing to its inherent moisture. Paper is made from the fibres of various grasses and plants and from wood pulp. It is frequently loaded with fillers, such as china clay, and these are not deleterious provided that they are chemically inert. They may, in fact, be advantageous in rendering the paper less springy. The use of rubber latex in the manufacture of paper suggests the possibility of an improvement in the insulating properties of the material. For securing a high insulating value, the paper may be impregnated with a varnish of some kind.

Tapes may be divided into three types: (*a*) those woven from cotton or silk and not treated; (*b*) those woven and treated; and (*c*) those loaded with a rubber compound. Untreated tapes are very hygroscopic, and their use is therefore limited. Tapes that have been varnished stand well, if they were bone dry when they were varnished. Tapes that have been loaded with a rubber compound cannot be used where they are exposed to light and air, as the rubber perishes quickly under the influence of air and light.

What is known as "vulcanised fibre" finds extensive use. It consists of cellulosic materials chemically treated and compressed into sheets, or manufactured into rods and tubes. Zinc chloride is used in its manufacture, and for this reason the product is always more or less hygroscopic, which is a serious disadvantage.

The value of wood as an insulator is determined by its condition as regards sap and moisture, and the drier the wood the better the insulation obtained. Well-dried wood, it is said, should stand 10,000 volts per inch of thickness without overheating or burning. Ash, teak, maple, hornbeam, and lignum vitæ are all used, and of these hornbeam is the best. Additional protection may be given by boiling the wood in oil, linseed oil for preference, but the pieces should be cut to size before this treatment, as the protective coating does not extend deeply into the substance of the wood.

Of mineral insulators there are several. Slate and marble are used extensively, but frequently give trouble owing to metallic veins which run through the slabs. Slate is a worse offender in this respect than marble, but even marble is not free from such veins. Slate can be treated with a varnish which renders surface leakage small, but holes for conductors must be bushed with vulcanite or one of the synthetic resins. Porcelain, when of good quality, is very good, but when it is of poor quality its value as an insulator is due entirely to the glaze, which may be full of pinholes and very imperfect. The mineral most widely used is mica. The micas are a family of related minerals which differ slightly in chemical composition. They are all complex aluminium silicates or alumino-silicates, and are distinguished by the ease with which they cleave into thin laminæ, which are flexible and more or less elastic. The three forms which are used chiefly in electrical work are muscovite, first found by A. B. de Boodt in Moscovia; amber mica, mined in Canada and so called because it is amber in colour; and lepidolite, which is chiefly obtained from India. Of the three, muscovite has the highest dielectric strength, but it is hard and not so easy to work as the others, and consequently is used less. Crystals of muscovite measuring 10 ft. across the basal planes have been found in India, but these are uncommon. Crystals of from 6 to 12 in. are common, however, and sheets 30 in. by 24 in. have been obtained in Canada free from flaws. Oil has a very harmful effect on the material, and T. O. Maloney found that a piece of mica which withstood 16,000 volts alternating current broke down under 9,000 volts after being lightly wiped over with paraffin oil. One of the chief uses of mica is for interposing between the segments of the commutators of motors, and the breakdown voltage of sheets 0.12 mm. thick has been given as 10,000 volts. Mica waste is made up into what is known as micanite, or mica cloth, by bonding the fragments with shellac varnish on a fabric base. Asbestos, another complex silicate, is also used, but its hygroscopic nature and poor insulating qualities make its scope limited. For fuse blocks and switch blocks it is used after impregnation with sodium silicate.

Rubber is produced from the sap of a number of trees, but chiefly from the Hevea brasiliensis. The sap, or latex, is a milky fluid holding the rubber in suspension in the form of exceedingly minute particles. By evaporation of the water, or coagulation, the rubber is obtained, and after washing is exported from the plantation in the form of loaves, balls, crepe or sheet. Pure rubber is little used as an insulator, but high-class cables and flexible conductors frequently have a layer of pure rubber immediately over the wire to prevent the sulphur of the vulcanised rubber from acting on the metal of the conductor. Whilst rubber, being waterproof, might be used for submarine cables, this is not the case owing to the difficulty of making good joints, its unsatisfactory resistance to water pressure (in comparison with gutta-percha) and the difficulty of preventing the action of sulphur on the conductor. Ebonite, or hard rubber, contains upwards of 30 per cent. of sulphur. It is somewhat brittle, but can be turned and takes a very high polish. It has a very high dielectric strength, but softens at comparatively low temperatures. It is not hygroscopic, and is useful where a first-class appearance is essential.

Gutta is obtained from a latex similar to rubber latex. It is a hydrocarbon of very similar character, being $(C_{10}H_{16})_n$, but has entirely different physical properties. It is not pure, but invariably contains more or less resin. At ordinary temperatures gutta is hard and tenacious, but it becomes plastic on warming, and can be moulded, the shape being retained on cooling without brittleness. Gutta is not affected by weak mineral acids, by strong hydrochloric acid, or by strong acetic acid, or by strong alkalis. It is readily attacked by strong nitric acid and strong sulphuric acid however. It slowly absorbs oxygen on exposure to air, becoming converted into a resin, and differs from rubber in that it is not attacked energetically by ozone. The value of gutta as an insulator depends solely on the proportion of gutta present and not at all upon the resin. Removal of the resin by appropriate solvents does not affect the electrical properties at all. Very hard gutta is made by extracting the resin from ordinary gutta.

Many of the synthetic resins form excellent insulators. The original researches were carried out by Kleeberg with formaldehyde and phenol, but those to which we owe most are those carried out by Baekeland, and it is one of his synthetic products which finds so extensive a use now under the name of Bakelite C. Other compounds of like nature have been used, and most of them have some value from the point of view of insulation. It is to be noted, however, that resins produced by the use of acid catalysts are less satisfactory, and have lower insulation values than those in the manufacture of which alkaline catalysts have been used. Bakelite C is a golden yellow compound of specific gravity 1.25. It resists pressure and shock, but is comparatively inelastic. It does not melt on heating, but above 300° C. chars, and at no time does it inflame. It is not hygroscopic and resists the action of strong mineral acids and of bromine. It is not so resistant to alkalis. Its golden yellow colour turns to red on exposure to light, but it has been stated that if the colour is not too deep the original yellow can be restored by heating the resin to 100-150° C. for several hours.

In concluding this account of some insulating materials, it must be noted that the list is not exhaustive, and that much more might have been said about each. The synthetic resins alone open a wider field of usefulness than the space allotted to them indicates, and as time goes on their application in all branches of the electrical industry will become more common and their value will increase to a much greater degree.

Reviews.

Electric Lighting and Power Distribution. By W. PERREN MAYCOCK. Vol. I. Ninth Edition, revised by C. H. YEAMAN. Pp. xiii+562; figs. 392. London: Sir Isaac Pitman and Sons, Ltd. Price 10s. 6d. net.

The lamented death of the author of the earlier editions of this work unduly delayed the appearance of the present edition. The necessary work of revision has been undertaken by Mr. C. H. Yeaman, who, without altering the general scheme of the work, has rewritten a large portion of the text. The popularity of the earlier editions of this book was undoubtedly due, not only to Mr. Maycock's peculiar gift for dealing with his subject in a simple and easily understood fashion, but also to the fact that few other books of similar character were available for the use of the elementary student. At the present time, however, there exists a large number of works of a rudimentary nature, of similar scope to the one before us, and we therefore rather regret that Mr. Yeaman has not made better use of the opportunity presented to him, by treating the subject in a more ordered and logical manner than he has. We very much question, for instance, the wisdom of endeavouring to describe the working of purely alternating-current instruments in a section devoted to the principles and application of direct-current work. These explanations can hardly convey anything to the student who has no knowledge of elementary a.c. principles. It is also to be regretted that the standard symbols for electrical quantities and for diagrams of connections have not been rigorously used. The obsolete symbol C has been retained for current, and a small, instead of a capital, omega has been used as the abbreviation for ohm.

Considering the work in detail, we find a very good introductory chapter dealing with mechanical units of force, energy, and power, which, if thoroughly assimilated, will be of excellent service to the student throughout his engineering studies. This chapter is followed by one dealing with electrical quantities and units, and elementary d.c. calculations. The author then leaves this part of the subject and proceeds to the fundamental principles of condensers, electromagnetism and electromagnetic induction. We then have a somewhat scrappy chapter dealing with batteries, bells, telephones, relays, and elementary transmission and distribution problems. The bulk of this matter should have followed immediately on the chapter on elementary d.c. calculations. The chapter on the magnetic circuit, and magnetic calculations, is a very good one, and deals with a difficult subject in a manner which will be most helpful to the beginner. A very large portion of the book is devoted to standards, measurements, testing and instruments, the two chapters dealing with these matters comprising no less than 211 pages, whilst the concluding chapter of the book.

treating of direct-current dynamos and motors, has 62 pages only. We consider that a more searching treatment of the principles of direct-current machines, affording, as it does, so excellent an illustration of the rudimentary principles discussed in the earlier chapters of the work, would have been more useful to the student than the detailed descriptions of many of the electrical instruments found in chapters 7 and 8. The latter chapters are, however, generally very sound and useful, although we came across one or two rather loose statements. On page 431, for instance, the moving-iron type of instrument is described rather contemptuously, as being suitable only in situations where accuracy is relatively unimportant. As these instruments are now supplied with a guarantee of Grade 1 accuracy, for a.c. work, this reference is hardly a just one, and, moreover, so far from the induction type of instrument superseding other types for a.c. work, as stated on page 463, the use of the moving-iron instrument is distinctly on the increase. On page 383 the author gives a list of the factory tests taken on cables before delivery, and states that these tests should be taken periodically after the cables have been laid. This is quite misleading, for few mains engineers would care to pressure-test their cables at regular intervals. The concluding chapter will serve as an introduction to the study of the elementary theory of direct-current machines.

There are large numbers of questions and exercises at the end of each chapter, and the answers are given to such as involve arithmetical calculation. The book has been admirably produced, and is very well illustrated. It will still rank as one of the best and most inexpensive of text books for the elementary student of limited educational attainments, although we are of the opinion that it would have been even more useful had greater attention been paid to the order in which the various subjects are dealt with, and to the allocation of space amongst them.

Notes on the Induction Motor. By H. E. DANCE, A.M.I.E.E., A.I.A.E., Lecturer in Electrical Engineering at the Birkenhead Technical School. Pp. viii+152; figs. 70. London: Oxford University Press. Price 6s. net.

This little volume is intended for those students of electrical engineering who desire to obtain accurate ideas concerning the theory underlying the operation of the induction motor without entering into matters which may be looked upon as falling within the province of induction motor design. The first chapter deals exhaustively with the production of rotating magnetic fields by means of polyphase currents in suitably disposed stator windings, and this is followed by a chapter in which consideration is given to the actions occurring in a conductor lying within a rotating field. The portion of the book dealing with the general theory of operation of the machine is completed by a study of the approximate circle diagram, the treatment being chiefly considered from the point of view of the utility of the diagram for testing purposes. Stress is laid upon the desirability of employing the phase currents and pressures when laying out the circle diagram, due allowance being made for the number of phases when determining the power scale. This may seem to be a point of minor importance, but we heartily commend the course advocated since we have in mind many cases where students have become involved in difficulties owing to lack of clear ideas as to whether line or phase quantities are under consideration.

In the succeeding chapters of the book, methods of starting, speed regulation, and power factor improvement are considered, and we find all the important methods described, the size of the book, however, necessarily limiting the amount of space devoted to each. The account of the phenomenon of "crawling," often a source of trouble with students, may be particularly commended.

The book concludes with brief accounts of the operation of the induction machine as a generator and of the single-phase induction motor.

The author achieves the object at which he aims, and the book, which is carefully and accurately compiled, can be recommended to the notice of students and engineers alike.

Legal.

Lazenby v. Gardiner

AT Plymouth County Court, on January 12th, Mr. G. C. Lazenby, wireless engineer, Plymouth, claimed the sum of £14 5s., the cost of a radio set supplied to Captain H. B. W. Gardiner, Marytavy, near Tavistock.

Mr. W. J. AMBROSE, for the plaintiff, said that his client supplied a "Marconiphone" receiving set to the defendant, who said that he did not want a loud speaker; headphones would meet his needs better. A cheque given in payment was stopped by defendant, who on the following day wrote alleging that the set was not what it was represented to be, and that he was getting very faint reception. Later the set was returned to plaintiff's shop. Giving evidence in support of this statement, Mr. Lazenby said that when he installed the set he obtained excellent reception from Daventry and good reception from Plymouth. Defendant did not say that he desired to get Continental and English stations other than Daventry and Plymouth.

Mr. FRANK JONES, of the Marconiphone Co., Ltd., said the set was capable, under ordinary conditions, of receiving radiotelephony on headphones up to a distance of 100 miles from a main broadcasting station and up to 250 to 300 miles from a high-power station. It was possible to get Radio-Paris, Madrid or Prague on the set. That day in Plymouth he had got Daventry direct on the loud speaker, and he thought that if the test had been made on Dartmoor reception would have been considerably better. Witness did not believe there were any such things as wireless "pockets," as had been suggested.

Mr. A. R. H. AKASTER, for the defence, stated that their case was that there had been gross misrepresentation by an expert on a technical matter to a person who had no knowledge of wireless. Plaintiff offered to supply a set which would get Continental and English stations apart from Daventry and Plymouth, which the set supplied would not do. Captain GARDINER bore out this in evidence, and Mr. W. E. GRAVES, a Tavistock wireless engineer, who examined the set, was called to report upon it. He gave it as his opinion that the set supplied by Mr. Lazenby had been very badly fitted.

His Honour Judge GURDON, remarking that upon the evidence put before him he was not satisfied that the set would not get the stations mentioned, gave judgment for plaintiff, with costs.

Action Against Stepney Borough Council.

IT is reported that Messrs. Pearson & Son, Ltd., printers, Aldgate, have entered an action against the Stepney Borough Council claiming £100, the amount of loss alleged to have been sustained on account of the cutting-off of the electricity supply during the general strike.

Rating Appeal by Aberdeen Corporation.

THE decision was given in the Valuation Appeal Court, Edinburgh, on January 13th, in the appeal by the Electricity Department of the Aberdeen Corporation against the refusal of the Valuation Committee to deduct sums of £6,971 and £419, in respect of sinking fund and interest on capital expenditure on buildings and plant before these were completed and became revenue producing subjects (*vide* our last issue, p. 53). The appeal was refused, the Court holding that the determination of the Valuation Committee was correct.

Lord SANDS, giving the leading opinion, said that in considering the application of the revenue principle it was necessary to keep in view that the question was not one as to the purpose to which the net revenue was applied or of profits or gains, but solely of the annual value of the subjects the value of which, if they were let, would be spelt in rent paid by a tenant. The revenue principle professed to ascertain this. But it had been contended that productive and unproductive works should be regarded as separate and distinct. Calling the productive works A and the non-productive B, admittedly B had at present no value, and they were not there concerned with putting any value upon them. The problem was to ascertain the annual value or hypothetical rent of A. His Lordship was unable to see how the rent which the hypothetical tenant of A was willing to pay could have any relation to the payments out of that rent by the landlord towards B. His Lordship was accordingly of opinion that the determination of the Valuation Committee was right.

The Court, on the same day, also dismissed appeals in three other cases in which the same question was raised.

Electric Sign Erection Dispute.

MR. JUSTICE FINLAY had before him in the King's Bench Division, on January 12th, an action in which Mr. Lewis Jackson, Gloucester Gate, W., sued Mr. John de Frene, Duck Lane, Wardour Street, W., for £200, one quarter's rent payable in advance for space for electric sky signs upon Harrington Mansions, Cambridge Circus. Defendant entered into an agreement with plaintiff to take the space at a rental of £800 a year. When defendant applied to the London County Council for a licence it informed him that it was superior landlord and that it would not allow electric signs to be put on its property. It appeared that there was a clause in plaintiff's lease to the effect that he would not without the written consent of the lessors cut or damage any of the principal walls or timbers. A clause similar to this was inserted in plantiff's agreement with the defendant. The latter pleaded that he did not know at the time he entered into the agreement that plaintiff had previously tried to get the permission of the L.C.C. to erect electric signs on the premises and that the L.C.C. had refused. In view of the failure to disclose this fact he submitted that consideration for the agreement which he entered into with plaintiff had failed, and therefore the agreement was of no effect in law. Defendant said he had re-let the space and had lost an anticipated profit of £5,000.

His LORDSHIP, in deciding for the plaintiff, said the agreement made it clear the signs to be erected must be in accordance with the lease. The failure to disclose the circumstance that the L.C.C. had previously refused permission to erect the signs was not a fraudulent concealment. If defendant had erected signs and the L.C.C. had taken action the burden would have fallen on the plaintiff. Judgment was entered for plaintiff for £200 and costs.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The organisers' report upon the Wiring the Homes of Britain Campaign for the week ended January 15th shows that four new circles were formed during the week at the following places; the chairmen's names are given in parentheses:—Bournemouth and District (Mr. H. F. Alger, secretary Mr. Norman Aish); Chesterfield (Mr. E. Morris); Dorchester; and Cambridge (Mr. Pierce, *pro tem.*). Electric demonstration homes were to be opened during the current week at Glasgow (2), Leicester, Bath, and Exeter, and two more are to be opened at Birmingham next week. The Wembley house has proved a great attraction, and many orders for appliances and fittings have already resulted from it. The builder and the furnisher have also expressed their satisfaction with the results. The Bishop Auckland house is attracting visitors from a wide area, and "excellent attendances and good results" are reported by Walsall. Dorchester has decided to run a demonstration house, and further houses or exhibitions are in contemplation at Bristol and Cardiff. The three-day exhibition at Greenock drew 800 people who paid for admission. Exhibitions are being arranged in a number of towns. That at Derby will include evening lectures on home lighting. The North Metropolitan Electric Power Supply Co. has held an exhibition at Hoddesdon in the form of an electric flat in the basement of the company's local premises. Wolverhampton will hold an exhibition from January 27th to 29th; Bingley has arranged one to run from February 28th to March 12th; and during February and March an exhibition will be held at the Weymouth electricity supply showrooms. Chesterfield contractors are also thinking of organising an exhibition. Successful works meetings are being held in all parts of the country. A recent one at Messrs. Ferranti, Ltd.'s, works was attended by 200 workers; the company has offered an additional prize for any employé who wins one of the ballot prizes. A crowd of 600 people attended a recent works meeting at the Metropolitan-Vickers staff canteen, Trafford Park. It is suggested that competition booklets might be given away by large manufacturers with the weekly pay envelopes. Bingley contractors have sent out 3,400 copies of the booklet, with a covering letter, to the principal residents of the town.

A pamphlet describing the Glasgow electric demonstration houses has been received. The first of these houses was opened this week at Muirend; three others are to be opened at later dates. The following are co-operating in the arrangement of the houses:—The Corporation Electricity Department, the Clyde Valley Electrical Power Co., the Strathclyde Electricity Supply Co., Ltd., electrical manufacturers and local wholesalers and contractors.

The German Cable Industry.

The *Deutsche Bergwerks Zeitung* learns that the order of the Reich Railways for 230 km. of cable, valued at approximately 6,000,000 marks, has at last been placed. As the order has been distributed among about a dozen cable companies, each company receives a share which will only give it employment for about a month. Delivery is to be made before the middle of 1927. With regard to the recently-completed cable from Berlin to Vienna, the paper learns that the German section is being laid by the Süddeutsche Kabelwerke, of Munich, Felten und Guilleaume, of Nüremberg, and the Kabelwerke Duisberg; the value of the order received by these concerns is estimated at between three and four million marks. —*Reuter's Trade Service* (Essen).

National Fuel and Power.

The Fuel Economy Department of the Federation of British Industries has received a request from the National Fuel and Power Committee appointed by the Government as a result of the recent Royal Commission on the Coal Industry, to be supplied with an account of the work undertaken by the Department. A Memorandum has accordingly been submitted to the Committee, and attention has been drawn to some problems of urgent industrial importance.

G.E.C. Exhibitions.

In conjunction with the local electricity authorities the General Electric Co., Ltd., has organised three exhibitions. The first opened on Tuesday last and will run until January 29th. It is being held at the Stoke Newington Electricity Department's showrooms. The second opens at the Hampstead Electricity Department's premises on January 22nd and remains open until January 29th. The last takes the form of a special window display of domestic electrical appliances at Hackney from February 7th to 19th.

The F.B.I. and the Next Budget.

The Grand Council of the Federation of British Industries has communicated with the Chancellor of the Exchequer setting out its views with regard to taxation in view of the near approach of the presentation of the next Budget. Economy in policy and administration is stressed as essential and the Council recommends that wherever the Chancellor may look for money, there shall be no increase whatever in direct taxation The loss of revenue resulting from the coal stoppage should be regarded as a capital loss to be spread over a term of years. Other matters dealt with are the incidence of super-tax and the change-over in the basis of assessment.

Unemployment in Germany.

The returns of German unemployed show that there was an increase of about 278,000 during the last two weeks of 1926. The number in receipt of relief at January 1st was 1,745,000.

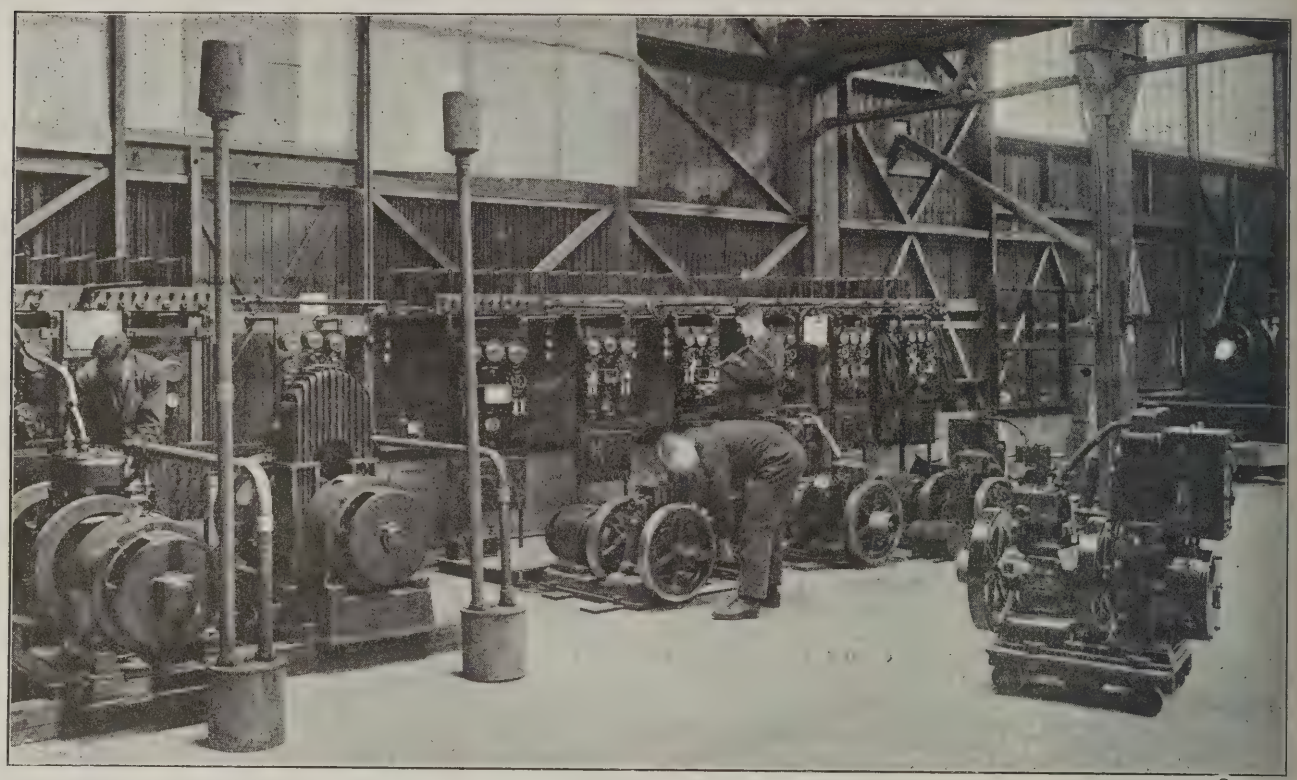
The Leipzig Fair.

We have received from the organisers of the Leipzig Spring Fair a number of pamphlets, &c., dealing with the display. The Technical and Building Fair is to be held from March 6th to 13th and the scope is wide, judging from a list of the goods that will be shown. The London office of the organisers is at 1, Gower Street, W.C.1.

Electrical Exhibits at Leeds.

At the Leeds Building Trades Exhibition, opened last week, Messrs. William E. Culkin & Co., manufacturing electrical engineers, Leeds, showed numerous examples of electric fires, cookers, washers, vacuum cleaners, and other household appliances. The firm also showed many kinds of electrical plant for industrial purposes, including dynamos, motors, switchgear, drills, meters, and various electrical instruments. A motor-driven planer and saw and the firm's own "WEC" blower were also exhibited. Mr. Arthur English, electrical contractor, Leeds, was responsible for the whole of the electrical work throughout the exhibition. He showed a model bungalow equipped with electrical appliances.

The Swedish Electrical Industry.



The electrical manufacturing industry in Sweden continued to improve last year. There was an increase in the value of the exports from 18.4 millions of kronen in the months of January-November, 1925, to 24.4 millions in the same period in 1926. In the case of the telephone industry further progress was made last year. The orders booked amounted to about 20 million kronen, of which 16.3 millions applied to foreign contracts. During the year the orders executed represented a value of about 14 millions, and the stock of orders at the beginning of 1927 was 20 millions, or twice the value of those in 1924.

Radio Apparatus Trade in Norway.

Various new broadcasting stations were established in Norway last year and it is said that such stations will cover the whole of the country at no distant date. It is calculated that the value of the wireless receivers already sold amounts to 8,000,000 kr., there being 100,000 registered owners. Good progress has been made with the development of the home radio manufacturing industry, which is claimed to be able to compete with foreign products in the matter of quality.

Messrs. Lister's Jubilee.

Last week Messrs. R. A. Lister & Co., Ltd., Dursley, Gloucestershire, celebrated their jubilee, and part of the proceedings consisted of tours of the works by p. of the company's distributing agents, electrical contractors, agriculturists, and members of the Press. The works is notable for the variety of products which it makes—ranging from butter churns to lighting sets. The shops are well laid out and equipped with the most modern labour- and time-saving machinery, practically all of which is driven electrically—mainly by overhead motors and line shafting. Messrs. Lister have a very large Continental and Dominion connection, generally taking the form of subsidiary companies in the countries concerned, and they have penetrated the United States market to a remarkable degree. In the production of "Lister" engines, which range from the equivalent of one to 10 kW, the work moves through the shops in a logical manner and is thus turned out with a minimum of labour and handling expenses. A feature noticed during the visit was a card on each large machine stating the cost of the machine and the running cost per hour when working and when idle, enabling the operators to understand that machines represent a burden when not running, apart from the stoppage of production. The impression gained from the inspection of the shops is that the work is carried out at a good pace, but without undue hurry. Most of the men are on piecework, which induces a sustained effort and they are afforded every assistance in the way of jigs and tools. It is noteworthy that no female labour is employed in the shops. The engines are subjected to thorough test before leaving the works. Our illustration shows a number of lighting and pumping plants on test in a department which also serves as a "showroom." Although this side of the company's business is very important, there are other branches of equal or greater moment. The works produces agricultural and dairy appliances, including ploughs, cream separators, butter churns, &c., which are known all over the world. Ornamental tubs, fire screens and other woodwork of a domestic kind are also made in large quantities. The stock of timber alone is valued at £25,000. The works covers an area of over eight acres and is well served in the way of transport. One of the latest developments shown to the visitors was an "Auto-truck," a run-about conveyor for workshops and loading platforms. This has a small petrol engine and simple controls. The company extended the most complete hospitality to its visitors during their short stay.

Testing "Lister" Electric Lighting Plant.

A Battery-Charging Chart.

We have received a copy of a new Exide publication which is one of the most useful things that have so far been issued. The primary intention is to provide at a glance all the needful information regarding the re-charging of all types of Exide batteries, and it is suggested that the chart should be fixed in garages, service stations, and any other places where batteries are charged. The comprehensive nature of the information it furnishes is another indication of the readiness of the makers to render the maximum service to all users of batteries and those who undertake the care of batteries. Copies may be obtained on application to the Chloride Electrical Storage Co., Ltd., Clifton Junction, nr. Manchester.

Anglo-French Discussions: F.B.I. Statement.

In view of certain inaccurate statements which have been published purporting to give details as to the scope of the proposed Anglo-French industrial conversations and the composition of the delegations, the Federation of British Industries has issued a statement that, up to the present, no definite arrangements have been made on either point. The present position is that the idea of such a discussion has been accepted in principle by both sides, but that the details remain to be worked out, when an authorised statement will be issued.

British Goods in New Zealand.

British Industries, quoting from the annual report of the New Zealand Association of British Manufacturers and Agents, says that during 1926 the bulk of the Government purchases of hydro-electric equipment, railway material, &c., were made from British firms, though there is still a good deal of business passed to foreign countries which could with advantage be placed in Great Britain. Local bodies have also mainly given preference to British goods. American firms practically control the market in garage air compressors, vacuum cleaners, washing machines, refrigerators, &c., though British makes of electric irons, kettles, &c., are now securing a large proportion of business. In electric cooking ranges there is a wide field for improved British products. Radio sets, &c., require to be more adapted to New Zealand requirements.

A German Export Selling Concern.

It is stated that a number of German electrical firms have formed a joint combination under the title of the Sales Company of the Special Electrical Works, of Berlin, to represent their interests in deliveries on reparation account, as well as in ordinary sales of material to France and Belgium, made by the interested firms. Herr K. Witthauer, of the Poege Electricity Company, of Chemnitz, has been elected manager of the company.

An International Rubber Exhibition.

There opens in Paris to-day (Friday) an International Exhibition of Rubber and Other Tropical Products, in which most of the principal rubber-producing countries are represented. The proceedings will include papers on the production, manufacture, and employment of rubber. The president of the exhibition is Lord Colwyn and the vice-president Sir Wyndham Dunstan.

American Enterprise in Poland.

The main points of an electrification scheme for Poland, involving an outlay of some £5,000,000, to be guaranteed by the Polish State National Economy Bank, have been agreed on in principle between the Polish Government and the representatives of the European and American Utilities Corporation. The machinery required will be imported from the United States. The American group is to obtain a long-term concession for the exploitation of the scheme, the final signature of which is expected shortly.—*Reuter* (Warsaw).

Our Foreign Electrical Trade.

The following were the values of imports and exports of electrical goods and machinery during December:—

	December, 1926.	Inc. or dec.	12 months, 1926.
Imports—	£	£	£
Electrical goods and apparatus	395,079	− 16,647	− 490,965
Machinery	1,129,374	− 40,961	+ 839,222
(Electrical machinery)	145,790	+ 43,484	+ 68,222
Exports—			
Electrical goods and apparatus	1,022,706	+119,712	+ 582,025
Machinery	3,782,147	−554,956	−3,515,314
(Electrical machinery)	511,691	− 32,727	+ 54,739
Re-exports—			
Electrical goods and apparatus	21,289	+ 6,346	− 39,715
Machinery	121,383	− 47,878	− 200,493
(Electrical machinery)	7,698	− 107	− 14,911

Works Visit.

Forty-two members of the Association of Women Science Teachers paid a visit to the Osram Lamp Works, Hammersmith, on January 7th. The party was greatly interested in the various processes connected with the manufacture of "Osram" lamps and valves which were witnessed.

Valve-Making in a Showroom Window.

The movements of a machine fascinate the general run of people, and if the action is complicated the attraction is increased. It was therefore an excellent idea of the Edison Swan Electric Co., Ltd., to fix a valve-stem-making machine

Valve-making Publicly Demonstrated.

in one of the windows of its Queen Victoria Street showrooms. The process was one entering into the production of the company's "R.C.2" valves, which are being extensively advertised, and large cards were placed near the machine explaining the working of the machine. The result was that large crowds of people were attracted to the window all day long, and the interest thus aroused must have had the effect of impressing the company's name and its products upon the minds of these people.

A Receiver and a Power Company's Plant.

Mr. Justice Romer, in the Chancery Division on Wednesday, had before him an application by the Cleveland and Durham County Electric Power Co. in the debenture holders' action, Stewart *v.* Richardson, Duck & Co., Ltd., of Stockton-on-Tees, for a declaration that it was entitled to remove from the respondent company's premises a transformer and other electrical plant which it had installed there, in spite of the fact that a receiver of the company's assets had been appointed by the debenture holders.

The application was opposed by the receiver and the trustees for the debenture holders on the ground that the applicants were not entitled, under their agreement, to remove the plant until 16 years from the year 1915.

His LORDSHIP granted the application, but said it must be without prejudice to any obligation of the applicants to supply the respondent company with electricity.

Book Notices.

"Radio for the Million." Vol. 1, No. 1; pp. 48, illustrated, including diagrams and blue prints, and priced. London: Mullard Wireless Service Co., Ltd. Price 1s.—The aim of this quarterly publication, which is to be supplied free to the general public, is to provide those who have no knowledge of the technicalities of the subject with the essential constructional details of good-class receivers in a simple and understandable form. The importance of selecting the correct valves to use is stressed, for upkeep cost depends upon a wise choice, and full details of Mullard "PM" valves are included.

"Quarterly Review." January, 1927. London: John Murray. Price 7s. 6d.

"Post Office Electrical Engineers' *Journal*." Vol. LXIX. Part 4. January, 1927. London: The ELECTRICAL REVIEW. Ltd. Price, 1s. 6d. net.

"*Journal* of the Institution of Electrical Engineers." Vol. LXV. January, 1927. No. 361. London: E. & F. N. Spon, Ltd. Price, 10s. 6d.

Calendars and Diaries.

Once again we have to return thanks for the kind wishes of a number of friends and for calendars, &c. Among the latter is one from MESSRS. ROPER BROS., 5, South Anne Street, Dublin. This is an elliptical wall card with a block of daily slips; the national emblem is given prominence.

From MESSRS. SAULTERS PATENT COILING DEVICE, 240, Lower Road, S.E.8, we have received a wall calendar with monthly sheets and an illustration of the device which gives the firm its name.

The Lytham St. Annes Electricity Department has sent two different calendars. One, which is intended for private residences, is very ornate, and bears a reproduction of a river scene in colour. The other is for golf clubs, hotels, &c.; it has a matchbox holder, and depicts a caddy with a patch upon his trousers on which matches can be struck. Both calendars have monthly date slips.

MR. J. MARTIN BLAIR, of Amberley House, Norfolk Street, W.C.2, has sent us a porcelain "Midget" insulator, made in Holland, in the form of a paper weight, representing the little couplings so named.

For 1927 the D.P. BATTERY CO., LTD., of Bakewell, Derbyshire, has again prepared a large wall calendar bearing a charming view in colour of the Bakewell country. Monsal Dale is the choice on this occasion.

We have to thank the RELAY AUTOMATIC TELEPHONE CO., LTD., of Marconi House, London, for a very neat ash tray in insulating material.

Trade Announcements.

The BILLING TOOL CO. has removed to larger premises at 89, Great Eastern Street, E.C.2, where it has opened showrooms. (Telephone: Central 7036-3).

The LONDON ELECTRICAL CO., of 1, Sherborne Lane, E.C.4, and other addresses in London, desires it to be known that it is in no way connected with the firm bearing the same name and recently trading under that title at Cardiff, and mentioned in our "Bankruptcy Proceedings" section to-day as well as in our issue of January 7th.

The ACME ELECTRIC WIRE & CABLE CO., LTD., of Shardlow, has opened a depôt at 12, City Garden Row, City Road, London, N., where stocks of cables, flexibles, and bell wires will be held. Telephone No.: "Clerkenwell 3197."

It is announced that the goodwill and stock-in-trade of the electrical engineer's business carried on by the late Mr. William Cargill at 14-16, Hilltown, Dundee, under the firm name of W. Cargill & Co., has been sold to Mr. JAMES HACKNEY, electrical engineer, residing at 93, Cobden Street, Dundee. Mr. Hackney will continue the business at the same address under his own name. Mr. P. J. McIntyre, C.A., 20, Reform Street, Dundee, will attend to debts.

Electric Heating and Hardware, Ltd., of Birmingham, have appointed the "QUICKFIX" ELECTRICAL FITTINGS CO., LTD., of 47, Sauchiehall Street, Glasgow, C1, as agents for their "Komet" and "Glowincoal" productions in Scotland, and large stocks will be carried.

New Catalogues and Lists.

MESSRS. SPENCER (MELKSHAM), LTD., Melksham, Wilts.—A pamphlet dealing with the company's gravity shutes and conveyors.

The BILLING TOOL CO., 89, Great Eastern Street, E.C.2.—List No. 48, containing illustrations and prices of hand and machine tools.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—A coloured poster and an illustrated and priced folder advertising "Marconi" valves. In the folder diagrams of typical receiving circuits are given.

MESSRS. HOUGHTON-BUTCHER (GT. BRITAIN), LTD., 88-89, High Holborn, W.C.1.—"Houghton's Radio News," containing notes on various radio components and accessories, as well as price and discount revisions.

AUTOMATIC & ELECTRIC FURNACES, LTD., 173-175, Farringdon Road, E.C.1.—Heat Treatment Bulletin No. 37, "Theory and Practice in the Hardening Shop," dealing with the use of Wild-Barfield electric furnaces.

MESSRS. HERBERT MORRIS, LTD., Loughborough.—A booklet illustrating and describing the "Morris" runway.

ENGINEERING AND LIGHTING EQUIPMENT CO., LTD., Sphere Works, St. Albans.—Catalogue No. 8, a well-illustrated list of industrial lighting fittings of many patterns for street lighting, docks and wharves, collieries, mills, &c. Full prices are given.

MESSRS. YOUNG & WILDSMITH, 20, Bloomsbury Street, W.C.1. —A list of "Association" radio valves of all makes, with details and prices.

KING'S SIGNS, LTD., 23, Collinwood Street, S.E.1.—A price list of advertising signs and brackets.

MESSRS. BAXTER & CAUNTER, LTD., 219, Tottenham Court Road, W.1.—List No. 39, containing illustrations, particulars and prices of domestic appliances, cables and wires, wiring materials, lighting fittings, violet-ray apparatus, &c.

MESSRS. HANS RENOLD, LTD., Didsbury, Manchester.—A January pocket-book blotter advertising standard chain drives.

THE BRITISH CENTRAL ELECTRICAL CO., LTD., 6 and 8, Rosebery Avenue, E.C.1.—An illustrated price list of switch- and fuse-gear, adaptors, plugs and sockets, flexible cords, cables, &c.

MESSRS. J. H. TAYLOR & CO., Macaulay Street, Huddersfield.—The "Reliability Wireless Guide," giving particulars and prices of all kinds of radio apparatus.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, W.C.2.—Leaflet No. 77, describing the "Philips" rectifier for radio battery charging; and Leaflet No. 78, dealing with a h.t. supply unit for working off a.c. mains. Both are priced.

THE EQUIPMENT AND ENGINEERING CO., 2 and 3, Norfolk Street, Strand, W.C.2.—A brochure containing illustrations of the company's destination indicators and accessories fitted to omnibuses in various parts of the country, as well as pictures of the equipment itself.

MESSRS. WILLIAM C. JONES, LTD., Collyhurst Waste Mills, Manchester.—An illustrated brochure describing the production and packing of "Jonex" cotton waste. Also a sample in a cellophane wrapping.

Bankruptcy Proceedings.

COMTON WIRELESS MANUFACTURING CO. (A. P. Pacifico, J. P. Pacifico, and R. Feitelson), 26-28, Bartholomew Square, E.C.—This firm failed last June, and an application for an order of discharge was made last week to Mr. Registrar Mellor at the London Bankruptcy Court by the bankrupt Feitelson. The Official Receiver reported that the provable claims amounted to £2,552; the assets, valued at £1,830, had realised £332; and a dividend of 1s. 6d. in the £ was expected to be paid. The failure was attributed to the trade slump; heavy depreciation in the value of stocks; to general trade depression following the general and coal strikes, and to other causes. The application was opposed by the Official Receiver on statutory grounds. His Honour granted a discharge subject to judgment for £5 to be satisfied by an immediate cash payment.

N. H. PAYNE, 4, The Triangle, Teignmouth, late 11, Queen Street, Dawlish, electrical and radio engineer.—The public examination of this debtor was held on January 13th, at Exeter. The statement of affairs showed ranking liabilities of £798, against assets of £560. Debtor attributed his failure to his having no free capital to enable him to tide over the period of long term credit he had to give customers, and to his liabilities being considerably increased by creditors suing. He stated that he commenced business in 1925 without capital. He had never prepared any balance sheet to ascertain his position. He had borrowed from relatives, and had been sued by 24 creditors since March. The examination was closed.

A. A. WILLIAMS, 22, Elgin Mansions, Maida Vale, N.W.—The public examination of this debtor took place last week, before Mr. Registrar Mellor, at the London Bankruptcy Court, the accounts showing liabilities £1,328, against assets valued at £6. The debtor stated that in February, 1923, he was associated in the formation of a company styled "Radio Phonopore and Electricals, Ltd.," the nominal capital of which was £5,000, divided into 5,000 ordinary shares of £1 each, of which he subscribed for 1,000 shares. He was appointed joint managing director of the company, which, however, was considerably embarrassed through lack of sufficient working capital, and in January, 1926, he and his co-directors had recourse to a professional moneylender, from whom they borrowed the sum of £1,000 on their joint and several promissory note for £1,300; the whole of the principal was used in, and for the purpose of, the company, and he personally received no consideration. The company defaulted in the first repayment instalment to the moneylender, and in May, 1926, judgment was given against him and his co-directors jointly in respect of their liability. The company went into liquidation in June, 1926, and shortly afterwards these bankruptcy proceedings were initiated at the instance of the aforesaid moneylender. The debtor attributed his insolvency entirely to this liability. The examination was concluded.

G. MELLOR, electricians' agent, 59, New Oxford Street, W.—This bankrupt applied to Mr. Registrar Francke, at the London Bankruptcy Court on January 14th, for an order of discharge. The Official Receiver reported that the applicant failed in April, 1926, with liabilities of £450, and assets of £8. He commenced business in November, 1924, as an agent for manufacturers of wireless apparatus, and traded at Vernon House, Sicilian Avenue, W.C., under the style of "Mellors." Although he had no capital he did a very good business for a time in radio crystals, but closed down in August, 1925. His Honour granted a discharge, subject to judgment for £100, to be satisfied out of the applicant's future earnings.

D. T. DONOVAN and H. A. LANGLOIS, trading as the London Electrical Co., 119, St. Mary Street, Cardiff, late 124, Queen Street, Cardiff.—The first meeting of creditors was held on January 7th, at 34, Park Place, Cardiff. The statement of affairs had been lodged, and the matter was left with the Official Receiver as trustee of the estate.

W. K. COXON (separate estate) (trading with E. R. Weare as the Western Mfg. Co.), wireless apparatus manufacturer, Nurshill, Lydney.—Last day for proofs for dividend, January 28th. Trustee, Mr. C. Latham, 78, New Oxford Street, W.C.1.

E. D. S. MUNDAY, electrical engineer, 272, Lake Road, Portsmouth.—Last day for proofs for dividend, January 29th. Trustee, Mr. H. Ashton, Official Receiver, 87, High Street, Portsmouth.

G. W. TEMPEST (Northern Radio Co. and General Wireless Trading Co.), radio and telephone engineer, 40, Brazennose Street, Manchester.—Last day for proofs for dividend, January 24th. Trustee, Mr. A. Yearsley, 27, Brazennose Street, Manchester.

J. R. HEREFORD-LAVEY AND V. DE FRECE (Radio Cash Stores), 371, Upper Street, Islington, N., 5, New Station Street, Leeds, and Parliament Street, Nottingham.—Last day for proofs for dividend, January 28th. Trustee, Mr. C. Latham, 78, New Oxford Street, W.C.1.

H. L. WOOD, electrical engineer, late of Elm Grove, Southsea.—First and final dividend of 1½d. in the £, payable at the Official Receiver's Office, 87, High Street, Portsmouth.

H. E. PARRIS (St. George's Electrical Mfg. Co.), 134, Upper Thames Street, late of Sydenham.—Bankrupt discharged January 14th, 1927.

Company Liquidations.

KNIVETOWN ELECTRIC WIRE CO., LTD., electrical engineers and radio manufacturers, Queensway, Ponders End, Middlesex, and 32, Sun Street, E.C.2.—A meeting of creditors was held on January 10th at the Institute of Chartered Accountants, E.C. The chair was occupied by Mr. S. W. Tubbs, of Messrs. Dixon, Wilson, Tubbs & Co., C.A., 24, Basinghall Street, E.C., the liquidator of the company. The statement of affairs presented showed liabilities of £4,647, of which £3,387 was due to the trade, and Mr. H. C. Bayldon, one of the directors of the company, was a cash creditor for £1,260, having paid off the claim of the bank under his guarantee to them. The net assets were £4,537, leaving a deficiency so far as the creditors were concerned of £110. The preferential claims included an amount in respect of income tax, but having regard to the trading losses of the company, it was thought possible that the claim might be withdrawn. The stock had only been written down by 20 per cent., as there was a possibility of a sale as a going concern taking place. The plant and machinery had been written down by about £600; it was comparatively new. The issued capital of the company was £8,386, and as regarded the shareholders, there was a deficiency of £8,496. The company was registered on April 9th, 1925, with a nominal capital of £1,000, and Messrs. Frank and Harold Kniveton were appointed life directors. The company rented a factory at Enfield, and equipped it. The capital was increased to £2,000 on May 14th, 1925, the additional £1,000 being subscribed in cash. In June, 1925, Messrs. Arthur and Samuel Jones were appointed directors of the company, but retired the following September, when Engineer-Commander W. H. Waters and Mr. H. C. Bayldon were appointed to fill the vacancies. In October, 1925, the share capital was increased to £8,000. On April 13th, 1926, Mr. G. H. Wilkinson, jun., became a director, and subscribed in cash for 1,000 shares, but he resigned in the same month. A little later the company's capital was increased to £10,000. Offices and stores at Sun Street were opened in June, 1926, for the purpose of carrying on the business of wholesale dealers in the products of the company. Mr. H. Kniveton was appointed the branch manager. Mr. Tubbs stated that the company had suffered from lack of capital. During the year ended March 31st, 1926, the turnover was £9,006, with a gross profit of £539, and a net loss of £1,106. Between April 1st and December 20th last the turnover increased, the sales being £9,184, but there was a net loss of £3,879. Owing to the loss on the trading, Messrs. F. and H. Kniveton agreed to forego the greater part of their remuneration for the year, amounting to an aggregate of £800. The heavy losses sustained were apparently due to incorrect costing, and the expenses of administration. There were two or three works' managers, or gentlemen who occupied a corresponding position, for a turnover of only £9,000 a year. Last November and December matters were brought to a head by several of the larger creditors commencing proceedings, and it was then decided that the company should go into voluntary liquidation. A creditor said that the preliminary expenses appeared rather heavy, and the chairman replied that shares to the value of £800 each were voted to Messrs. Kniveton, and that

accounted for £1,600. Some of those shares were subsequently sold for cash, and the money went to the company. Mr. Kniveton said that during 1925 and 1926 the sales of radio goods were extremely low at certain periods. Then the company had rush orders, which had to be executed. In the lean times they were obliged to keep on the workers, although there was not sufficient work for them. The result was that at periods large amounts had to be paid in wages, and there was not an adequate return. The prices which the company had obtained for its goods, and the allowances made, were the highest possible in the trade. A suggestion was made that another liquidator should be appointed, but this was not agreed to, and a resolution was passed confirming the appointment of Mr. Tubbs as the liquidator, whilst a committee of the principal creditors was also nominated. The following are creditors :—

	£		£
Ariadne Draht-und Kabel-Werke	575	Guido Horn	114
Albion Sewing Cotton Co., Ltd.	503	Turner Bros. Asbestos Co., Ltd.	77
Mather, Ormesher & Co., Ltd.	385	Johns, Son & Watts, Ltd.	71
McConnel & Co., Ltd. ...	200	Booth & Co., Ltd. ...	70
Charlesworth, Peebles and Co.	182	Ormerod Bros., Ltd. ...	62
Blades, East & Blades, Ltd.	136	General Electric Co., Ltd.	53

AUTOMATIC COMPANY (BRISTOL), LTD., electric sign manufacturers, Broad Quay, Bristol.—A meeting of creditors was held recently at the offices of Messrs. Cozens, Bate & Co., Baldwin Street, Bristol. Mr. W. L. Bate, the liquidator in the voluntary liquidation of the company, submitted a statement of affairs, which showed liabilities of £852, all of which were due to the trade. The assets were estimated to realise £643, leaving a deficiency so far as the creditors were concerned of £208. The company was registered in August, 1923, with a nominal capital of £3,000, of which £2,550 had been issued and was fully paid. Between August, 1923, and December, 1924, there was a loss of £67 on the trading, but in 1925 a profit of £68 was earned. The creditors passed a resolution confirming the voluntary liquidation of the company, with Mr. Bate as liquidator, whilst a committee was also appointed consisting of the representatives of Messrs. Dunn & Co., Pinchin, Johnson & Co., and T. Reynolds and Son. The following are creditors :—

	£		£
Ackroyd & Best, Ltd. ...	74	Reynolds, T., & Sons ...	35
Chappell & Co., Ltd. ...	31	Russian Oil Products, Ltd.	22
Dunn & Co.	125	Simpson, Baker & Co....	33
General Electric Co., Ltd.	33	Cook, N. F., & Son ...	40
General Tyre Co. ...	21	Protection Lamp and Lighting Co.	102
Pinchin, Johnson & Co., Ltd.	61		

SLOGASIGNS, LTD., 51, Bethnal Green Road, E.—The first meetings of creditors and shareholders were held last week at Carey Street, W.C., before Mr. E. T. A. Phillips, Official Receiver. A statement of affairs was presented showing liabilities of £1,594, against assets valued at £476, and a deficiency of £6,117 with regard to contributories, the issued capital being £5,000. The chairman reported that the winding up order was made on November 9th, 1926. The failure was attributed to insufficient capital; the necessity for further experiments with the devices instead of being able to put them straight on the market as was anticipated; and to the restrictions put by the Government on the use of electricity owing to the general and coal strikes. The liquidation was left in the hands of the Official Receiver.

DOMESTIC & GENERAL ELECTRICAL CO., LTD.—A meeting of members is called for February 18th, at the offices of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C., to hear an account of the winding up from the liquidator, Mr. W. A. J. Osborne.

BUCKS ELECTRIC WIRE & ENGINEERING CO., LTD.—A meeting of members is called for February 18th, at the offices of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C., to hear an account of the winding up from the liquidator, Mr. W. A. J. Osborne.

COMPRESSION STARTER & SWITCHGEAR CO., LTD.—A meeting of members is called for February 14th, at the offices of the British B.A.G., Ltd., Ormes Buildings, Parsonage, Manchester, to hear an account of the winding up from the liquidator, Mr. J. Abson.

Private Arrangements.

CLEARTRON RADIO, LTD., 1, Charing Cross, S.W.—A meeting of the principal creditors was held recently at the company's offices, when a statement was made by one of the directors. It appeared that the company had an issued capital of £55,000, and last year negotiations were entered into with the object of raising additional capital to the extent of £100,000, in order to extend and consolidate the business, but the matter fell through. There was an overdraft at the bank, and debentures for £30,000 were created. With that money the bank was paid off, and the balance was utilised in discharging pressing debts. One or two creditors had commenced proceedings, and if judgment was obtained, the debenture holders might appoint a receiver. Since November, fresh negotiations had been commenced with a view to raising further capital, and it had been decided to call the principal creditors together in order to ask them to refrain from taking steps against the company, as it was believed that the negotiations could be carried through and the business continued successfully. The principal creditors decided to recommend the creditors generally to hold their hands for the time being. It was also decided that the meeting should be adjourned, and it was hoped by the time of the adjourned meeting that the negotiations would be carried to a successful issue. It was also suggested that Mr. Bertram Day, a large creditor, should be appointed to the board. The suing creditors would be asked to stay their hands. The liabilities, apart from the debentures, were stated to be about £30,000.

Dissolution of Partnership.

DEESIDE RADIO SERVICE, wireless instrument makers, 33, Grange Road, West Kirby, Chester.—Mr. J. L. Bull and Mr. K. W. Pardoe have dissolved partnership. Mr. Bull will attend to debts and continue the business.

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from January 12th :—

Octron. No. 475,558. All goods in Class 6. No. 475,559. All goods in Class 13. No. 475,560. All goods in Class 18.—H.S. Electric, Ltd., 32, Charles Street, Birmingham.

Contax.—No. 469,382. Class 8. Telemeters, searchlights, &c.—Contessa-Nettel Gesellschaft, Stuttgart. (British representatives : Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

Sifam. No. 473,522. All goods in Class 8.—Sifam Electrical Instrument Co., 95, Queen Victoria Street, E.C.4.

Herculene. No. 475,891. Class 8. Electric cables.—W. T. Henley's Telegraph Works Co., Ltd.

Social Events.

The Committee of the G.E.C. Social and Athletic Club was "At Home" to the junior members of the staff at Magnet House on the evening of January 7th, when 150 members were entertained. Dancing, games and conjuring contributed towards a most pleasant evening. Sir Hugo Hirst, the president of the club, who was accompanied by Mr. L. C. Gamage (the chairman) and Mrs. Gamage, addressed those present. Mrs. Gamage presented and distributed prizes to the best dancers in a special competition.

The Magnet Club of Fraser & Chalmers Engineering Works, Erith, held its third dance of the season in the Belvedere Public Hall on January 8th, in which over 100 members of the club and their friends took part. Special "G.E.C." lighting effects, combined with the decorations, added to the enjoyment of the evening.

The annual dinner of the Willesden Polytechnic Electrical Engineering Society will be held on Saturday, February 12th (the 25th anniversary of the Society's formation), at the Café Marguerite, Oxford Street, the president, Mr. Frederic H. Taylor, A.M.I.E.E., A.M.I.Mech.E., in the chair. Old members of the Society should apply for tickets to Mr. T. Bowen, the hon. sec.

Mr. Arthur Cozens, registered electrical contractor, of Ascot, Camberley, Clacton, and Henley, again entertained his staff and friends of the firm at a New Year's party and dance at the Cordes Hall, Sunninghill, on January 7th, over two hundred being present. Dancing commenced at 7.30 and was followed by an entertainment excellently rendered by the Cozens Co-Pessimists. Songs, monologues, &c., were given by Messrs. G. Hyde, A. E. Godden, M. Adams, G. Ross, E. Sales, J. Beckwith, and Barry Cozens. Mrs. Bailey's band provided the dance music. During an interval Mrs. Cozens was presented with a bouquet of carnations.

The concluding portion of the first annual sales conference of the Pirelli-General Cable Works, Ltd., was held at the Royal Pier Pavilion, Southampton, on the 7th inst., and the directors of the company invited the members of the staff and their wives to a supper dance. About 250 people were present, and a most enjoyable evening was spent.

The annual carnival and dance of the staff of Messrs. Johnson and Phillips, Ltd., was held at the Blackheath Concert Hall on January 7th. The attendance exceeded 450 and included Sir Philip Dawson, M.P., Mr. J. Macgregor and Mr. C. Stewart, directors of the company. The costumes were judged by Miss Annie Croft and Mr. Reginald Sharland, of the Shaftesbury Theatre, and the prizes were presented to the winners by Lady Dawson, Mrs. Macgregor and Mrs. Stewart. These prizes were the gift of Mr. H. L. Dawe (South African representative), the provincial branch managers, and Mr. E. P. Weston.

Railway Rates Increase.

According to the Federation of British Industries, the increased rates upon railway goods traffic, mentioned in our last issue, are to come into force on February 1st.

Meter Approved.

The Electricity Commissioners have approved the "Rex" single-phase, type "SIP.1a," induction watt-hour meter (sizes 2.5 to 100 A, 110 to 240 V, at 50 cycles), for which Messrs. THOMPSON & Co., 1, Old Swan Lane, E.C.4, are sole British agents.

Colchester Joins Joint Board.

The Colchester Council has agreed to join the District Joint Board of Employers and Members of Staff (No. 9 area).

A Petters' Indian Award.

Messrs. Petters, Ltd., inform us that their agents for the Bombay Presidency, Messrs. Turner, Hoare & Co., Ltd., were awarded a gold medal at an Agricultural Show held at Poona in October last. This was in respect of a portable chain-driven pumping plant, comprising an 8-b.h.p. "Petter" crude-oil engine and a "Pulsometer" 6-in. centrifugal pump, mounted on a trolley. The Show is said to have been the largest ever held in Asia.

For Sale.

Lytham St. Annes Electricity Department has for disposal surplus generating plant. (See our advertisement pages to-day.)

The Contractors' Dinner.

The annual dinner of the Electrical Contractors' Association and Allied Associations was held at the Trocadero, W., on Tuesday last. The president, Mr. H. J. Miles, was in the chair, and the principal guest was Col. Wilfrid Ashley, the Minister of Transport. The speakers included Sir Hugo Hirst, Bt., and Messrs. P. J. Hannon, M.P., T. E. Alger, R. W. L. Phillips, W. R. Rawlings, J. Y. Fletcher, and H. J. Galliers. A report of the proceedings will appear in our next issue.

The Progress of British Electrical Industry.

At the end of last week several daily papers published statements which had been issued by the British Electrical and Allied Manufacturers' Association regarding the excellent record of the British electrical industry in 1926. As quoted by the *Daily Telegraph*, it appears that in spite of the severe industrial crisis which reigned throughout the last eight months of the year as a result of the coal stoppage, the electrical industry had a record year both at home and abroad. "All branches of production, with the exception of the industrial motor section, have been working full time; thousands of new employés have been engaged to cope with the increased demand, and the leading firms now report that they have work on hand sufficient to last for fifteen months. The orders received for generating plant on home account, due to the new super-power stations being erected in London, Coventry, Bristol, Oldham, Birmingham, and Kearsley in preparation for the national power scheme, were 24 per cent. higher than in 1925 and only 6 per cent. below 1920. On export account the increase over 1925 was 22 per cent., and over 1920 43 per cent., while, for the entire range of business, 1926 was 10 per cent. above all previous records. Britain has become the world's leading supplier of electrical goods, and, in the face of the most intense competition from Germany, the United States and Switzerland, obtained important contracts in 1926, totalling over £20,000,000 in the Dominions, especially India, Australia, New Zealand, and South Africa, in Brazil, Argentina, Japan, China, Norway, Sweden, Poland, France, Italy, Russia, Belgium, Spain, Holland, Denmark, Mexico, Chile, and the United States. Railway electrification, water-power schemes, giant power stations, transmission systems, and industrial electrification formed the bulk of overseas demand, many of the contracts secured being on a scale unparalleled in in the history of the industry. British electrical engineers are active now in almost every country of the world, developing power resources and consolidating everywhere the British reputation for high-quality production and sound design. Export shipments totalled £18,194,000 in 1926, an increase of £630,000 over the previous record year of 1925, and there are indications that 1927 should establish the £20,000,000 level. In electrical machinery the competitive position of the British electrical industry is higher now than at any previous time, and new markets are being opened every year for the British product."

Prices of Materials.

With reference to the lead position, Messrs. James Forster and Co. report, under date January 15th:—"A better demand from consumers, particularly for early delivery, has been experienced this week, which accounts for the firmer tone in evidence in the market."

The Board of Trade returns for December, 1926, are:—Imports 28,504 tons, exports 1,169 tons, left for home consumption 27,335 tons.

Messrs. F. Smith & Co. report, January 18th:—Copper (electrolytic) bars, £63, 10s. inc.; ditto ditto sheets, no change; ditto ditto wire rods, £73, 35s. dec.; ditto ditto h.c. wire, 9 3/16d., 1/16d. inc.

Messrs. James & Shakespeare report, January 18th:—Copper bars (best selected), sheet, and rod, £90, £2 dec.; English pig lead, no change.

Messrs. Edward Till & Co. report, January 18th:—India-rubber, Para fine, 1s. 5d., ¼d. inc.

Recent Contracts.

The METROPOLITAN-VICKERS ELECTRICAL CO., LTD., has received from Spain an order for one hundred and four 230-h.p. motors for motor coaches which are required in connection with an important electrification scheme for two main-line sections of the Norte Railway near Barcelona. The first sections of line to be electrified are from Barcelona to Manresa, a distance of 64 km., and from Barcelona to San Juan de las Abadesa, a distance of 106 km. The system adopted is 1,500 V d.c., with overhead conductor. The passenger stock arranged for comprises 26 train units, each unit consisting of one motor coach and one trailer coach, providing seating accommodation for about 200 people. The mechanical parts for the coaches will be manufactured by the Sociedad Española de Construcción Naval, which is associated with the Metropolitan-Vickers Company, at its Bilbao works. Each motor coach will be equipped with four 230-h.p. motors of the M.-V. self-ventilated series-wound type, each pair of motors being connected permanently in series on the 1,500-V supply. The field system of the motors is arranged for weak-field control, thus giving additional economical running notches on the controller. The trains will operate at an average schedule speed of 32 m.p.h., and will be capable of a maximum speed of 56 m.p.h.

The ELECTRIC FURNACE CO., LTD., 17, Victoria Street, S.W.1, which controls the patent rights, is supplying to Messrs. Edgar Allen & Co., Ltd., Sheffield, an Ajax-Northrup high-frequency furnace for the manufacture of special steel. The furnace, which will be of about 3 cwt. capacity, will be operated by a 150-kW high-frequency motor-generator. This plant is of interest as being the first high-frequency furnace for commercial steel making in this country. Messrs. Edgar Allen & Co. were the first British company to install an electric arc furnace for commercial steel making, a Héroult furnace erected in 1909.

MESSRS. SIEMENS BROS. & CO., LTD., of Woolwich, have received orders valued at £200,000 for automatic telephone exchanges in the Brisbane area for the Commonwealth of Australia (P.M.G.'s Dept.), concerning which we give some particulars in a leaderette to-day.

We learn that the Peking Chinese Electric Light and Power Co., Ltd. (a purely Chinese company, in which there is no foreign capital), has placed an order with the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., for a 10,000-kW turbo-generator.

Reuter's Trade Service reports that the English Electric Co. of Canada has secured a contract for the complete electrification of the Noranda mines.

Unemployment.

The Employment Exchange returns dated January 3rd showed a total of 1,495,000 persons who were totally unemployed. This was 144,755 more than on December 24th and 244,094 more than on January 4th, 1926.

Irish Free State Electrical Imports.

The imports of electrical goods, excluding machinery, into the Irish Free State during November last amounted to a value of £39,591, as compared with £48,166 in the corresponding month of 1925.

Electric Locomotives for Spain.

The North of Spain Railway Co. has ordered 22 electric locomotives from the Euskalduna concern. An important part of each of these engines will be manufactured in Switzerland.—*Reuter's Trade Service* (Madrid).

New Italian Companies.

Among the concerns recently organised in Italy are the Società Officine Elettrotechniche e Meccaniche, of Milan, capital 2½ million lire; La Società "Isolo" Fabbrica Isolanti Elettrici Sterlingati, Milan, capital 25,000 lire; La Società Industria Apparecchi Termo-Elettro Sanitari, Milan, capital 30,000 lire; and La Società Forze Idrauliche Alta Maira, Rome, capital 500,000 lire.

The Signs of Trade Revival.

In the article bearing the above heading in our last issue a sentence in the third paragraph—"Unhappily the restlessness of China, Russia, and Mexico are still features in the situation"—should have appeared at the end of the paragraph, as our readers will have seen. The sentence was misplaced during proof correction.

More Birmingham Exhibitors.

We inadvertently omitted MESSRS. EARLE, BOURNE & CO., LTD., and MESSRS. HOLLINGS & GUEST, LTD., from our last week's list of exhibitors in the British Industries Fair. In their capacity of metal and tube producers, Messrs. Earle, Bourne are closely connected with the electrical industry; and the machinery made by Messrs. Hollings & Guest is of special interest to the electrical trades.

Registered Electrical Contractors.

At a meeting of the Executive of the National Register of Installation Contractors, on January 14th, applications by the following for registration were approved:—

Savage, Thomas A., London, W.3.
Winship, William P., South Shields.
Dagleas, James T., South Shields.
Electric Wiring and Repair Co., Cambridge.
Fryer & Howarth, Rochdale.
Gatley & Co., Todmorden.
Velox Tool Manufacturing, Electrical and Wireless Engineering Co., Newcastle-on-Tyne.
Ross, David, Newcastle-on-Tyne.
Deal and Sandwich Electrical Co., Ltd., Deal.
Walker & Co., Smethwick, Birmingham.
Wright, T., & Co., Leicester.

At the same meeting one application was withdrawn and four were declined.

Lighting and Power Notes.

Australia.—TASMANIA.—The transmission line from Waddamanna to Railton, the erection of which has been carried out by Messrs. Armstrong, Whitworth, Ltd., has been completed, and secondary distribution feeders to supply different services on the North-West coast are nearing completion. Satisfactory progress has also been made with the erection of an 88,000-V sub-station at Railton. It is expected that the whole service will be in operation shortly. It will supply electricity to Sheffield, Railton, Devonport, Ulverstone, and Penguin, in addition to the cement works at Railton and the shale oil works at Latrobe.—*Reuter's Trade Service* (Melbourne).

Barnsley.—EXTENSION OF SUPPLY.—The Electricity Committee is to borrow £1,624 for the extension of its electricity supply to Monk Bretton.

Barrow.—ELECTRICITY SCHEME.—The Town Council has decided to make no further application to the Electricity Commissioners for sanction to proceed with the Backbarrow hydro-electric scheme, but has decided to request them to approve of extensions at the existing station by increasing the capacity by 6,000 kW. The cost of this scheme is estimated at £60,000.

Bradford.—ELECTRICITY SCHEME.—It is reported that the Corporation is to proceed with a scheme of extensions to its electricity undertaking, involving a capital expenditure of £300,000. It is proposed to enlarge the present Valley Road works and to erect a boiler-house which will contain extra-high-pressure boiler plant with a pressure of 1,100 lb. per square inch. The pressure employed in this installation will be the third highest in the world, one at Milwaukee having a pressure of 1,400 lb., and another (at Boston, New York) having a pressure of 1,200 lb. per square inch. The estimated cost of this section of the scheme is £80,000, and it is estimated that a saving of 12 per cent. of coal will be made. The Electricity Commissioners have already sanctioned a scheme which includes provision of a 20,000-kW set, and the whole of the scheme will cost approximately £300,000.

Bridge of Allan.—TRANSFER OF ORDER.—The Town Council is to make application to the Electricity Commissioners for sanction to transfer the Bridge of Allan Electricity Special Order, 1925, to the Scottish Central Electric Power Co.

Canada.—MANITOBA.—The third set of 29,000 h.p. at the Great Falls plant of the Manitoba Power Co. on the Winnipeg river was put into commission recently, bringing the capacity of the station up to 84,000 h.p. The ultimate capacity of the station will be 168,000 h.p., and the fourth set is on order and is expected to be in service by August next.

Cockermouth.—ELECTRICITY SUPPLY.—The Urban District Council on January 5th decided to appoint a committee to go into the question of providing an electricity supply for the town.

Continental.—BELGIUM.—A new power station is being established at Moli by the Société d'Electricité de la Campine. The plant will comprise two 10,000-kW turbo-generators, supplied by the Ateliers de Constructions Electriques de Charleroi, and Brown Boveri & Co., of Baden, Switzerland.

FRANCE.—The Compagnie d'Electricité Industrielle, of Paris, has recently secured a concession to establish a hydro-electric plant to utilise the water power of the River Pique near Saint Aventin in the Upper Garonne Department.

Dewsbury.—ELECTRICITY EXTENSIONS.—The Electricity Committee has authorised the expenditure of £8,000 for extension of the h.p. main from the generating station to various districts. The scheme involves the erection of four sub-stations.

Douglas (I.O.M.).—NEW STORAGE BATTERY.—Owing to delay in proceeding with the scheme of extension it will be impossible to have the new plant completed for next season's load, and in the circumstances the Committee has decided to duplicate the existing storage battery at an estimated cost of £4,000.

Eastbourne.—LOAN SANCTION.—*Correction.*—The amount recently sanctioned for sub-station buildings was £250, being an outstanding balance, and not £52,671 as stated in the Finance Committee's report and quoted by us in our last issue.

East Dereham.—PROPOSED BULK SUPPLY.—The Urban District Council has received an offer of a bulk supply of electricity from Norwich Corporation. The cost of an overhead transmission line would be £8,500, and electricity would be transmitted to Dereham at a pressure of 11,000 V. The charge to the Council would be £4 10s. per kW of maximum demand, plus .71d. per kWh for electricity taken. The Council has referred the matter to its electrical expert for advice.

Eastry.—ELECTRICITY SUPPLY.—The Rural District Council has decided to offer no objection to the Order of the South-Eastern Electric Power Co., for the supply of electricity in the area, but the company has been requested to lay cables underground wherever possible when crossing highways.

Edinburgh.—APPLICATION FOR ORDER.—The Corporation recently approved a recommendation of the Electricity and Lord Provost's Committees to promote an Order for powers to construct outlet pipes from the electricity station and a pier at Portobello, and for other purposes. The estimated cost of outlet pipes and pier combined is £60,000.

PRICE INCREASE.—The Electricity Committee has announced that, in consequence of the increase in the cost of coal, there will be an increase in the price of electricity for lighting from 4d. to 4¼d. per kWh as from the beginning of the spring term.

Hatton (near Warwick).—INSTITUTION SUPPLY.—New heating and lighting services are to be installed at the Warwickshire Mental Home, at an estimated cost of £35,638.

Hastings.—LOANS SANCTIONED.—The Corporation Electricity Committee has received sanction to the borrowing of £7,000 for services and £1,000 for transformers and sub-station equipment.

Hereford.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £6,000 for electricity purposes.

Huntingdon.—ELECTRICITY SUPPLY.—The Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co. has informed the Town Council that, owing to the action of the Government, it is unable to proceed with the provision of the station at St. Neots as proposed, but it is hoped to provide a supply of electricity for Huntingdon and Godmanchester in eight months' time.

Irish Free State.—DUBLIN.—The City Commissioners have adopted a recommendation to reduce the charge for general heating from 2¾d. to 2d. per kWh. Other reductions and modifications, principally in connection with special classes of supplies, will be put into operation as from the beginning of the last (December) quarter.

ENNISCORTHY (Co. WEXFORD).—The Urban District Council's electricity undertaking is to be formally inaugurated on February 3rd.

Keighley.—LOANS SANCTIONED.—The Town Council has received sanction to the borrowing of £8,095 for mains and £3,011 in connection with the main transmission line from the generating station to the Bingley Urban District Council's distribution station.

Loughborough.—EXTENSION OF SUPPLY.—At a recent meeting of the Town Council a proposal to withdraw an application for sanction to the borrowing of £3,850 and to substitute a more comprehensive scheme for a supply of electricity to Nanpantan was considered. The new scheme involves the raising of a loan of £5,802, and includes the erection of a sub-station and the laying of underground mains to Nanpantan. The matter was referred to the General Purposes Committee.

Luton.—LOAN.—The Town Council has applied for sanction to a loan of £26,636 for supplying electricity to villages near the borough. There have been 178 applications for electricity from the area in question.

Newhaven. — ELECTRICITY SUPPLY. — The Rural District Council has been informed by the Electricity Commissioners that the Peacehaven Electric Light and Power Co., Ltd., has asked that the Council's consent should be dispensed with in connection with an application to supply electricity to the parishes of Piddinghoe and Telscombe. As the Piddinghoe Parish Council has decided in favour of the Order, the Council has withdrawn its objection in respect of that parish, but adheres to its objection regarding the parish of Telscombe, and has asked the Commissioners to hold a public inquiry into the matter.

North-West Midlands Electricity District.—TRANSFER OF UNDERTAKINGS.—At a recent meeting of the Stafford Town Council, a report submitted by the Electricity Committee with regard to the question of the transfer of generating stations by the authorised undertakers in the North-West Midlands Electricity District and the establishment of a Joint Electricity Authority for that district was considered. The Committee stated that it had given careful consideration to proposals contained in a report of a conference of the authorised undertakers, and recommended the adoption of the principles contained in the report, subject to the following reservations: (*a*) That an independent audit be made of each undertaker's capital accounts, which are to form the basis of calculation for the consideration for the transfer of generating stations. (*b*) That the basis upon which the transfer of stations should be made in each case should be the original capital cost, less an amount in respect of depreciation, to be determined at one uniform rate for all buildings to be transferred, and another uniform rate for all plant and machinery to be transferred, without regard to any outstanding liabilities in respect of either building or plant.

Portsmouth.—NEW TURBINE HOUSE.—The foundation stone of the new turbine house at the Corporation power station was laid by the Mayor on January 12th. The new building will house two 10,000-kW sets, and the total cost of the scheme will be approximately £70,000.

ELECTRICITY SUPPLY.—The Electricity Committee is to carry out extensions at the generating station at a cost of £1,700, to extend the mains in the Waterlooville area at a cost of £1,000, and to erect a sub-station near Prospect Road, the cost being estimated at £1,000.

Pwllheli.—INAUGURATION OF SUPPLY.—An electricity supply for the district was formally inaugurated by the Mayoress on January 15th. Electricity is supplied by the Electricity Distribution of North Wales and District, Ltd.

Rugeley. — ELECTRICITY SUPPLY. — The Urban District Council has approved of the draft agreement with the Power Development Co. for a supply of electricity to the district within 2½ years of the granting of the Order.

St. Austell (Cornwall).—ELECTRICITY SUPPLY.—Owing to the disappointment expressed by residents that a supply of electricity should thus be vetoed, the Rural District Council on January 7th rescinded the resolution which it passed recently refusing permission to the St. Austell and District Electric Lighting and Power Co., Ltd., to erect overhead lines in connection with an electricity scheme for Tywardreath and district.

Sheffield.—MAINS EXTENSIONS.—The Corporation Electric Supply Committee has approved extensions of mains, at an estimated cost of £28,227.

Slaithwaite (Yorks.).—LOAN.—The clerk to the Urban District Council reported recently that, in response to an application to borrow £3,150 for electricity extensions, the Electricity Commissioners had suggested that, as the Council would require £2,000 per year for normal extensions, the application should be increased to £7,250, which would cover the amount overspent to April 1st (£1,148), and leave £2,000 for each of the three following year's extensions, the sum of £6,250 being for mains and services and £1,000 for meters. Extensions made up to date had been greater than had been anticipated. The Council agreed to apply for a sum of £7,250.

South Durham.—SPECIAL ORDER.—Application has been made to the Electricity Commissioners by the Cleveland and Durham County Electric Power Co. to amend the draft of a Special Order so as to include certain parishes in the rural district of Darlington.

Spalding.—EXTENSION OF SUPPLY.—The Urban District Council is to apply for a Special Order to supply electricity to Crowland, Borough Fen, and Newborough. The estimated cost, with transformer, meters, and services, is £2,500.

Stoke-on-Trent.—RELAYING CABLES.—The Corporation Electricity Committee is to relay cables in Longton at a cost of £5,700. The Committee has decided that as the North-Western Electricity and Power-Gas Co. has not exercised any of the powers conferred upon it by its Act of 1903 in any portion of its area of supply within the North-West Midlands Electricity District, application shall be made to the Ministry of Transport for an Order annulling the powers of the company, so far as they affect that district.

Walsall.—ELECTRICITY EXTENSIONS.—The Town Council reports that in connection with the extension of Birchills power station, contracts for machinery, amounting to £140,721, have been placed.

Weymouth.—PRICE REDUCTIONS.—The Electricity Committee has reduced the electricity charges by ½d. per kWh, and hopes to effect a further reduction before next quarter.

Tramway and Railway Notes.

Australia.—SYDNEY.—Details of the new underground railways in Sydney and the electrification of the Sydney suburban railway system were given in a recent speech by the Assistant Commissioner of the New South Wales Railways. It had been found necessary, he said, to increase the width of the carriages and consequently to rearrange the tracks. This work, with the erection of overhead equipment and alteration of bridges to carry the overhead lines, was estimated to cost £15,000,000. Rolling stock for the electric services would cost £6,000,000, and the construction of the underground railways £7,000,000. In addition, £4,000,000 had to be paid towards the construction of the Sydney Harbour bridge.—*Reuter's Trade Service* (Melbourne).

Bradford.—PASSENGER SIDINGS.—The Tramways Committee has approved the alteration of Leeds Road tramway terminus to provide passenger loading sidings in Hall Ings, at an estimated cost of £1,537.

Continental.—SWITZERLAND.—Work is in hand on the construction of an electrically-operated cable railway between Lake Trub and Gerschnialp, near Engelberg. The line is being constructed on the Bleichert system, the electrical part of the work being in the hands of the Bell Gesellschaft, of Kriens, Lucerne. The difference in altitude between the upper and lower stations is about 6,560 ft., which, it is expected, will be covered in 10 minutes.

GERMANY.—According to a statement recently issued by the German State Railway Exploitation Co., owing to the existing financial stringency it will not be possible at present to consider the electrification of the railway system in Baden.

FRANCE.—A new mercury-arc rectifier station has lately been brought into operation near the Louvre, Paris, to supply the Nos. 1 to 7 lines of the Paris underground railways. The station, which has a capacity of 3,600 kW, comprises four rectifier-transformer sets of the Brown-Boveri mercury-vapour type, each capable of supplying 1,500 amps. at 600 V. The Compagnie Electro-Mécanique, of Paris, which has carried out the installation, has previously completed one at "La Nation" station, and is at work on a third transformer plant at the Saint Antoine station.

JUGO-SLAVIA.—It is reported from Belgrade that the Municipal Council proposes to extend the tramway network, enlarge the central generating station, and construct water mains, &c. Consideration is being given to an offer of credit of from $15,000,000 to $20,000,000, which is said to have been made by American circles for these purposes.

United States.—RAILWAY ELECTRIFICATION.—According to the *Tramway and Railway World*, work is in hand on an electrification scheme on the Great Northern Railway. The present undertaking involves the revision of the original electrification between Tye, Washington, at the western end of the Cascade Tunnel and the eastern portal of the same tunnel, and the extension of the electric lines westward to Skykomish, Washington. The electrified mileage will thus be increased from 4 miles to 24 miles of main-line track, exclusive of sidings. This project constitutes what is reported to be the first step in a programme that will include 96 miles of main line *via* a new tunnel, from Gold Bar to Wenatchee.

Telegraph and Telephone Notes.

Communication with Aircraft.—TELEGRAPHY TO SUPERSEDE TELEPHONY.—In order to bring into effect the decision of the International Commission for Aerial Navigation that wireless-telegraphy instead of wireless-telephony shall be used for normal communication between air liners and aerodrome ground stations, which was embodied in regulations that came into force this year, flying mechanics of Imperial Airways, Ltd., are being trained as operators at the Marconi Co.'s College at Chelmsford. Hitherto wireless-telephony has been employed for the convenience of pilots who have themselves been able to speak direct to Croydon or other aerodromes. With the increasing volume of air traffic, however, it has been considered advisable to relieve the pilot of large passenger-carrying machines of this duty, and Morse-code telegraphy is to be gradually introduced in order to speed up traffic and avoid confusion. To provide for this change, the regulations lay down that all machines carrying 10 or more passengers must include a qualified wireless operator in the *personnel*, who will give his undivided attention to the wireless service. No change in the apparatus used on Imperial Airways machines will be involved, as the Marconi AD-6 aircraft set, which is their standard equipment, may be used either for telephony or telegraphy by the simple movement of a switch; telephony can still be used, of course, when desired.

India.—BURMA TELEGRAPH TROUBLES.—Complaints are made regarding the inefficient telegraph service between Burma and India, and when the Director-General of Posts and Telegraphs recently visited Rangoon, the Burma Chamber of Commerce represented to him that a submarine cable should be laid between Rangoon and India; however, the sea bed is singularly unfavourable to such an enterprise. A senior officer of the engineering branch has been instructed to inspect the lines between Burma and India, and Rs.1½ lakhs have been sanctioned for the overhaul of these wires.

TELEPHONES IN BURMA.—The Posts and Telegraphs Department has, during the past two years, linked outlying places by public telephone circuits. In every case this has been done by making use of the existing telegraph wires, as the traffic would not be sufficient to justify the cost of erecting special telephone wires. The facilities thus provided have been much appreciated by the public, and Mandalay has in this way been linked with Maymio, Rangoon with Pegu, Thanatpin, Syriam, Kauktan and Tavoy with Harmingyi.

RANGOON'S FIRST WIRELESS TELEPHONE.—The Port Authorities in Rangoon have introduced a wireless telephone, the first one in Burma, between the Port Offices and the pilot vessel *Beacon*. The telephone is fitted with an automatic calling device, and the installation is capable of communicating with vessels at sea for a distance of 200 miles.

TELEPHONES IN CALCUTTA.—The report of the Calcutta Telephone Corporation for the year ended June 30th, 1926, draws

attention to the growth in traffic since the message rate system was introduced toward the end of 1924. The average cost of an exchange line has dropped from 23 rupees to 21 rupees 8 annas a month, and the number of lines has been increased by 100 a month. Ineffective calls have been reduced from 36 to 20 per cent. The profit for the year amounted to 570,000 rupees, says *Commerce Reports*. The number of exchange, extension, and private lines in Calcutta totals 11,549 for a population of 1,328,000.

Iceland.—TELEPHONE SERVICE.—Official figures show that the telephones in use now total 1,507,000, representing an increase last year of 145,000, the largest increase yet recorded, or 10.8 per cent. There is thus one telephone to every 29 persons, which leaves Britain still inferior to Iceland, with its one telephone to 26 persons. During the past year 170 new exchanges were opened.

Portugal. — SUBMARINE CABLE CONTRACT. — From Milan, Italy, we learn that a definite contract has lately been arranged between the Società "Italcable" and the Portuguese Government for the laying of new submarine telegraph cables between Lisbon, Malaga, Azores and Cape Verde. The Italian submarine cable system will, as a result, be notably increased by a new cable which, starting at Anzio, will cross the Tirreno and then continue across to Corsica and Sardinia, thence to Barcelona and on to Malaga.

Portugal.—INTERSTATE TELEPHONY.—The Portuguese Government is negotiating with the Spanish Government, says *The Times*, with the object of establishing telephone communication between Lisbon and Madrid.

Radio-Telegraphy.—"BEAM" STATION TESTS.—The short-wave "beam" stations recently completed by Marconi's Wireless Telegraph Co., under contract with the General Post Office, for wireless communication between this country and Australia, were taken over on January 14th by Post Office engineers for a week's official test. Preliminary tests indicated that the new Australian stations will provide a service as good as the Canadian, if not superior, says the *Daily Telegraph*. On the English side the transmitting station for the Australian service is situated at Tetney, a village six miles from Grimsby, and the receiving station is at Winthorpe, two miles from Skegness. Both the transmitting and receiving stations are connected by land wires with the Central Telegraph Office of the G.P.O. in London. In Australia the station for transmitting messages to England is near Ballan, fifty miles north-west of Melbourne, while the receiving station is at Rockbank, fifteen miles from Victoria's capital, with which both stations are connected by land wire to the chief telegraph office.

Submarine Telegraphy.—INCREASED OPERATING SPEED.—It is claimed that quicker communication between this country and South Africa is now possible, says the *Daily Mail*, as the result of two years' experiment by the engineers of the Eastern Telegraph Company. By abolishing the system of relaying messages from the islands of St. Vincent, Ascension, and St. Helena, and speeding up the rate at which the signals travel along the cables, it has become possible to receive messages in Capetown at the same instant as they are dispatched by the instruments in London. The new system of regenerator working, as it is called, will enable messages to be transmitted as fast as a person can talk, so it has been called "cable telephony." There will be no increase in charges.

The Telephone Service.—DEVELOPMENT IN LIVERPOOL.—Mr. W. J. Medlyn, superintending engineer, South Lancashire District, Post Office Engineering Department, has sent us a copy of the report of the Liverpool and District Advisory Committee for the year ended December 31st, 1926, which shows that progress has been made in all directions. The equipment at many exchanges has been increased, and complete new manual exchanges have been provided at Hoylake and Upton. A new exchange at Huyton will be ready for service early this year, and arrangements are also well in hand for providing new exchanges at Garston, Maghull, and Stockton Heath. Sites have been acquired for buildings at Prescot and St. Helens, in which exchanges of the automatic type will be installed. During the year 6,762 new telephones were fitted, a net increase of 4,125, or approximately 7¼ per cent. The provision of additional underground cables is proceeding steadily, and several additional long-distance circuits to London and other important centres have been brought into use by means of the repeater stations associated with the main underground cable routes. There has been a further substantial increase in the number of calls dealt with in the district, the total approximating 62¼ millions (58 million local and 4¼ trunk), an increase of 6 per cent. over the previous year. Phonograms numbered 214,000, an increase of 10 per cent., and the new phonogram room at the Liverpool head Post Office has been equipped with the latest type of ancillary panel board. The use of street telephone call kiosks is still being extended. A new coin box, permitting of shillings, sixpences, and pence being inserted, has been introduced in certain towns and, if it proves successful, its issue will be generally extended.

FIRE ALARMS.—The question of extending and improving the system of public fire alarms is under consideration by the Liverpool Corporation.

TELEGRAPHS.—The type keyboards and automatic transmitters on the London and Paris routes have been entirely successful, and this method of working is likely to be extended to other routes. Direct telegraph working between Liverpool and Antwerp has been introduced, and the question of further direct lines between Liverpool and the Continent has been reviewed. The circumstances, however, are not such as to justify any extension in this direction at the moment, but the matter is being kept in view.

Transatlantic Radio-Telephony.—NEW RECEIVING STATION.—In connection with the recently-inaugurated transatlantic radio-telephone service, work is to start at once on the erection of a new receiving station in Fifeshire, on the estate of Sir Donald Makgill, Bart., of Kemback. Three lines of aerial masts will radiate from the station for a distance of three miles each, and in the event of the station proving satisfactory, substantial buildings will take the place of those now to be erected. A lead-encased cable will be laid between Kemback and Cupar Post Office. It is of interest to record the fact that one of the first calls across the ocean was made *via* a Relay automatic telephone installation in the *Daily Express* office in London.

MEXICO NEXT?—Telephone communication between Mexico City and New York is expected to be established this year over a direct wire some 3,000 miles long. It will then be a matter simply of linking up this new development with the transatlantic service. The Mexico City-New York service will be made possible by a "hook up" between the American Telephone and Telegraph Co.'s line from New York to Laredo (Texas) and the International Telegraph and Telephone Co.'s line, which is to be completed between Mexico City and Nuevo Laredo across the Rio Grande from Laredo. The total distance, as the crow flies, is about 2,676 miles, but some 400 miles are added by the telephone route.

Radio Notes.

Australia.—NEW STATION.—Arrangements are said to have been completed for the erection of a new broadcasting station in Melbourne, of the "B" class, on the top storey of a high building in the centre of the city; it will receive no revenue from licence fees, but will rely solely on advertising for its income. The call sign will probably be 3BO and the wave-length 255 metres, with a power of 500 watts. Provision is being made for suitable programmes of music and other special features, and one minute's advertising will be allowed between each item. The station will operate for four hours on each of six evenings a week, Mondays to Saturdays. At the present time Melbourne has two "A" class broadcasting stations (3LO and 3AR) and with the new station it will have two "B" class stations (3UZ and 3BO).

MANUFACTURE.—Good progress is being made with the local manufacture of wireless equipment. One of the largest manufacturers of radio parts is the Electricity Meter Manufacturing Co., Ltd., whose lines are marketed under the name of "Emmco." The latest addition to its plant is machinery for the manufacture of headphones, which are now being turned out in large numbers.

RESEARCH.—Details have been completed of important proposals for conducting organised research into problems connected with broadcasting in Australia. The Broadcasting Co. of Australia Pty., Ltd. (which operates 3LO) recently offered the University of Melbourne a grant of £500 a year for three years to enable the University to undertake wireless research work. The offer has been accepted, and it is understood that a similar offer has been made to the University of Sydney by Farmers Pty., Ltd. (2FC). The research work will be performed by the Faculty of Science under the direction of the Dean (Prof. T. H. Laby).—*Reuter's Trade Service* (Melbourne).

Canada.—WAVE-LENGTHS.—The wave-lengths of the broadcasting stations in some Canadian cities may be changed as a result of negotiations now in progress between Lieutenant-Commander C. P. Edwards, Director of Radio for the Dominion of Canada, and the Hon. Herbert Hoover, Secretary of Commerce in the United States, who has jurisdiction over the broadcasting stations in the Republic. According to *World Radio*, reception in Canada has been far from satisfactory of late owing to the clash of wave-lengths and to the fact that, following the decision of a Chicago court, certain United States stations are poaching on Canadian channels. It is hoped that the necessary legislation conferring full authority on Mr. Hoover may be introduced at Washington.

B.B.C. Advisory Committee.—LISTENERS' LIAISON.—The B.B.C. officially announces that, as the result of a conference of wireless organisations on January 13th, it has been decided to set up an advisory committee representative of four national societies, *viz.*, the Radio Society of Great Britain, the Radio Association, the Wireless Association of Great Britain, and the Wireless League. Capt. Ian Fraser, the blind M.P., who is prominently associated with the Wireless League and Radio Society, has accepted the chairmanship of the Committee, which will have as its main function the establishment of an effective liaison between the national societies of listeners and experimenters and the B.B.C. on matters of mutual interest.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—MELBOURNE.—February 28th. City Council. Two 2,500-kW motor-convertors and accessories, or two 2,500-kW rotary convertors, with transformers and accessories. (B.X. 3124.)*

March 14th. 6,600-V, 3-phase switchgear. (B.X. 3138.)*

March 8th. Postmaster-General's Department. Induction coils and registers. (B.X. 3136); testing instruments. (B.X. 3132.)*

March 7th. State Electricity Commission of Victoria. Paper-insulated lead-covered control cable. (B.X. 3137.)*

March 14th. D.c. switchgear and accessories. (B.X. 3131.)*

SYDNEY.—March 9th. New South Wales State Railways. Two sets of electric overhead travelling crane equipments. (A.X. 4103.)

Argentina.—BUENOS AIRES.—March 15th. Ministry of Marine. Machinery in connection with the extension of electrical generation (involving the enlargement of two existing power stations and the construction of two new ones) at the Naval Base, Puerto Belgrano. (B.X. 3140.)*

March 24th. Department of Navigation and Ports. Electric cranes, pumps, &c. (A.X. 4087.)*

Ayr.—January 27th. Education Committee. Electric lighting installation, school extensions, Prestwick. Mr. William Reid, Education Offices, Ayr.

Barnes.—February 8th. Electricity Department. One 1,000-kW rotary or motor convertor with transformer, l.p. switchgear and connections. (January 7th.)

Belfast.—February 5th. Electricity Department. One induction motor-driven vertical type centrifugal pump. (See this issue.)

Belgium.—IXELLES.—February 18th. Municipal Council. Armoured three-phase cable and armoured l.p. cable. Particulars for 9 fr. 30 c. from Bureaux du Service de l'Electricité, 20, Rue d'Alsace-Lorraine, Ixelles.

January 27th. Belgian Ministry of the Colonies, 7, Place Royale, Brussels. Seven tons of enamelled phosphor bronze wire in two lots, and 2,700 telephone line insulators. Particulars on application from Cahier des Charges. No. 116e.

Carlisle.—January 24th. Town Council. Electric lighting installation, blocks of 50 houses, Lower Sowerby estate. Mr. Percy Dalton, city engineer, 18, Fisher Street.

Clacton.—February 2nd. Electricity Department. Two 1,125-b.h.p. Diesel oil engines, direct coupled to 750-kW, 3-phase alternators; two 750-kW alternators, two rotary-convertors, and e.h.p. switchgear. (See this issue.)

Cheltenham.—January 31st. Corporation. Twelve months' supply of electric lighting fittings. Mr. J. S. Pickering, borough engineer.

Douglas.—February 28th. Corporation. 3½ miles of e.h.p. cable, two synchronous motor alternators. (See this issue.)

Edinburgh.—January 25th. Edinburgh District Board of Control. Electric lighting installation at Bangour Mental Hospital. Mr. J. D. Gibson, surveyor, 60, Frederick Street, Edinburgh.

February 14th. Electricity Supply Department. E.h.p. and l.p. switchgear, e.h.p. and pilot cables. (See this issue.)

January 22nd. Gas Department. One electrically-driven automatically-controlled pump, complete, including all wiring. Mr. H. H. Gracie, engineer and manager, 15, Catton Hill, Edinburgh.

January 31st. Corporation. Structural steel work for extension of turbine house, Westbank, Portobello generating station. City architect.

Egypt.—EGYPTIAN STATE RAILWAYS.—Chief Inspection Engineer, Queen Anne's Chambers, S.W. Signalling materials and 43,420 metres of braided cable.—*Reuter's Trade Service* (Cairo).

Huddersfield.—January 28th. Huddersfield Industrial Society, Ltd., Butchering Department. Electricians' work required at premises, Hillhouse Lane. Messrs. Jos. Berry and Sons, architects, 3, Market Place.

India.—India Store Department. January 25th. Overhead electric travelling cranes. Specifications (5s.) from 15, Belvedere Road, Lambeth, S.E.

10 miles dry core telephone cable. (See this issue.)

Ilford.—February 1st. Electricity Department. 660-V, l.p. paper-insulated cables. (See this issue.)

Liverpool.—January 27th. Electricity Supply Department. Twelve months' supply of materials, including cables and accessories, meters, lamps, &c. (January 7th.)

London.—LONDON COUNTY COUNCIL.—January 31st. Electrical installation at the Hornsey Rise housing estate (approx. 1,100 wiring points). (See this issue.)

HAMMERSMITH.—February 16th. Electricity Department. Twelve months' supply of stores, including several electrical items. (See this issue.)

Macclesfield.—January 31st. Rural District Council. Electric generating plant to supply 24 houses at Gawsworth, consisting of engine, battery, switchboards, cable, small motor and pump; wiring for electric light installation, including lamps and meters. Mr. Geo. Clayton, architect, 4, Wellington Street, Stockport.

Manchester.—January 31st. Electricity Department. Two electrically-driven circulating-water pumps, piping, &c. (January 14th.)

February 4th. One 1,500-kW and one 750-kW motor convertors, with switchgear. (See this issue.)

Newport (Mon.).—February 5th. Electricity Department. Two water-tube boilers, steam and feed-water piping, economisers, air heaters, induced- and forced-draught plant, steel stack and grit catcher, coal and ash conveyors, extension of boiler house, including structural steelwork and foundations. (January 7th.)

New Zealand.—AUCKLAND.—March 22nd. Harbour Board. Electric motors, gearing, shafting, and control gear for the operation of vehicular and passenger gangways at the New Devonport Ferry Wharf. (A.X. 4102.)

Sleaford.—Electricity Works. 50 tons Diesel oil fuel. (January 14th.)

South Africa.—JOHANNESBURG.—February 10th. Municipal Council. Electric cable. (B.X. 3130.)*

Stoke-on-Trent.—February 9th. Electricity Department. Steam and water piping, valves, &c., constructional steel work, platforms, crane gantries, &c. (January 7th.)

Torquay.—Electricity Department. Two vertical circulating-water pumps for Newton Abbot power station. (See this issue.)

Dismantling and removal of four Babcock & Wilcox boilers from Newton Abbot power station. (See this issue.)

Uruguay.—MONTEVIDEO.—February 18th. State Electricity Works. 65,000 kg. unvarnished black iron wire and 10,000 kg. g.i. wire. (A.X. 4019.)*

February 11th. 37,500 electric filament lamps. (B.X. 3117.)*

February 15th. 55,500 iron pieces (angles, ties, bolts, &c.) for overhead lines. (A.X. 4018.)*

March 2nd. Lead fuse wire, silver fuse wire, switches, cable end boxes, compound and insulating type. (B.X. 3159.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Barnes.—Urban Council. Accepted:—

Additions and alterations to switchgear (£1,626).—English Electric Co., Ltd.

Belgium.—Keen international competition was again in evidence last week when the municipal authorities of Schaerbeek opened tenders for the supply of 11¼ kilometres of h. and l.p. electric cable. Offers were received from three Belgian, three German, one Dutch, one French, one Czecho-Slovakian, and two British concerns—the last being the British Insulated Cables, Ltd., and Callender's Cable and Construction Co., Ltd. The quotations ranged from £2,199 to £3,182, the lowest being that of the Société des Câbleries et Corderies du Hainaut, of Dour.

Croydon.—Tramways Department.

10 sets of tramcar electrical equipments.—General Electric Co., Ltd.

Dartford.—Urban Council. Accepted:—

Installing electric light at 188 houses (£5 7s. 6d. per house).—Mr. E. E. Beaven.

East Ham.—Town Council. Accepted:—
Bodies and top covers for 10 double-decked tramcars (£15,870); trucks and brakes (£2,460).—Brush Electrical Engineering Co., Ltd.
Motors, switches, &c. (£4,081).—British Thomson-Houston Co., Ltd.

London.—LONDON COUNTY COUNCIL.
Dry cells.—Edison Swan Electric Co., Ltd.

SHOREDITCH.—Lighting Committee. Accepted:—
House-service cable, 1 mile 19/.052, 1 mile 7/.064, 2 miles 7/.052 (£1,280).—W. T. Glover & Co., Ltd.
Electrical installation work at the City Corporation Dwellings, Shepherdess Walk, and the L.C.C. Dwellings, Horner House.

	City Corporation Dwellings.	Horner House, L.C.C.
Barlow Bros. & Co.	£1,463	1,130
Electrical Installations, Ltd. ...	1,485	1,124
Malcolm & Allan, Ltd. ...	1,697	1,253
H. J. Cash & Co., Ltd. ...	1,540	1,250
Toy & Winslow (accepted) ...	1,526	**1,042**
City Electrical Co. (accepted)	**1,400**	1,165

ST. PANCRAS.—Contracts and Stores Committee.
One 3,750-kVA transformer, complete with equipment for linking up with Islington (£1,901).—C. A. Parsons and Co., Ltd. (recommended).
Cable for linking up (£1,570).—Siemens Bros. & Co., Ltd. (recommended).
4-way 4-in. conduits (£600).—Doulton & Co., Ltd. (recommended).

Marlborough.—Town Council. Accepted:—
Installing electric lighting at 20 houses (£136).—James Bros.

Rochdale.—
Electrical equipment of the Townhead Mill Co.'s Duke Street mill, including motors, 20-200 h.p.—Swedish General Electric, Ltd.

Forthcoming Events.

British Electrical Development Association.—Friday, January 21st. Royal Society of Arts. 7.30 p.m. "Industrial Heating." Mr. S. E. Monkhouse.

Junior Institution of Engineers.—Friday, January 21st. 39, Victoria Street, S.W. 6 p.m. Exhibition of Scientific Instruments and Apparatus.
Friday, January 28th. 7.30 p.m. "The Design of h.p. Sub-stations." Mr. C. E. Atkinson.

Meter Engineers' Technical Association.—Friday, January 21st. Lighting Service Bureau. 7 p.m. "Testing of Large-Capacity Meters *in situ*." Mr. W. Casson.
Saturday, January 22nd. Engineers' Club, W. 5.30 for 6 p.m. First annual dinner.

Salford Technical and Engineering Association.—Saturday, January 22nd. Royal Technical College. 7 p.m. Presidential address by Mr. J. Morris, and musical social evening.

Association of Mining Electrical Engineers.—Saturday, January 22nd. Newcastle. "Static Transformers for Collieries." Mr. J. W. Rodger.

(Western Sub-Branch).—Saturday, January 22nd. Swansea. "The Working of Thin Seams with Electrical Power." Mr. D. P. Jones.

Nottingham Society of Engineers.—Monday, January 24th. "Lightning Conductors." Mr. G. A. Collier.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, January 24th. London. "The Electricity Bill." Mr. M. Whitgift.

(Mersey and North Wales (Liverpool) Centre).—Monday, January 24th. Liverpool. "Electrical Equipment of Large Buildings." Messrs. J. Frith and F. Buckingham.

(North-Eastern Centre).—Monday, January 24th. Newcastle-on-Tyne. "60,000-V Underground Network of the Union d'Electricité," Col. E. Mercier; and "33,000-V Cables, with Special Reference to the S.L. Type." Mr. P. Dunsheath.

(North-Midland Centre).—Tuesday, January 25th. Leeds. Faraday Lecture, "What is Electricity?" Prof. W. M. Thornton.

(North-Western Centre).—Tuesday, January 25th. Engineers' Club, Manchester. "Recent Developments in Radio Reception." Mr. J. H. Reyner.

(Tees-Side Sub-Centre).—Thursday, January 27th. Middlesbrough. Annual dinner.

(London Students' Section).—Friday, January 21st. 6.15 p.m. "Electrons in Solid Conductors." Mr. S. N. Ray.

Institution of Production Engineers.—Wednesday, January 26th. 7.30 p.m. At the Society of Motor Manufacturers and Traders, Ltd., 83, Pall Mall, London, S.W.1. Discussion on "The Professional Registration of Engineers." Mr. R. Hazleton.

Electrical Power Engineers' Association (North-West Midland Section).—Wednesday, January 26th. Wolverhampton. 8 p.m. "Overhead Distribution." Mr. T. A. G. Margary.

Manchester Association of Engineers.—Thursday, January 27th. Manchester. "The Link Between Theory and Practice in Engineering." (Open discussion.)

Birmingham Electric Club.—Friday, January 28th. Grand Hotel. 7 p.m. Presidential address.

Institution of Engineering Inspection.—Friday, January 28th. Royal Society of Arts. 7.30 p.m. "Manufacture and Uses of Arsenical Copper." Mr. J. Taverner.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

JASEN vacuum cleaners.

Notes.

Electric Vehicle Records.

We have received a copy of a mechanical road transport cost sheet, which has been prepared by the Electric Vehicle (Main) Committee of Great Britain. Each sheet forms a record for one vehicle for one month, and notes on the use of the sheet are printed on its back. Copies are obtainable from 15, Savoy Street, Strand, London, W.C.2.

Birmingham Electric Club.

The programme of this Club for the first half of 1927 includes the following fixtures:—January 28th, presidential address; February 25th, "Wireless Telephony," by Mr. C. G. A. McDonald; March 11th, annual dinner; March 25th, "Electricity Supply in the Midland Area," by Mr. S. T. Allen; April 22nd, "Radiation Effects," by Mr. J. B. Kramer.

"Wireless" Moving Pictures.

The broadcasting by "wireless" of moving pictures was demonstrated by Dr. E. F. W. Alexanderson in New York on January 10th, says *The Times*. With simple apparatus he projected upon a screen by wireless a moving picture of himself conversing with a friend. The reproduction was crude, but the heads and arms of the two figures moved as they had done in the original. In addition, the inventor exhibited three photographs which had been broadcast with his apparatus for a distance of two miles. They looked as though they had been painted with a brush, but were clear reproductions, one, the portrait of a woman, having much of the quality of an original photograph. The method employed by Dr. Alexanderson is, as he frankly said, similar to a process already used commercially, but the new process, though under the disadvantage of being more affected by atmospherics than the dot and dash system now used, has the advantage of speed. Even now it takes Dr. Alexanderson only two minutes to broadcast a picture, and when the apparatus is perfected television may be expected as an early development. To make a picture, the inventor directs upon a screen seven beams of light, multiplied 24 times by mirrors. The beams are rotated rapidly and travel from top to bottom and from right to left of the screen, illuminating its entire surface with lines of light of varying intensity. The modification of these lines by means of a reflected image, which modulates their tone values, produces the picture.

I.E.E., Western Centre, Dinner.

On January 10th, the annual dinner of the Western Centre of the Institution of Electrical Engineers was held at the Royal Hotel, Bristol. Mr. W. G. Heath, chairman of the Centre, presided, and about 130 members and guests were present. The occasion was marked by a presentation to Mr. A. J. Ostler, the retiring joint honorary secretary of the Centre, who received a slide rule, and a silver tray for Mrs. Ostler, in recognition of his valuable services to the Centre. In calling upon Dr. W. H. Eccles, president of the Institution, to make the presentation, Mr. Heath described Mr. Ostler as a large man with a still larger heart. Mr. C. T. Allan, hon.

secretary, spoke of the great help he had had from Mr. Ostler during their years of joint secretaryship.

After the loyal toasts, the Rt. Hon. the Lord Mayor of Bristol, Alderman E. M. Dyer, proposed "The Institution of Electrical Engineers." He referred to the rapid strides made of recent years in the electrical world and to the part played by England. His only complaint with regard to his local undertaking was that the product might be cheaper.

Dr. Eccles, in reply, said that the Institution constituted an electrical parliament. It represented all phases of electricity from the "nippy" little electrons to large-power turbines. This year would prove the most important year in the life of the Institution up to the present. It was marked by transatlantic telephone development, the passing of the Electricity (Supply) Act, and the introduction of new communication cables with "Permalloy" loading giving a tenfold speed increase. Now that the Electricity (Supply) Act was established he believed and hoped that controversy on the subject would be dropped and that all good citizens would help to make it a success. It would result in a much fuller use of electricity. He had recently returned from Northern Italy, where power lines were more numerous than telephone lines. He thought that as a result of the electrification of Northern Italy the people were more prosperous now than before the war. Our men were earning less in purchasing power than those in that country. This year ought to see us lead the procession in the world's electrical advancement.

Mr. C. G. Morley New proposed "Our Guests," to which the Sheriff of Bristol, Mr. Frank E. Sampson, and Mr. J. H. Inskip, chairman, Bristol Electricity Committee, replied. The Sheriff believed that largely as a result of the work of electrical engineers this country would again lead the world in industry. He was a mechanical engineer, but it was plain to him that the electrical profession was the leading one. He was impressed by the spirit of co-operation in the ranks of the Institution. Mr. Inskip referred to Bristol's new scheme and hoped that they would soon have the opportunity of showing the members of the Institution one of the largest and most up-to-date generating stations in the country. He paid a tribute to Mr. Faraday Proctor, city electrical engineer, Bristol, Mr. A. J. Newman, the deputy engineer, and Mr. Ostler, for the work they had done on the undertaking.

Mr. W. J. Bache, Cheltenham, proposed "Kindred Institutions" and referred to the cordial relations which existed between the Western Centre and other Institutions, in particular, the South Wales Institute of Engineers and the Institution of Post Office Electrical Engineers.

In reply, Mr. E. J. Eldridge, Institution of Post Office Engineers, referred to the close association which had always existed between the P.O. Institution and the I.E.E.

Mr. Thomas Hood made an appeal on behalf of the Institution benevolent fund. The estimated income for the present year was £1,700, which, for a membership of nearly 13,000, was unsatisfactory. During the evening musical items were given by the Bristol Glee Singers.

The proceedings were concluded by a vote of thanks to the chairman, proposed by Dr. Eccles, to which Mr. Heath very briefly replied.

Appointments Vacant.

Meter mechanic and tester for the Rawtenstall Corporation Electric Tramways and Motor Department. Mains assistant engineer for the Crewe Corporation Electricity Department. Cable jointer for the Corporation of Nelson Electricity Department. Meter mechanic for the Wimbledon Corporation Electricity Department. Assistant mains engineer (£271), for the City of Chester electricity department; draughtsman for the Stepney Corporation electricity department. (See our advertisement pages to-day.)

A Lecture to Contractors.

Mr. Alexander Ramsay, consulting engineer, Glasgow, read a paper before a meeting of the SCOTTISH ELECTRICAL CONTRACTORS' ASSOCIATION in Glasgow, on Tuesday last week, on questions relating to the industry, dealing especially with some aspects of the Electricity (Supply) Act.

Mr. Ramsay said it seemed probable that many undertakings would continue to retail electrical energy under the existing conditions, particularly where the supply was direct current, such stations purchasing a.c. energy from the Central Electricity Board to operate rotary converters or other transforming plant. Unless every undertaking retailed standardised alternating current, the argument in respect of mass production and consequent reduced cost of manufactured electrical goods completely broke down, even with regard to the home market.

It was claimed, and the general public had been led to believe, that under the Bill the cost of electrical energy would be materially reduced. There appeared to be little justification for optimism in this direction, however, since the conditions under which, it would appear, the business of generating, distributing, and retailing electricity was to be conducted suggested an increase rather than a decrease in the rate per unit. Whilst the annual cost of electrical energy, even in the case of the large consumer, was trivial in relation to the total oncost charges, rarely exceeding 2 or 3 per cent., it must be borne in mind that owing to the keenness of competition, manufacturers found themselves obliged to curtail their oncost charges in every direction. To assume that electricity would be left a free field for development would be absurd, and, it might be accepted, that the war between electricity, gas, and oil would be waged more fiercely in the future than in the past. Consequently, unl supply authorities continued to offer electrical energy on su terms that it could compete successfully with other for of power, it was probable that the tendency would particularly with the larger consumers, towards install private plant. Indications were not wanting that a per of industrial activity was about to be experienced, a instead of allowing our industrialists freedom to make go now that the opportunity has arrived, it seemed to have be decreed that many of them should be harassed with electri re-equipment. Was that sound business?

Dr. Eccles, when speaking at the recent dinner of t Glasgow Branch of the I.E.E., was reported to have stat that "in consequence of the Electricity Bill having beco law, the services of many additional professional engine would be required"; that might be, but it would appear th the chief beneficiaries were likely to be gentlemen attached the legal profession.

That the Bill was viewed with grave misgiving by certa sections of the industry was common knowledge; but, t Bill being an accomplished fact, it was for all concerned make the best of it.

Mr. Ramsay then dealt with other questions, and said wi regard to contract documents in Scotland, the conditions, terms of which work should be executed, were, as a rul framed in conformity with the Scottish National Buildi Code, the interests of client and contractor alike being fair well protected. But with regard to electrical work, revisio might be desirable since, in certain districts, the tendenc was to invite tenders on the lump-sum basis—a most pern cious practice, and one which was equally unjust to th parties principally concerned. In support of the lump-su tender the claim was made that the plans should be so pr pared, and the quantities measured therefrom should be s scrupulously accurate as to render after-measurement unnece sary. Such Utopian conditions were seldom encountered i practice, however. In the course of installation unforesee obstructions invariably presented themselves, or the client, t suit his needs, decided to alter the plans. Under such ci cumstances a contract let on the basis of after-measuremen could be readily adjusted, whereas, more often than not, th lump-sum tender was the subject of litigation. On a properl drafted specification and schedule the variation between th lowest and the highest offers should not exceed 10 to 15 pe cent., and more frequently than not it was well within th lower limit.

Extra-high-pressure Steam Plant at Bradford.

As briefly mentioned in a leaderette last week, Mr Thos. Roles, M.I.E.E., city electrical engineer, has put i hand for the Corporation electricity works at Valley Roa an installation of unusual design, consisting of a boiler t work at 1,100-lb. gauge pressure and a 2,500-kW turbin which will exhaust into the existing main steam range a 195-lb. gauge pressure, the turbine acting as a reducing valve The steam will be superheated to 800 deg. F., and will no require reheating; the boiler will have a rated output o between 75,000 and 94,000 lb. per hour. The size of th plant has been so chosen that the electrical output of the new set, together with that of the low-pressure plant using the exhaust steam from the former, will be as nearly as possible equal to the estimated future base load of the station, which will thus be dealt with on the most efficient lines. No condensing plant being required, the water supply to the station need not be augmented. Provision has been made for reheating the steam exhausted from the new set, if thought advisable in the future.

The boiler will be equipped with divided chain-grate stoker gear and compartmental balanced draught. A combination of air preheater and economiser has been adopted, and the furnace is to be provided with water screens and air-cooled side walls. The turbine will be a plain impulse machine running at high speed and driving the alternator through gears at 1,000 r.p.m. The feed pumps, valve gear, instruments, and control will be of special design.

The whole contract has been placed with the English Electric Co., Ltd., which, it is generally known, has for many years been quietly conducting experiments on the use of h.p. steam. The Benson boiler plant of the company, which generates steam at the critical pressure, has put the company in a position to test out many of the pressure and temperature problems met with in plant such as that referred to. During the last eight years a number of finished turbines for working at a pressure of 1,500 lb. have been tested out at the Rugby works of the English Electric Co. The h.p. boiler plant is to be supplied, through the English Electric Co., by Messrs. Babcock & Wilcox, Ltd. It is interesting to learn that, prior to placing the order for the new plant, Mr. Roles made an extended visit in the United States to all the power stations and engineers in that country where experience of the higher pressures had been obtained. While it was decided that at the present time the adoption of pulverised-fuel equipment would probably not be justified, provision has been made in the combustion chamber of the new plant for the adoption of the new system of firing should it be found to be economical. The estimated cost of the new plant and boiler house is £80,000, but we learn that the Electricity Commissioners have approved of a scheme which includes the provision of a new 20,000-kW turbo-generator the total cost of the scheme will be about £300,000.

E.A.W. Activities.

The first fixture of the Electrical Association for Women for 1927 was a visit to Messrs. Liberty's "All-Electric Canteen" on January 19th. Mrs. I. E. Bray, a member of the E.A.W. Council, lectured before the Women's Institute and Women's Citizens' Association at Wendover, Stoke-Mandeville, and Haddenham on January 10th and 12th. Mr. Turnbull, the Aylesbury engineer, provided electrical apparatus for demonstration purposes. The E.A.W. also took part in the recent Electrical Exhibition at Ashford, Kent, when Mrs. I. E. Bray lectured. A branch of the Association is about to be formed on the North-East Coast, with headquarters at Newcastle-on-Tyne. Miss Anna Holm is acting as hon. secretary, and the inaugural meeting will probably be held early in February.

Institution Notes.

Institution of Electrical Engineers.

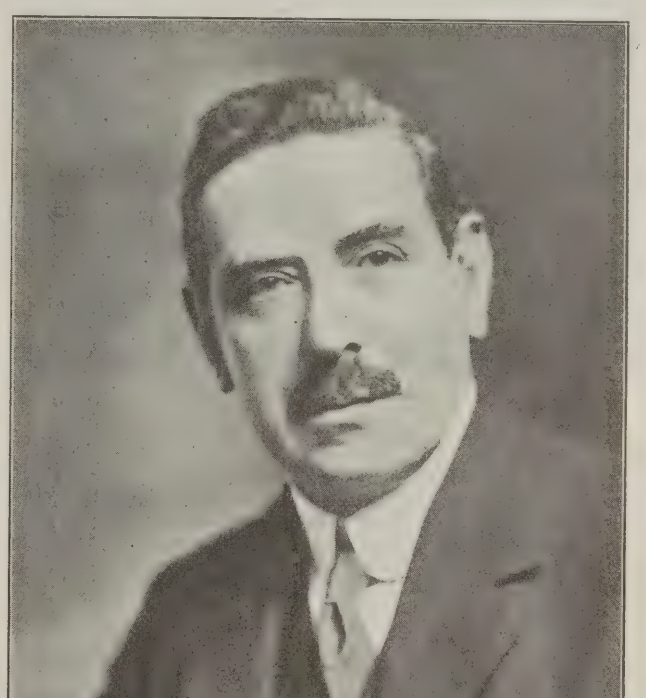
SCOTTISH CENTRE.—Mr. R. Borlase Matthews, M.I.E.E., lectured in Edinburgh, on January 11th, under the auspices of the Scottish Centre of the Institution, on the subject of "Electro-farming." There was a large attendance of electrical engineers, while the farming industry was well represented; Mr. W. L. Winning, M.I.E.E., chairman of the Centre, presided. Mr. Matthews did not say that electricity was going to be the one salvation of the farmer, but the modern farmer, he contended, would not be able to "get on" without an adequate supply of cheap power such as electricity would provide. It was of vital importance to the whole nation that agriculture should be placed on a sound basis, and on this account alone the subject was well worthy of the most serious investigation by the electrical engineering world. The instinctive nature of the lecture was increased by the films and slides shown, illustrating many of the uses to which electric power is now being put on the lecturer's own farm at East Grinstead, Sussex and on farms abroad. An interesting discussion was taken part in by many well-known Scottish agriculturists.

Mr. Matthews also lectured to the members of the Institution, Dundee, last week. Mr. J. S. Thomson, of the Fife Power Co., presided. The lecturer said he had toured Fife that day and had found that something like 65 farms were using electric power. He was sure the methods adopted in Fife were more advanced than any he had seen.

INFORMAL MEETING.—At the meeting on Monday, January 10th, Mr. F. Pooley was in the chair, when Mr. O. M. Andrews opened a discussion on a paper by Mr. L. Henshaw, entitled "Some Notes on the Earthing of Metal Objects other than Conductors." The discussion, in which 16 members took part, showed how very difficult it might sometimes be to obtain an efficient "earth." In London and many big cities the water system might form a perfect earth, but in dry districts the difficulties were often almost insuperable. It was in the cities, however, where the extended use of domestic apparatus made efficient earthing imperative, that the occasion when, sooner or later, the "earth" would be called upon to function had to be provided for.

Faraday Society.

A general discussion on "The Theory of Strong Electrolytes" will be held at Oxford on Friday, April 22nd, and Saturday, April 23rd. On the first day "Ionic Mobility" will be the subject of debate, and on the second day "The Activity of Strong Electrolytes." Arrangements are being made to accommodate members attending the meeting at Exeter and Lincoln Colleges, but the accommodation is strictly limited, so that early application should be made. An inclusive charge of £1 2s. per head will be made to members. The charge to non-members will be 30s. Arrangements are being made with the railway companies for tickets at reduced rates. The second (experimental) "Report on Atmospheric Corrosion," by Dr. W. H. J. Vernon, will be read and discussed before the Society in London on Wednesday, March 30th, at 7 p.m.



Junior Institution of Engineers.

On Friday, January 14th, Mr. R. L. Kirlew (Chairman of the Institution) read a paper entitled "The Thermionic Valve and its Characteristics." One of the points made by Mr. Kirlew was that it was always advisable to ascertain the plate current-grid volts characteristic of a valve with a loaded anode circuit when signals were being received, as there was a difference between the graphs obtained with a loaded and an unloaded valve. The curves issued by valve manufacturers with their goods were obtained with an unloaded valve. The method recommended really gave a characteristic curve of the complete receiving circuit, and so enabled the most suitable working conditions to be observed. Some little trouble was necessary to obtain the data in order to make the various adjustments, but the advantages to be gained were of value, especially in sets designed and constructed by amateurs. For very accurate work in a multi-valve set, a measuring instrument in each circuit was desirable, but quite a lot might be done with one combined instrument, of which there were several known types.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. CHARLES VERNIER, who, as mentioned in our last issue, is leaving the Newcastle-on-Tyne Electric Supply Co. to become chief engineer to the Macintosh Cable Co., Ltd., on February 1st, was educated at the Regent Street Polytechnic and at the City and Guilds of London Technical College, Finsbury. He served his apprenticeship with Messrs. Reyrolle and Co., and after experience with other firms he was appointed in 1897 to be electrician in charge of testing work with the Brockie Pell Arc Lamp Co. Two years later he became assistant engineer on mains work with the Cork Electric Tramways and Lighting Co. He entered the service of the Newcastle-upon-Tyne Company as mains engineer in 1900 and has remained there until now. For 21 years he was in charge of the mains construction, repair and maintenance work for that company, and its associated concerns, from their absorption. When he joined the company it had only five miles of cable route in existence and he has been responsible for the laying down of the major part of the large transmission systems (overhead and underground) and of numerous distributing networks operated by the Newcastle companies over an area of 1,800 square miles. For the past five years he has been their technical expert on mains construction work. Amongst the most notable work for which Mr. Vernier was responsible we

Elliott & Fry] *[London.*

Mr. Charles Vernier, M.I.E.E.

may mention the laying down in County Durham of the first large 20,000-volt cable system in the world, comprising initially 40 miles of 3-core cable in 1906 and continuous current extensions in subsequent years; also the laying down of the first 66,000-volt cables and 66,000-volt overhead transmission lines in Great Britain, from 1923 to date. Mr. Vernier was chairman of the North Eastern Local Section of the I.E.E. in 1913 and a member of Council from 1920 to 1923. He is a member of the Overhead Lines Regulations Committee, and his papers read before the Institution include one on "The Laying and Maintenance of Transmission Cables" and one on "Wayleaves." He has performed numerous important activities in the electrical industry, such as his connection with the E.P.E.A., the Joint Industrial Council of the Electricity Supply Industry, and committee work under the British Electrical and Allied Industries Research Association, and he is, of course, well known as the inventor of various improvements in electrical cables and joints.

The Burton-upon-Trent Corporation has increased the salary of Mr. A. B. SLATER, the general manager of the tramway and motor system, by £75 per annum.

Mr. JOHN A. CRESSEY, control electrical engineer to the South Wales Electrical Power Distribution Co. at the Upper Boat Station, Cardiff, has been appointed engineer-in-charge of the power station of the Shanghai Municipal Electricity Department. He will sail on January 28th.

Mr. H. M. PEASE, managing director of Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.), of Connaught House, Aldwych, W.C.2, has been appointed vice-president of the International Standard Electric Corporation. It was in 1902 that Mr. Pease (whose photograph accompanies these notes) first became associated with the Western Electric Co., Ltd.; being in charge of the engineering side of the business, he was responsible for the installation of the majority of the central-battery telephone exchanges erected in this

Elliott & Fry] *[London.*

Mr. H. M. Pease.

country for the National Telephone Company and later the General Post Office. In 1908 he became sales manager of the Western Company and in 1919 managing director, which position he now holds. Mr. Pease included amongst his other activities a directorship in the recently dissolved British Broadcasting Company.

M. JEAN-BAPTISTE PERRIN, Professor at the Sorbonne, Paris, has been awarded the Nobel prize for physics.

M. BARTHELMY, who has lately been elected president of the Radio Club de France, is well-known in French electrical circles. After serving in the army for the first two years of the war he was appointed director of the French military wireless factory. Since then he has been associated as consulting engineer with several French manufacturers and in 1921 gave successful demonstrations of radio-telephony on moving trains.

Dumfries Town Council has appointed Mr. J. D. MARSHALL as Corporation electrician for the ensuing year.

With reference to the statement appearing on p. 1085 of our issue of December 31st regarding the appointment of Mr R. W. WILLIS as consulting engineer to the Corporation of Newark-on-Trent, Mr. Willis informs us that though the matter has been considered by the Corporation he has received no official intimation with regard thereto and in consequence he has made no decision.

Mr. G. E. WHITTLE has been appointed mains engineer to the Calcutta Electric Supply Corporation, Ltd., and he leaves for Calcutta on January 22nd.

In response to an invitation by the Ministry of Transport, the Emergency Committee of the Convention of Royal Burghs, Scotland, recommends Treasurer GRAHAM GUEST, Edinburgh, for appointment to the Central Electricity Board under the Electricity (Supply) Act, 1926. Mr. Guest is a member of the Institute of Treasurers, and managing director of Messrs. MacVitties, Guest, Ltd. He has taken a keen interest in electrical development.

We learn that Mr. J. W. THOMAS, B.Sc., assistant general secretary of the Electrical Power Engineers' Association, is one of the successful candidates in the Bar final examinations. Mr. Thomas expects to be called to the Bar of the Middle Temple in June next.

Obituary.—MR. J. W. CUSHNY.—From an announcement published in *The Times* we note that Mr. John William Cushny, electrical engineer for the construction of the Kojuk Pass Tunnel, India, 1888-89, "subsequently lighting Pretoria and Johannesburg, latterly resident owner of a ranch at Lumbwa, British East Africa," passed away on December 30th at Warner Beach, Natal, "after long suffering." He was 64 years of age.

MR. S. M. BANKER.—We regret to read in *The Times* that the death occurred on January 16th of Mr. Stewart Melville Banker, late Superintendent Electrical Engineer to the General Post Office, at the age of 82 years. The interment took place yesterday at the Great Northern Cemetery, New Southgate.

DR. E. HEILBRON.—The death is reported from Berlin, at the age of 65 years, of Dr. Ernst Heilbron. The deceased was one of the leading experts in Germany on electricity meters, and he had been associated with the A.E.G. for upwards of 35 years.

Will.—The late Sir J. W. SZLUMPER left £1,309 gross and £439 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Boynton & Co., Ltd.—Private company. Registered January 13th. Capital, £300 in £1 shares. Objects: To carry on the business of manufacturers, importers and exporters of and dealers in wireless apparatus, electrical goods, motor cars, &c. The first directors are:—H. Boynton, 4, Woodstock Road, Moseley, Birmingham; Ernest Boynton, 24, Valentine Road, King's Heath, Birmingham; Evelyne Boynton, 4, Woodstock Road (as above). Qualification, 1 share. Registered office: 34, Bradford Street, Birmingham.

Lamb & Co. (Westcliff), Ltd.—Private company. Registered January 12th. Capital, £100 in £1 shares. Objects: To acquire the business of Lamb & Co., Ronald Park Avenue, Westcliff-on-Sea, carrying on business as electrical engineers and contractors, makers of armatures, field coils, stators, &c. The first directors are:—A. A. Lamb, 30, Electric Avenue, Westcliff, electrical engineer; C. C. Mee (same address), electrical engineer. Qualification, 1 share.

Natural Power, Ltd.—Private company. Registered January 10th. Capital, £1,500 in 1,250 ordinary of £1 and 5,000 founders of 1s. each. Object: To adopt an agreement with H. Rowsell for the purchase of a scheme in regard to the production of light, heat and power from natural sources, of which he is the originator or inventor, and to carry on the business of electricians, mechanical engineers, dealers in electricity, &c. The first directors are:—H. E. Nickels, F.C.S., 125, Hendcorn Road, Thornton Heath, analyst; H. Rowsell, 41, Trafford Road, Thornton Heath, accountant. Solicitors: Jordan & Lavington, 78, Queen Victoria Street, E.C.4.

Wireless Pictures, Ltd.—Private company. Registered January 13th. Capital, £100 in £1 shares. Objects: To acquire any patents for inventions relating to television and what is known as "photo-telegraphy," and for the electrical transmission and reception by wire or wireless of signals, drawings, photographs and the like, &c. The subscribers (each with one share) are:—J. M. Sharp, 75-7, Shaftesbury Avenue, W.1, solicitor; F. R. Sprinz, 75-7, Shaftesbury Avenue, W.1, solicitor. Qualification, 5 shares. Solicitor: J. M. Sharp.

Johnson, Ross & Co., Ltd.—Private company. Registered January 14th. Capital, £100 in four 7 per cent. cumulative preference and 96 ordinary shares of £1 each. Objects:

To acquire the business of a vendor of electric lamps and wireless valves carried on by W. H. Johnson, at Kingsway Corner Buildings, 109, Kingsway, W.C.1. The directors are:—W. H. Johnson, Coppermill Road, Horton, nr. Slough, Bucks.; C. B. Liddell, 25, Cleveland Square, W.2; N. O. Liddell, The Croft, Chiltern Road, Chesham Bois, Bucks. Qualification: £1. Secretary: N. O. Liddell. Registered office: Kingsway Corner Buildings, 109, Kingsway, W.C.1.

Ernest Jones & Co., Ltd.—Private company. Registered January 13th. Capital, £500 in £1 shares. Objects: To acquire, as from December 1st, 1926, the business of electric light, power and radio engineers carried on by Ernest Jones and Co., at 1, Cateaton Street, Manchester. The first directors are:—E. Jones, 540, Hepshaw Lane, Stockport, electrical and radio engineer (permanent governing director); Mrs. H. Jones, 540, Hempshaw Lane, Stockport. Qualification, £10 shares. Secretary, E. Jones. Solicitors: Pearson, Son & Co., 438, Corn Exchange Buildings, Manchester.

Official Returns of Electrical Companies.

Robert W. Blackwell & Co., Ltd.—Particulars filed of £14,000 debentures authorised December 29, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Woodstock Power Syndicate, Ltd.—Particulars filed on December 29th, of £2,800 debentures authorised October 4th, 1926, charged on the company's undertaking and property, present and future, the whole amount being now issued.

H. L. Wood & Son, Ltd.—W. E. Beales, of 1, Worcester Street, Belgravia, S.W., ceased to act as receiver on January 6th, 1927.

Barnes Brothers (Radiex), Ltd.—Debenture dated December 14th, 1926, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital (if any). Holder: P. G. Barnes, 109, York Road, Southend.

Wye Lighting, Heating and Power Co., Ltd.—Charge on premises at Wye, Kent, dated January 3rd, 1927, to secure all moneys due or to become due from the company to Lloyds Bank, Ltd., not exceeding £600.

Teignmouth Electric Lighting Co., Ltd.—Satisfaction to the extent of £500 on August 19th, 1924, of debentures dated February 19th, 1923, securing £4,000. (Notice filed January 8th, 1927.)

Electrical Devices, Ltd.—Debenture dated January 5th, 1927, to secure £1,250, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.

Oriental Telephone and Electric Co., Ltd.—Satisfaction to the extent of £2,316 on December 20th, 1926, of debenture stock secured by trust deed dated June 28th, 1905, and supplemental deed of acknowledgement dated June 12th, 1907, securing £200,000.

Win-Sum Electric Diffusers, Ltd.—G. A. Siday, Plant House, Ealing, W.5, ceased to act as receiver or manager on July 9th, 1926. (Notice filed January 11th, 1927.)

Patent Conveyor Co., Ltd.—J. R. Watson, Cheapside, Bradford, was appointed receiver on January 7th, 1927, under powers contained in instrument dated March 5th, 1908.

City Notes.

Marconi Interests in Argentina.

The November *Journal* of the British Chamber of Commerce in the Argentine Republic reports that an arbitration tribunal, consisting of Mr. A. G. Pruden, C.B.E., Major W. A. McCallum, and Mr. R. Fraser, of the Council of the Chamber, has issued its findings in a dispute between Marconi's Wireless Telegraph Co., Ltd., and the Cia. Marconi de Telegrafia sin Hilos del Rio de la Plata. The matter had been before the Argentine Courts for some years without result. The Argentine company brought an action against the British company for breach of contract, but finally the British company offered to purchase the undertaking of the Argentine concern outright. This was agreed to, and the tribunal was appointed to determine the purchase price and conditions. The total price has been fixed at $3,236,928 (Argentine gold), and this includes the cost of damages sustained by the Argentine company as a result of the British company's non-fulfilment of its obligations. The tribunal also stipulates the manner in which the money shall be apportioned to the shareholders of the Argentine company.

Companies to be Struck off the Register.

The names of the undermentioned companies will be struck off the Register at the expiration of three months unless cause is shown to the contrary:—

Blackpool and Garstang Electric Light Rly. Co., Ltd.
Bovey Light and Power Co., Ltd.
Clar-o-phon Radio Co., Ltd.
Electric Lamp and Bulb Co., Ltd.
High Temperature Generators (1918), Ltd.
Horsa Electrical Contracting Co., Ltd.
Ivor Electrical Co., Ltd.
Mayfair Light and Power Co., Ltd.
National Conduit and Cable Co,. Ltd.
Pneumatic and Electric Syndicate, Ltd.
Sceando Lamp Co., Ltd.
Searlight Projectors, Ltd.
Southport Electrical Supply Co., Ltd.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Compania de Electricidad de la Provincia de Buenos Aires—350,000 new 8 per cent. non-cumulative participating preference shares of £1 each, issued at par, partly paid and fully paid, Nos. 175,001 to 525,000.

Hankow Light and Power—4,000 8 per cent. cumulative second preference shares of £5 each, fully paid, Nos. 1 to 4,000.

The undermentioned have been ordered to be officially quoted:—

Coventry Chain Co., Ltd.—100,000 ordinary shares of £1 each, fully paid, Nos. 400,001 to 500,000.

Hendon Electric Supply Co., Ltd.—146,450 6 per cent. cumulaive preference shares of £1 each, fully paid, within Nos. 1 to 150,000.

London Power Co., Ltd.—£4,000,000 5 per cent. debenture stock.

New Chinese Companies.

The *Chinese Economic Bulletin* states that during the past few months the following electricity supply companies have been formed:—The Fuyang Ping Li Electricity Supply Co. (Szepo, Western Chekiang); the Sing Hing Electric Light Co. (Yuankiahsiang); the Shentang Electric Light Co. (Shentangchen); the Pu Yao Electric Light Co. (Yotsing, Eastern Chekiang); the Tsungjen Electric Light Co. (Chenghsien); the Chowhong Electric Light Co. (Yuyao), and others at Fotang and Santunchen (Hangkow).

Anglo-American Telegraph Co., Ltd.

The directors announce balance dividends of 1¼ per cent. on the ordinary consolidated and preferred stocks and a first and final dividend of 1¼ per cent. on the deferred stock. The total ordinary dividend is 3¾ per cent. and the total preferred dividend 6 per cent., as in the previous year.

Electrolytic Zinc Co. of Australasia, Ltd.

A dividend of 6 per cent. has been declared on the preference and ordinary shares for the six months ended December 31st, as in the preceding year.

Italian Loan in New York.

It is reported that the $10,000,000 loan floated in New York on behalf of the Unione Esercizi Elettrici met with immediate success.

Traction and Power Securities Co., Ltd.

The directors recommend a final dividend of 10 per cent. on the ordinary stock, making 14 per cent. for the year, as compared with 13 per cent. for the previous year.

Brazilian Traction, Light and Power Co., Ltd.

A quarterly dividend of 1¼ per cent. has been declared on the common stock, as against 1¼ per cent. last year.

Stocks and Shares.

MONDAY EVENING.

ACTIVITY and rising prices continue to characterise most of the Stock Exchange markets. The epidemic of influenza forms no check to the healthy expansion of general business. A boomlet in gilt-edged stocks is an excellent tonic to other securities. The reason is that, as investment finds the supply of the best-class stocks is diminishing, the would-be buyer enlarges the scope of his search, and takes what he can obtain in other issues. The market in the new 4 per cent. Consolidated stock is due to start on the Thursday in this week, and the recent advances in gilt-edged descriptions are deemed to hold the promise of a possible premium on the 4 per cent. scrip. London Power 5 per cent. debenture, at 98, stands at 3 premium over its issue price. Traction and Power Securities 4½ per cent. debenture stock has strengthened

to 87, at which price it returns £5 3s. 6d. per cent. on the money. The stock is redeemable at 100 in 1974. Recently-introduced, City of London Electric 5 per cent. debenture, January and July interest, is on offer at 99 ex dividend, the yield being £5 1s. per cent. on the money.

Shares in the London electricity supply group are steady in price, and there is still divergence of opinion as to the correct method to employ in calculating the yield derivable from investment in the ordinary shares at current prices. As previously explained, we take the austere, perhaps too austere, dividend rate of 7 per cent. that will become common to all the companies' ordinary capital after 1931. The Charing Cross date is after 1936. If the 1927-31 dividends, inclusive, are taken alone, the returns will be, of course, higher, and Westminsters, for example, show a little over 7 per cent., South Londons 7 per cent., Londons £6 19s. per cent. on the money for the next five-year period. Optimism, moreover, maintains it to be quite conceivable that some of the companies, after 1931, will be able to make such price concessions as will enable them to increase the statutory 7 per cent. dividend fixed by the Electricity Acts on the basis of existing charges to consumers. In this expectation resides the hopefulness of there being a possible rise in the share prices, a rise which otherwise could hardly be looked for in face of a known reduction to 7 per cent. dividends all round.

A jump of 3s. in Marconis to 16s. 9d. is an outstanding feature in their section. The precise reason has not yet been made apparent, but the accepted explanation in the market is that the company is regarded as likely to benefit by the long-distance telephony which is the latest marvel of wireless development. Probably there were a good many bears about, and they, rendered timid by the strength of markets as a whole, have turned buyers. Canadian Marconis are, sympathetically, the turn stronger at 3s. 6d. Cable stocks remain very steady. Great Northerns and Anglo-American preferred show moderate gains.

The idea of wireless telephony "cutting out" the cable service is treated with more politeness than attention. Every wireless scare in the past 20 years—and there have been many such alarms—has gone harmlessly over the heads of cable stockholders. Experience has, so far, demonstrated that plenty of room exists for both systems. Increased facilities have quickened the expansion of traffics, and, with the Eastern Telegraph Company taking an active hand in wireless work, the argument runs that the future can be viewed with equanimity, broadening into hopefulness, by the many investors who hold cable companies' stocks and shares.

We hear, incidentally, that the Eastern group handled 70,000 messages of greeting sent last Christmas under the scale of cheap rates offered by the companies.

In the manufacturing group, Henleys have strengthened to 87s. 6d., Brush ordinary and Metropolitan-Vickers ordinary to 26s. 9d. in each case, and Ever Readys to 4⅛. The last-named touched 4¼, and the preference are up to 30s. India Rubber shares reacted to 20s. The handsome appreciations in the prices of Henleys, Callenders, British Insulated and Enfields, with a few others, have aroused discussion as to whether proprietors of such shares are likely to see their interests go higher. We have mentioned several times of late that profit-taking has played its part in the market, though ample support took readily what stock came in. The opinion may be ventured that current quotations admit of little scope for further advance; indeed, that they are over-valued when related to the very modest returns on the investor's money that the prices now allow. Callenders yield 4¼; so do British Insulated. Henleys pay 4½, British Aluminium rather over 4. Better yields are obtainable from British Government securities available to strict trusts. But the holders and the present buyers of cable and allied companies' manufacturing shares are looking well ahead. It may be retorted that to-day's prices discount a great deal of expected prosperity in the future. They do; and, what is more, responsible Stock Exchange circles in touch for many years with the operations and growth of these companies, are calmly confident of the prices becoming both justified and higher. In the hills and the valleys of transitory changes, there may be falls in prices before the latter go ahead again actively. But the outlook for the future is held to be as bright as ever, and that this view finds serious favour is exemplified by the steadiness with which the prices hold what look to be unduly high levels.

Brazilian Tractions have continued their dramatic recovery, and are another 2 points up, at 112. The Brazilian Government bonds have returned to speculative popularity, and most Brazilian descriptions are in favour once more. British Columbia Electric Railway stocks have advanced, and a gain of a point lifted Anglo-Argentine Tramways 5 per cent. debenture to 68½. British Railway stocks are steady, and Undergrounds exhibit a further disposition to go ahead on dividend anticipations. Underground income sixes appear fully priced at their present figure of 104.

Iron, coal and steel shares are somewhat hesitant. Babcocks keep their price because the people attracted to this market, by the prospect of improved trade conditions, are discreetly choosing the best-class shares, for safety's sake. The rubber market is quiet, business having dropped back into a jogtrot groove after enjoying a spasm of animation last week.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Continued from page 71.*)

Igranic Electric Co., Ltd.

Primarily intended to provide anode voltage to wireless receivers by obtaining the supply from a.c. mains, the recently improved Igranic units are made in three patterns, all intended to operate at 110 or 220 volts at 40 to 60 cycles. One model, fig. 11, has a maximum output voltage of 200 with tappings at 35, 50, 65, 100, 120, 180, and the full 200 V. Three

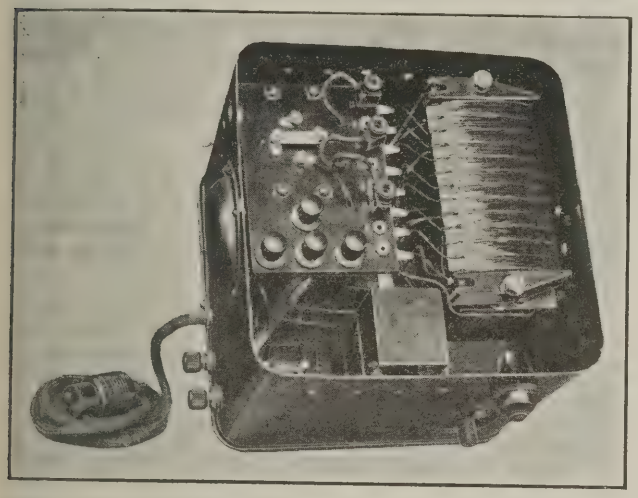

Fig. 11.—De Luxe H.T. Mains Supply Unit, showing Tapping Points.

tapping plugs are provided so that different voltages may be obtained to suit various valves in a receiver. An "on-and-off" switch is provided, and a ruby lamp indicates when the unit is operating. The second model has a maximum output voltage of 120, with tappings at 20, 30, 40, 60, 80, 100, and the full 120 volts. Two tapping plugs are provided and an "on-and-off" switch, but no indicating lamp. The third model has a maximum output of 70 volts, but no tappings, as it is possible to select suitable valves so that all receive the same anode voltage. They employ full-wave rectification.

The filament units are designed to operate off a.c. circuits at 110 or 220 volts at 50 to 60 cycles, and can be arranged for delivering current at 2, 4 or 6 volts. The current output will be sufficient for multi-valve receivers.

The "Neutrosonic Seven" receiver, fig. 12, is particularly compact, combining the advantages of the neutrodyne and superheterodyne principles. The receiver itself is contained in a black leatherette-covered carrying case, and the batteries are accommodated in a similar, but smaller, case. A flexible armoured lead fitted with a special plug enables the battery box and receiver to be connected rapidly and easily. The outfit is suitable for those requiring a powerful receiver suitable for use with a frame aerial which is readily portable, and yet equally suitable for home use. The short-wave tuning unit, also on show, with the interchangeable units obtainable for use with receivers built from the super-heterodyne outfit, gives the complete receiver a tuning range of approximately 40 to 3,500 metres. Amongst the smaller components exhibited the new peep-lamp indicating plug is designed for use in conjunction with an Igranic-Pacent jack as a means of switching the receiver "on" and "off" and indicating when the receiver is "on" by the lighting of the lamp. Other exhibits included a comprehensive range of components, amongst which was the neat frame aerial shown in fig. 13.

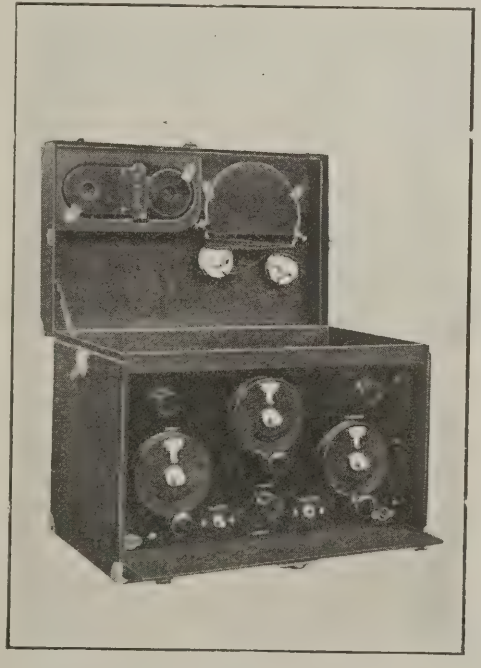

Fig. 12.—Igranic "Neutrosonic" 7-valve Receiver.

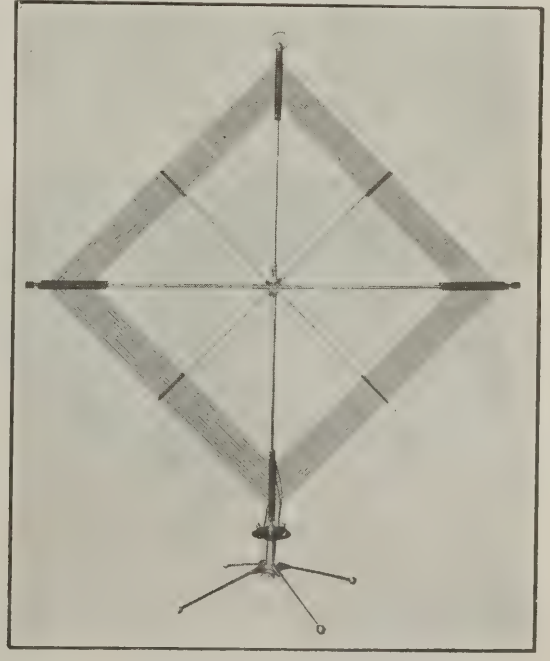

Fig. 13.—A Neat Frame Aerial.

Watson & Sons (Electro-Medical), Ltd.

This company's display included a "carboscope," a commercialised X-ray apparatus for examining the quality of coal. It consists of a tank containing the high voltage transformer immersed in oil, and in the same tank is arranged a self-rectifying Coolidge tube, also oil-immersed; the rays are focused upwards through a small window on the bottom of a shallow wooden drawer in which the specimens of coal to be examined are placed. Above the drawer is the fluorescent screen which is viewed from without by the aid of a tilted mirror. The tank and mirror afford ample protection, and control is by means of a single exterior contact. Very fine stereoscopic pictures have been taken by this apparatus, which should be of the utmost service for the examination of fuel for large central stations. The De-Lavel Watson oil-testing apparatus is, in effect a h.p. transformer giving easy graduations of pressure up to 70,000 r.m.s. volts by the agency of choke control arranged to electrify an oil-immersed gap. The gap can be set at the requisite distance, and the glass receptacle is then filled with the oil to be tested; the break-down pressure is read on a voltmeter on the outside of the apparatus, conveniently arranged over the control wheel. The metal casing lid is arranged to break the primary circuit when open, thus eliminating any possible danger of shock when filling the oil container.

Various Coolidge X-ray tubes were on view, and a series of radium ores with various appliances for storing, handling, and applying therapeutically the salts obtained therefrom; also a cadmium photo-electric cell for measuring ultra-violet radiation intensity. The radiations are allowed to fall on a plate within an evacuated glass cell the walls of which are cadmium covered, the window of entrance being of quartz. The intensity of the ultra-violet radiation is proportioned to the time taken for the loss of charge of the previously electrified plate, the electrification being measured by an aluminium-leafed electroscope. The Watson ultra-violet lamp was primarily designed for medical work, but is equally suitable

for use in a laboratory where a constant supply of ultra-violet radiation is required.

Cox-Cavendish Electrical Co. (1924), Ltd.

A selection of electro-medical instruments, such as diathermy apparatus, a simple portable photometer for gauging the intensity of ultra-violet rays, and goggles for use with lamps producing such rays. Of actino-therapeutic interest was a demonstration of the latest type of open tungsten arc lamp for ultra-violet radiation, popularly known as artificial sunlight, together with an improved quartz mercury-vapour lamp,

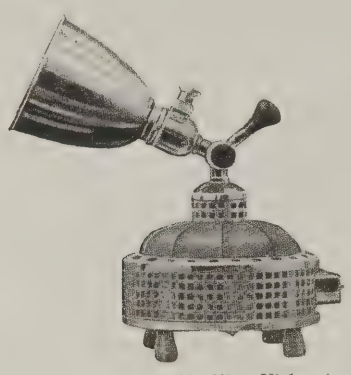

Fig. 14.—"Sunbeam" Portable Ultra-Violet Arc Lamp.

and a clinic type, combination open tungsten and carbon arc lamp. A new portable, impregnated, cored, carbon-arc lamp for home use, or microscopic illumination, was shown for the first time. This "Sunbeam" lamp (fig. 14) is arranged to work off d.c. and a.c. mains (approximately 100 to 200 volts) and is provided with a length of flex and plug adaptor; the current consumption is 3.5 amps. The light weight (2.5 lb.) and inexpensiveness of this outfit should appeal to the electrical trade.

Record Electrical Co., Ltd.

Apart from minor improvements in standard designs, the company this year introduced two improved instruments.

One novelty was a range of skeleton instruments suitable for demonstration purposes; they consist of the well-known "Cirscale" and "'xtra" type moving-coil and moving-iron ammeters and voltmeters mounted on a wooden base with transparent dials and enclosed under a glass cover, with front connection terminals attached to the wooden base. The object of the series is to enable the lecturer to explain the construction of various types of measuring instruments in everyday use to his students, all the important parts being easily visible through the glass case. The instruments are actual working models and can therefore be put to practical use in the laboratory and the student can watch the movements of the parts whilst the current is on. The transparent dial enables observers on both sides of the lecture table to read the indications of the pointer; furthermore, the scale can be stood in the path of a beam of light and projected on to a screen.

The bridge ohmmeter shown in fig. 15, is of novel design, being a recent patent of Mr. J. W. Record, its object being to provide means for extending the range of an ohmmeter to enable it to measure low resistances, such as are met with in

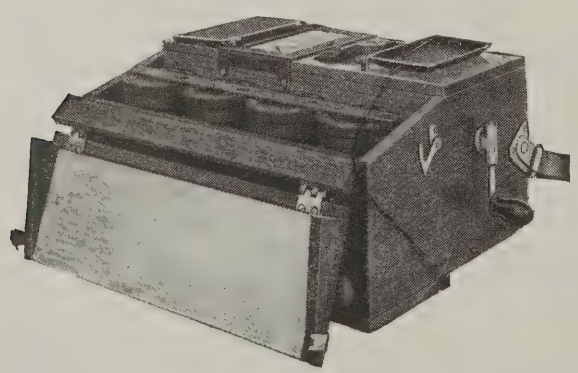

Fig. 15.—"Record" Bridge Ohmmeter.

ordinary general industrial work. An ohmmeter usually gives its first indication at 10,000 ohms, but the bridge ohmmeter will measure from .01 ohm up to 999,900 ohms on the bridge, and from 10,000 ohms to 100 megohms on the ohmmeter scale: it also indicates a short circuit (zero) or open circuit (infinity). The instrument consists of a generator, a direct-reading ohmmeter convertible into a galvanometer for bridge tests, a decade resistance box with ratio switch in one arm of the Wheatstone bridge, and a multiple-contact switch for changing connections, all arranged in a portable carrying case. The indicating unit is the same as that employed in the Record ohmmeter patented in 1902; constructional improvements, however, have been effected—chiefly the use of cobalt steel and a combination of resistance bobbin and dust shield, all forming a complete unit. The magnetic field for the pressure and current coils is provided by the same magnets, so that any loss of field strength due to diminishing magnet strength, or any change in temperature, would affect both coil systems equally, and as the pointer takes up a position which is the resultant of these forces, its true indication would be unaltered by such changes. Immunity from stray magnetic fields is effected partly by compensation as above and finally by shielding; the generator is also provided with cobalt-steel magnets, and its handle is an entire departure from the usual folding knee joint pattern.

H. Tinsley & Co.

Besides scientific instruments, a model was exhibited of Mr. Galletti's radio "beam" transmitter. The actual transmitter could be seen in operation by appointment at Hendon, but the model illustrated the principle upon which the transmitter works. It is capable of sending out an actual beam of radiation of radio-wavelength exactly like a searchlight, and not in the same way as the angular wedges of radiation are sent out by the "beam" stations at present working. Thus the beam can be directed upon a given target and limited both vertically and horizontally; the angle of the beam is negligible.

It will be realised that this is a very remarkable achievement, of which the future possibilities are large indeed. The actual apparatus at work at Hendon is operating on 4-metre waves, which could be varied without affecting the principle of the transmitter. The beam responds to all the optical laws of reflection and interference.

Amongst other items was a frequency bridge, built according to a suggestion of Dr. Pedersen, of Copenhagen, which has the unusual advantage of being suitable for low as well as high frequencies. The circuit employed is the well-known non-inductive combination of a resistance and a condenser in parallel with a resistance and an inductance; the frequency is measured by balancing the e.m.f. upon one of the resistances against the secondary of the mutual inductance, in series with the combination. The bridge shown had three ranges, which are obtained by three tappings on the mutual inductance, reaching from zero to 5,000 cycles, zero to 2,000 cycles, and zero to 1,000 cycles. Great latitude in the available frequency range is obtainable, and the bridge can be adapted for the measurement of quite low frequencies if required, as the square root of the resistance on the adjustable dial.

Hoope's conductivity bridge has been specially designed for for the convenient measurement of the percentage conductivity of copper samples. It is a Kelvin double bridge in principle, the sample being measured against a copper standard of the same nominal size: the procedure is to cut a specimen in the special cutting-off machine to a known length and to weigh the specimen against a special weight, the difference in weight being noted. The specimen is then put into the bridge and the "difference of weight" dial set to the value found when weighing. The slider of the bridge is then adjusted for balance and the percentage conductivity read directly upon the scale. The weight against which the copper sample is balanced is so adjusted that the percentage conductivity of the standard, as well as the dimensions of the standard, are compensated for, so that no further correction is required; there is a separate weight for each standard. Since measurements are made against copper, the temperature coefficient of the sample is compensated for, and measurement can be carried out without any rigorous temperature control; an accuracy of 0.1 per cent. is obtained.

A four-phase tuning fork has been developed to produce a continuous torque phonic motor. By means of a special type of contact, the fork is made to pass impulses of current displaced 90 deg. in time phase; the duration of these impulses can be controlled with great facility by the adjustment of the contacts. The fork exhibited was of a double type, provided with two pairs of limbs, one pair vibrating 180 deg. out of phase with the other set, both maintained by the same fork, so that a great many phased contacts can be obtained; there were five contacts on the fork exhibited, but several more can be added if required.

A number of N.P.L. pattern low-resistance shunts of wire construction were exhibited for the first time: the wire has the advantage of greater homogeneity than rolled sheet manganin, and shunts for carrying up to 16,000 amperes are under construction in this type. A curve-tracing machine of the "Ondograph" type, suitable for commercial frequencies, was shown operated by a tuning fork. A reflecting dynamometer specially designed for the measurement of zero power factor is intended for use in establishing quadrature in such measurements as dielectric losses; its sensitivity is such that, with full-range current, a power factor of 0.00013 can be detected. The instrument is provided with four current ranges, so as to make it suitable for a wide variety of tests. A submarine cable balancer (D. C. Gall's adjustment restorer) is designed to measure the errors in the duplex balance of submarine cables, the balance being obtained by operating the dial of the instrument. The settings of the dials give the resistance and reactance errors, a series of determinations of which is made at a number of frequencies, and from the nature of the errors, adjustments can be made by the artificial line, which will eliminate them. The position at which the adjustment to the artificial line must be made is found by means of a special chart, which was also exhibited.

(To be continued.)

Electric Railway Track Equipment.

A Comparative Review of the Electrical Apparatus installed on the London Underground Lines, and Experience Gained in their Operation.

By ARTHUR R. COOPER, M.I.E.E.

(*Abstract of a paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

(*Concluded from page 75.*)

Conductor rails endeavour to move or creep in the direction of the traffic, even on up-gradients, due to the effect of the train shoes and of the variation in temperature. These effects have been responsible for the over-turning of rails in many cases. Various types of insulators have been designed to act as anchors, but the best results have been obtained with a giant strain insulator, fig. 6. This is fixed at one end to a strap bolted to the underside of the rail, and the other end is secured to a sleeper by means of a strap fastened to the top of the sleeper and turned down over its side. The present practice for new lines is to install anchors, on the average, 300 yards apart.

Experiments are being made on a special joint for taking up conductor rail movement, fig. 7, and observation extending over 12 months shows that a daily movement up to 1¼ in. is recorded, the joint providing for movement up to 4¼ in.

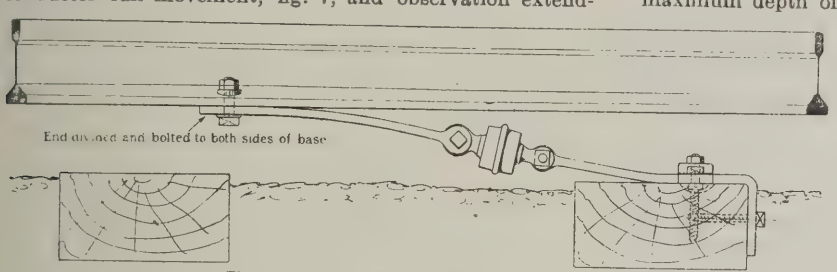

Fig. 6.—Giant Strain-Insulator in Position.

Failures have occurred with the earlier jumper cables laid direct in the ground at junctions and other places where gaps occur in the current rail, the cables being lead-covered and rubber-insulated. To overcome these failures it was decided to lay the cables in wooden troughs on the sleepers and above ground, the cable used being a special one with rubber insulation, having a covering of bitumen-rubber and being taped, braided, and compounded, but not lead-covered.

Cable connections to the conductor rails are made by flat lugs fixed with set-screws. An improvement made in recent years in such joints is the use of stainless steel in place of gunmetal for the set-screws; it is found that better connections result, apart from a clean surface being maintained.

The appearance of the rail is somewhat misleading, in that the heavy scaling would appear to indicate a much more rapid wastage than has actually occurred. The loss on the Underground Railways, due to corrosion and wear, varies from about 0.2 per cent. under favourable conditions to 1.2 per cent. under specially adverse conditions. The wear off the head of the rail is increased materially where moisture is present. It is suggested that a thin film of rust forms on the surface where moisture is present, and that this film is swept off by the train shoes and a clean surface left for a fresh formation of rust, and that as a result a much quicker corrosion effect takes place. Heavy loss from corrosion occurs at Earl's Court; it is suggested that vibration accelerates corrosion, and the amount therefore is dependent to some extent on the train service. In the tube tunnels the wear of the positive rails is about 0.08 lb. per yard per annum, and in the open 0.66 lb., or about 8 times as much.

It is interesting to note that positive rails wear a little more quickly than negative rails, and in particular where current is being collected. The wear on the conductor rails is also influenced by the weight of the shoe.

It is desirable to record a feature which has come to light in investigations on the loss of weight, and that is the extraordinary difference in the amount of wear that has taken place within the length of an individual conductor rail. The rail taken as an example is the worst one on record. The least vertical wear of the head is about ⅜ in. and the maximum depth of wear 1¼ in. These differences are about 20 ft. apart on the same rail, so that there can be no marked variation in chemical composition. Brinnell tests taken on the sections of rail cut out at these two places only showed that there was a slight difference in hardness. It is apparent that the painting of rails in the tunnels would not be justified. From experiments carried out on rails on the outside sections, the same conclusions have been drawn. To effectively stop corrosion by painting the rails would cost about £20 per annum per mile of rail.

For ordinary maintenance purposes the height of the current rail is hand-gauged by the permanent-way maintenance gangs who are responsible for keeping it to the standard level, the maximum variation permitted being ¼ in. up or down. Wood-packings fixed between the sleeper and the insulator are generally employed to adjust the height of the current rail. These are of creosoted pine for the open sections, and hard-wood for the tunnels. They are of sufficient size to take the insulator base and fastening clips, and are supplied in thicknesses from ¼ in. to ¾ in. Experience has shown that it is very necessary to bend, by careful "crowing," the rails installed on curves, to ensure that they are set properly to gauge.

The insulators originally installed on the outside sections of the District Railway were of two materials, some being of porcelain and some of a granite composition. They had a metal cap and a metal tripod base, as shown in fig. 8. The porcelain insulators have given little cause for complaint as regards insulating qualities, but a number of breakages have occurred almost entirely by crushing or breaking away at the jointing of the metal cap. In the type of insulator without a metal base this weakness still exists. The fractures have occurred with insulators having the centre lug on the metal cap cemented in, as well as where a flat cap is cemented on to the top of the porcelain. The breakages of porcelain and the desirability of doing away with the metal cap led to the introduction of the composition insulator, which has been found to be more robust, although experience has shown that some strengthening of the head or side lips is necessary; this has been provided by moulding in some metal reinforcement. The insulation under adverse

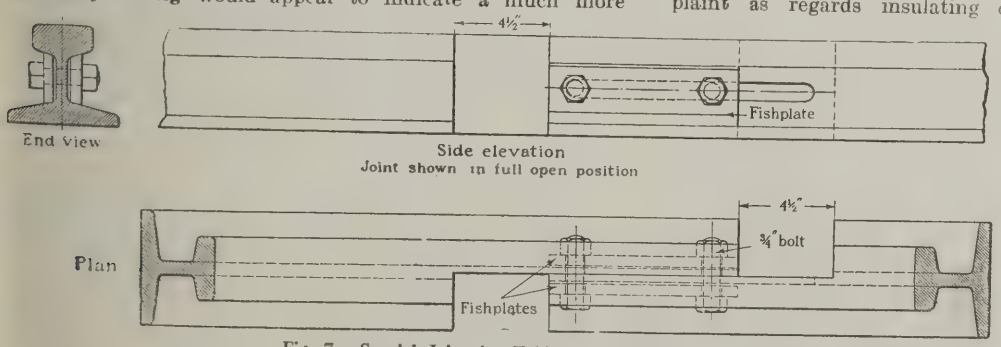

Fig. 7.—Special Joint for Taking up Rail Movement.

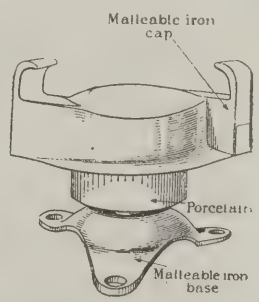

Fig. 8.—Outside-Type Insulator.

conditions is not so good as with porcelain, probably due to the less smooth surface. There is room for an insulator not requiring a separate cap and of a more robust nature than the porcelain or stoneware type of to-day, and yet possessing the smooth surface and insulating qualities of porcelain.

In doing away with the tripod base of the original type of insulator, it has been found necessary to obtain a more even surface on the sleeper top for the insulators to rest upon. Glass insulators with metal caps and metal-frame bases, but without petticoats, have been tried, but found to be too brittle; numerous breakages occurred. The use of insulators made from wood is not favoured, although good results were obtained from these insulators in the District Railway tunnels. They were used on the negative rail only and were dipped in hot insulating material. In tube tunnels earthenware insulators are used with moulded side-clips. This material is quite suitable for such conditions, and is cheaper, but is too absorbent for outside use. Insulators are installed at every third sleeper, 8 ft. or 9 ft., but it is general practice to provide an insulator on each side of the current-rail joints so as to lessen the tendency for vertical motion at the joint or rail-ends.

Some experiments have been carried out to determine whether the cost of cleaning insulators is justified, with the result that the practice has been discontinued. No case of short-circuit has occurred due to dirty insulators, and no ill-effects of any account can be traced to the small leakage currents which could be reduced during wet weather by cleaning the insulators. The value of the current lost is not a factor of any consequence.

Reference to the electrical equipment of the track would be incomplete without a description of the arrangements in force for cutting off the current from the track in emergency. Short-circuiting bars are carried on each tube train. These consist of an arm with a clip at one end to fit over the negative rail. The arm is arranged to pivot in this clip, and a conductor is arranged along the arm to connect to a contact so placed at the other end that it will fall on to the rail as the arm pivots; a wooden handle is provided on the arm. This device is placed across the rails after current has been taken off by a special device for making dead any section of the track in tube tunnels at a moment's notice. Two bare tinned-copper wires, tunnel lines, are run throughout the tunnels on insulators and at a height convenient for the train staff to reach. When these wires are short-circuited the circuit breakers at the sub-station relating to the section in question are opened automatically by relays. Provision is further made that the train staff, by attaching to these wires the portable telephone carried on all trains, can speak to the sub-station operator, giving particulars of the reason for switching off the current.

As forming part of the arrangement in connection with taking off current, relays have been installed across the conductor rails to switch on automatically the general tunnel lighting when the current rails become dead. The tunnel-lighting circuits are fed from the a.c. station lighting supply and are in general use during non-traffic hours for maintenance requirements. As a further arrangement, in each car of a train two small lamps are provided which, on the current rails becoming "dead," automatically light up from a battery on the train.

Interruptions to train working on account of ice or snow on the conductor rails occur on an average only about once or twice each year, but they are serious in effect. Snow itself does not prevent the shoes from collecting current, the trouble arising from a film of ice on the rail. The methods in general use to overcome this difficulty are mechanical. The most successful form of apparatus used up to the present is a steel strip brush fitted to a proportion of the motor-cars. The details of construction are shown in fig. 9, from which it will be seen that a raising and lowering device forms part of the equipment.

Experience has shown the need of exercising particular care with regard to the effect on the strength of materials of a burn from an accidental electric arc. On a steel rail the effect of an arc is practically the same as a nick, the burnt rail being easily fractured by a blow or similar shock. With regard to this effect on rails, an investigation was carried out some few years ago. A number of pieces were cut from the same length of rail, and in each case one piece was tested untreated and the other pieces were electrically burned and tested in various ways. The results showed that the strength of a rail to withstand impact, when the burnt metal was in tension, was very much reduced; with the burn in compression little or no diminution of strength occurred; the effect of a burn was very similar to that of a nick, and annealing after an electric burn produced a tendency to restore the strength, but only to a very limited extent. It is the practice on the Underground Railways, when signs of electric burning are found on a track rail, to have the rail replaced. A similar rule is adopted with regard to axles on the rolling stock.

The adoption of the insulated return has undoubtedly reduced the likelihood of injury to cables, particularly those in the railway tunnels. Breakdowns on the h.p. cables have been very few and, in the majority of cases, have been caused by mechanical damage rather than by an internal electrical breakdown or damage to the lead covering by electrolysis. No system of marking on the site the presence of "Underground" cables has been adopted, reliance being placed on the rule that before any work of opening up is undertaken the staff responsible for the h.p. and l.p. cables is to be consulted.

The h.p. cables for the District Railway tunnels were originally laid in sheet-steel troughs 12 ft. long, these being supported at each end on cast-iron brackets fixed to the tunnel walls. It was subsequently decided, with the concurrence of the Board of Trade, to take down this troughing entirely and provide a bracket support every 4 ft. No ill-effect of supporting old unarmoured h.p. cables in this way has been experienced.

In the open sections unarmoured lead-covered cables were originally laid in earthenware ducts a few feet in the ground, the ducts being surrounded with concrete. Some defects have taken place due to subsidence of these ducts, as well as from electrolysis in wet places and from the presence of impure water. The cables in the ducts have in several cases had to be removed and erected on posts. In being unarmoured, these cables do not accord with the general practice on railways, but our experience, extending over a number of years, does not show any ill-effect. It is our practice on outlying sections to run all new cable armoured, but the additional expenditure, about 20 per cent., is not justified where the cables are free from trespass.

Cables over bridges were originally carried in 4-in. wrought-iron pipes, no special steps being taken either to earth the lead covering of these cables or to insulate them from metallic structures. Some replacement of the cables has been necessary on account of cracks in the lead sheathing caused by vibration. The pipes are gradually being taken out, and where the cable is serviceable it is supported on raw-hide hangers provided at about 3 ft. spacing.

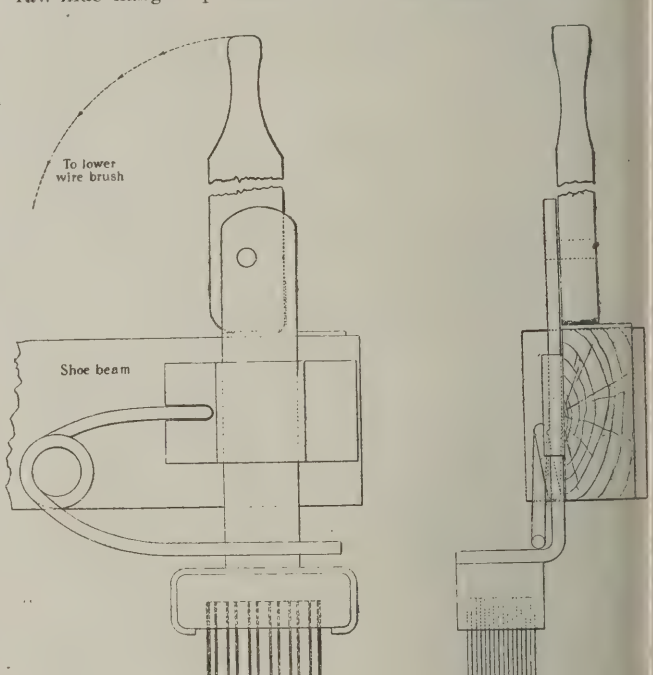

Fig. 9.—Ice Clearing Equipment.

On the tube railways the h.p. cables are unarmoured, and are supported from the iron tunnel lining on cast-iron brackets. On the railways where the insulated return has been adopted, no bonding either of the cables to the tunnel iron, or of tunnel iron to tunnel iron to make it continuous has been carried out, and no steps have been taken to keep the lead separate from the tunnel lining.

At points where sub-station feeder cables are connected to the rails short jumper cables are kept, with the necessary means for quick attachment to the conductor rails should a failure occur on the cables between the sub-station and the conductor rails.

There are two special items of electrical equipment particular to tube railway speed restrictions. The first is a machine to record the speed of all trains passing over some predetermined point, and is used to check the proper observance of speed restrictions. The recorder can be fitted up for use at any place. The second machine, a speed indicator, shows a motorman the actual speed at which his train is travelling over a particular place just in the rear of where the indicator has been installed. For the speed recorder two pairs of electric contacts are clamped to the track rail about 50 ft. apart at the point where the speeds are to be recorded, and are operated by the passage of the train. The first contact starts up the pointer of the recording instrument, and the second causes marks to be made on the chart as the train wheels pass. The record is made on a paper strip 6 in. wide, driven at 6 in. per hour, by mechanism which also moves the timing pointer, this consisting of an arm passing across the paper once for each train

recorded. A small electric motor drives the recording arm nd runs in synchronism with an electrically-driven tuning ork. The speed indicator consists essentially of a disk iming-device which is electrically released to rotate during he passage of a train over a measured section. The disk is ierced near the edge with numbers in decreasing order, nd when it stops, as the train leaves the measured section, lamp lights up and, by means of a small optical lantern rrangement, shows on a board an image of the number to vhich the disk has rotated and which naturally corresponds o the speed over the section. The measured section is about 80 ft. long, the indicator being placed about 200 ft. beyond his section. The rotation of the disk is carried out by a gravity arrangement assisted by a spring in order to increase the initial speed and thus allow of the numbers being evenly spaced round the disk. The rotation of the disk is controlled by the damping effect of the electric currents generated in it by its rotation between suitably-placed magnets. The disk is returned to normal by a simple electric motor device.

Both of these devices are worked from ordinary accumulators and, being portable, are frequently moved from place to place;; in fact, the recorder is generally moved after having been installed for about 24 hours on any one section. The use of these instruments has resulted in the much-improved observance of the speed restrictions.

Electric Ploughing.

A New Italian Development, employing a Double-Locomotive Equipment.

SOME particulars of what is described as the first electric ploughing outfit on the funicular or cable system of Italian manufacture have been given in the *Implement and Machinery Review*, whose permission we have to make use of he following information and reproduce the accompanying lustration. The makers of the equipment are Messrs. Fratelli iolati-Tescari, of Milan, and there are already many of the oughs at work in Italy, where it is expected they will prove great assistance in the campaign which has been instituted that country to produce more home-grown fruit.

The equipment, which is admittedly modelled on the Fowler stem, consists of two electric locomotives weighing about 55 vt. each. They are four-wheeled vehicles, the two front

Double-Locomotive Electric Ploughing Equipment.

heels being the steerers. The frame is rectangular and of annel-section iron. The driving motor is of 36 h.p., and is ced on the forefront of the locomotive chassis; its speed, 0 r.p.m., is so reduced by a double set of gearing that the um pays out or winds on slowly, up to less than 30 r.p.m. necessary, so that the cable, which is 400 metres long, is ound on at a correct speed for the task in hand. One locootive draws the plough or other implement as the drum of e second prime mover, running light, pays off the cable, d the reverse happens for the opposite run. The motor is itably enclosed, and the transmission system is also proted, as is the winding gear. The sheet-steel cabin contains the controls and the necessary instruments, and affords e operator a good view of the ploughing operations while lly sheltering him from the weather. The entire outfit is nply designed, permitting the use of wearing parts of ample rength without adding unduly to the weight, and the iving arrangements are conveniently arranged.

In a trial which took place at Rogoredo, a plough was erated at 500 V, the supply pressure of the district, and there was no need to use the portable transformer, which is supplied with the set for making the necessary pressure adjustments. The soil conditions were superficially favourable, but the draft was increased not so much by the matted top growth as by the dry and hard subsoil of land that had not usually been deeply worked. A four-furrow balance plough was hauled along at a rate of 2¼ miles per hour, and had an effective working width of about 4 ft. The operation was regular and uniform throughout, there not being a single hitch in the free flow of movement from bout to bout. The depth of the work was also well maintained throughout at approximately 10½ in.

The price of the apparatus is said to be about a third of that of a steam ploughing set. The equipment is capable of ploughing, it is claimed, about eight acres of ground, under the conditions which prevailed at the trial, in a ten-hour day with an effective power of 30 h.p. The necessary personnel is three men, one on each locomotive and one on the implement, though where a bigger implement is used and more work undertaken in the course of a day it might be necessary to supplement the crew. The average life of the outfit, with the exception of the cable and certain accessories, is placed at from 15 to 20 years, and where a working knowledge of the plant is used to advantage in protecting the delicate electrical apparatus from rust and water, the maintenance costs are reduced to a very low figure. It is claimed that the total cost for ploughing 2½ acres is about 16s., where the cost of energy is about 0.65d. per kWh.

It is interesting to note that the makers produce other electric ploughing sets ranging from 35 to 100 h.p., and that they have turned out some 350 of such sets in 10 different types. These include an electric prime-mover much on the lines of the double set mentioned above, but arranged for working on its own with an anchor placed at the far end of the field. Two drums are fixed horizontally in the middle of the chassis, and one of these pays off as the other draws on while the implement is hauled to and fro.

Hollow Electrical Conductors.

An Economical Means of Reducing Corona Loss.

NOTWITHSTANDING the fact that corona loss has been studied sufficiently to enable engineers to develop the transmission of power electrically by means of overhead conductors operating at pressures up to 220,000 volts, research is constantly in progress with the object of improving the efficiency of conductors.

The solution of the problem has hitherto generally been sought by the employment of a conductor of a diameter large enough to confine corona loss within tolerable limits. In the case of the highest-voltage transmission lines, however, such a policy often involves the use of more material in the conductor than would otherwise be economical. It is, of course, unnecessary to make the conductor solid; it may be stranded and wound round a core of some other material, either insulating or metallic, thus increasing the total diameter. Such a composite cable, however, introduces difficulties: its cost and weight may be increased, and in

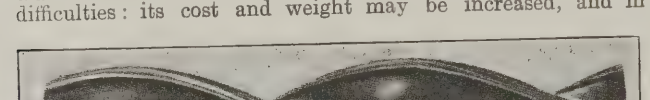

Fig. 1.—Cylindrical Core, Twisted Copper Strip of I-section.

some cases its use may necessitate the provision of extra strong towers and foundations; the core material may deteriorate according to climatic conditions, whilst differences between the coefficients of expansion of the conductor and core materials result in varying stresses with temperature changes, which may reduce the combined strength and cause alternate tightening and loosening of the conducting strands on the core, with the result that the surface-conducting metal tends to "crawl" towards the lowest point of the span sag, with the possible consequence of the conductor strands fracturing at their points of support.

In order to obtain cable of the desired diameter without the difficulties enumerated above, the Anaconda Copper Mining Co. and the American Brass Co. have introduced hollow cables, which are so constructed that their outside diameter and cross section are independent within wide limits, it is claimed, thus permitting transmission lines to be designed for maximum economy as regards both corona and resistance losses. Moreover, such cables are said to be advantageous for carrying alternating currents of such magnitude as to make the "skin effect" important.

Hollow conductors may be constructed in various ways: for the sizes required to accommodate the transmission voltages so far "standardised," the most rugged and economical design is claimed to consist of a core made by twisting around its longitudinal axis a copper strip I-section in shape (fig. 1). The web part of the strip at any section remains perfectly straight, giving a rigid column across the diameter of the cable, while the flanges provide a bearing surface for the strands laid around the core to form the cable. This I-section of copper can be twisted more or less closely as required to support the strands, and forms, in effect, a light-weight flexible cylindrical core capable of withstanding considerable compression and supporting the surrounding strands at short intervals. The first layer of strands is spiralled in the opposite direction to that of the core strip; successive layers can be spiralled alternately in opposite directions as in the construction of concentric cable.

The strength of such a cable is that of the strands, plus the strength of the core, and its conductivity is the conductivity of the strands, plus that of the core. The core in a cable approximately 1 in. in diameter and 500,000 c.mils will not be more than 7 per cent. of the total weight of the cable, and its conductivity will be about 90 per cent. of the conductivity of a solid copper wire of the same weight per foot. The conductivity of the complete cable will therefore be over 99 per cent., and the tensile strength approximately the same as that of a concentric cable of the same weight per foot. Whenever the cross section of copper required to carry the current economically does not give the desired tensile strength, the hollow conductor can be reinforced with bronze strands having the same temperature coefficient of expansion as copper, so that the strength of the combination cable does not change with temperature.

In January, 1925, a 500,000-c.mil "Anaconda" hollow-conductor line was installed by the Montana Power Co., near Great Falls, Montana. The operating engineer reported later that "On September 19th, 1925, our hollow-conductor line withstood, without the slightest deformation, the most severe wet snow and ice storm which this territory has experienced in twenty-five years. The adjacent spans of 1/0 copper were broken down by the snow, and there were twelve breaks within a distance of approximately five miles. Other lines in the neighbourhood of Great Falls were seriously broken down by the storm. We also had over 100 miles of telephone line laid flat on the ground." The cable in question was erected by the regular line crew without additional help, or supervision . . . "It was more flexible and, of course, lighter than a stranded conductor of the same diameter; it ran through the blocks without any difficulty whatever, and there was no tendency for the cable to crush or fray."

A hollow conductor can be handled and erected in the same manner as a concentric cable, except that it is necessary for the sheaves over which it is pulled to be made with grooves which closely fit the outside diameter of the cable; all clamps, both suspension and dead-end, should have accurately-fitted, smooth-bored surfaces. A 5-ton solid rubber tired motor truck with a load of 2 tons was run over such a cable laid on concrete, several times, without damaging it. Such conductors can be furnished bare; paper insulated and lead sheathed; and varnished-cambric insulated, either lead sheathed, or braid covered.

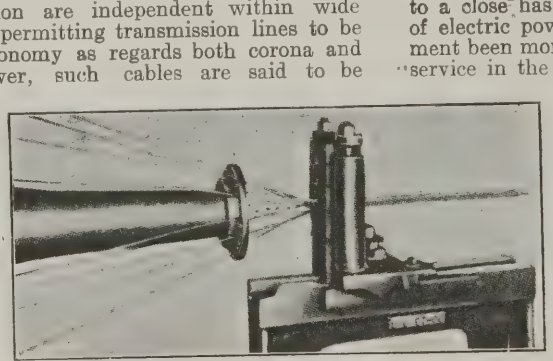

Fig. 2.—Stranding Wire Over Copper Core.

Fig. 3.—"Anaconda" Hollow Conductor.

Rural Electrification in Ontario.

A Canadian correspondent says that the year just drawn to a close has been marked by a great expansion in the use of electric power in Canada. In no respect has this development been more pronounced than in the rapid extension of this service in the rural districts of Ontario, where approximately 18,500 farms are now being supplied with power by the provincial Hydro-Electric Power Commission, the operations of which probably cover a larger territory than those of any similar organisation. The Commission has already constructed 2,24 miles of rural transmission lines, of which 700 miles were erected during 1926, supplying about 5,000 new customers. The plans of the Commission involve a considerable further widening of this field of its operations, by the extension of the system at the rate of about 600 miles of transmission line per annum for some years to come. Farm consumers at present are using about 8,000 h.p., and when the objective of the Commission is attained, it is estimated that about 20,000 h.p. will be required. These figures, it may be noted, are for *bona-fide* farms, and do not include the suburban areas near the large cities. The contracts for power are made with the townships in which the farms are situated, which are held responsible for the payment of all charges. The introduction of electric light and power has done much to lighten the labour and increase the efficiency of the farmers, as there is a wide range of services on the average Ontario farm to which electricity can successfully be applied.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

New 6-V "DE" Valves.

We have received samples of two new valves, one of which s illustrated in fig. 1, which are the first of the 6-volt class to e issued with the new Marconi nomenclature. As their ames imply, the DEH.612 and DEL.612 are high- and low-requency types respectively, having a filament consumption f 0.12 amp. The characteristics of the former, fig. 2, show hat it is a good detector and suitable for resistance or choke-

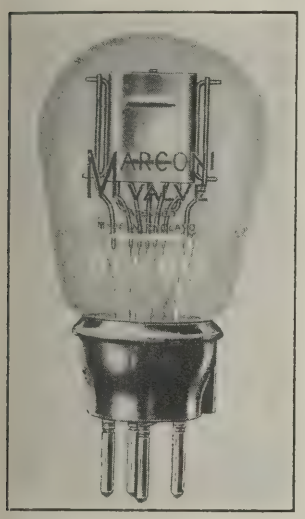

Fig. 1.—New DEH.612 Valve, 6 Volts.

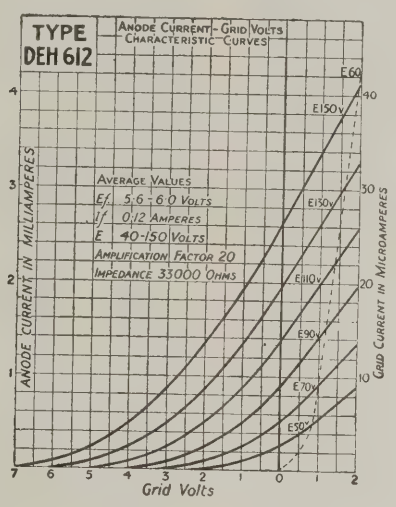

Fig. 2.—New Valve Characteristic Curves.

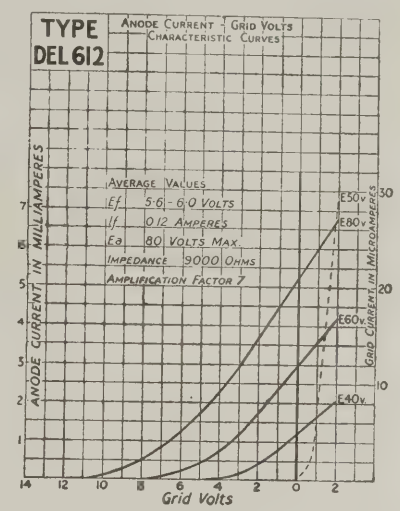

Fig. 3.—Characteristic Curves of DEL.612 Valve.

pacity coupling, or high-frequency stages. The latter, fig. 3, suitable for use in the first stage of a transformer-coupled nplifier, and with 80 volts on its plate will need about 4-volts id bias; it may also be used in the second stage when only oderate output is required. Both valves represent excellent lue, and their chief constants are shown in figs. 2 and 3. ese valves are manufactured by the M.O. Valve Co., Ltd., d similar ones are being marketed by the General Electric ., Ltd., under the name of "Osram." They offer all the vantages of the 6-V filament, taking 0.12 A only, for the me price as 2- or 4-V general-purpose valves, another step wards economy.

Battery Eliminator Components.

In view of the extraordinary interest which has been aroused the introduction of high-voltage plate-battery eliminators

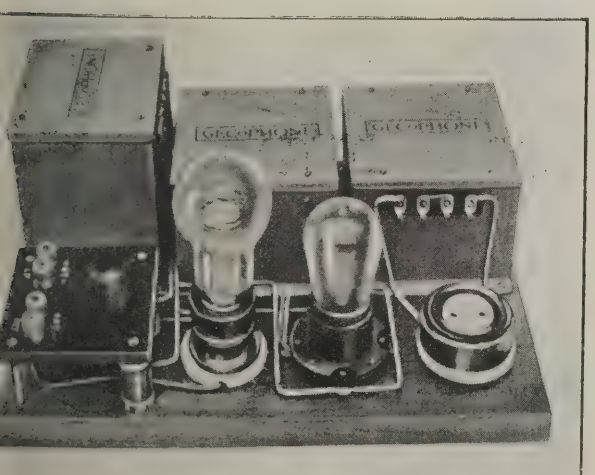

Fig. 4. G.E.C. Battery Eliminator Set.

the wireless market, it is gratifying to learn that a full set components, specially manufactured to enable the con-uctor to build up his own unit, can be bought for use in junction with a.c. circuits. This enterprising move has n made by the General Electric Co., Ltd., which also sup-plies assembled units, in attractive containers, for a.c. in 100/115-volt and 200/230-volt types, and for d.c. As the components, in the case of the a.c. units, are similar in every respect to the individual components now being sold separately, there would appear to be no valid reason why equally efficient and serviceable units should not be constructed by those who prefer to build up their own eliminators; moreover, the circuit for which they are designed is at the constructor's disposal, permitting him to assemble them in accordance with his own requirements. The components in question embrace a transformer, choke unit, condenser-bank unit, fixed resistance, regulating resistance, "Osram" GR.1 rectifier, "Osglim" voltage-regulator and lamp holders, each of which can be acquired separately, or the whole kit complete, as detailed (fig. 4).

A New "PM" Valve.

The valves used in a resistance-capacity coupled amplifier should have a higher amplification factor than those used for a transformer-coupled amplifier. Such a valve is the new Mullard PM.5B, whose amplification factor is 37 approximately, or 30 overall per stage in practice when correctly used, which value is nearly as high as that obtainable from the best transformer amplifier, it is claimed, but with superior quality: the new PM.5B valve has the very low impedance of 74,000 ohms. It must be emphasised that in a multi-stage amplifier, the amplification over two stages may be as high as 1,000 and therefore it is important that the valves used in the later stages must have a sufficiently long "grid base" to avoid the "cut off" effect which causes bad distortion in l.f. amplifiers. The anode current flowing when the grid is at zero potential, should be halved by the application of the negative grid bias. Other characteristics of the new valve are filament voltage from 5 to 6 volts and current 0.1 amp.; the maximum anode voltage is 150 volts and total electron emission 20 mA, while the mutual conductance is 0.50mA-volt (at anode volts = 100, grid volts = zero).

The Condenser Telephone.

A lecture on "The Condenser Telephone: a Development of the Speaking Condenser," was delivered to members of the Royal Philosophical Society of Glasgow last week by Dr. George Green, Lecturer on Natural Philosophy at the University, who explained that the idea of employing condensers as mechanisms for converting electrical vibrations into sound vibrations was by no means new, but none of them had been able to survive the competition of the ordinary electromagnetic telephone. Interesting demonstrations were given by the lecturer, whose experiments proved that the condenser telephone was capable of giving volume of sound as well as quality in transmission work. By means of condenser telephones of various capacities and having plates made of different materials, the tuning of the condenser telephone was demonstrated. The quality of the instrument improved and the volume of sound emitted also increased as the capacity was increased. Instruments of high capacity were apparently best suited for the reproduction of music. The lecturer pointed out that the condenser telephone was capable of being used either as a transmitter or as a receiver.

The Use of Low-Grade Fuels.

A Comparison of the Methods of Burning High Ash-and-Moisture-Content Coals for Steam Generation; Chain Grate Stokers *versus* Pulveriser Equipment.

By W. F. GOODRICH, M.B.E.

(*Abstract of a Paper read before the* INSTITUTION OF FUEL ECONOMY ENGINEERS.)

UNDER the conditions of acute coal shortage which have prevailed during the past few months, large quantities of low-grade coal have been used. It is not suggested that the users have been generally very enthusiastic, either in regard to its cost, calorific value, composition, or the results obtained, but its use has undoubtedly enabled many steam users to carry on. Opinions will widely differ as to what fuels may reasonably be placed within the category of "low grade," but the author would submit that the following may all for one or more reasons be classed as low-grade fuels: Coal having a calorific value "as received" of 10,000 B.th.u's or less; coal having an ash content of 20 per cent. or upwards, coal and coke dust; slurry, gum, duff, smudge, dant, pond tank or washery settlings, ballast, bats, and pickings; town's refuse; certain waste gases; timber, wood waste and sawdust peat; brown coal and lignite; and bagasse.

In a paper entitled "Notes on the Use of Low Grade Fuels in Europe," by R. H. Fernald, issued by the United States Bureau of Mines eleven years ago, the position in the United States at that time, in so far as the use of low-grade fuels was concerned, was referred to thus:—"The unrestricted use of our better grades of fuels and the ruthless waste and neglect of fuels which should be of real commercial value, are phases of our national extravagance which are but little short of appalling." Whether the United States can afford to neglect to utilise those fuels which are described by Mr. Fernald as "of real commercial value" is a matter for those concerned to decide. Our position, however, is entirely different, and it may without any hesitation be stated that we cannot afford to neglect to use any fuel of real commercial value. It would seem that the only hope of cheaper coal in the future is dependent upon the much more extended use of low-grade and so-called waste fuels; and the drastic reorganisation of the coal mining industry. It is idle to disregard the fact that as a whole the coal mining industry has functioned wastefully and inefficiently; and it can scarcely be denied that drastic changes must be made. All authorities are agreed that underground and surface waste of coal at collieries represents a colossal loss in revenue, a loss which has been and still is discreditable to all concerned.

Generally speaking, there can be no doubt that low-grade fuels should, so far as may be practicable, be utilised at or adjacent to the point of production. Providing that an assured supply of low-grade coal is available at an attractive price, the question arises as to the conditions which should obtain in order to ensure that the utilisation of such fuel is advantageous to the user. This question involves various considerations, but the main problem presented is essentially one of providing suitable steam generating plant and the correct firing equipment. It has been constantly asserted that while the utilisation of these fuels in the future is of national importance, the only satisfactory method of their utilisation is in pulverised form. The author dissents entirely from this view. Low-grade fuels have been burned in this country, as also in other European countries, in the raw condition on grates, both hand and machine fired, in increasing quantities for from thirty to forty years past.

If efficient use is to be made of those fuels which have a commercial value, instead of accumulating millions of tons as hitherto, this will only be accomplished by providing steam boilers of suitable design, with firing equipment of such a type as will ensure the most efficient use of the available fuel, at the lowest capital cost, consistent with low labour, operating and maintenance costs and reliability in service.

If these desiderata be conceded as essential, then it is submitted that to a very large extent internally-fired boilers such as those of the Lancashire type can no longer be used. Only in certain cases where the fuel has a low volatile content, and when the evaporative output demanded is very moderate, can the use of such boilers be justified. It is submitted that a water-tube boiler suitably designed, arranged, and equipped for burning fuel having a high ash content, will efficiently deal with low-grade fuels in such a manner as is clearly impossible with a boiler of any other type.

While comparatively little attention has been given to the fusion temperature of ash, in the burning of low-grade fuels this often presents a very serious difficulty. If ash in forming is subjected to a temperature in excess of its fusion temperature the formation of clinker is inevitable. The nature and condition of the clinker will depend upon the composition of the ash and the excess heat to which it may be subjected. In the case of many low-grade fuels the fusion temperature of the ash is relatively low, and when cold air is used for combustion, as the ash percentage increases so the furnace temperature is appreciably reduced. If, on the contrary, preheated air is used, while it is undoubtedly advantageous in improving the combustion conditions, increasing the rate of combustion, reducing the excess air used, and decreasing the percentage of combustible in the ash, it is frequently the cause of very serious trouble in the rapid formation of very difficult clinker and impossible operating conditions.

The alternative method of utilising certain low-grade fuels is that of pulverisation. Up to the present time there has been no opportunity of definitely determining the relative advantages of this and other systems. The author is aware that low-grade fuels have been used in pulverised form in some few installations during the past few months, under the stress of the conditions which have obtained, but whether it is more efficient and economical to burn certain low-grade fuels with high ash and moisture contents on grates or in suspension will not be settled until such time as comparative and conclusive trials are made over an extended period, with precisely similar fuels, and under normal operating conditions. Any system of utilisation which involves intermediate or preparatory treatment of fuel before its energy can be converted into useful work is clearly at a disadvantage, and all costs involved up to the time the fuel is actually fired must be taken into consideration in comparison with the use of raw coal, having in mind that there is no practical difficulty in burning raw coal as delivered despite its condition.

In considering the relative advantages of the two systems of firing, the question of ash demands attention. The problems presented in dealing with ash differ widely. When the ash is formed on a grate, one knows where it is, and it is to a large extent automatically removed. On the contrary, when the ash is all in suspension not only are the heating surfaces much more readily coated, but fusion and slagging much more easily occur. What becomes of the ash which escapes into the atmosphere in considerable quantities? The discharge of large amounts of finely subdivided material, even if it is invisible, very closely approximates to atmospheric pollution.

With very few exceptions, all fuels which may be efficiently utilised in pulverised form may also be efficiently utilised with suitable mechanical stokers.

Those fuels which are admittedly specially suitable for use in pulverised form, and which in their dry and grade condition alone are not suitable for stoker firing, are certain dry fuels finely subdivided, which, by reason of their size and physical condition, require but the minimum of drying and pulverisation.

It is imperative that such fuel should be utilised where it is produced; it would, however, be a mistake to suppose that it could not be utilised with mechanical stokers, either mixed with fine slack or in a moist condition. It is claimed that in the choice of fuels which may be efficiently burned for steam generation, there is beyond question no overwhelming advantage in favour of pulverisation. Among the most recent information available concerning the use of low-grade fuel for steam generation are details of boiler tests lately carried out at the Kashira power station, Russia, with both unscreened and screened, low-grade non-choking coal from the Moscow basin, containing a considerable proportion of fine. The approximate analysis of the unscreened coal was: Moisture, 33.1 per cent.; ash, 20.9; sulphur (volatile), 3.; volatile matter, 21.0; and fixed carbon, 21.9. The net calorific value of the fuel equalled 4,800 B.th.u's. per lb.

The tests were carried out with a Babcock & Wilcox boiler having 3,250 sq. ft. of heating surface, a superheater, but without an economiser. The firing equipment comprised

hain grate mechanical stoker having a grate area of 74 sq. ft. ir was supplied to the grate under pressure by means of a Schiele fan, being preheated by means of a mixture of a ertain volume of the hot gases. The range of the preheated ir temperature was from 265 to 590 deg. F., while a thermal fficiency of 70 per cent. was obtained, this being largely ue to the use of preheated air. In a second series of tests ith screened coal, the thermal efficiency was increased to he extent of 2.7 per cent.

The screened coal used had the following proximate analysis: loisture, 30.03 per cent.; ash, 18.20; sulphur (volatile), 2.24; olatile matter, 23.97; and fixed carbon, 25.56. The net alorific value in this case was 4,418 B.th.u. per lb.

Towns' refuse has been aptly termed the lowest of all w-grade fuels. Ever varying in its composition, usually aving both a high moisture and incombustible content, it anything but homogeneous in character. Nevertheless, it ossesses an unquestionable fuel value, and assuming that disosal by fire be decided upon, the available heat should be lly utilised, not only with a view to reducing the cost of isposal, but also in the interests of coal conservation. Rearded solely from the point of view of its fuel value, the tilisation of refuse for steam generation merits much more erious consideration than it has hitherto received. In a eport to the Electricity Committee of the Metropolitan orough of Shoreditch on the disposal of London refuse rather ore than a year ago, Mr. C. Newton Russell, A.M.I.C.E., .I.E.E., the then borough electrical engineer, estimated that the whole of the refuse collected in the Administrative ounty of London were burned in large, modern, and coneniently located destructors, designed for steam generation, ie steam being fully utilised, there would be a saving of wards of 128,000 tons of coal per annum, and 30 million Wh could be generated yearly and sold at 0.4d. per kWh, quivalent to a revenue of £50,000. Taking into account all ie charges, the estimated net cost of disposal would be . 11d. per ton, as compared with the present cost in London r burning of about 9s. per ton.

Waste heat as low-grade fuel may be said to include blast rnace gas, waste gases from various types of metallurgical rnaces, gas retorts, water gas plant, and producer gas.

In a report of the Electricity Commissioners, coke oven gas included as waste heat, while the reports for the three years ding March 31st, 1925, show that the respective annual perntages of the total units generated for the three years in estion from waste heat were 3.21 per cent., 3.26 per cent., d 2.51 per cent.

Whether it is desirable to utilise such a fuel as coke oven s for the firing of steam boilers is a debatable question, ving in mind the very moderate thermal efficiency which is o often obtained. The use of blast furnace gas has not en developed in this country to anything like the extent ich it should be. As ordinarily available, heavily charged th dust, the pressure varies considerably, thus introducing ficulties in adjusting the correct mixture of the air supply r combustion with burners of the aspirating type.

In the more recent practice the gas and air are conveyed the burners under pressure, the supply being maintained a minimum regardless of the gas pressure in the main. the burner the gas is broken up into thin streams, the air ing so introduced as to ensure complete diffusion before nition. Large furnace volume is essential, also great length gas travel. Compared with the early installations with ter-tube boilers, furnace volumes have increased in the io of from 4 to 6, to 1. It is essential that the furnace ckwork be so designed as to maintain the highest possible rnace temperature.

With a draught at the outlet damper of 2.2 in. W.G., 2.9 in. essure at the gas burners, and 1.7 in. air pressure at the rners, an average evaporation of 5.27 lb. of water per square ot of heating surface has been obtained over a continuous n of 168 hours.

Discussion.

Mr. W. D. Wylde, in a written communication, said that the penditure in terms of potential heat units involved in the -treatment of coal was not usually included in the comative test results. With low-grade coal at 15s. per ton ivered, the heat value referred to gave mechanical stokers per cent. start in the race for maximum steam-production ciency. He had in mind numerous instances where a 50 cent. increase in the steam demand was comfortably met boiler plant equipped with modern chain-grate stokers. re were the banking losses debited to the firing of solid l, but there could not be such a wide disparity in the losses he two methods of boiler firing as was generally supposed.

Mr. C. Newton Russell agreed that the pulverised fuel advoes had not yet proved their case. Recently he had had to sider whether he should go in for pulverised-fuel firing or , and in view of the extra cost of the pulverising plant, the ge staff required to look after it and the huge buildings uired, together with the risk that it would not work out as ected, he had decided that the time was not yet ripe for ting down that plant. Dealing with the prevention of the ssion of grit from small chimneys, he had devised a system which the bottom of the chimney was left quite open, there ng a receptacle with a volute round which the gases sped on their way to the chimney proper. It was found that 0.4 per cent. of the whole of the fuel burned was retained at the bottom of the chimney in the form of grit. He had been astonished to find that there were 4,000 B.th.u. per ton in the grit. With the pulverised-fuel firing system the grit was finer than when chain grate stokers were used, and if one were unable to catch it, it would float for miles and become a nuisance. He looked upon the coal deposits of the country as so much capital belonging to the nation in the bank; we were living on our capital, and the present wasteful methods amounted to practically a crime in some cases.

Mr. P. C. Pope agreed as to the necessity for making use of low-grade fuels when those low-grade fuels were other than coal, but did not agree that there was any necessity to make use of coal in the form of a low-grade fuel. It was very much more economical to treat the coal at the collieries and éliminate a very large proportion of the ash before it was sent to the boiler plant, and it was not a paying proposition to cart a lot of dirt to the boiler plant, heat it up, make clinker of it, handle it, and then get rid of it. If coal contained a large amount of inherent ash it should be crushed to ⅜-in. and then washed. The overall cost of washing or dry-cleaning coal did not exceed from 2s. to 3s. per ton as a rule.

Mr. J. D. Troup, referring to the coal treatment laboratory which had recently been opened at the Birmingham University, said that the equipment consisted almost entirely of various types of wet and dry plant for the screening and cleaning of coal. There seemed to be no practical reason why the gas producer should not be combined with a water tube boiler.

Mr. P. W. Griffin said that the collieries should utilise the low-grade coals, but the trouble was that most of the collieries in this country used Lancashire boilers. With regard to the burning of low-grade fuels when mechanical stokers were used, he said that one necessarily had to use a high draught in order to burn the fuels, and he would like information as to the cost of maintenance of the bars, because it seemed that a lot of trouble would arise from their wearing away, melting, and so on.

Mr. J. Golder wondered if the statement that all fuels which might be efficiently utilised in pulverised form might also be efficiently utilised with suitable mechanical stokers were true. What about the arch in a mechanical stoker? The quality of the fuel did not make much difference in the case of a pulverised-fuel fired plant, whereas in a stoker-fired furnace there was flexibility only with regard to the area of the grid, and stoker equipment designed for a particular fuel could not be made efficiently to utilise fuels of a widely varying nature. If the statements in the paper were entirely true, capital outlay alone would be the factor responsible for prolonging the days of the mechanical chain grate stoker. It was a fact that less than 5 per cent. of the coal consumed in this country annually was used for transformation into electrical energy. If all the "unsaleable" coal produced at our collieries were turned into electrical energy and distributed among the people, the present average consumption could be multiplied by five.

Mr. W. R. Griffiths said he had found that as against a Lancashire boiler using double-screened nuts at a calorific value of about 13,000 B.th.u. per ton, costing 19s., he could use a water tube boiler, with chain grate stokers or pulverised fuel equipment, with fuel having a calorific value of from 9,000 to 10,000 B.th.u. per ton, costing 11s. per ton, and in consequence of the savings effected it would pay for itself in seven or eight years.

Mr. Smeaton urged that the waste material in the dumps at the pit heads should be cleaned and utilised, and that we should look at the problem from the point of view of conserving our coal resources instead of comparing the merits of two firing systems.

Mr. P. O. Roberts said the calorific value of the dump face was extremely small, and could not be improved sufficiently to make the washing worth while; the consumer would not pay for the cleaning.

Mr. Goodrich, in reply, said it was generally found that with modern machine firing equipment the cost was about the same as the application of the unit system of pulverised fuel firing. The central system for one or two boilers only would be very much more expensive. With regard to the suggestion for the elimination of ash at the point of production, he pointed out that if only 5 per cent. of the incombustible were removed at the collieries, we should save the use of 425,000 ten-ton railway wagons in this country. He agreed that the gas producer could probably be applied even to the largest of water tube boilers of every type. He was surprised that rocking firebars had not been used to a greater extent in this country, because there was not the slightest doubt that a well-designed grate of that kind for hand-firing was very beneficial indeed in riddling through the air spaces a lot of the finer incombustible, thus preserving a cleaner fire and making it easier to burn a dirty fuel. With regard to the question of grate maintenance where low-grade fuels were used, with air temperatures not exceeding 250 deg. F. the grates seemed to stand up exceedingly well; he believed Mr. Newton Russell had grates in some of the refuse furnaces at Shoreditch which had been in use for nearly 30 years. He maintained that practically all fuels which could be efficiently utilised in pulverised form might also be efficiently utilised with suitable mechanical stokers, but it was very necessary to add that the question of relative efficiency had yet to be determined If time proved that pulverised firing was better than any other system he would be the first to hold up both hands for it.

Correspondence.

The Permissible Current-Carrying Capacities of High-Pressure Cables.

In your issue of January 7th there is an article by Mr. E. Berry Nixon giving certain sets of curves. As these stand they are of no real value and, in fact, might very much mislead.

In the first place, the permissible current that any particular cable should carry depends on several factors, none of which are so much as mentioned in the article :—

(1) Depth of cable in ground.
(2) Moisture content of soil.
(3) Ground temperature.
(4) What maximum temperature rise is allowable in the particular cable.

The article does not state on what bases the curves are prepared. Under fig. 1 there are certain reduction figures given for two cables laid together, but any particular reduction figure depends on the distance apart of the cables. It would be a different figure if the cables were 4 in. apart from when they were 12 in. apart, and the author does not say what distance apart his reduction figures are supposed to be based upon.

With regard to the curves in fig. 2, why does the author provide for three armoured cables for voltages up to 11,000 volts and for unarmoured cables at higher voltages? What has the voltage got to do with the question whether a cable will be armoured or unarmoured? One would have thought that the lower-voltage cables had better be unarmoured, seeing that they are likely to carry the heavier currents and that the sheath losses depend largely on the currents in the conductor. The sheath losses in single-armoured cables would be very great on 3-phase a.c. circuits, and consequently the heating in the sheath would have to be taken into account in fixing the allowable current in the conductor. Are the curves in fig. 2 supposed to take this into account? The losses and consequent heating in sheaths of single-core a.c. cables depend also on whether they can be worked with open-circuited or short-circuited sheaths; see paper on "The Use of Single-core Cables for Alternating Currents" by Prof. Cramp and Miss Calderwood, *Journal* of the I.E.E., April, 1923.

Then, how near are these three single cables together, and are they in triangular formation or in horizontal formation?—because this question determines, to some extent, the sheath losses and heating.

In the case of the high-voltage single-core cables the permissible current will also depend on the design of the cable, *i.e.*, the diameter of the conductor and the thickness of the insulation.

Instead of using the curves in this article, I should strongly recommend your readers to go to the proper place, *i.e.*, the "Technical Report" referred to by Mr. Nixon in the footnote on page 6. This "Technical Report" gives the loadings for various standard cables, and also states very clearly and definitely on what bases the different loadings are fixed.

For single-core cables working on a.c. circuits the maker's recommendations should be obtained.

J. A. Morton.

Prescot, *January 11th*, 1927.

Power Supply for Wireless Sets.

Having to do with a great number of wireless sets, most of them 2-valve and some 3-valve, all of the loud-speaker type, I long ago came to the conclusion that even on the 2-valve type, dry batteries are a "wash-out" for h.p. My customers were strongly urged to go over to accumulators, and none of them have regretted it.

But it has become very plain that regular touch with users is highly desirable. What happens is that, so long as the loud speaker works, the battery is allowed to drop far below two volts per cell, a 100-volt battery often going down to 70 or so without the user troubling himself.

There are two palliatives: the seller must give each customer a call every two months or so, carrying a high-pressure voltmeter; or, still better, he must try to sell to each user a small h.p. voltmeter. Moving-coil types, or those of extremely high resistance, are not required for this simple service, and there are plenty at a few shillings each which will not damage the battery in the time required to take a reading.

As to the high-pressure wattage required for good loud-speaking, remembering Mr. P. K. Turner's term as editor of *Experimental Wireless*, there is no one I would sooner listen to than to him, and, if it can be mentioned here, I have a grateful recollection of a prompt and personal reply by post on a point not very clear to me, in an issue of that journal.

A. O. Griffiths.

Caergwrle, *January 15th*, 1927.

The "H"-type of Cable.

As the question of the "pros" and "cons" of "H" cables is very much to the fore just now, it may perhaps be of help to that large class of mains engineers and consulting engineers who have not yet thought it necessary to make themselves fully familiar with the questions of potential gradient, thermal resistance, capacitance, &c., if I suggest that in the paper which I read before the Junior Institution of Engineers in January, 1925, they will find (in the Appendix) an analysis of the thermal and electrical characteristics of a 66,000-volt, three-core cable manufactured in England, and another 66,00-volt three-core cable manufactured in France (the latter I have since gathered to have been constructed under the Hochstadter patents, but of this I was not aware at the time of making my calculations), and also of a single-core cable.

Assuming that my figures are substantially correct, then, for any who wish to compare on theoretical grounds the performance of the "H" cable (both for heating and potential gradient) with that of an ordinary three-core cable, a first approximation can be obtained by considering—and this, of course, is favourable to the "H" cable—that the "H" cable merely consists of three single-core lead-sheathed cables; and taking the calculations given in my paper referred to as a guide, an approximate idea of the relative performance of the "H" cable can be arrived at.

For those who wish to investigate the matter further, I would add that in the *Electric Journal* (U.S.A.) for February, 1926, pages 60 to 63, there is given a rather careful analysis by D. M. Simons, of the Standard Underground Cable Co. of America, of the thermal resistivity, &c., losses occurring in the metallised paper coverings, which will enable those who are so inclined to get an idea of the deficiency in thermal conductivity, as compared with that of a cable, for example, of the Henley three-core type.

Of course it must be remembered that Mr. D. M. Simons represents a company which takes a commercial interest in "H" cables, but, on the other hand, his reputation as a scientific investigator is pretty high.

I may add that, in my paper referred to, calculations for capacitance currents are also given.

A. M. Taylor,
Major, S.O.2.

Birmingham, *January 10th*, 1927.

As Mr. G. H. Nash is away on the Continent, may I be allowed to clear up on his behalf a point which Mr. Nisbett has apparently misunderstood. In dealing with the point that the ability to withstand tangential stresses is considerably weakened by service conditions, he suggests that the only source of deterioration is due to mechanical causes. That a cable can be seriously damaged by bad handling no one will dispute, but there is, in addition, a structural change due entirely to expansion and contraction of compound under service conditions which cannot be avoided. This expansion of the compound on heating permanently stretches the lead in spite of any reinforcement, with the result that minute voids are produced on cooling. These are most likely to be of appreciable dimensions in the filling, which is screened in the "H"-type; and are least dangerous when the stress is across their smallest dimensions, as it will be in the case insulation when the stress is always radial.

That this change occurs is shown by the power factor-voltage characteristic. Can Mr. Nisbett obtain on a belted type cable a power factor-voltage characteristic which is initially flat and is unchanged on cooling after a heat run to, say, 50 deg. C.?

T. N. Riley,
Cable Engineer,
Standard Telephones & Cables, Ltd.

London, *January 15th*, 1927.

As all that I could usefully say in answer to Mr. Nisbett's reply to my previous letter on this subject is contained in one or other of your correspondents' remarks, I write this solely to correct a slight misprint: I am not C.E., but

C. G. Watson.

Alston, *January 15th*, 1927.

Regarding the very interesting letters that have been lately published in your journal on "H"- and "belted"-type cables, I am loth to let the subject pass without making some comment.

The mileage of "H"-type cable operating at different voltages is easily obtained, and has already been published in different pamphlets.

I notice Mr. G. H. Nisbett mentions in his last letter in your current issue the fact that there are many miles of the "belted"-type that have been working successfully for years both at home and abroad, at 33,000 volts. I suggest it would be most interesting to all engineers if particulars of and places where these cables are installed could be published. Mr. Nisbett further points out that there are cables made by the firm installed in this country that have been alive for five years, presumably at 33,000 volts—I say presumably because one hears of other cables which have been designed for 33,000 volts, but, after being installed, have been operated at about half, or even less than half, the working pressure. Regarding the comparison of thickness of insulation, Mr. Nisbett says both types of cable need the same thickness to earth. As others have already pointed out, this is not so. Owing to the perfect distribution of the electrostatic field, the "H"-type cable can be designed to work with perfect safety with much

less insulation to earth than is necessary in the "belted"-type. It follows, therefore, that for a given size of conductor, "H"-type cables are smaller, and consequently cheaper, than the "belted"-type.

I think we must face the facts that, electrically, the "H"-type cable is a distinct advance on the "belted"-type, and, if made properly, is at least mechanically equal; whilst not wishing to be too optimistic, I think the "H"-type cable for super voltages has come to stay. Whether this be so, time will tell.

D. D. Watson.

Liverpool, *January 14th*, 1927.

Wattmeter Calculations.

Contrary to the conclusions come to in Mr. M. G. Scroggie's article in your issue of December 31st, I suggest that the volt-coil of a wattmeter should *always* be connected on the load side of the current-coil for the following reasons:—

(1) The power consumed by the volt-coil circuit can, if necessary, be quite easily and accurately allowed for when the resistance of this coil is known by simple subtraction, and the allowance is not vitiated by changes of resistance as the coil warms up.

(2) When it is required to deduce the current in the load, the volt-coil current is easily allowed for because it is in phase with the load voltage.

(3) The loss in the current-coil with any given current is uncertain to perhaps 20 per cent., or more, owing to the change of its resistance as it heats up.

(4) It is very troublesome, even when possible, to deduce the load voltage from the total because the p.d. across the current-coil is not in phase with the current in it, and the phase difference is seldom known.

(5) The volt-circuit should be joined to the terminal of the load itself, and not to that of the current-coil as shown on his fig. 1, in order to eliminate unknown losses due to the resistance of the connecting main and contacts; this is especially important where the load current is large.

Incidentally, your contributor goes a long way round in order to obtain an incorrect result. The error is the ratio of the power used in the volt-circuit, or current-coil, as the case may be, to the load power, which is the same thing as the ratio of the active currents in the one case, or of the in-phase components of the voltage in the other. The last line but one in his expressions for E is simply this same statement put down in symbols, and might far better have been written down without any mathematical gymnastics; but it is only the second case that this ratio works out to the simple form given. In the first, it reduces to $(R_v/Z_v^2) \div (R_L/Z_L^2)$, where the z's are the impedances of the two circuits. This gives R_v/R_v only in the particular case of unity power-factor for both circuits. Consequently, figs. 5 and 6, together with the deductions therefrom, are based on error.

David Robertson.

Bristol, *January 14th*, 1927.

Electrical Refrigeration.

Your leader in No. 2561, December 24th, is interesting, but where are the *British made* refrigerators, cooling cabinets, and home ice-making plant? The American companies which sell through English agents try, in every instance, *to sell direct to the user*; there is no percentage usually reserved to the factor, and precious little to the electrical contractor. With clients who settle quarterly, half-yearly, and annually it is not worth while to the contractor under at least 15 per cent., and the factor who takes financial risks, as well as the charges for boosting, advertising, and tendering, must have at least 10 per cent. to exist.

The American companies usually allow 5 per cent. to the contractor, *if he introduces the business*, and there is nothing further for *anyone* else, though the prices for the equipment are HIGH. There is a *great* chance for British firms, at *good* prices, even if they allow factors and the trade reasonable terms, to make and sell suitable equipment. Will any British firm rise to this and design equipment on British lines, to compete easily with transatlantic stuff, whilst giving all arrests a chance to live?

Refrigerator.

January 3rd, 1927.

Great Britain's Power Resources in Truer Perspective.

Hoping all have length and breadth of vision sufficient for a perspective, may I recall attention to the position of Great Britain in relation to its consumption of electricity, while agreeing that it is justly placed by two writers in the *Journal* of I.E.E. below 14 other countries in potential water power resources? The other countries envy our abundant, cheap coal as some here seem to envy their water power.

On page 4, current Volume 65, *Journal* I.E.E., Great Britain is credited with 350,000 potential water horse-power, and on page 129 with 1,070,000. In each case the developed water horse-power is given as 280,000, which figure, I believe, is very considerably above the truth; you published my request three weeks ago for the location of the sites of those 280,000 water horse-power in Great Britain, without drawing a reply.

I should prefer to collect up-to-date figures, but time is not available. I therefore quote those dated February 3rd, 1925, as follows:—

Table I.—Kelvins Output in a Year.

1. U.S.A.	49,802,000,000
2. British Isles	6,400,000,000
3. Canada	5,125,000,000
4. Switzerland	2,700,000,000
5. Italy	2,400,000,000
6. Sweden	2,144,000,000
7. Norway	1,331,000,000
8. Netherlands	343,000,000
9. Denmark	190,000,000
10. New Zealand	136,000,000

It appears practical to also look at the horse-powers in relation to the areas and populations of the countries, because this places Great Britain, with her relatively small water-power resources, in a very different position in the list.

Making use of the horse-powers shown on page 129, *Journal* I.E.E., and the areas and populations in *Whitaker's Almanac*, the countries rank as follows:—

Table II.—Developed Horse-power (Water).

	Per square mile.	Per 1,000 population.
1. Switzerland	102	410
2. Norway	17	830
3. Italy	14	47
4. France	10	54
5. Sweden (g)	8	225
6. Japan	7	21
7. Spain	6	51
8. Germany	5	16
9. U.S.A.	3	104
10. Great Britain	2	6
11. Canada	0.7	370
12. Mexico (f)	0.4	20
13. Brazil	0.2	33
14. India	0.2	1
15. Russia (f)	0.03	1

(f) From *Journal* I.E.E., Vol. 65, p. 4.
(g) Sweden is placed above France below.

Incidentally, on page 129 J.A.I.E.E., January, 1927, Sweden is credited with 34 per cent. more potential water power than on page 4 of the same journal December, 1926, and it credits Sweden with 1,350,000 water h.p. developed, while my reference, February 3rd, 1925, gave it as 1,950,000. Using the latter figure, Sweden has 11 water horse-power per square mile average, which places Sweden fourth in Table II above, and with 325 w.h.p. per 1,000 inhabitants.

Theodore Stevens.

London, *January 15th*, 1927.

A Motor-generator Snag.

Mr. Theodore Stevens asks for the seat of the pain in my complaint respecting difficulty with a motor-generator whose field coil burnt out when run at no load. Mr. Stevens may have no objection to field coils burning out in these circumstances, but in this respect he is exceptional. Most people prefer a generator to run without trouble.

All that is necessary is that the field coil should be made of such proportions that the field coils will not become unduly hot when the generator is run for long periods at no load.

"Rheostat" suggests a variable resistance, but one cannot rely on this in an ordinary charging station. The machines are usually run by unskilled people who regulate the current by putting lamps in series with the batteries that are being charged, or by any other method that may be handy.

One might have expected that makers would have themselves applied field coils which would stand up to all conditions of running, but my experience is that one must specify this to ensure that there will be no trouble.

Motor Generator.

January 13th, 1927.

Electric Ovens.

Is your correspondent trying an experiment in leg-pulling, or starting a "spoof" correspondence? None of the conditions which are present in an electric oven, when it is in use, fulfil the conditions necessary for the production of ozone by electrical means, and one condition which is present is sufficient to render any attempt at ozone production futile. I refer, of course, to temperature.

I have not yet heard that ozone in any concentration but the highest is damaging to bread or pastry. As a matter of fact the presence of ozone in such quantity as might be produced, even if the conditions were favourable, would be certain to improve the quality of the food, whilst being cooked in an electric oven, rather than otherwise.

Edward L. Joseph,
Managing Director, OZONAIR, LTD.

London, *January 15th*, 1927.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

AMPTHILL.—Electrical installation at Scones & McMalin; U.D.C. surveyor.
ASHFORD (KENT).—Housing scheme (65), Beaver, for the U.D.C.; surveyor.
AUSTRALIA (HOBART, TASMANIA).—Factory, Sackville Street; Fur Traders, Ltd.
BARNSLEY.—Central 'bus station; borough engineer.
BEBINGTON.—Schools (£92,350), for Cheshire E.C.; F. A. Brown, county architect, Newgate Street, Chester.
BIRKENHEAD.—Additional 553 houses, Bidston, for the T.C.; C. Brownridge, borough engineer.
BLACKPOOL.—Kinema, Whitegate Drive; W. Halstead Best, architect.
BRADFORD.—880 houses, Eccleston estate; city architect.
BRIDGWATER (SOMERSET).—Housing scheme (50), for the R.D.C.; surveyor.
BURTON-ON-TRENT.—Brewery extensions, with electric lift, for James Eadie, Ltd.; T. Lowe & Sons, contractors, Curzon Street. Electricity supply, Mount Pleasant Works, Woodville; John Knowles & Co.
BURY (LANCS.).—Power and lighting installation, dairy, for the Co-operative Society; C. R. Cooper, architect, 20, Market Street.
CAERNARVON.—Town hall, Special Committee.
CAMBRIDGE.—Art school extensions (£11,830), for Cambs. E.C.; C. Kerridge, builder.
CARDIFF.—Additions to the National Museum of Wales, Cathays Park; Museum authorities.
CHELTENHAM.—Hospital extension; governors.
COLYTON.—Town hall; J. Archibald Lucas, architect, Exeter.
CORK.—Wharf and stores (£8,220); city engineer.
DAGENHAM (ESSEX).—Housing scheme (75), for the U.D.C.; surveyor.
DARWEN.—35 houses; borough engineer.
DUNDEE.—Proposed extensions at Baldovan Institute for Children (£40,000); Mr. R. Freer Myles, clerk to Forfar District Board of Control, Forfar. Proposed 500 additional houses for Corporation; city architect.
EASTCOTE (MIDDLESEX).—Kinema, Field End Road; Telling Bros., Ltd.
EDINBURGH. — Gynecological and maternity hospital; Medical superintendent, Royal Infirmary.
EGHAM (SURREY).—Housing scheme (100), for the U.D.C.; surveyor.
ELLESMERE PORT (CHESHIRE).—Additional 80 houses, for the U.D.C.; surveyor.
FENTON (STAFFS.).—Erection, Camacs Potteries; Baker and Co., Ltd.
FERRYHILL (Co. DURHAM). — Kinema, Main Street; W. J. R. Wallace, architect, North Shields.
FLEETWOOD.—Extension of Fleetwood Hospital; hon. sec.
GLASGOW.—Premises for Boots, Argyle Street and Union Street (£50,000); Campbell & Harley, 18, Duke Street, Edinburgh. 156 houses in Govan (£61,327); Messrs. Robert Anderson & Co., builders.
GOLDENHILL.—40 houses, Collinson Square; Stoke City engineer
HAYES.—100 houses; U.D.C. surveyor. 50 houses; Great Western Garden Village Society.
HESTON.—48 houses, Bulstrode Avenue; W. H. Allen.
HORSFORTH (LEEDS).—54 houses, Cragg Hill; J. Davidson, clerk to Council.
ISLEWORTH.—80 houses, Victoria Gardens, &c.; W. W. Harbrow.
KETTERING.—Hospital extension; Joint Hospital Board.
KIDDERMINSTER.—Dance hall, Vicar Street, for the Midland Counties Circuit, Ltd. Carpet weaving shed, Green Street, for T. & A. Naylor. Municipal offices, Mill Street, for the T.C.; borough surveyor.
LEISTON (SUFFOLK).—Re-erection of Leiston Hall, residence of A. J. Wearey.
LINCOLN.—Central 'bus garage and workshops, and additional 20 houses, for the T.C.; city engineer.
LITTLE HULTON (NEAR BOLTON).—Housing scheme (46), Worsley Road; surveyor to U.D.C., Council Offices.
LONDON (EAST HAM, E.).—38 tenements, Central housing estate; Johns Bros.
(ILFORD, E.).—Schools, Valentines, for the borough E.C.; Adam Partington, clerk.
(MUSWELL HILL, N.).—Congregational Sunday school (£10,000); trustees.
(GREENWICH, S.E.).—Dismantling and removal of six water-tube boilers, with economisers, at Greenwich power station; general manager of tramways.

LONDON—*continued.*
(CAMBERWELL, S.E.).—Isolation accommodation, Grove Hospital; J. Crewsdon, of Horley.
(PECKHAM, S.E.).—Rebuilding 138, 140, 142, and 144, High Street; Selfridge & Co., Ltd.
(TOOTING, S.W.).—Sisters' Home at South-Western Hospital; W. S. Sharpin, Bow.
LUTON (BEDS.).—Factory extensions, Collingdon Street, for Lincoln, Bennett & Co. Shops, Ridgway Road, for the Industrial Co-operative Society. Block of shops, George Street, for Edgson & Wilsdon.
LYTHAM ST. ANNES.—Sewage disposal works (with pumping machinery); G. W. Lawson, borough engineer.
MACCLESFIELD.—Housing scheme (48), for the T.C. borough surveyor.
MAIDENHEAD.—Additional 60 houses, for the T.C.; borough surveyor.
MAIDSTONE.—Re-erection of the Len Cabinet works, Water Lane (£10,000); the proprietors.
NESTON AND PARKGATE.—Waterworks pumping station for the U.D.C.; H. B. Ward, engineer, Commerce Chambers, 15, Lord Street, Liverpool.
NEWBURY (BERKS.).—Housing scheme (80), for the T.C. borough surveyor.
NORTHALLERTON.—Registry of Deeds building (£10,584 for North Riding C.C.; D. Oakley, builder.
OLDBURY.—Re-erection of kinema, Freeth Street, for C. Dent.
OLDHAM.—Maternity home (£9,000); borough engineer.
PLYMOUTH.—36 flats, Mount Stone, Stonehouse; borough surveyor.
PORTSMOUTH.—56 houses, Merthyr Road, Coshan Gammons & Coffin. Block for 62 patients, Milton mental hospital; E. H. Harvey, architect, The Square
REIGATE.—Housing scheme (40), for the R.D.C.; W. Hatton, surveyor, 48, High Street.
ROMFORD.—Houses (64), for Harber & Cox.
RUGBY.—Extensions, Hospital of St. Cross (out-patients' and administrative block); Young & Hall, architects, Southampton Street, London, W.C.
SALE.—Secondary schools, for Cheshire E.C.; F. A. Brown, county architect, Newgate Street, Chester.
SALFORD.—Trades Exhibition Hall, &c., on Cattle Market site; chairman, Exhibition Hall Committee.
SCUNTHORPE.—Housing scheme (38); W. Farrar, engineer and surveyor, Council Offices.
SHEFFIELD.—New kinema, Barkers Pool; Provincial Cinematograph Theatres, Ltd., Regent Street, W.
SOUTHPORT.—Kinema, Liverpool Road, Ainsdale; Southport Coliseum Co., Ltd.
SOWERBY (YORKS.).—Housing scheme (77), for the U.D.C. surveyor.
STARCROSS.—Extensions, mental hospital; Devon C.C.
STOKE-ON-TRENT.—Wholesale market; city engineer.
TORQUAY.—Houses (52) and seven shops, Barton Nurse estate, for A. Nettleton. Houses (62), Barton Road, G. E. Tozer. Additional 36 houses, for the T.C. borough surveyor. 100 houses; borough engineer. Central depôt (£3,500), for the T.C.; borough surveyor.
TWICKENHAM.—Development of the Carpenters' Company estate for 300 houses; Sir B. Fletcher, F.R.I.B.A.
WAKEFIELD.—Electric lighting, Alverthorpe School; education director. Electricity supply, Silcoates School managers.
WARRINGTON.—Housing scheme (258), for the T.C.; A. Ker, borough surveyor. 60 houses, Bewsey estate borough engineer.
WATFORD.—Housing scheme (124), for the T.C.; W. Newman, borough engineer. Extension and improvements, Leonesden Asylum (£107,000); Metropolitan Asylums Board.
WEMBLEY.—Hospital; H. Kenchington.
WHETSTONE (HERTS.).—70 houses, Totteridge Lane; R. Peachey & Sons.
WOLVERHAMPTON.—Extension of Wolverhampton and Staffs. Hospital (£45,000); W. Sharratt, Ltd., builders, Wolverhampton. Schools, Low Hill (£16,500), for the borough E.C.; Mr. Warren, director of education. Extensions, Staffs. Hospital (£45,826), for the Board of Management; Elcock & Sutcliffe, architects, Northumberland Avenue, London. W. Sharratt, Ltd., builders,

The
Electrical Review

VOL. C. JANUARY 28, 1927. No. 2,566.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEKKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Importance of Trade Expansion.

DURING the past few weeks there has been another of those periodical epidemics of speeches and newspaper articles on peace and goodwill in industry which always occupy so much thought without seeming to yield any tangible result. The discussions are strangely reminiscent of the war years, when in the heart of London something like mothers' meetings were held whereat, after tea and cake, men and women discussed the problems of industry in a comfortable drawing-room atmosphere. We suppose it is because we have had to listen to so much from so many that we deplore the want of originality on the part of those who, in 1927, pose as advisers of industry. If only we could hear something new! Something new and practical at the same time!

The most helpful contribution, as we regard it, that has lately come under our notice is a speech delivered from the earth, not from the clouds, by Mr. Frank Hodges. Mr. Hodges doubts whether industrial relations can be improved by any formula, and asseverates that any plan that can be devised is useless unless it is based upon the will to good relations which must begin in the workshop itself. He declares that good relationships between Capital and Labour cannot be imposed from without—they must spring up from within. Of what use is it merely to preach goodwill? The better plan altogether is to employ practical means in the works themselves to introduce it or to give effect to it if already there.

Works committees have in quite a number of electrical and other factories done much to secure smoother working through the early consideration of grievances and suggestions and the introduction of various reasonable facilities and improvements.

Mr. R. R. Hyde, the Director of the Industrial Welfare Society, has lately quoted in the Press the outcome of an inquiry that he has made regarding the results attending the operation of such committees in many

trades. In respect of an electrical engineering works on the South Coast, he says: "there has been a greater tendency to settle minor disputes and grievances since the committee was organised"; and of similar works in the Lancashire area it is stated: "the committee has formed an invaluable medium between employers and management in settling the problems of working hours and short time during trade depression. Certain aspects of shop discipline have been greatly improved by the activities of this committee."

We are inclined to believe that, so far as the immediate outlook is concerned, all parties in industry are likely to obtain greater good from a large addition to the number of properly organised works committees than from any other single measure.

We have passed through a year of sore trial and have learned at what a gigantic cost we can engage in struggles to attain economic impossibilities. We have witnessed the great failure of the professional agitator, and now we need to get down together in each individual business, each of the parties interested therein contributing its own best efforts toward the re-establishment of stability and prosperity. It is certain that we cannot secure goodwill and contentment when the conduct of a business is unprofitable. When trade is low and losses take the place of profits, bankruptcy threatens and the menace of insecurity settles down upon worker and shareholder alike, the possibilities of improvement are at a minimum. Prosperity makes many things possible that without it cannot be introduced.

The Industrial Parliament that is again proposed for the twentieth time cannot provide a solution to our troubles unless it can find a way for our industries to be well occupied with profitable work. It may be the legitimate occupation of the politician and some others to engage in conferences, to draw up Bills, and to deliver speeches. Many of us have had our fill of this sort of thing, and we prefer to direct our effort primarily to securing additional trade for our manufacturers; nothing is more immediately essential for the well-being of the nation. All parties in industry ought to concentrate upon measures for securing new work. All kinds of schemes for finding ways out of the great unemployment problem of the British people must be examined and adopted; that is recognised. But while such ways are being developed throughout the Empire we must concentrate on reviving world trade and bringing business to our factories.

In his speech at the British Industries Fair luncheon last week the President of the Board of Trade referred to the perceptible growth in world trade as the world settled down, and he said that the advice to "Buy British Goods" had now become a national determination. We must sell British goods in every market that could be reached—there must be efficient salesmanship and advertising to that end, especially for trade development in our Empire markets. With "Peace, Progress and Trade" as our national policy at Home and abroad, we must increase our share of the expanding trade of the world while other countries were treading the path that we had already trodden back to financial stability.

As we desire to be above all practically minded in making these observations, let us look right at home in our own trade. The electrical industry—save perhaps the motor section which awaits the fuller revival of the various industries upon which it partly depends—is in a very active condition, and the prospect is excellent. This state of things should encourage electrical undertakings and traders to make further additions to their staffs, who shall at once get to work on ground that is waiting for attention and extract therefrom the new orders for goods and work that will produce more employment for electrical and allied manufacturers and contractors. If everybody in the industry and trade would see that his staff was adequate for the present opportunity, electrical men who are now waiting for a chance to make better use of their faculties might be absorbed.

High-Pressure Cables.

ONE effect of raising the pressure employed on underground cables from 11,000 to 33,000 volts has been to increase the frequency of breakdown to an altogether disproportionate extent, and it is clear that there is much to be learnt before the high standard of reliability attained at the lower pressures can be claimed for cables operating at 33,000 volts. At first the troubles were attributed largely to the joints, but experience has shown that faults occur in the cables themselves, for no obvious reason, and cable makers and users in all parts of the civilised world have been anxiously seeking the cause and the appropriate remedy. One theory, which appears to be well founded, is that however completely the interior of the lead sheath is filled with solid or liquid matter when the cable leaves the maker's hands, it is possible for spaces to be formed after the cable is laid, which are filled with gas of one kind or other; the gas being ionised by the electric field becomes a conductor, and permits electric discharges to take place, at first on a small scale, which eventually lead to the breakdown of the insulation. The fact that such failures frequently occur during times of light load suggests that when the cable is heated, the sheath is slightly stretched by the expansion of its contents, and lead being inelastic, it does not resume its original volume when the cable cools, so that spaces are left in the interior. We recall a somewhat similar trouble which arose in connection with 10,000-volt alternators, 15 to 20 years ago; the stator conductors were found to be attacked by nitric acid or other such corrosive agencies, which could only have been formed by electrostatic stress from the gases of the atmosphere. To prevent this class of mischief, the greatest care is taken to avoid the formation of air pockets and high potential gradients in the windings.

The importance of this subject, and the keen interest with which it is regarded by cable makers, are evidenced by the lively correspondence which has recently taken place in our pages, but even more significant are the reports that reach us and the disinterments of cables that may be seen in progress. British cables in the past have attained a world-wide reputation for reliability, and we have no doubt that our manufacturers will successfully solve the problems with which they and their competitors are faced.

One method which promises to attain the desired end was the main theme of the excellent and timely paper read by Captain P. Dunsheath, O.B.E., before the Institution of Electrical Engineers last week; another, which has been adopted by a number of British cable-makers, gave rise to the correspondence above mentioned. This is a matter for experts to decide, and we shall not presume to anticipate their ultimate verdict. But we may express satisfaction at the evident readiness of our manufacturers to undertake prolonged investigations and to adopt new methods when the need arises, and our confidence in their ability to deal with the present difficulties. Is not this the kind of problem which could be most efficiently tackled by co-operative research, such as is contemplated under the schemes of the Department of Scientific and Industrial Research? Presumably this aspect of the matter has not been overlooked by that admirable organisation, the Cable Makers' Association, which has done so much to enhance the status of our cable industry, and done it so well.

Sir George Sutton, in his speech at the recent extraordinary meeting of the Henley Company (ELEC. REV., December 24th, p. 1046), seemed to suggest some such pooling of research with other companies, with a view to eliminating wasteful expenditure.

Smoke Abatement.

THE Public Health (Smoke Abatement) Act, 1926, which is to come into force in July, 1927, whilst it still excludes the greatest sinners of all—the innumerable domestic chimneys—from the scope of its censure, greatly increases the penalties imposed on the emission of "smoke in such quantity as to be a nuisance" from other chimneys, and extends the

definition of smoke to include soot, ash, grit, and gritty particles. However, it accepts as a defence in proceedings for sending forth smoke other than black smoke (the unpardonable sin) from a chimney evidence that the person charged "has used the best practicable means for preventing the nuisance, having regard to the cost and to local conditions." The limiting colour, density, or content of smoke may be prescribed by by-laws made by any local authority, and it is to be hoped that the Minister of Health, in approving such by-laws, will take measures to secure something approximating to uniformity of treatment throughout the country.

An interesting section is one authorising urban authorities to make by-laws requiring the provision in new buildings of such methods of heating or cooking as are calculated to prevent or reduce the emission of smoke; but here again, unfortunately, private dwelling-houses are excepted. Local authorities are also put under the supervision of county councils, which may report them to the Minister of Health if they fail to carry out their duties with regard to smoke nuisances, and may be by him authorised to do the work at the expense of the defaulter.

It seems, therefore, that in future the laws against the emission of smoke will be enforced in many places where they have hitherto been allowed to lie dormant, and the owners of works in such areas had better take steps to make sure that they have a clean sheet—and clean chimneys—to show.

Further Artificial Silk Openings.

CONSTANT developments are taking place in the artificial silk industry in various parts of the world, and the opportunities for the electrical trade are considerable in view of the increasing use of the electric drive. The International Paper Co., of America, is now planning the erection of a mill for the preparation of artificial silk on its land near Ottawa, where it already has large pulp and paper mills.

In France, the Compagnie Française des Levure, Alcool et Drechure de Grains has formed a subsidiary company known as Soie Artificielle d'Amiens for the purpose of commencing the manufacture of the fibre, and as recently announced, the Rock Investment Co., of London, has let a contract for machinery to the value of £400,000 for a new factory at Branston, Burton-on-Trent. It is understood that extensive electrical power supplies and plant will be required in the latter case.

The development of the eucalyptus plant as a raw material for the preparation of wood-pulp both for paper and artificial silk manufacture, has resulted in the establishment in Brazil of a paper factory to be operated by the Paulista Railway Co. In this connection it is interesting to note that an effort is being made to persuade the Brazilian Congress to allow the importation of machinery duty free when required for the manufacture of national fibres.

The Electric Drive in Woodworkers' Shops.

A SERIES of visits to sawmills and pattern shops in the Midlands and North Country, recently, revealed the fact that in a very large proportion of them the electric drive has been adopted.

One of the great advantages of driving woodworking machines by electric motors is that their consumption of power varies almost in direct proportion to their loads: this is a very important consideration in pattern shops, because it is seldom that all the machines are in operation at the same time. In a sawmill, and in some carpenters' shops, the machines are run steadily throughout the day, but in pattern shops this is not so. The individual drive has obvious advantages when machines are used intermittently, one point in its favour being the fact that upkeep and maintenance costs for shafting and belting are reduced; small electric motors require little attention and cost but little to maintain: also, if additional machines are purchased and fitted with an individual electric drive, no difficulties are experienced with the existing countershafting and the output of the driving motor. In the case of the heavier saws and planers, there are obvious advantages in installing the electric drive and doing away with counter-shafting.

At one time it was considered the most economical policy to drive this class of machinery entirely by steam, because the burning of the wood shavings and cuttings enabled a certain amount of power to be generated for next to nothing: but with the installation of the electric drive, it was found that the wood refuse could be sold in a ready market, and that its value exceeded the cost of the electric power purchased from an outside source for operating the machinery employed. Hence, the woodworker, or sawmill owner, has obtained a reliable, steady, economical and safe drive by employing electric power, purchased from the public mains at a cost that may be covered by the sale of the refuse he was formerly in the habit of burning in inefficient and uneconomical steam-boiler plant.

There are, of course, other uses for electricity in the woodworking shop besides that of driving the machines. The electrically-heated glue pot, with facilities for regulation of the temperature, is a case in point. A very important recommendation of electricity in sawmills and other woodworking shops is the material reduction of the fire risk, for in such shops machinery has to be used in close proximity to heaps of shavings, and other inflammable material.

The Chairman of the Board.

THE announcement last Friday that the Minister of Transport had appointed Sir Andrew Duncan, M.A., LL.B., to be chairman of the Central Electricity Board put an end to the suspense in which the electrical industry has been hanging during the past month. It is in conformity with the statement of the Prime Minister a year ago, that the Board should be constituted of men of the highest business capacity, for although Sir Andrew has not figured prominently in the public eye, he has undoubtedly made his mark in the public service, as the record of his career which we print elsewhere will fully demonstrate. Though comparatively a young man, he has acquired much experience in national affairs during recent years, and has given evidence of fairness, tact, and breadth of vision, allied with energetic action and organising ability, which should admirably fit him for the very responsible and onerous post that he has accepted; we wish him all success in his new sphere of work.

It remains for the Minister, with the help of the chairman, to select the remaining members of the Board, whose names, it is anticipated, will be announced before the reassembly of Parliament next month. The various interests specified in the Act have been consulted by the Minister, but some of them appear to have taken a narrow view of the matter, making a selection from their own membership instead of casting the net over the whole country and seeking the best men for the job, irrespective of all other considerations. The Electricity Commissioners are charged with the technical work—the Board with administration; it should really resemble a first-class board of directors.

The "Agreed Clause."

EVERY speaker at last week's dinner of the Electrical Contractors' Association made reference to the "agreed clause" inserted in the Electricity (Supply) Act, to govern the sale of appliances, &c., by municipal electricity supply authorities. While the general tone was optimistic, in one or two passages a certain anxiety could be sensed. Of course, the scheme is not yet actually working, and it will need the continuance of the good feelings engendered by the Conferences under Mr. D. N. Dunlop to make it a success. Nevertheless, we think that, generally, success will be attained, for both parties realise that continued dissension will be harmful both to themselves, and to the industry as a whole.

Generating Station Costs.

Logarithmically ruled paper has certain advantages over ordinary squared paper, but hyperbolic ruling is more generally useful in engineering work. It suits costing problems particularly well, as is shown below.

By REGINALD O. KAPP, B.Sc., A.M.I.E.E.

LOGARITHMIC paper is well known, though not very extensively used. There are two principal types of problem for which its use has advantages over that of ordinary squared paper: Firstly, it enables curves to be plotted over a wider range of values with equal percentage accuracy at all parts of the curve; secondly, certain functions which give curved lines on ordinary squared paper give straight lines on logarithmic paper. For instance, a rectangular hyperbola of the type $yx = a$ constant gives a straight line at 45 deg. if plotted on paper in which the scale divisions are logarithmic both in the horizontal and vertical direction. Equations of a type to give straight lines on logarithmic paper are very rare in engineering work, and that may be a reason for the restricted use of such paper.

Many problems in engineering work involve calculations on the lines of a two-part tariff for electricity. This tariff may, therefore, be taken as an example. One wants to find out the cost per kWh of electricity where that cost is made up of a kilowatt charge and a unit charge. To arrive at the total cost, one divides the kilowatt charge by the number of kWh per kilowatt and adds the unit charge to the result. Written in a formula, the calculation becomes:

Cost per unit = kilowatt charge/8,760 × L.F. + unit charge.

The equation is, therefore, of the form—

$$y = b/x + a.$$

This equation gives, if plotted on ordinary squared paper, a rectangular hyperbola, of which the origin is not on the x axis. Plotted on logarithmic paper, it does not give a straight line, and therefore logarithmic paper is of little use for plotting such an equation.

If plotted on hyperbolic paper, a straight line is obtained.

The convenience of being able to employ a straight line for any plotting operation is considerable. It is only necessary to determine two points in order to rule the line. Intersections with other lines are definite, and the operation of drawing with a ruler is much simpler and more accurate than drawing a curve. In fact, the time spent in determining a sufficient number of points to draw a curve through them, the inevitable inaccuracy of the curve when drawn, and the lack of clarity, particularly at the steep parts, is sufficient to make the use of squared paper hardly worth while. This is unfortunate, since curves give more information than "spot" readings obtainable from pure arithmetic. If an engineer can plot his results on a curve, he sees not only the general tendency of the occurrences he is interested in, but also obtains a better idea of the relative importance of various factors. There is nothing like plotting results to help one's sense of proportion. Moreover, one may make a mistake in arithmetic and not notice it very readily. A curve is more likely to show up any errors.

Problems of maxima and minima can, of course, be solved by algebra or differential calculus. They can often be solved more readily by the simple process of plotting a couple of curves and finding where these intersect. In this case the advantage of the plotting method, apart from the fact that it is easier and more convincing, is that it shows up clearly whether a departure from the mathematical minimum matters much or not. It may often happen that one pedantically designs for the mathematical minimum in cases where there is hardly any difference between the minimum point and points quite a long way on each side. For instance, one can calculate the amount of condensing water required to give the minimum running cost, taking account of turbine steam consumption and energy expended in pumping. The calculation does not show readily that the cost is almost the same, even if one employs a good deal more or a good deal less condensing water. I think that much time and argument would be saved and better engineering practice employed if co-ordinate paper were more fully used. Some works put up placards in their shops with slogans intended to improve the minds of their staff. A slogan that I have never seen, but which would be more useful than many adopted, would be: "Use more squared paper." This excellent advice would be more readily followed if the plotting of curves were easier; but ordinary squared paper does not always meet the bill and functionally divided paper is of greater practical value.

Since so many cases are of the hyperbolic type mentioned above, a useful scale in which to divide the paper is a hyperbolic one, since this enables all

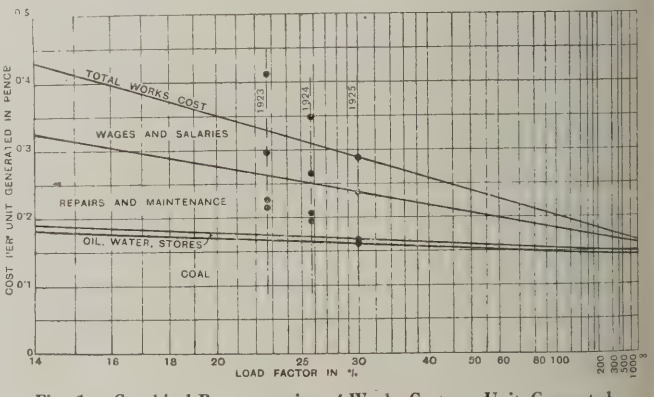

Fig. 1.—Graphical Representation of Works Cost per Unit Generated.

equations of the above form to be plotted as straight lines. The costing of electricity is not the only case where this equation forms the basis of one's work. It is the basis of all costing operations. For instance, take the case of a motor-car; it costs so much per year to *keep* a car, and it costs, in addition, so much a mile (for petrol and the like) to *run* a car. It costs so much per year to be in a position to manufacture screws (capital charges on the machines, and so on), and it costs, in addition, so much for materials per screw. The total cost per mile run in the case of the car, or per screw manufactured, is obtained by dividing the annual charge by the number of miles or number of screws per year, and adding the unit charge. All costing problems of this type can be plotted as straight lines on hyperbolically-divided paper. As an example, let us consider the case of generating costs of electricity.

Figure 1 shows the generating costs as imagined for

a station in the year 1925. The actual load factor for that year was 30 per cent., and the lines show what each item would have amounted to at any other load factor. They enable, therefore, a direct comparison to be made with the results obtained in previous years, and "spot" readings for these are plotted for the years 1923 and 1924, showing a steady improvement in total works cost. The graph shows clearly how much of the improvement is due to improvement in load factor and how much is due to improved working conditions. There is a reduction in coal per unit and in wages and

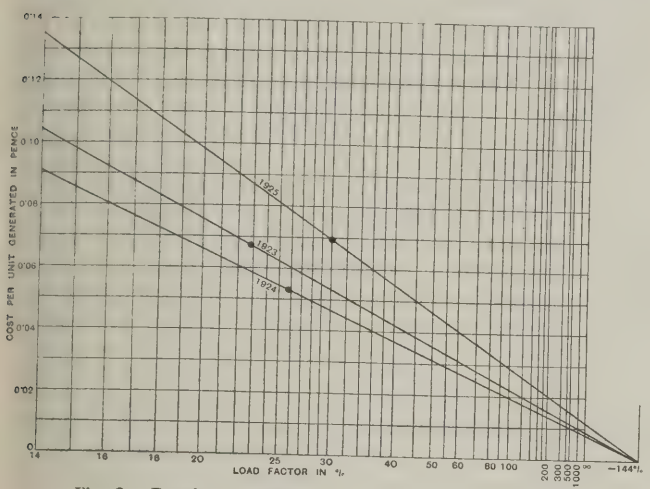

Fig. 2.—Repairs and Maintenance Costs Per Unit Generated.

salaries independently of the reduction due to improved load factor every year.

Repairs and maintenance lines for the three years are plotted separately on fig. 2, and these show that, whereas there was an improvement in 1924, the 1925 figures are not so good. If, instead of plotting the curves, "spot" readings were taken, it would appear that the 1925 results were almost equal to those of 1923. When allowance has been made for improvement in load factor, it is seen, however, that they are distinctly worse, and the lines on fig. 2 show this immediately. Clearly the repairs and maintenance items need investigation. Here is a case, therefore, where the station engineer can, by plotting curves, see clearly what his station is doing in all respects. He can see clearly where his results are gratifying and where there is room for improvement.

Other costing problems arise when a decision has to be made between alternatives. Suppose, for instance,

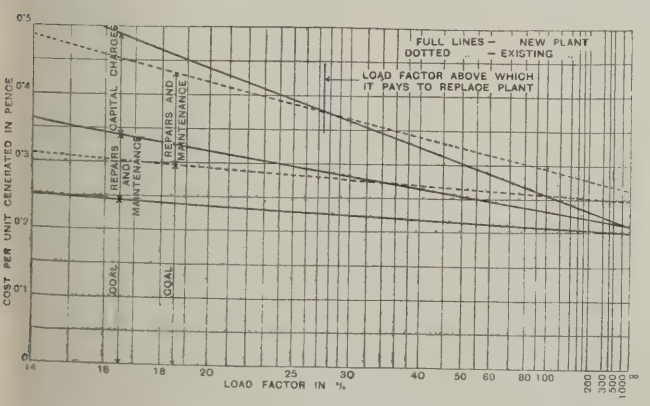

Fig. 3.—Relative Costs Per Unit with Existing and New Plant.

a station engineer wants to find out whether it is worth while retaining an old somewhat inefficient set, or whether it would pay to replace it by new efficient plant. If he buys new plant he has to incur the capital expenditure on it, and in exchange he will reduce his running costs. Such an example is worked out on fig. 3. Let us assume the load factor is 30 per cent. and that the coal costs at this load factor amount to 0.28 pence, and that repairs and maintenance cost 0.09 pence per unit. The engineer finds that this cost is subdivided for coal into 79.3 pence per kW maximum demand + 0.249 pence per unit generated, and for repairs and maintenance 195 pence per kW maximum demand + 0.0155 pence per unit generated.

New plant could reduce these costs to 63.6 pence per kW maximum demand + 0.2 pence per unit generated for coal and 126 pence per kW maximum demand + 0.01 pence per unit generated for repairs and maintenance. Suppose the new plant would cost £10 per kilowatt of maximum demand and the capital charges are 9 per cent., this amounts to an additional kilowatt charge on the new plant of 216 pence per kW maximum demand. We will assume that the other items of works cost are identical in both cases and need, therefore, not be introduced into the calculation. If the plant is to be worked at a high load factor, the saving in works costs of the new plant will be great compared with the extra cost per kWh due to capital charges on the new plant, whereas if it is to be worked at a low load factor the bill for coal and repairs and maintenance will be small in any case and will not matter much. There must, therefore, be a point above which the saving in coal, repairs, and maintenance predominates over the extra cost per kWh, due to the capital expenditure on new plant. Where this point is can be found without great difficulty by arithmetic, but it is much easier to obtain it graphically as is done in fig. 3, where it will be seen that it is at a load factor of 27.5 per cent. If, therefore, the plant is to be worked above this load factor, it is worth replacing it. If below this load

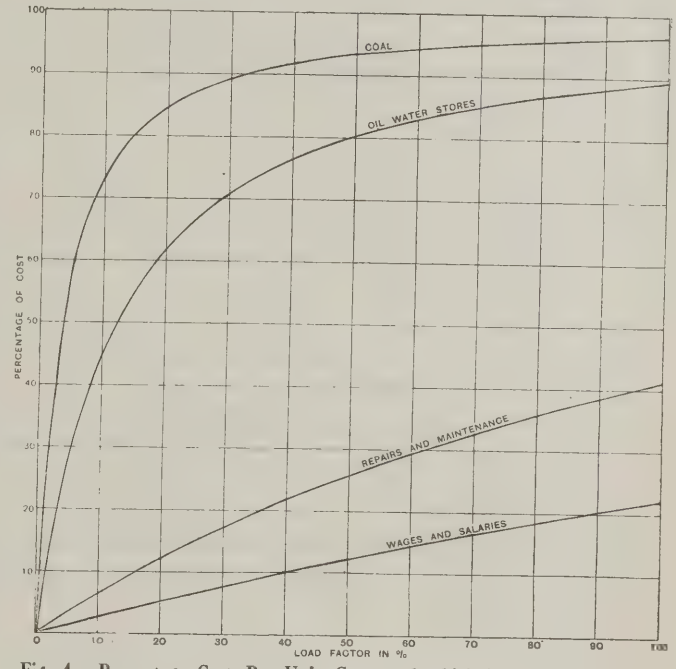

Fig. 4.—Percentage Cost Per Unit Generated which is a Running Cost.

factor, it is better to retain the old plant. It will be seen, however, that the lines do not intersect at a very sharp angle, and that therefore there is not much in it between load factors of, say, 20 per cent. and 40 per cent., so that probably in a case like this the engineer would decide to wait a while before making a change.

Though, as mentioned above, the same result can be obtained by arithmetic, or can be expressed in the form of a table to the engineer's satisfaction, he may often find that he has not finished his job when he has satisfied himself on the point in question. There may be a committee or a board of directors to convince, and many engineers have found out that a non-technical body of men has little faith in figures and little ability to understand them or patience to try to do so. It is often much easier to convince non-experts of a technical matter, in itself sound, if one can show them a graphical representation. Even if they do not understand the graphical representation, they may think they do, which for all practical purposes is just as good. A graph impresses itself on one's memory more definitely than mere figures can do.

It is convenient to have a ready rule to determine

what the slope of the lines corresponding to each item should be. This depends, of course, on the particular conditions of the station, since the proportion of fixed to running charges must vary somewhat in each station. It is not quite easy to analyse station costs in such a form as to be very certain what the proportion should be: it is admittedly largely a matter of opinion, but I think that fair average figures are as follows:—

For coal, kW cost = 318 × unit cost.

For oil, water, and stores, kW cost = 1,080 × unit cost.

For repairs and maintenance, kW cost = 12,600 × unit cost.

For wages and salaries, kW cost = 31,100 × unit cost.

In this form the figures convey little to the mind. They can be expressed in other ways. For instance, at 30 per cent. load factor the running cost part of the total cost of each item is as follows:—

Coal, 89.2 per cent. of the total cost for coal.

Oil, water, and stores, 70.8 per cent. of the total cost for oil, water, and stores.

Repairs and maintenance, 17.3 per cent. of the total cost for repairs and maintenance.

Wages and salaries, 7.8 per cent. of the total cost for wages and salaries.

Given the works costs for each of these items at a load factor L, the following formulæ give the part of each item, which is the running cost component:—

Call the percentage of the total cost per unit, which is a running cost, n and the load factor L, then for coal—

$$n/100 = 87.6\ L/(318 + 87.6\ L);$$

for oil, water, and stores—

$$n/100 = 87.6\ L/(1{,}080 + 87.6\ L);$$

for repairs and maintenance—

$$n/100 = 87.6\ L/(12{,}600 + 87.6\ L);$$

for wages and salaries—

$$n/100 = 87.6\ L/(31{,}100 + 87.6\ L).$$

From these formulæ the unit charge for each item can be obtained, or it can be read off the curves on fig. 4. If an infinite number of kWh are sold, the only cost per kWh is the unit charge. This is the figure that, when using hyperbolic paper as in figs. 1 to 3, must be plotted on the scale at infinity and a straight line through the point thus obtained, and the working point at the working load factor gives the cost at any load factor.

In the case of items having a steep line, an even simpler construction is possible. The line for each item passes through a certain characteristic point on the x axis. For repairs and maintenance this is the point which will be given by minus 144 per cent. load factor if fig. 4 is applicable to the station in question, that is, a point as far to the right of the infinity line as 144 per cent. load factor is to the left. Of course, load factors above 100 per cent. are practically impossible, let alone negative ones. The graph, however, does not take account of this practical absurdity. On fig. 2 the point is shown through which all repairs and maintenance lines must pass. A similar point for wages and salaries is at minus 355 per cent. load factor. For capital charges and anything containing no unit price at all, the point is, of course, at infinity l.f., that is, at the bottom right-hand corner of the sheet. The point for coal is at minus 3.63 per cent., and for oil, water, and stores minus 12.35 per cent. l.f. These points are, however, inconveniently far away.

With regard to the use of hyperbolic paper, it should be noted that the figures on the horizontal scale can be multiplied by any figure, and the scale still remains hyperbolic, so that, for instance, the left-hand edge of the scales used in figs. 1 to 3 (starting at 10) could be made 1 per cent. or 20 per cent. the 1,000 per cent., or 50 per cent. mark then respectively becoming 100 per cent.

Electricity Supply Tariffs.

Some particulars of the various deferred-payment agreements and electric light and power tariffs in force at Basle, Switzerland.

By Professor W. CRAMP.

IN the course of his article upon Tariffs for Electricity Supply in the Electrical Review of October 22nd (pp. 659-660), Lieut.-Col. Vignoles plumps for two-part tariffs, and in his concluding paragraph uses these remarkable words:—"It is to be hoped that engineers will consider this question of tariffs as settled." By a "two-part tariff" Lieut.-Col. Vignoles means a tariff consisting of a first charge, based directly, or indirectly, on the consumer's maximum demand, and a second small running charge per kWh.

On the other hand, in the President's address to the I.E.E., we read that 90 per cent. of the houses in Switzerland are electrified as against 18 per cent. in Britain, and we know that the load factor in Basle was 56 per cent. in 1915 and 74 per cent. in 1924. We know further that in the same city no less than 8,200 kW of water heaters are installed, largely for domestic purposes, and many of them in quite small houses. Have these results been obtained under a two-part tariff? I think not; nor do I believe that like results can be obtained in this country by "considering the question of tariffs as settled." For the two-part tariff fails in one most important respect. It does not give the consumer enough encouragement to take his energy during the periods of very light load. In Manchester I was on a two-part tariff of the kind approved by Lieut.-Col. Vignoles. I paid, I believe, 12½ per cent. of my rateable value plus ½d. per kWh. This led me to use electric radiators day and night, but it did not encourage me to switch off during the periods of heavy load. That is not the way to achieve a 74 per cent. load factor.

For the chief obstacle to a cheap domestic supply of electricity is the absence of such adequate storage as the gas undertakings possess in their gas holders, whereby any load factor, however poor, may be increased to unity at the generators. In Switzerland, the importance of this principle has been more fully recognised, and arrangements have been made to combine the supply of apparatus with such tariffs as shall encourage the virtual storage of energy by the consumer. In effect, this amounts to the substitution of a large number of small local holders for a small number of large central holders. It may be that these developments in Switzerland are due to the fact that the power comes chiefly from waterfalls; for the cost per kWh in a hydro-electric station is dependent very largely upon capital charges, so that a high load factor is of the greatest importance. On the other hand, in this

country the perpetual increase in the size of the steam generating station and its power units, coupled with the greater radii of distribution, tends also to increase that part of the cost per kelvin which is due to capital charges, relatively to the part which is due to fuel.

Thus the conditions in this country constantly tend to approach those in Switzerland, and we should do well to compare the Swiss results with our own, that we may benefit by their successes while avoiding their mistakes.

My assistant, Mr. L. G. A. Sims, who was recently in Switzerland, has brought back for me the various regulations and tariffs published by the Electrizitätswerk, of Basle. These seem to be so important that I have translated and analysed them. They may be divided into: A, those regulations which govern the supply of apparatus; and B, those which govern the supply of energy. In all cases I have interpreted the prices at the exchange rate of 25 francs to £1, which is roughly correct to-day.

In group A we have deferred-payment agreements provided for various purposes, but in all cases the payment is extended over a period of six years from the installation of the apparatus. Also in all cases the work is carried out by firms holding special concessions from the supply authority for that purpose, the supply authority exercising a control over the apparatus and the manner of installation.

Although the period for the complete payment does not vary, the period for the instalments varies considerably, some being half-yearly, some quarterly, some monthly, and so on. This must complicate the accounts of the supply authority, as well as those of the purchaser, and the amount of bookkeeping involved must be very great. It is difficult to see any reason in or for this variation.

A (1) Coming now to examples of these agreements, we have first the regulations to "facilitate the installation of electric lighting in small dwellings," which seem to refer chiefly to flats (Etagenwohnungen). Here the installation includes the supply and installation from and including the main switch to the lamp holder, but not the lamps. A maximum of ten lamps per dwelling is allowed on the deferred system, although extensions of this number may be arranged privately by the tenant. However small the first installation may be, once it is completed, no extension whatever is permitted on deferred payment; and the first installation must include those points where light is most used, *e.g.*, living room and kitchen. The standard installation includes:—

(*a*) For the parlour or dining room, one simple rise and fall pendant, with an ordinary lamp holder and porcelain shade.

(*b*) For the remaining rooms, a plain pendant with a porcelain shade, or a simple ceiling fitting.

For each lamp a switch is provided, but all making good of paint, brickwork, &c., is at the charge of the tenant. No reduction is made if the tenant provides his own fittings.

The payment for each point installed is 55 cts. (5.3d.) per month. The cost of an installation, therefore, is about 5s. 4d. per year per point for six years. This would be regarded in England as exceedingly dear, since it is quite possible to wire a small house in this simple fashion for 15s. per point.

A (2) Next we may take the regulations "to facilitate the installation of small boilers (and to reduce unemployment in electric factories)." Here the installation consists of the supply and erection of the boiler, switches and fuses, also wiring up to a length of 10 metres (33 ft.). Anything beyond this length must be paid for in cash, and the connection of the boiler to the water supply is not included. Two sizes of boiler are offered, and the extended payments are quarterly. The details are:—For a boiler of 30 litres (6.6 gallons) capacity and 360 watts loading, 12 fr. (9s. 8d.) per quarter; for a boiler of 50 litres (11 gallons) capacity and 600 watts loading, 16 fr. (12s. 10d.) per quarter.

These prices amount to £1 18s. 8d. and £2 11s. 4d. per annum for six years, and are relatively much cheaper than the lighting installation, doubtless because boilers have been developed to a greater extent in Switzerland. It is also of interest to note, in conformity with what has been said above, that long-hour heating of the water is taken for granted. It is evidently anticipated that advantage will be taken of the terms offered for energy supplied during off-peak hours (see B8 below), and thereby the equivalent of heat storage of energy is introduced. For a simple calculation shows that to raise the temperature of the water in either of these boilers by 70 deg. C. will require at least seven hours. The list price of the smaller boiler in this country is £16. 16s., and of the larger size £20, which compare unfavourably with Swiss prices.

A (3) A third example of this deferred-payment policy is found in the regulations to facilitate the installation of automatically controlled electric lighting in the staircases common to two or more flats or other dwellings. In this case again the installation is complete up to, but not including, the lamp. The owner is responsible for the proper use and maintenance of the installation, as well as for any painting and making good of the building after installation. Simple ceiling fittings are provided, but if better fittings are desired, they must be supplied by the owner, and no reduction is made on that account. The conditions apply to a new installation in an existing building, or to the exchange of an old non-automatic system for one with automatic control, but they do not apply to new buildings. The actual hours during which the automatic switch turns on the light are in the agreement for the supply of energy (see B11 below), clearly indicating that the two are supposed to be related. The charges for the installation are as follows:—Two points, three switches and 22 metres (73 ft.) of wiring, 9.5 fr. (7s. 7d.) per six months; for each further point with one switch and 7 metres (23 ft.) of wiring, 2.5 fr. (2s.) per six months.

Thus for the first two lamps the charge is about 15s. per annum for six years. Considering that this includes special switches, it is quite reasonable; for the cost of the switch alone in this country would be about £12.

B (1) We turn now to the electric light and power supply prices. The ordinary flat rate for electric light is 55 cts. (5.3d.) per kelvin.

B (2) There is, however, a double tariff for installations controlled by time-switches, as follows:—

Peak-load hours, *i.e.*, 6.30 to 10 p.m. in summer, and 6.30 to 9 a.m. and 4.30 to 10 p.m. in winter, 55 cts. (5.3d.); all other hours, 20 cts. (1.92d.).

B (3) For power purposes the following tariff holds:—

Kelvins per month.	Price per kelvin. Centimes.	Pence.
Up to 1,000	22	2·1
1,001 to 2,000	18	1·72
2,001 to 3,000	14	1.34
above 3,000	10	0·96

A discount is allowed from these prices which introduces the maximum demand. It is calculated as follows:—

Discount per cent. = (kelvins per annum) ÷ 150 times the maximum demand for the year in kW. The nearest whole number to this figure is taken, and no discount is allowed below 5 per cent. or over 40 per cent. Also the value of the monthly consumption must not fall below 7 fr. (5.6s.) per kW of maximum demand, or the latter minimum is charged. The calculation of the maximum demand for large power users is obtained from an m.d. meter, which gives the mean of the maxima over any quarter of an hour in the year. As a method of calculating the monthly payments, the m.d of the previous year is taken until December, when the adjustment is made for the whole year. In the case of a new load, the m.d. is reckoned as 70 per cent. of the installed kW. It is usual to grant more favourable terms than these to electrochemical and other industries with a specially high load factor. Nothing whatever is said as to power factor.

(To be concluded.)

Extra-High-Pressure Transmission.

With the adoption of extra-high-pressure distribution to outlying districts, continuity of service may be sacrificed to some extent for the sake of economy in first cost. This article emphasises the importance of guarding against that error.

By A. T. SCOTT, A.M.I.E.E.

AT the present time transmission lines and cables are being rapidly extended by electricity undertakings to their outlying districts in order to increase the load on the generating stations, and to cover the authorised supply areas. The immediate gain in revenue from such extensions is often small in comparison with the expenditure, and is not helped by the fact that the price per unit is cut as low as possible in order to obtain increased business; consequently the initial cost of extensions tends to become a leading consideration, and it is to be feared that under these circumstances the continuity of the supply given, and the service rendered, is not always comparable with that formerly given from the l.p. networks supplied direct by local generating stations.

It might appear unnecessary to draw attention to the fundamental importance of maintaining a good supply and a truly continuous service, but there is a real danger of too frequent breakdowns being explained away, and of a certain number of interruptions being accepted as a necessary evil common to e.h.p. transmission systems of any considerable magnitude. This is especially so when such interruptions are not confined to one particular area. A 90 per cent. supply has been advocated as being better than none, but on the other hand, continuity of service is essential in order that electricity may be universally adopted, not merely as a stand-by, but as an indispensable source of energy. If an electricity supply can be absolutely relied upon, the demand for it will increase and its usefulness reach a maximum value.

That an electric supply can be cheapened more effectively by increasing the demand and load factor than by any other means has often been pointed out, and there can be no doubt that good service will eventually contribute more towards this increase than the initial cheapening of a supply at the expense of reliability. An e.h.p. supply is vastly more important than any individual l.p. supply, and generally the importance may be considered as proportional to the transmission voltage. Very satisfactory and reliable supplies have been and are being given at pressures up to 20,000 V in many places.

More recently 33,000 V has been adopted for long-distance transmission, and for large modern generating stations this is now the usual bus-bar voltage, yet it is very doubtful if the use of this pressure has contributed towards any improvement in the reliability of the supply up to the present. It is not the highest pressure that has been used in this country, but it is the highest contemplated by many undertakings, and it is considered the most suitable for main transmission and for interconnecting within the bounds of the areas outlined by the Electricity Commissioners. In certain cases where it is being used, the results are not as good as had been anticipated, and in other cases the results have been altogether unsatisfactory.

During the past few years it would appear that there has been a tendency for certain undertakings to be unduly ambitious in their endeavours to cover their authorised areas with transmission lines or cables, and that they have been guided far more by political than commercial or economic considerations. Where such influences as over-ambition and politics have predominated it is quite possible that a higher voltage than necessary has been chosen and put into use before sufficient experience has been gained, before any really complete scheme has been formulated, and before sufficient capital has been available to enable adequate provision to be made for the effective operation of the extended system.

Under such circumstances it is more than likely that only the bare necessities for a supply have been provided, that switchgear and protective gear have been reduced to an ill-considered minimum, and that very possibly the factors of safety of overhead lines and cables have been reduced below the safe value. Static sub-stations may have been left unattended and overhead lines unpatrolled, and an organisation for speedily attending to breakdowns may have been conspicuous by its absence.

The present uncertainty with regard to the future national developments is no doubt responsible for certain important centres being left dependent upon one source of supply only, whereas with a proper scheme of interconnections, a duplicate and alternative supply could be provided. It should not be inferred that continuity cannot be realised with e.h.p. transmission without providing elaborate and expensive apparatus, neither is there any reason to suppose that 33,000 V is particularly difficult to deal with. It is, however, desirable to bear in mind that as the voltage of transmission is increased so the minimum economic load is increased, and also that if interconnections are desirable for the maintenance of continuity on l.p. networks, they are much more so where e.h.p. supplies are concerned.

Attention might also be drawn to the practice of laying cables made for a comparatively high voltage and using them at a lower one until the demand justifies their use on the pressure for which they were designed. This practice creates a premature demand for high-pressure cables, and the experience which might be gained by their normal operation is deferred; so that, as cable design and manufacture are rapidly improving, the cables are liable to become of an obsolete type before they are used on their designed pressure.

Having now emphasised the importance of continuity of supply and considered certain conditions which possibly hinder improvement, the following brief suggestions will probably suffice to indicate where advancement might be made.

A definite improvement can be effected by the provision of a greater margin of safety throughout the insulation of the line, by the adoption of a more liberal design of insulator which will definitely ensure that an adequate factor of safety over the worst conditions under which the insulators may operate. Certain rules are laid down in reference to tests etc., but such rules are likely to be very misleading. Operating

conditions vary very considerably in different parts of the country, and an insulator may operate very well in one locality while proving very unsatisfactory in another. Herein lies the danger of the adoption of general rules. The design of insulator should be studied in connection with each line, and the ideal solution will be found as a result of close co-operation between the designer of the line and a reputable firm of insulator makers with the advantage of experience behind it.

The provision of more liberal clearances between the lines, and if necessary the use of suspension insulators in place of the pin type, may also prove to be advantageous. Faults due to external causes will also be diminished in number by the same means, and further improvement will be realised by a strict and periodic patrol of the lines, by the provision of a liberal right of way cleared of trees, and by duplicate lines to any given point being run along separate routes. When the factor of safety of the insulators is low, efficient means of cleaning these will be desirable. Duplicate supplies are essential for loads above 1,000 kW, and effective discriminating protective gear, working in conjunction with reliable automatic switches, is necessary in order that a faulty feeder or line may be disconnected while the supply is still maintained through the other line. When substations are unattended, automatic self-acting switches are desirable in order that a line or feeder may be switched back into service after a fault has been cleared.

Important centres of distribution or load centres are served to the best advantage when supplied from more than one generating centre, and therefore interconnection becomes a necessity. When several generating centres feed a common load area, unity of supervision and control is essential. Long-distance transmission lines require sectionalising at suitable intervals, and organised repair gangs located at strategic points connected by telephone are desirable. In times of war and civil disorders underground supplies are freer from disturbances than overhead lines, and they are also less liable to be damaged by, or constitute a menace to, aircraft; and where a large number of circuits have to emanate from a given centre, overhead lines may be impracticable on account of the space required for their accommodation. For these and other obvious reasons it is worth while to consider whether eventually all main or national electrical supplies shall be laid underground or overhead, and in this connection the practice of the G.P.O. with regard to trunk telephone lines may be significant.

Legal.

British Thomson-Houston Co., Ltd., v. West Yorkshire Electric Co., Ltd.

ON an *ex parte* motion, Mr. Justice Tomlin, in the Chancery Division on January 21st, granted an injunction over a week to the British Thomson-Houston Co., Ltd., restraining the West Yorkshire Electric Co., Ltd., of Leeds, and its manager from parting with certain incandescent electric lamps which the plaintiff company alleged infringed its patents.

Mr. BASIL DREWE, for the plaintiff company, said he moved *ex parte* because they found that persons in possession of infringing lamps very often got rid of them as soon as the writ was served on them.

Theft of a Vacuum Cleaner.

AT Darlington Police Court, on January 20th, Robert Evans, a labourer, was fined £3 for the theft, as bailee, of a vacuum cleaner, valued at £20, the property of Mr. William Sykes, electrical engineer, Darlington. The evidence showed that the accused was engaged by the prosecutor to sell goods on commission, on the representation that he was accustomed to demonstrating and selling vacuum cleaners. He was given a cleaner for demonstration purposes only, but becoming dissatisfied with accused's conduct, prosecutor demanded the return of the cleaner, and then found that it had been sold. Accused had had other articles from Mr. Sykes to sell on commission, and they had been sold, but the money had not been handed over. In all £45 worth of goods had been sold by accused in that way. Evans's defence was that he bought the goods and that he was to pay for them at the end of the month and receive 2½ per cent. trade commission.

General Engineering Development Trust, Ltd.

MR. JUSTICE ROMER, in the Companies' Winding Up Court, on January 18th, had before him the petition of Walter Hill and Co., Ltd., for an order for the compulsory liquidation of the General Engineering Development Trust, Ltd., which was formed to exploit an invention relating to an electrical route indicator called "The Pathfinder."

Mr. SWORDS, for the petitioners, who are judgment creditors, said suggestions for a scheme of arrangement and an offer to pay had been made, but the petitioners were not satisfied with them.

Mr. WALLINGTON, for the company, said that a good deal of money had been put into the invention, and it was now getting on to its feet. The company was short of capital, and an arrangement had been made to provide a further £10,000. The majority of the shareholders were in favour of the scheme.

His Lordship adjourned the petition for 14 days.

Correspondence.

Maximum Potential Gradients.

Perhaps I may be allowed a few lines in your esteemed journal to reply to the question raised by Mr. Dunsheath in the discussion on his paper this week.

I do not wish it to be taken that I am at all putting forward the maximum potential gradient in any "blindfold" way, as the figure obtained by a stereotyped formula; I am contending for the importance of knowing *what is* the maximum potential gradient, and *at what part* of the cable it takes place.

May I give the following quotations:—

Messrs. Roper & Halperin (paper before the Amer. Inst. Electrical Engineers, May, 1926):—

"The brown or black spots generally appear in the middle or outer portion of the conductor insulation, sometimes accompanied by tiny punctures *in the layers near the conductor*. . . .

"The evidences of ionisation are generally found in the largest quantity *where the stresses are the greatest*. . . ."

The next paper I would refer to is that by Mr. Farmer, read before the Am.Inst.E.E. in May, 1926, in which, after attempting to get the relation between life and stress based upon average values of the gradient, he finds he gets a much more consistent result by introducing the *maximum* gradient.

The third reference which I shall give is from the paper by Mr. Hoover, presented to the Amer.Inst.E.E. in June, 1926, in which he endeavours to show that the volt-ampere characteristic of the insulation, which has its critical point at about 3 milli-amperes per sq. cm., is the determining factor of the maximum gradient itself, and he arrives at the rather interesting result expressed by the following quotation from his paper:—

"It is seen that the maximum gradient is at some point near *the centre* of the wall of insulation, and is *not* at the surface of the conductor as is ordinarily assumed. In fact, the gradient at the conductor is less than that at any other point in the insulation."

My present position in the matter is that an engineer must be guided by various practical considerations in assessing the position of the maximum potential gradient.

Such things, for example, as the non-uniformity of the arrangement of the layers of the paper, the poorness of impregnation towards the centre of the cable (except in the case of Pirelli) and the temperature gradient through the insulation under load have all, it seems to me, quite an important bearing, apart from the latest qualifications introduced by Mr. Hoover.

Other things being equal, the current density through the insulation would be a function of the potential gradient at that point, for uniform permittivity and resistivity.

A. M. Taylor,
Major, S.O.2.

Birmingham, *January 22nd*, 1927.

The Electric Market Place of the Future.

I was very interested in Mr. Berry's article in your issue of January 7th.

I think the idea of holding demonstrations of and lectures on domestic electricity in cities and towns is excellent, but I do not think it would be of much use in villages, even where there already is power, as villagers proper would not be likely to install electrical apparatus in farm or cottage even if they could afford to do so, and the large houses probably

have all the latest appliances. I think this method is far better than house-to-house canvassing, which often annoys people, but after the public demonstrations it would most likely be possible to arrange to give some at private houses to likely purchasers. A great deal might be done by qualified demonstrators and lecturers; the lectures should be of the popular type, and be given by women—in fact, "the use of electricity by women for women" might be a good heading for placards and advertisements.

At present I am sure the majority of women are scared of electricity and absolutely ignorant even of fundamentals. I quote two instances from personal experience. A friend asked me if it was a sign that her iron was hot *when it made a noise!* Her little girl used to say: "Mummie, the iron's talking!" and she thought it was then hot enough to use!! The solution was probably a loose connection. Another woman always took her iron about with her and put it on to the lighting circuit of any hotel at which she was staying, blissfully ignorant of such a detail as difference in voltage! These instances are, I think, representative of the average woman's attitude towards electrical apparatus, and this must be overcome if power is to be used to any extent in ordinary homes.

One point I think important is that women should be taught simple maintenance repairs, just as the woman driver can do ordinary running repairs to her car. Probably the local contractor would disapprove of such knowledge being general, as he would lose a great many jobs which can be very profitable under the vague wording "time and material," the latter usually meaning a piece of fuse wire! It is not enough to demonstrate a vacuum cleaner or cooking stove and leave the woman without the slightest idea of what to do if minor faults develop; particularly does this apply to replacing blown fuses. With a cooking stove a fuse *might* blow just before the arrival of guests for dinner, and the local contractor *might* have gone home; the result is awful to contemplate! Nor should such practical knowledge be left to the man of the house; domestic appliances are in the women's department, and she ought to have the necessary knowledge to keep things running. One thing that is very much against the greater use of electrical apparatus in the home is the extraordinary conservatism of servants, and this is a very real difficulty that the mistress is up against; they have a fear and distrust of "new-fangled" notions—whether this applied equally to the pioneer days of gas perhaps some reader older than I may remember.

Gladys F. Moreland.

Shinfield, Berks., *January 22nd*, 1927.

I should like to express my appreciation of the article by Mr. H. H. Berry in your issue of January 7th, and particularly to emphasise the desirability of all supply undertakings which are contemplating holding an electrical exhibition getting in touch as soon as possible with the Exhibition Committee through the director of the Electrical Development Association.

The value of a special electrical exhibition for a week or a fortnight cannot be too highly appreciated, and my own experience, which will no doubt be supplemented by many other supply engineers, is that the money is well spent whatever the cost may be.

Mr. Berry's vision of an electric market-place in every city is that of the idealist, but without an ideal to aim at we shall not make progress, and I am certain that many will agree with me that of all propaganda that which gives the best return is actual demonstrations and exhibitions where all interested may see actual apparatus, examine it, test it, and criticise it.

Mr. Berry is throwing himself heart and soul into this particular aspect of electrical development, and it is to be hoped that all will contribute their full measure of support, suggestions, and assistance in order to ensure its fullest practical use for the purpose in mind.

As Mr. Berry says, Wembley on a miniature scale in every town and village in the country should be our ultimate aim.

Fredk. W. Purse,
Engineer and Manager,
West Ham Electricity Dept.

Stratford, *January 17th*, 1927.

The Signs of Trade Revival.

Some friend of mine—I do not know him personally, but anyone who believes in better times is a friend—writes an interesting article in your issue dated January 14th, 1927. No more suitable time than the opening weeks in the New Year could be selected for making resolutions, even though they be doomed to failure.

Among a few, the cry of "Trade Revival" has become a catch-word, and if the Electricity (Supply) Act has supplied politicians with a want, it does not prove that industry can assimilate the suggested improved conditions; admitted that everything is new in the world, and that no one knows who is bankrupt, and who is solvent, the scheme cannot do what is suggested. On the other hand, it offers serious objections and features that have been disparaged and denounced, and, like all the other fashionable huge combinations in and out of operation, causes grave and serious discontent, especially among the middle class, which has not the "ear of the Press" or the public. That class bears all the burdens of changing life silently, and with no offer of co-operation; the outlook is not encouraging, for all these amalgamations provide a channel for scrapping loyal servants, usually of middle age.

Platform speakers urge the necessity of preserving individual liberty and freedom, and immediately agree to conditions that destroy the possibility.

The cotton industry, it is said, offers great hopes! If I read correctly, the reason is that orders for new machinery have been placed, but where is the machinery going to? Read in the *Manchester Guardian* of the world's competition, and probably you will assume that our foreign rivals have reaped another advantage. Read, also, of the efforts of various professors, and well-known economists, to salvage the industry, and discern any improvement, if possible. With cotton at about 2s. 6d. a lb., a boom was prophesied when it dropped to 1s., but to-day, at less than 7d., the state of prosperity is as far off as ever; consequently, many cotton shares stand at a discount. Textile people do not buy on a falling market, and it is just possible that the foreign customer will not buy for stock until he thinks the market has touched "bottom"—raw cotton has; but can he think the same of the existing high taxes, rates, and other items? The fact of working a few hours a week, or "short time" as it is called, instead of being fully occupied, is sufficient proof that prices have not touched "bottom."

It is pleasing to read of the "record" prosperity of the electrical trade. Statistics indicate full time work in all branches of production, with the exception of the *industrial* motor section; just so. Again, an increase of 24 per cent. due to orders for super-stations at home is reported, but as this type of order savours of "taking in one another's washing," perhaps we can only be thankful that Bumbledom did not send these orders abroad.

The world we live in is a new one, and history teaches us nothing. Commerce is new, and, unfortunately, there is a tendency to employ soulless methods, where loyalty and service are not of recognised value. Many unpleasant facts are not brought into light and frankly discussed, prosperity requires more confidence and co-partnership under the new conditions. For years past, a few gentlemen in high estate have seen a "silver lining in the sky" and preached optimism, but their arguments were not based on facts, so perhaps you will believe that the trial and anxiety of waiting for something to turn up has forced many thoughtful people to expect new remedies, and view with suspicion any prophecy.

L. E. Wilson.

Manchester, *January 17th*, 1927.

Electric Ovens.

Our attention has been drawn to a letter in your journal by "Oven," referring to the above subject.

We have had nearly four years' practical experience of baking, both bread and confectionery, in electric ovens, and can assure you this experience proves that the statement made—that the products taste of ozone—is entirely erroneous.

A "Magnet" oven which we obtained from the General Electric Co., Ltd., is in daily use at one of our depôts, and with this type of oven it is impossible for the food to come into direct contact, as the heating wires are entirely enclosed. One might just as well claim that a steam-pipe oven, when fired by coal, coke, or oil, creates a taste in the products according to the fuel used.

Assuming that ozone was created, every baker knows that, in the case of bread, for at least the first half-hour steam is being given off by the dough, and therefore it cannot absorb anything during that period, after which the crust would equally prevent any contamination.

In conclusion, it may be of interest to many of my friends in the trade to know that since we have had these ovens in use not a single one of the heating wires has melted.

Trusting the foregoing explanation may help to dispel any doubt on the point raised.

W. Parker-Butler,
Manager,
F. Carrington.

London, *January 18th*, 1927.

We are particularly interested in the letter signed by your correspondent "Oven" in your issue of January 14th, and wish to offer our opinions based upon fairly wide experience. As Switzerland is mentioned, we may say that our parent house, situated in Aarau, has installed large numbers of electric ovens in bakeries in Switzerland, and obtains better baking results than with steampipe ovens, which type is known to be fired alternatively with coke, oil, gas, &c.

Our sister house in Pantin, Seine, has similar experience; also our Milan house. So much for Continental users.

Our experience in this country and the United States, combined with intimate knowledge of Continental practice as above mentioned, prompts us to state that there is no foundation for the statement of the gas journals unless they have located some isolated oven or ovens of bad design and with unique characteristics.

We do not place the elements in the baking chamber, but locate them in tunnels directly below the oven deck and above the oven crown. In common with most designers, we grade the resistors to dissipate their full rated energy at normal temperatures without reaching red heat. Can you imagine

such a design generating ozone to spoil the bloom, flavour, colour, or odour of the baked loaf?

Being impartial on the question of types fired by coal, coke, wood, coal gas, natural gas, and oil, and ignoring working cost in view of the unreasonably high charges per kWh prevalent in most parts of this country, we can assure "Oven" that the goods baked in a well-designed electric oven are superior in every respect to goods baked by any of the other types enumerated, and far from being damaged, they are many points ahead under all tests known to bakery experts: volume, bloom, flavour, colour, odour, and keeping qualities. As usual, the gas journals live up to the scare-monger reputation.

We conclude with the following facts given to the undersigned in June last when at Berne with President Ad. Ingold and Secretary Hans Haldemann, of l'Association Suisse des Patrons Boulangers et Patissiers (Association of Swiss Master Bakers and Confectioners). This Association has 145 local Associations, comprising 5,300 Swiss bakers out of a total of approximately 6,000 throughout Switzerland, and they are antagonistic towards the prohibition of night baking, which is now law. Although this edict is in force, they have a strong case against it. The Associations have estimated that with the 6,000 ovens in Switzerland, and assuming that 4,000 will be electrified within the next fifteen years, they will save 120,000 tons of imported coal per annum, and will use 320 million kilowatt-hours of electricity, which is available from their natural resources through the hydro-electric power stations. This conversion will only be possible so long as they are able to use the ovens during the night hours, when special low rates are charged. At present in Zürich alone, 30 per cent. of the ovens are electric.

Does this indicate that electric bake ovens damage the goods? Would they talk of wide conversions of ovens to electric heating if the finished articles were inferior?

Gas journals please copy.

W. ELLERD-STYLES, M.I.E.E.,
Managing Director.

London, *January 20th*, 1927.

River Water—or Cooling Towers?

I feel sure that many of your readers, in common with myself, have read the article in your issue of the 14th inst. on "River Water or Cooling Towers," by Mr. J. N. Waite, M.I.E.E., with considerable surprise.

Mr. Waite sets out to prove that instead of there being a difference of 10 per cent. in thermal efficiency as between a station using river water and one using cooling towers, only half that gain can be obtained in practice. Mr. Waite's basis of comparison, namely, 29.1 in. for river-water conditions and 28.2 in. for cooling-tower stations, is cutting the difference very fine, and I doubt whether he could substantiate that difference by a series of comparative calculations. This, however, does not account for the main difference, nor does the fact that he neglects to make any allowance for the additional power required to raise the circulating water to cooling-tower level, which in practice generally amounts to the equivalent of practically 1 per cent. of the steam consumption of the unit. His main argument is based on the statement that modern steam turbines are not able efficiently to utilise the difference in energy available at the lower terminal pressures. The half-load figures published in fig. 1 prove that practically the whole of the theoretical gain can be obtained, given a correctly designed low-pressure end.

I believe that every turbine maker, not only in this country but all over the world, is prepared to guarantee his ability to build turbines of the largest sizes required which will utilise the heat energy efficiently down to 0.9 in. Hg, and even below that. Are we to assume that all these engineers are mistaken, and that they are staking huge sums of money rashly on opinions which they cannot substantiate, practically every day of the week?

There is no need to question the accuracy of the methods employed by Mr. Waite in carrying out the tests which have led him to his conclusions, but the figures he shows seem hardly sufficiently conclusive to justify such a sweeping condemnation of a world-wide industry, that incidentally has the honour of including the greatest living inventor of our generation.

R. J. Kaula.

Erdington, *January 19th*, 1927.

Power Supply to Wireless Receivers.

With all due respect to the position which Mr. Turner holds, I do not think that some of the statements he has recently made regarding wireless receivers should be allowed to go unchallenged.

I think that the human ear, provided it be competent, must be the final judge as to whether a broadcast receiver is distortionless or not, and after several years' experience with receivers of all types, including Burndept, I am now using instruments which, to my mind, give absolutely distortionless reproduction of both speech and music, although they break all the laws recently laid down by Mr. Turner.

In the first place, the low-frequency amplifier in these receivers employs THREE transformers, two intervalve and one output, which should, according to Mr. Turner, absolutely ruin the quality of reproduction. Also the h.t. consumption at 120 volts maximum is as follows:—2-valve receiver (1 power valve) 3 mA; 3-valve receiver (1 power valve) 5 mA; 4-valve receiver (1 power valve) 8 mA, as against Mr. Turner's figures of 13 to 20 mA, below which he states it is impossible to obtain good reproduction.

I do not wish to name the receivers, as I do not think the Correspondence Column is the place for any kind of advertising, but I should imagine that Messrs. Burndept have a great respect for the makers of the receivers that I have in mind, as they are using a cone type loud-speaker manufactured by this firm in conjunction with their own Ethophone receivers, and I should be glad if Mr. Turner would confirm my measurements if he has an opportunity.

I should state that my opinion as to the excellent quality of the reproduction of these receivers is supported by many other users, most of them far more competent to judge than I am, and whose names are well known in the musical world.

With all due respect to resistance capacity coupling for the good reproduction of music, I have yet to hear really good speech reproduced by this method, and it seems to me that the whole question is a matter of correct receiver design.

To avoid any risk of being accused of attempting to advertise a rival receiver, I enclose my card, but prefer to sign myself

Interested.

January 14th, 1927.

The "H" Type of Cable.

I have read with some regret, not amusement, the many letters which have been published in the last two issues of your journal. Quite apart from the relative merits of either the belted or the "H" type of cable, Mr. Nisbett is quite right in intimating that there is no reason for booming the "H"-type cable as though it is the only satisfactory one which is being made by British manufacturers; obviously this attitude is very depreciatory towards our colleagues. Mr. Nisbett is to be congratulated for his stand in this direction, as there are undoubtedly as good brains in this as any other country, and it was noticeable that at least one C.M.A. cable designed to eliminate tangential stresses was not received with the same joy as the "H" type.

There is no reason why the "H"-type cable should not be made by our cable firms, but we can surely overcome the difficulties in three-core cables in our own manner, and one way to this end would be to eliminate destructive criticism and obtain our amusement at the expense of others quite apart from business.

No one is entirely blameless, but let us try to expend our energies in the right direction.

E. B. Nixon, A.M.I.E.E.

Newcastle-on-Tyne, *January 15th*, 1927.

New Uses for Electricity in Switzerland.

Our correspondent at Vevey, Switzerland, says that the year 1927 opens with yet further demonstrations of the wide use to which electric power can be put in Switzerland. There are two new undertakings, both of which have to do with quarries, but for very different purposes. In the Ajoie, a new society, "Electrolyse" by name, has taken over the quarries at Cornol, rich in gypsum, from which it hopes to extract sulphuric acid and sulphate of aluminium. To this end the "Electrolyse" has acquired an old foundry in the district, and transformed the whole thing into an electrical works with all the latest appliances likely to speed up the purposes for which the quarries have been bought. Thanks to this up-to-date plant, the "Electrolyse" has already made progress; the yield from the gypsum is most satisfactory, and the residuum after the sulphuric acid and the sulphate of aluminium have been extracted can be used as a fertiliser, and on account of its low price is fairly certain to obtain a ready market.

The second undertaking is in the canton of the Tessin, near Mendrisio. The marble quarries of Arzo, near by, have been celebrated for centuries in Switzerland and North Italy for their reddish-tinted marble, beautifully veined and spotted, and visitors to the Milan Cathedral never fail to admire the Baptistery Chapel, which is decorated with this particular marble. Thanks to the far-sightedness of the present director of the quarries, the output, which had been languishing a little, has more than recovered its former activity. Mr. Rossi has taken the initiative, and under his superintendence all the plant of the Arzo quarries has been electrified. One of the specialities of these quarries is a thin slab of marble used for facing purposes; the new electrically-driven saws give much satisfaction, as the thickness desired can be more evenly obtained than by means of the old hand saws, or even machine saws, and the marble facings can be kept at the desired size. In order to encourage the development of the new enterprise at Arzo, the Swiss Government has ordered this marble to be employed for the decoration of the lobby and office of the new post office at Bellinzona, now in course of construction, and the electrical installation at Arzo is at present working at high pressure.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The official report of the Campaign for the week ended January 22nd states that new circles were formed during the week at Peterborough (chairman, Mr. H. Sanders) and Beckenham (Mr. J. Tapper). Demonstration electric houses were opened at Muirend (Glasgow), Hull, and Leicester. The attendance at the Denton (Manchester) demonstration house is reported to be satisfactory. The Hull demonstration house is being opened officially by the Lady Mayoress. In connection with the Sheffield house, which was to be opened on January 24th, 1,000 bills have been posted in the city tramcars. Coloured lighting has been freely used in the Muirend house, which was opened by Lady Paxton; between 750 and 1,000 people are visiting the house daily. "Electroville," one of the latest Newcastle houses at Bishop Auckland, is attracting an average of 1,000 visitors per day. It is expected that a demonstration house will be opened at Carlisle next week. The Manchester circle has decided to run four more houses at Rusholme and Chorlton-cum-Hardy (Manchester), Prestwich (Salford), and Stretford. The demonstration house at Beckenham has resulted in a considerably increased demand for cookers in the district; another, larger, house is in contemplation. Tamworth is preparing to open a house early in February. Over 5,000 people visited the Walsall house during the first fourteen days of its run. As reported below, the Hampstead Circle opened an exhibition at the borough electricity works on January 22nd. The North-East Coast Area Committee is organising a special children's competition in connection with the campaign. Prizes are being awarded for the best models of the prize house—the materials to cost not more than two shillings; for the best "slogan"; and for the best reproduction of the front cover of the competition booklet.

We have already made several references to the big part which is being played in its area by the Shropshire, Worcestershire, and Staffordshire Electric Power Co., to further the objects of the campaign. We now illustrate another phase

A Campaign Display at Dudley.

of the company's activities—a special campaign display at an electrical exhibition at Dudley organised by the company in conjunction with Messrs. Cook & Co., Lloyd & Ferrer, G. G. Walker & Co., and F. H. Jennings, all Dudley electrical contractors.

An exhibition organised by the Wolverhampton Circle was to be opened by the Mayor of Wolverhampton yesterday (Thursday). Mr. W. N. Gordon, A.C.I.S., is the hon. secretary of the circle.

Last week at the London Lighting Service Bureau, the organisers of the campaign had on view a model of the prize house prior to its being sent to the Provinces. The model is on a fairly large scale and is provided with a vertically-hinged front which opens outward and closes again continuously, actuated by a small motor and gearing concealed in the base. The little rooms are handsomely furnished and equipped with tiny "electrical" appliances. While the cooker seen in the kitchen does not cook, all the lamps light and provide ample illumination to enable the interior to be inspected. The model is available to local circles, which are required to pay a small fee for its use. Its first public appearance will be made in a shop window in one of the main streets of Liverpool.

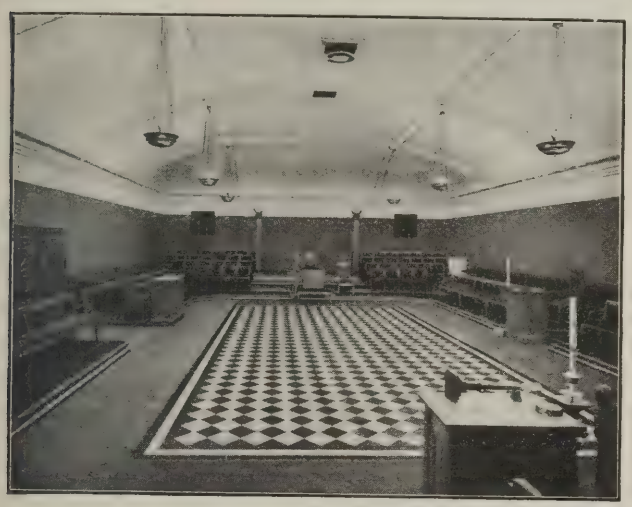
Since being opened on January 17th, the all-electric house at Muirend, Glasgow, has been visited by large numbers of people. Lady Paxton, who performed the opening ceremony, is a vice-president of the Electrical Association for Women. The equipment is of the most up-to-date character. The pantry-kitchen has a "High-Low" cooker installed in it. The vacuum shown is a "Little Glutton." Among the heating apparatus of different types in the various rooms are a "Magicoal" fire and an "Inventum" heater. Downstairs the lighting fittings are by Messrs. Osler & Faraday, and upstairs by the General Electric Co., Ltd.

The Americans are watching the progress of the Campaign with interest, and will not be slow in taking advantage of the benefits which will accrue from it. *Commerce Reports*, after commenting on the campaign and indicating the share of the United States in the British domestic electrical appliance business, says:—"These figures indicate that electrical household appliances of American manufacture meet with a favourable reception in the United Kingdom, and that if our manufacturers take full cognizance of the co-operative marketing campaign now under way, they should have an excellent opportunity still further to increase their sales for this particular class of apparatus." There seems to be room for a "Buy British Electrical Goods" slogan.

Russian Orders for Germany.

The head of the Russian Trust for Mass Production, M. Ots, who recently returned to Leningrad from the Ruhr, has sent an order to the Deutsche Maschinen Fabrik A.G., Duisburg, for the delivery of the equipment for a metal works. The German firm has accepted the required guarantee that the factory equipped by it will deliver annually two million poods of rolled metal and only twenty workmen will be necessary to look after the machines. The Siemens-Schuckert concern has received the order for the electrical equipment of the factory. Other German firms have received orders for the equipment of other factories under the Trust to the value of half a million roubles. —*Reuter* (Duisburg).

The B.E.A. and Railway Rates.



The following resolution was passed last week by a special committee of the British Engineers' Association:—"The British Engineers' Association deplores the policy of the railway companies in proposing to increase the burden of railway rates to be borne by industry and trade in their present state of depression, and at a time when they are struggling to recover from the serious effects of their recent dislocation. The engineering industry, like most other producers, is working on very small margins with the object of recovering trade, and in these circumstances it is thought to be most unfair that railway rates should be increased without at least three months' notice being given to enable the manufacturer to avoid or minimise this new encroachment on his margins in respect of existing contracts. The daily experiences of manufacturers and traders in this country make it abundantly clear that considerable railway economies could be effected, and it is strongly felt that the possibilities of such economies should be thoroughly investigated before a further handicap is placed on industry and trade by any such increase of railway rates as is now threatened."

The Radio Manufacturers' Association.

This Association has addressed to the wireless trade a request for particulars of any matters which the recipients consider to militate against the maintenance and improvement of the sale of British radio apparatus. Replies are required before February 1st, and upon the receipt of these the matters raised will be analysed and collated. The Association points out that the greater the backing which is received "the greater the prospect of a successful issue to any case presented by the Association—in whatever quarter—on behalf of the industry."

A "Mazda" Lighting Installation.

The accompanying picture has been reproduced from a photograph taken solely by the light provided by the lighting installation. The view shows the interior of the Masonic Temple, Douglas, I.O.M. The installation consists of eight "B.T.-H." "Eye-Rest" fittings, each furnished with a 500-W "Mazda" gasfilled lamp. The fittings give an excellent daylight effect

The Masonic Temple, Douglas, I.O.M.

and the lamps being hidden from normal view no glare is caused. The illumination is obtained by means of secondary reflection from the ceiling and upper parts of the walls. The installation was carried out by Messrs. V. A. Bellamy, electrical contractors, Douglas, to the specification of the architect, Mr. W. H. Lomas, Douglas.

Employment During December.

The *Ministry of Labour Gazette* states that employment in the engineering industry during December last was bad, but showed a general improvement as compared with the previous month. The industry was still handicapped by a shortage of raw materials. There was a marked improvement in electrical engineering; the percentage of unemployed fell from 6.8 in November to 6.1 in December. The "overall" figures for the engineering industry were 16.7 per cent. in November, and 14.3 in December. The improvement extended to other branches of electrical industry. In the electrical wiring and contracting section unemployment decreased from 8.7 to 8.2 per cent., and in electrical cable, wire and lamp manufacturing there was a fall from 7.9 to 7.1 per cent.

Unemployment.

There was a decrease of 63,840 in the number of registered unemployed during the week ended January 10th. The total at that date was 1,432,000, as compared with 1,221,400 on January 11th, 1926.

Radio Business in Poland.

The British Commercial Secretary at Warsaw has forwarded statistics from the local Press which show that the number of broadcast receiving licences issued in Poland increased from 4,977 in 1925 to 34,556 in 1926. On the other hand, the number of dealers declined from 269 to 239, indicating that Poland has also experienced the usual process common to the initiation of a wireless industry, in that numbers of small firms which went into the business, lacking both experience and capital, have not been able to withstand even favourable conditions.—*Board of Trade Journal.*

Radio Royalties in Australia.

It is reported from Melbourne that Amalgamated Wireless, Ltd., has claimed the exclusive Australian patent rights for the principal articles used in the construction of radio receiving sets. The company has notified manufacturers that it requires them to pay royalties of 12s. 6d. and 17s. 6d. per valve in respect of each set sold. The report also states that the company is endeavouring to make this claim retrospective, and this has caused some concern among the smaller traders. The Commonwealth Government holds a large interest in the company, but is reported to have declared that it does not intend to take any action.

The Hampstead Electrical Exhibition.

We incorrectly stated in our last issue that the Hampstead Electrical Exhibition, which opened on Saturday last and closes to-morrow, was organised by the General Electric Co., Ltd. The Hampstead Circle under the E.D.A.-E.L.M.A. Campaign is the responsible body, and while the G.E.C. has a stand at the show, other leading companies are also playing an important part. The British Thomson-Houston Co. has a display which includes electric lighting fittings and other domestic electrical appliances, electric fans, and industrial motors suitable for driving sewing machines, washing machines, and other appliances. There is also exhibited a quantity of radio apparatus, including the "R.K." loud speaker, which faithfully reproduces both speech and music. "Tungar" battery chargers, in sizes suitable for home use and for the battery-charging station or garage, are also shown. A special demonstration exhibit of the various stages of manufacture of "Mazda" lamps provides a very instructive feature. The Siemens & English Electric Lamp Co., Ltd., also has a good display of domestic and other appliances, including irons, kettles, vacuum cleaners, many types of electric fires, table cookers and cooking ranges of the "Siemens-Xcel" pattern. The exhibition, which is being held at the Electricity Department's premises, Lithos Road, was opened by the Mayor of Hampstead, who was accompanied by the Mayoress; he was received by the chairman of the Circle, Ald. Geere Howard, Mr. Leadbeater (borough electrical engineer), and Mr. M. Watson (hon. secretary and treasurer of the circle). An excellent handbook has been prepared in connection with the exhibition, containing details of the exhibits. In addition to those mentioned above, the following companies are showing appliances of various kinds:—Messrs. Falk, Stadelmann & Co., Ltd.; the Metropolitan-Vickers Electrical Co., Ltd.; the Edison Swan Electric Co., Ltd.; the Sun Electrical Co., Ltd.; the Hotpoint Electric Appliance Co., Ltd.; the Cable Accessories Co., Ltd.; the Jackson Electric Stove Co., Ltd.; Berry's Electric, Ltd.; the British Electric Transformer Co., Ltd.; Standard Telephones & Cables, Ltd.; and Burndept Wireless, Ltd. The circle has a special display which includes "Arora," "Belling" and "Heatrae" fires, the "Tellus" vacuum cleaner, "Helios" adjustable fittings, "Selz" shades, "Frigidaire" refrigerators, "Ever Ready" novelties, &c.

A French Company's Centenary.

The works at Mulhouse and Belfort, Alsace, of the Société Alsacienne de Constructions Mécaniques were recently *en fete*, the occasion being the 100th anniversary of the establishment of the undertaking. Commenced in a small way in 1826, the concern is now one of the largest in France, and in recent years has considerably extended its electrical engineering department, which has turned out the bulk of the plant for the large power station at Gennevilliers.

Philips Lamps at the "Astoria" Kinema.

In the "Astoria," a palatial kinema in Charing Cross Road, W.C.2, which was opened on January 12th, Philips electric lamps have been extensively used. No fewer than 3,000 of these lamps have been installed in the outside signs, which are shown in the accompanying illustration, and 840 have been used in the interior lighting, in addition to flood-lighting

The "Astoria" Kinema.

lamps and special Philips projector lamps used with the kinematographic apparatus. The outside signs are made up of 650 daylight lamps and 1,900 red, blue and yellow colour-sprayed and clear lamps. For the interior lighting special diffusing fittings have been installed which provide soft and restful, but adequate, lighting.

Local Exhibition.

The Electricity Committee of the Stepney Borough Council has recommended that an electrical exhibition be held at the Queen's Hall and Winter Garden, Stepney, between April 25th and May 13th next.

D

A New Cable Company.

According to a report in the *Western Mail*, a new company is in process of formation with a capital of £100,000 to manufacture electric cables. Sir Edward Nicholl, who is described as the head of the concern, has purchased an aircraft works at Addlestone, in Surrey, for £17,250. Sir Herbert Blain is one of the directors. It is stated that the existing machinery in the factory is to be disposed of, but that the new plant for cable manufacturing is already available for installation.

An Illuminated Tramcar.

The illustration herewith shows an illuminated tramcar provided by the Bristol Tramway and Carriage Co., for collecting purposes in connection with the Lord Mayor of Bristol's Christmas Dinner Fund. This car was equipped with over 1,000 "Siemens" helical traction lamps, and its journeys

An Illuminated Tramcar at Bristol.

created considerable interest, and were responsible for the collection of a large sum of money. The Automobile Accessories (Bristol), Ltd., operated their public speech equipment on this car, thereby providing amusing nightly programmes.

British Electrical Equipment in Canada.

In connection with cabled dispatches from London, quoting the criticisms of the British Press concerning the requirements of the Fire Underwriters' Association that all electrical installations and equipment in Canada, as well as in the United States, must conform with the National Electrical Code and be sanctioned by the Chicago Testing Laboratories, which apparently discriminate against British-made equipment, it is stated here that the new Canadian electrical code will probably be completed within a few months. A committee of the Engineering Standards Association, at the instance of the Trade and Commerce Department, has been working on the intricate problem for several years, and on January 20th the first draft was completed; it conforms largely with the American National Code, which is also undergoing revision. The final revision of the Canadian code is expected to be ready for submission to the meeting of representatives of fire underwriters, provincial authorities, and others interested, at Winnipeg, a few weeks hence. This code will provide for Canadian autonomy in respect of both fire and safety "hazards" of all electrical installations in Canada, though it will be necessary subsequently to establish adequate testing laboratories to obviate the present necessity of the Chicago tests. At present, the standards prescribed by the Ontario Hydro-Electric Power Commission are accepted by the underwriters for that province, and in some measure also by the other provinces, though there is not yet uniformity for the whole Dominion. It is declared in Canada that, in respect of Canadian importation of British electrical equipment, there is no evidence to show that any important contracts have been lost through failure to secure the sanction of the Chicago authorities, since compliance with the Ontario regulations is practically acceptable to underwriters of the other provinces. It is known, however, that British manufacturers have practically no chance of securing the United States market because of the refusal of the Chicago laboratories to approve their products.—*Reuter* (Ottawa).

The Electrical Contractors' Conference at Scarborough.

We have received at the moment of going to press a copy of the preliminary programme of the Second Annual Conference of the Electrical Contractors' Association Allied Associations, which takes place on June 22nd, 23rd and 24th next. We shall refer to the matter more fully next week.

South African Contract Regulations.

The *Board of Trade Journal*, dated January 20th, contains extracts from the Tender Board Regulations for the Union of South Africa (Railways and Harbours excluded), and from the Rules for the Purchase of Government Supplies. These appear to offer no special preference to British manufacturers, but South African manufacturers and merchants receive first consideration in the awarding of contracts, other things being equal. The document referred to can be inspected by interested British firms at the Department of Overseas Trade, 35, Old Queen Street, S.W.1.

British Companies Underquote Continental Competitors.

The Johannesburg correspondent of *The Times* says that gratification is expressed in local business circles that the British tenders for the erection of the new Johannesburg municipal gasworks are lower than the foreign offers. Of the eight tenders, only five are complete offers to build the plant and structure, and these complete tenders range from £153,160 to £266,968. The firms who have tendered are Bruce Peebles and Co., Ltd., Edinburgh; Drake's, Ltd., Halifax; Woodall-Duckham Vertical Retort and Oven Construction Co. (1920), Ltd., London; West's Gas Improvement Co., Manchester; Julius Pintsch, Ltd., Germany; Francke Werke A.G., Germany; Aug. Klonne, Germany; and the Skoda Works, Ltd., Prague. The tenders will probably be submitted to a consulting engineer.

A Manchester Power Efficiency Exhibition.

Textile and Industrial Exhibitions, Ltd., 121, Deansgate, Manchester, is organising a Power Efficiency Exhibition to be held at the City Hall, Manchester, from June 22nd to July 2nd. The exhibition will include machinery, apparatus, and precision instruments designed to secure power economies, and it is claimed to be the first of its type.

New French Telephone Company.

It is reported from Paris that the Société de Téléphone Grammont has been formed by the Etablissements Grammont with the participation of the General Electric Co., Ltd., and an American company. The share capital is 18,000,000 fr., and the object is to carry out the orders given to the parent French company in connection with the conversion of the Paris network to automatic working.

The Irish Radio Import Duty.

Mr. J. J. Walsh, the Postmaster-General of the Irish Free State, said in a recent speech that it was impossible to abandon the import duty upon radio apparatus. The Government intended to spend a large amount upon the development of broadcasting, including the erection of a station at Cork in the near future and a high-power station later, and it relied upon the duty as well as licence fees to meet the expenditure. There was no justification for making those who were not listeners pay for the amusement of those who were.

Mullard Window Displays.

The Mullard Wireless Service Co., Ltd., has arranged three different window displays for the use of retailers of its radio valves. One of these is illustrated herewith; it

A Mullard Window Display.

makes a feature of "Radio for the Million," a publication which the company has brought out. Retailers who wish to avail themselves of these displays are asked to give particulars of the size of their windows and the dates upon which the displays are required. If necessary, a professional window dresser is sent to arrange the window.

Another Birmingham Exhibitor.

The lists of exhibitors at this year's British Industries Fair which appeared in our issue of January 14th, contained the names of firms whose products were directly of interest to our readers. There are many others who are connected with the electrical industry by parts of their business. Such are Messrs. H. H. Vivian & Co., Ltd., who intend to show at Birmingham, *inter alia*, condenser tubes, busbar and strip copper, &c.

The Ideal Home Exhibition.

This year's Ideal Home Exhibition is to be held at Olympia, W., from March 1st to 28th. The General Electric Co., Ltd., informs us that it intends to make a special display of "Magnet" domestic appliances.

Rumoured Continental Electrical Agreement.

Rumours continue to be circulated concerning a scheme for the formation of a working community between German, French, and Belgian electrical concerns, in the matter of international contracts. Discussions between the firms in the last two countries are said to have already led to the drawing up of "guiding lines" for joint action. On the other hand, the A.E.G. and the Siemens group do not appear to have been definitely approached in the matter.

Calendars and Diaries.

We have received from Messrs. SINCLAIR, PAGET & Co., LTD., New Inn Yard, Shoreditch, E.C.2, a wall calendar with boldly-figured monthly sheets.

What is, we suppose, one of the last but by no means the least of the pocket diaries for 1927 to reach us from electrical firms is that received from Messrs. J. H. TUCKER & Co., LTD., of King's Road, Tyseley, Birmingham. It is an excellent case, with receptacles for all kinds of things, and the diary and note-book portion is particularly useful to business men.

We have received from Messrs. W. G. BEAUMONT & SON, of Priory Works, Bow, E.3, a copy of their large year book and desk diary for 1927—bound in cloth, and illustrating some of the chimneys, steel buildings, bridges, &c., which they have painted or repaired.

Trade Announcements.

MESSRS. NEWTON BROTHERS (DERBY), LTD., state that owing to the rapid expansion of their manufacturing department it has become desirable for them to be allied with certain large manufacturing interests of a kindred nature, and the scope of their activities will be considerably increased. Although they have found it necessary to form themselves into a public company to meet the new conditions, the control and management of the business remain the same. The contracting and retail department of the business conducted from the St. James's Street premises has been taken over by Mr. C. A. Newton, who is carrying on the business under the style of C. A. Newton & Co. All outstanding contracts which are in course of execution by that department will be taken over by C. A. Newton & Co., and will be carried out by the same staff, with Mr. G. F. Nuttall as manager. Mr. C. A. Newton retains his seat upon the board of the limited company.

THE DEVON ELECTRIC LAMP CO. has opened new showrooms at 29, King Street, Tavistock, and will be pleased to receive catalogues and factors' quotations for all electrical fittings, lamps, and accessories.

MESSRS. SINCLAIR, PAGET & Co., LTD., New Inn Yard, Shoreditch, E.C.2, have recently enlarged their works and have commenced making battery-charging switchboards.

THE AUTOCAR ELECTRICAL EQUIPMENT CO. has taken over an additional building at 115, Old Street, E.C.1, and its Mitchell Street premises are being retained solely as a workshop. Telephone numbers: Clerkenwell 5470 and 7318.

MESSRS. GREENWOOD & Co. have opened electrical showrooms at Prince's Crescent, Bare, Morecambe.

MESSRS. ALEXANDER & Co., 266, Windmill Road, Ealing, W.5, have been appointed sole British agents for the radio and electrical products of Messrs. H. Constable & Co., Paris.

It is announced that, in order to cope with the demand for its radio specialities, the FELLOWS MAGNETO CO., LTD., of Park Royal, N.W., is giving up the manufacture of magnetos.

New showroom premises at 4, Northampton Street, Dover, have been opened by Mr. C. O. CLARK, electrical engineer and contractor, of the East Kent Radio and Electricity Works, Mill Road, Deal.

MESSRS. G. E. WALLIS & SONS, LTD., electrical engineers, of 30a, High Street, Ashford, Kent, have taken over the electrical department of Messrs. C. Hayward & Son, of 18, New Street, Ashford. Messrs. Hayward will continue their radio department.

MESSRS. WELLS & Co., of 23-27, High Street, Bedford, have taken over the electrical staff of Messrs. Kilpin & Billson, of High Street, Bedford. They are equipping showrooms and workshops for this department of the business.

The CENTRAL RADIO STORES on January 22nd opened premises at 51, London Road, Bromley, Kent.

MR. C. H. H. KENWORTHY has opened an electrical engineering business at Bank Street, Herne Bay.

New Catalogues and Lists.

MESSRS. JAMES MCMILLAN & Co., Clun House, Surrey Street, W.C.2.—A pamphlet describing a portable telephone instrument for line testing made by the A.S. Elektrisk Bureau, Oslo.

THE RADIO COMMUNICATION CO., LTD., 34-35, Norfolk Street, Strand, W.C.2.—List No. X.1,226, illustrating and describing the company's radio direction finder equipment.

THE TELEGRAPH CONDENSER CO., LTD., Norwich House, Southampton Street, W.C.1.—Catalogue No. 51, describing "T.C.C." static condensers for power-factor correction. Examples of actual installations are depicted.

MR. ALAN WRIGHT, 124, Chancery Lane, W.C.2.—A pictorial pamphlet explaining the construction and operation of Film cooling towers, which are made by the company of that name.

MESSRS. STEWART, THOMSON & PATRICK, LTD., 10 & 12, Hart Street, Liverpool.—A stock list of d.c. and a.c. motors, ranging from 1 to 130 h.p., &c.

THE STONEBRIDGE ELECTRICAL CO., LTD., Victoria Road, North Acton, W.3.—Leaflet No. 95/1, containing an illustration of and notes upon one of the company's universal precision instruments for various kinds of tests.

THE BEKO LAMP CO., LTD., 5, Finsbury Square, E.C.2.—A price list of "Beko" electric lamps and a separate net trade price list.

THE RELIANCE TELEPHONE CO., LTD., 12-13, Henrietta Street, W.C.2.—An illustrated folder advertising the company's automatic intercommunication systems.

FRANCIS LAMP LOCKS, LTD., 83, Pall Mall, S.W.1.—A priced and illustrated pamphlet detailing the construction and use of the company's lamp locks.

THE BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, W.C.2.—Leaflet R.7335-2, containing illustrations and details of a number of "B.T.-H." radio receiving sets, and the "R.K." loud speaker; and Leaflet R.7432-2, dealing with the company's l.f. transformers, giving performance curves. Both publications are priced.

MESSRS. SMITH & COVENTRY, LTD., Gresley Iron Works, Manchester.—Two well-illustrated publications describing, respectively, a boring, facing, and recessing machine for electric motor frames, and plano-milling machines.

METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester.—A three-colour window poster and a booklet advertising "Cosmos" valves. The booklet gives details, illustrations and prices of ten types with a table summary.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A descriptive pamphlet (B.C. 4352) containing illustrations and details of "Gecophone" h.t. radio battery eliminators for d.c. and a.c.

ELECTRIC FANS, LTD., 53-54, Royal Mint Street, E.1.—An illustrated price list of d.c. and a.c. exhaust fans, regulators, &c.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—A series of illustrated descriptive pamphlets dealing with auxiliary-current limit switches, truck-type switchgear, earthing resistances, outdoor oil-immersed circuit breakers, switch fuses, and metal-clad compound-filled switchgear.

THE MULLARD WIRELESS SERVICE CO., LTD., Denmark Street, W.C.2.—A series of illustrated and priced pamphlets dealing with "P.M." radio valves.

MESSRS. G. CUSSONS, LTD., The Technical Works, Lower Broughton, Manchester.—An illustrated booklet dealing very thoroughly with the construction and use of the "Scholes" bomb calorimeter.

Bankruptcy Proceedings.

H. A. MILLS, 1, Lorne Villas, Old Windsor, Berks., electrical engineer, &c.—The first meeting of creditors was held recently at 29, Russell Square, W.C.1. The statement of affairs showed liabilities of £452, against assets of £177, leaving a deficiency of £275. Debtor attributed his failure to lack of capital and depression in trade. He commenced to trade without capital in December, 1923, and his wife assisted him. In 1926 he borrowed £200, which he used in the business, and he undertook that the loan was to be secured on the book debts due and to become due. At the date of the receiving order, however, there had been no proper assignment, and no notice had been given to the book debtors, and there was thus no effective charge. Debtor stated that he had carried on business from the commencement with difficulty owing to lack of capital, and a few months ago his wife was taken ill, and he was, therefore, deprived of her services. His creditors began to press him in October last, and an execution was levied on December 18th, 1926, when he decided to file his petition. He became aware of his position in January, 1926. The case, being a summary one, was left with the Official Receiver as trustee of the estate. The following are creditors:—

	£		£
Condor Lamp Co.	... 28	Times Electric Co.	... 55
Filling & Son, W.	... 26	Supra Electrical Co.	... 24
Meares, L. V. N.	... 187		

A. J. CULLUM, 8, Church Street, Diss, Norfolk, motor and electrical engineer.—The public examination of this debtor was held on January 14th, at Ipswich. The statement of affairs showed gross liabilities of £180, and a deficiency of £135. Debtor commenced business in 1922 on his own account without capital. Most of the trade done was repair work, but the profits had never been sufficient to meet the charges. The examination was adjourned.

H. BEBBINGTON, electrical engineer, Cestrian Street, Bolton.—This debtor appeared at Bolton Bankruptcy Court on January 19th for his public examination. Debtor estimated his deficiency at £79. He was formerly in business, and after his wife's death he received a claim for the payment of £108 which he thought had been repaid by his wife during her lifetime. Apart from this amount he owed less than £2. The examination was closed.

J. G. SANDELL, electrical contractor, 20, Hart Road, Dorking.—Receiving order made January 18th on creditor's petition.

F. A. HARTLEY and R. HARTLEY (F. A. Hartley & Son), electrical engineers, 98, Katherine Street, Ashton-under-Lyme, F. A. HARTLEY (separate estate), and R. HARTLEY (separate estate).—Last day for proofs for dividend, February 5th. Trustee, Mr. F. Murgatroyd, Official Receiver, Byrom Street, Manchester.

W. C. RHODES (L. J. Palmer & Co.), electrical engineer and contractor, 141, Newspaper House, Corporation Street, Birmingham. Trustee, Mr. C. Hoult, Official Receiver, 191, Corporation Street, Birmingham, released January 11th.

H. WILSON, electrical contractor, &c., 1057, Grangefield Avenue, Thornbury, Bradford.—Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford, released January 11th.

C. E. F. PARKER, electrical engineer, Greendale, Privett Road, Gosport.—Second and final dividend of 5s. in the £ and 4 per cent. interest, payable at the Official Receiver's offices, 87, High Street, Portsmouth.

Company Liquidations.

CLEARTRON RADIO, LTD.—A meeting of creditors was held at the Institute of Chartered Accountants, Moorgate Place, E.C., on January 26th.

NATIONAL WIRELESS CORPORATION, LTD.—First meeting of creditors and contributories, February 1st, at Carey Street, W.C.

Private Arrangements.

NEUTRON, LTD., wireless accessory manufacturers, Sentinel House, Southampton Row, W.C.—In response to a circular letter issued by Messrs. Booth, Anderson & Co., C.A., of 40-43, Norfolk Street, W.C., a meeting of the creditors was held on January 24th, at the Holborn Restaurant. The circular stated that at a meeting of creditors held on November 26th last the creditors resolved that Messrs. M. D. Booth and T. H. McArthur should represent them on the board to watch the interests of the creditors in connection with the proposals put forward for the discharge by the company of its indebtedness over a period of twelve months. There appeared to be little possibility of the scheme in the form in which it was presented to the meeting of creditors being proceeded with. Mr. Booth occupied the chair, and said that the position had changed materially from that disclosed at the meeting held last November. Messrs. P. G. Marr, Ltd., the second debenture holders, had not taken any steps to jeopardise the position of the company, but they had come to the conclusion that Neutron, Ltd., was no longer of any interest to them for the purposes which they originally intended, namely, the development of their own valves, and the crystal business. Furthermore, Messrs. Marr stated that the business done by the company, in their opinion, did not warrant their acquiring control. Messrs. Marr had, however, made a new proposal for the discharge of the indebtedness to the creditors out of future profits, but he (Mr. Booth) did not consider that he was in a position to accept or reject what was, in fact, an entirely different proposal. The necessary finance to meet wages, &c., during the past few weeks had been provided in part from the sale of crystals in the ordinary course of business, and in part by purchases of crystals made for cash by Messrs. P. G. Marr, Ltd., and Mr. Wolsey, at a price much below that charged to the distributors. He was informed that those crystals could be re-purchased by the company at the same price. A receiver had been appointed by Mr. Bennison, the first debenture holder. Furthermore, the company had sent out a notice convening an extraordinary general meeting for the purpose of liquidation. The proposal of Messrs. Marr was that they should provide for the re-financing of Neutron, Ltd., and the discharge of the creditors' claims out of future profits. So far as he was aware, Messrs. Marr were not prepared to give up their security. Mr. Booth said that if the company was re-financed and had a proper selling organisation it should make very handsome profits. There was some possibility of an order which might bring in a profit running into £1,000 or £2,000. The statement of affairs which was submitted by the solicitor to the company at the previous meeting showed assets of £3,391. The liabilities consisted of debentures for £300 and £3,150. The unsecured trade creditors' debts were scheduled at £4,271. Mr. Latham thought that it would be better if the company was wound up, and a resolution to that effect was carried.

J. W. NUTTALL, electrical and wireless engineer, 668a, Liverpool Road, Ainsdale.—A meeting of creditors was held recently, when it was reported by the debtor that his trade liabilities amounted to £111, while he valued his assets at £82, leaving a deficiency of £27. The debtor stated that he commenced business about two years ago without capital, and one of the creditors provided him with the necessary stock. He attributed his present position to lack of trade and keen competition. He was unable to give any accurate information as to the turnover. The creditors decided that the debtor should be requested to approach his father with a view to making a cash offer, it being intimated that if a composition of 5s. in the £ was forthcoming it would be accepted. The debtor undertook to do this, and also to make efforts to dispose of the business as a going concern. It was decided that no further steps should be taken by the creditors for a fortnight.

Recent Contracts.

The important scheme of the Bristol Corporation for the construction of a large power station at Portishead has received the approval of the Electricity Commissioners, and the City Council has sanctioned the placing of contracts. The main contract for the construction and initial equipment of the station is to be placed with Messrs. Vickers, Ltd. The whole of the electrical plant, comprising the turbo-alternator sets complete with condensers and auxiliaries, and the transformers and switchgear, will be supplied by the Metropolitan-Vickers Electrical Co., Ltd., as sub-contractors. The scheme was planned by Mr. H. Faraday Proctor, city electrical engineer. It provides for a power-station of an ultimate capacity of 280,000 kW, to be built at Portishead, on the Bristol Channel, about seven miles from the city. The first section of the station, on which work has now commenced, will be initially equipped with two 20,000-kW main turbo-alternator sets. Provision will be made to transmit the whole output at 33,000 V to the Corporation power station at Feeder Road, Bristol. The contracts include the necessary transformers and switchgear for feeding the transmitted power into the existing 6,600-V distribution network. Each of the generating sets will consist of a two-cylinder turbine of 20,625 kW maximum continuous capacity and 16,500 kW economical rating, driving at 3,000 r.p.m. a three-phase, 50-cycle alternator of equivalent capacity at 11,000 V and 0.8 power factor, and also a 625-kW house-service alternator generating at 550 V. A three-phase, 25,000-kVA group of single-phase transformers will be permanently coupled to each main alternator for stepping up the pressure to 33,000 V for transmission. The main 33,000-V switchgear will consist of 13 units of the metal-clad type, each unit having a guaranteed breaking capacity of 750,000 kVA. The station boards will also include 45 smaller metal-clad units for the supply circuits of the station auxiliaries. At the Feeder Road power station similar step-down transformers will be installed.

The new sets mark the advance which is being made in the development of generating plant for operation at 3,000 r.p.m., while the boiler pressure of 325 lb. per sq. in. conforms with the increasing preference for pressures over 300 lb. Special arrangements will be made for the taking of the condenser cooling water from the Bristol Channel.

Among the orders recently received by Messrs. John I. Thornycroft & Co., Ltd., are two for omnibus chassis from the Bombay and Rangoon Tramway Companies. They are also supplying a number of wagons for the Buenos Aires Great Southern Railway.

The General Electric Co., Ltd., has received an order from the London Electric Railway for the complete motor and control equipments for 64 motor-coaches and 48 trailer coaches. This is the fourth consecutive order received from the London Electric Railway Co., and the total quantities of equipment ordered from the G.E.C. now comprise motors and control equipment for 159 motor-coaches, 78 driving trailer coaches, and 103 trailer coaches. Each motor-coach equipment comprises two 240-b.h.p. motors (one hour rating), 575 V, together with complete "all electric" contactor-type control gear.

The Birmingham Fair.

We have given so much attention to the arrangements for the forthcoming British Industries Fair that it might be supposed that there would be little more to say until the opening date, but many interesting things were said at a luncheon at the Savoy Hotel, on January 19th, which we should like to report had we the space to spare. The event was organised with the object of expressing the exhibitors' appreciation of the support given to the Fair by the Government and of its appropriation of £25,000 for the second year in succession toward the cost of advertising the Fair. The principal toast, "His Majesty's Government," was given by Sir Hugo Hirst, Bart., who referred to the legislative record of the present Government and to the efforts made to assist and even safeguard British industries. He hoped that the appropriation of £25,000 per annum for the Fair would continue. Sir Hugo carried us back to the days when the Board of Trade was the subject of widespread criticism amongst business men. Well do we recall the days when, for instance, the speaker, having occasion to visit the Board on an electrical matter, searched for two hours before he found the particular department to deal with it—namely, the Fisheries Department! Or, as a further example, the occasion when he inquired for statistics of our imports of electric lamps and found that gas, oil, arc, electric, and all other kinds of lamps were classified as "lamps." Sir Hugo contrasted that state of things with the greatly increased efficiency of the department and its officials to-day, and directed traders' attention to the large store of knowledge that was available at the Board's offices and the readiness with which it was given to those requiring it. He paid a high tribute to Sir Philip Cunliffe-Lister, M.P., the President of the Board of Trade.

Sir Philip, in responding, referred to Sir Hugo Hirst as a very prominent representative of the Birmingham Fair, a great manufacturer, a great salesman, a great Imperial trader, and a great public servant. On behalf of the Government, he congratulated all parties upon the success of the coming Fair. He spoke highly of the work of the committees, and said that the success of the 1927 Fair was based on the cumulative efforts of those who had stood by it in good and bad times. During the coming year business people should keep the next Fair

well to the fore in their correspondence with overseas buyers. The cry "Buy British Goods!" had become a national determination in this country. We must sell British goods in new markets. World trade was expanding as the world settled down, and we must increase our share of that expanding trade. Other countries had yet to tread the path that we had trod back to financial stability. The one thing wanting was salesmanship. We required Peace, Progress, and Trade—that was the Government policy. The speaker went on to allude to the Government policy with regard to China.

Other speakers included Mr. G. C. Vyle, the president of the Association of British Chambers of Commerce, who proposed "The Organisers of the Fair," seconded by Sir Charles Higham, and Sir William Clark, Comptroller-General of the Department of Overseas Trade, Col. H. J. Walduck, the president of the Birmingham Chamber of Commerce, and Mr. T. R. Martin, the chairman of the Birmingham Fair Management Committee. Among other interesting points mentioned by Mr. Martin was a statement to the effect that for the first time the Birmingham section of the Fair would include a complete power house—a co-operative exhibit to which 30 leading firms had contributed.

Electrical Advertising.

Messrs. E. Brook, Ltd., of Empress Works, Huddersfield, whose enterprise in the electric motor manufacturing business has already been referred to in our pages and is well known in the trade, have hit upon an ingenious means for announcing the further reduction in the prices of their motors which came into force on January 1st. A discreetly folded list bears on the outside the words, "It is said," which compel one to open and read further, and the story continues with a still unfinished sentence, "the modern electrical Press," so then we eagerly turn over to find what new thing there is to be said about *us*. Unfolding again, we find that it is no new thing at all, for it has been said occasionally by some quite elementary users of the Press that some journals "contain too many adverts." It may be true of *some* journals—indeed, it surely is, for we wonder why they contain any at all—who is to blame for that? All of Messrs. Brook's interesting ingenuity is intended to induce the reader to turn over again to see the announcement referred to above, and after he has done so, to see other advertisements in the ELECTRICAL REVIEW and certain other journals which are named. We appreciate the compliment, but lest anybody should be led astray by the suggestion that there is too much advertising in the technical Press, we would suggest that he should, when he has opportunity, watch the absorbing interest with which the advertising pages of the ELECTRICAL REVIEW are studied in the offices, trains, club lounges, and homes that he frequents, or when he travels abroad he should call at the consular offices and chambers of commerce and learn how those pages are carefully scanned by overseas buyers to find out the names of the best *British* makers of electric motors and other products. He might even find it interesting to keep lonely vigil outside places where the REVIEW is sold and note the feverish haste with which the proud possessor turns to what are known as "The Smalls"; or to enter some important offices of which we know where the "Official Notice" advertisements of new contracts are searched before the pages have even had a chance to get dry or cold. As a matter of fact, the manufacturer learns much and the buying sections of the profession and industry much more from the careful study of the advertised doings of the trade. The buyer is the last man to complain about the number of announcements put before him; perhaps he is more impressed by one than by another because he is susceptible to brightness, originality and strength in design, but we are anxious that our advertisers should all appear at their best—that is why we have organised advertising competitions. The distribution of a heavy paper may be inconvenient to those who publish it, but who ever heard of a reader complaining that he received too much for his money? He needs a good and complete paper, and for the production of such, in the best interests of the trader, it is essential that it should contain as many announcements as possible from the manufacturers and traders who have goods to sell. We have never heard it argued against the motor Press or the society and fashion papers that there were too many advertisements; indeed, on the contrary, we know that these pages are studied as closely as any part of the paper. So the things concerning which it is written "*It is said*" are sometimes neither new nor true. There used to be some trade publications published containing advertisement sheets only; there are still many publications in which manufacturers waste a considerable part of their advertising allocation for reasons which have nothing to do with real "business-getting." When the trade makes its effective announcements, between one set of covers, which convey the complete truth regarding the course of productive and trading activity to the real buyers everywhere, it gets results, and it no longer remarks about things that are *said*, but states with confidence those things which it *knows*.

Book Notices.

"Aluminium Facts and Figures."—A useful little book, issued by the British Aluminium Co., Ltd., containing a wealth of information concerning numerous products of aluminium, including electrical conductors and cables. Most of the data given are in table form, and the authorities are given for the values under physical properties of aluminium. Aluminium alloys are also dealt with, and various processes appertaining to the preparation of certain articles are described, as are also a number of parts or accessories, such as collector bows for electric railway overhead track work, and numerous sections with their applications.

"Overhead Transmission Lines." Publication No. 193 of the British Aluminium Co., Ltd.—This little book should prove of great value to all those interested in the construction of overhead transmission lines. Much information and many technical data are given upon the actual lines and the accessories. Some interesting illustrations are given of lines in various parts of the world.

"Treatise on Thermodynamics," by Dr. M. Planck, translated by Mr. A. Ogg. Third edition. Pp. xiv+297. London: Longmans, Green & Co., Ltd. Price 15s. net.

Amongst new books published by the D. Van Nostrand Co., New York, is one on "High-Tension Line Practice," by E. V. Pannell, and one on "Household Refrigeration," by H. B. Hull.

"These Hundred Years" is the title of an inspiring oration delivered by Sir Gregory Foster at University College, University of London, reviewing the history of the college, of which the centenary is to be celebrated this year. It has been issued in the form of a brochure, price 1s. net, by the University of London Press, Ltd.

Circular No. 312 of the U.S.A. Bureau of Standards.—United States Government Master Specification for Matting, Rubber, for use around Electrical Apparatus or Circuits not exceeding 3,000 V to Ground. Price 5 cents.—This pamphlet contains the detailed official test requirements for electrical protection mats in the United States.

Bulletin of the British Cast-Iron Research Association. No. 15, January, 1927.

The 1927 volume of "Sell's Telegraphic Address Directory," which is now in the press, will, we are informed, be in an altered form and less bulky than in the past.

Social Events.

The social club connected with the Ayrshire Electricity Board held a successful supper and dance at Kilmarnock last week; Mr. W. C. Bexon, engineer and manager presided. Replying to the toast of "The Employés," Mr. Bexon said that last year their revenue was £194,782, and he hoped, with the operation of the coal clause, they would increase it to a quarter of a million this year. He was satisfied that in the near future there would be a great increase in the consumption of electrical energy.

The staff of Messrs. Ernest F. Moy, Ltd., held its annual dinner on January 15th. The guests included the Mayor of St. Pancras, representatives of electricity supply authorities, and many others. Major C. G. Fox was in the chair, and accepted, on behalf of the board, from the staff and employés a portrait of the late Mr. E. F. Moy, the founder of the company, to whose memory a toast was drunk. A souvenir matchbox bearing a miniature portrait of Mr. Moy was given to everybody present.

On January 21st the annual staff dinner of the Osram-G.E.C. Lamp and M.O. Valve Works was held at the Café Royal, Regent Street. As usual, Mr. C. Wilson occupied the chair, and among those present were Sir Hugo Hirst, Bart., and Mr. C. C. Paterson. After an excellent dinner and the loyal toast, Mr. T. Oldbury proposed the toast of "The G.E.C.," and mentioned the confidence which existed between the directorate and the staff. Sir Hugo Hirst replied in an optimistic manner. Mr. H. C. Wilson proposed the health of the guests, and recalled that the original Osram staff dinner was held in 1895; three or four of those who attended that function were present that evening. Mr. C. C. Paterson, in reply, said that he was glad to be associated with the General Electric Co., Ltd. In that organisation all that was best in initiative found encouragement. Mr. S. Rentell, one of those who were present at the 1895 dinner, replied on behalf of the Press. Mr. E. R. Grant proposed the health of the chairman, to whom, he said, the success of the lamp works was mainly due. Mr. Wilson briefly responded, and stressed the importance of research and the development of the social side. A concert followed, the entertainers being Messrs. E. C. Holmes, L. Richards, H. Herrick, G. O'Hagan, P. Albert, and Miss Rita Barnaby.

The fifth annual staff dinner of Messrs. Francis Polden & Co., Ltd., was held at the Old Bell Restaurant, Holborn, E.C., on January 15th, when one hundred people sat down to an excellent dinner under the chairmanship of Mr. F. C. Polden, the managing director. The speeches and toasts were interspersed with singing, and were followed by a dance.

The General Electric Co., Ltd., announces the following events in connection with its Witton Engineering Works:—Annual Hockey Club dance, January 29th; and annual exhibition, Photographic Club, January 31st.

The staff and friends of the Igranic Electric Co., Ltd., held their annual fancy dress carnival at the Café Dansant, Bedford, on January 14th. There were over 500 guests, the majority of whom were in fancy dress, exhibiting a wide variety of taste and fancy. During the dancing, community singing was indulged in by those present. The dress parade was a gorgeous spectacle, and the decisions of the judges were highly applauded. Eighteen prizes, presented by members and friends of the company, were distributed by Mrs. A. H. Curtis, the wife of the general manager.

For Sale.

By order of the joint receivers and liquidators of Messrs. Eastwood, Swingler & Co., Ltd., iron founders, engineers, &c., in voluntary liquidation, Messrs. Richardson & Linnell will sell by auction on March 8th, at St. James' Sale Rooms, Derby, the freehold property of about 13 acres, situate at Osmaston Road, Derby, formerly used as engineering, &c., works, with the workshops and machinery. Shipley Urban District Council invites offers for two 1,000-kW turbo-alternators, with condensing plant, and two 20,000-lb.-per-hour Babcock & Wilcox water-tube boilers, with chain-grate stokers.

Shoreditch Borough Council Electricity Department invites offers for the dismantling and removal of two 1,500-kW d.c. turbo-generating sets. Messrs. Leopold, Farmer & Sons will sell by auction on February 16th, at the London Auction Mart, 155, Queen Victoria Street, E.C., the modern manufacturing premises known as Arden Works, Pixmore Avenue, Letchworth, with vacant possession. Fuller, Horsey, Sons and Cassell, will sell by auction on February 15th and following day, at the Baltic Exchange, engineers' machine tools, electric motors, &c. (See our advertisement pages to-day.)

German Engineering Workers' Wages Demand.

A delegate meeting of Mannheim metal workers has decided to give notice of denunciation of the present wages agreement and to demand advances of 15 per cent. for skilled and 20 per cent. for unskilled workers. Mannheim is one of the chief centres of German engineering and motor manufacture.—*Reuter* (Mannheim).

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

CHEMICALS, &c.	Price Jan. 25th.	Fortnight's inc. or dec.
a Acid, Oxalic ... ... per lb.	5¾d.	...
a Ammoniac, Sal ... ... per ton.	£60	...
a Ammonia, Muriate (large crystal) ,,	£52	...
a Bisulphide of Carbon ... ... ,,	...	...
a Borax ... ... ,,	£25	...
a Copper Sulphate ... ... ,,	£25 10s.	...
a Potash, Chlorate ... ... per lb.	4d. to 4½d.	...
a ,, Perchlorate ... ... ,,	5½d.	...
a Shellac ... ... per cwt.	£13 10s.	...
a Sulphur, Commercial ... ... ,,	£9 10s.	...
a ,, Roll ... ... ,,	£9 10s.	...
a Soda, Chlorate ... ... per lb.	3½d. to 3¾d.	...
a ,, Crystals ... ... per ton.	£5 to £5 5s.	...
a Sodium Bichromate, casks ... per lb.	4d.	...
METALS, &c.		
b Aluminium, Ingots... ... ... per ton.	£107 to £112	...
b ,, Wire ... ... per lb.	1/6 to 2/-	...
b ,, Sheet ... ... ,,	1/8 to 2/9	...
p Babbitt's Metal and Anti-friction Metal—		...
Grade I ... ... per ton net.	£255	£7 dec.
Grade II ... ... ,, ,,	£180	£4 dec.
Grade III... ... ... ,, ,,	£96	£2 dec.
c Brass (rolled metal 2" to 12" basis) per lb.	9⅝d.	½d. dec.
c ,, Tubes (solid drawn) ... ,,	11¾d. to 1/-	½d. dec.
c ,, Wire, basis ... ... ,,	9½d.	½d. dec.

Under date January 22nd, Messrs. James Forster & Co. reported:—"Arrivals of lead show a tendency to decrease, and, apart from warehouse stocks, there is not too much metal available for early delivery. Demand from consumers this week has been quieter, but a steady consumption of lead is going on. The future is still rather obscure. The weak spot in the position is on the Continent, but last week a better demand was reported from Germany. The price is now at the lowest point touched for four years, and consumers would be well advised to cover their future requirements at the present level of prices."

Lighting and Power Notes.

Bedford.—Electricity Agreement.—The Electricity Committee has recommended that an agreement be entered into with the Ampthill Urban District Council regarding a supply of electricity to Ampthill, the cost being estimated at £8,750.

Bristol.—Loan.—The City Council is to apply for sanction to a loan of £31,165 for the laying of two additional cables from the Feeder Road power station and the erection of a substation to meet the increased demand for electricity in the Bristol East district.

Bury St. Edmunds.—Opposition to Bill.—The Town Council has decided to oppose the Bill being promoted by the East Anglian Electric Supply Co., Ltd., on the ground that one of the clauses would prevent the Corporation from supplying houses on the extended boundaries, and might also prevent it from supplying new streets with electricity for public lighting.

Continental.—Sweden.—The change-over from gas to electric lighting of the streets of Gothenburg, which was first commenced in 1922, has now been completed, this city being the first large town in Scandinavia to make such a complete change.

Austria.—Negotiations have been proceeding for some time past between the Vienna City Council and the Austrian works with the object of extending the municipal electricity works in Vienna. Orders of the value of about 50,000,000 schillings are to be given chiefly to the Siemens-Schuckert, Brown-Boveri, and the A.E.G.-Union companies.

Fleetwood.—Ice-Producing Plant Supply.—Extensions to a local ice-producing plant, at present worked by steam power, are contemplated, and the company is in negotiation with the Urban District Council with a view to obtaining a supply of electricity. New generating plant for the Council's station has been ordered for several months, and immediate delivery is now promised of the new 2,400-kW set.

Glasgow.—Wiring Scheme.—The Corporation electricity manager has submitted a report to the Electricity Committee regarding a supplementary scheme for the wiring of houses. The scheme, which is similar to the hire-purchase scheme at present in operation, is that there should be no initial payment on the installation being fitted up, and that the cost of the wiring should be spread over a period of 10 years, the effect of which would be that the quarterly payments would be less than half the payments under the 3-year system, but that there would be a greater total sum to pay in 10 years for interest and maintenance charges. The Property Owners' and Factors' Association has intimated that it would support generally any applications by tenants to wire premises, and is willing to co-operate with the department to ensure wiring agreements being taken over by succeeding tenants. The Committee has recommended that the scheme be adopted.

Supply to Housing Estate.—A letter from the Clyde Valley Electrical Power Co., relative to the provision of an electricity supply to the Corporation's Shettleston housing estate, has been considered by the Housing Committee. The estimated cost of overhead lines is £805, and of underground mains, £3,540. The Committee has recommended that the underground system be adopted.

Hawarden.—Electricity Extensions.—The Electricity Committee has had under consideration the second instalment of its electricity scheme, as submitted by the Council's consulting engineers (Sir Douglas Fox & Partners). Part of the scheme was approved, and the engineers were requested to revise the parts relating to Broughton and Bretton. The villages of Cymmau, Ffrith and Tryddyn were considered too small and too remote from any existing overhead line to warrant inclusion in the scheme.

India.—Madras Hydro-Electric Schemes.—It is reported that Messrs. Merz & McLellan, consulting engineers to the Indian Railway Board, who were asked to report on the Madras hydro-electric schemes, with special reference to railway electrification in South India, state that while the speeding-up of the hydro-electric programme is essential in view of the lack of fuel near the industrial areas of the south, it would be better to make a beginning in the areas immediately round about the source of power and gradually educate public opinion as to the utility of electrification. They do not recommend the extension of electrification to Madras for the time being, because the rates would be prohibitive owing to the cost of transmission. In these circumstances, the Government of Madras proposes to appoint a committee of officers to tour the area concerned and obtain definite undertakings from consumers of power. As soon as the committee completes its labours, the Government will formulate its policy and place the facts before the Legislative Council.—*Reuter's Trade Service* (Bombay).

Irish Free State.—Limerick.—At a recent meeting of the Electricity Committee, the revised draft agreement with Messrs. Siemens-Schuckert for a temporary supplemental supply of electricity from the Shannon works was submitted by the City electrical engineer and approved by the Committee.

Kingussie.—ELECTRICITY SCHEME.—The Town Council has under consideration an electricity scheme for the burgh, and at a recent meeting it was stated that a local company would be formed in the event of the Council's negotiations with the Grampian Electricity Supply Co. proving unsuccessful. In the meantime the Grampian Company has Parliamentary powers to supply electricity to the district, and it is understood that a commencement will be made with its scheme by August next.

Leeds.—LOAN SANCTIONED.—The Corporation has received sanction to a loan of £500,000, which includes provision for the cable-laying and linking-up which will be necessary in connection with the projected new generating station at Kirkstall.

WIRING OF SMALL HOUSES.—The Corporation has approved a recommendation of the Electricity Committee to adopt a scheme of assisted wiring and to operate the clause of the Electricity (Supply) Act for the wiring of premises and sale of appliances.

Lowestoft.—INQUIRY.—The *East Anglian Daily Times* reports that Col. T. C. Ekin, on behalf of the Electricity Commissioners, held an inquiry at the Town Hall on January 18th, into the applications of the Corporations of Lowestoft and Yarmouth, and the Southwold Electricity Supply Co., for Special Orders authorising them to supply electricity in certain areas of Norfolk and Suffolk. Lowestoft Corporation was also applying for sanction to a loan of £53,000 for extensions to its generating station. It was stated that Lowestoft Corporation was prepared to withdraw its application in respect of the Southwold area, and would raise no objection to the Southwold Company's application. A conference was then held between the representatives of the two Corporations, as a result of which Col. Ekin was informed that they had come to an agreement which would obviate all opposition to their applications for extensions to their areas of supply, and would involve the withdrawal of the Lowestoft Corporation's application for sanction to extend its generating station. An agreement had been entered into for the Yarmouth Corporation to provide Lowestoft with a supply of electricity in bulk. The proceedings were then closed.

London.—ST. PANCRAS.—The Borough Council has received sanction to the borrowing of £2,341 for switchgear at the Grafton Road sub-station, and £36,365 for the following purposes:—Mains and services, £25,406; meters, £8,078; wiring installations (for hire), £402; domestic appliances (for hire), £2,479. The Electricity Commissioners have requested the Council to furnish additional particulars in connection with its application for £20,090 for machinery.

ST. MARYLEBONE.—The Electric Supply Committee has recommended that application be made for sanction to loans of £8,000 and £12,000 for mains and services, respectively.

HACKNEY.—The Finance Committee has recommended to the Borough Council that application be made for sanction to a loan of £85,000 as working capital.

Norwich.—OPPOSITION TO BILL.—At a meeting of the City Council, on January 18th, it was decided to oppose the Bill promoted by the East Anglian Electric Supply Co., Ltd., to confer further powers on the company relative to the supply of electricity in the counties of Essex, Norfolk, and Suffolk.

LOANS.—Application is to be made for sanction to loans of £4,500 for the provision of trunk mains to Wymondham, Wroxham, and North Walsham, and £1,800 for transformers and switchgear.

Padiham.—WIRING OF SMALL HOUSES.—The Housing Committee of the Urban District Council has decided to have the new Council houses wired for electric lighting.

Palestine.—THE RUTENBERG SCHEME.—The Jerusalem correspondent of *The Times* reports that the Government has issued the Order for the expropriation of the land required at Jisr el Mejamie for the construction of the dam, power house, and other buildings connected with the Rutenberg scheme for damming the Jordan just south of its exit from the Sea of Galilee for the purpose of providing electricity for the whole of Palestine.

Preston.—LOAN.—The Corporation Electricity Committee has considered a resolution to apply for sanction to borrow £87,000 for the erection of overhead transmission lines between Preston and Blackpool. The Electricity Commissioners have intimated that application for borrowing powers for such work should be made by the Corporations responsible in each case. The Corporation will therefore apply for sanction to borrow £45,775, the estimated cost of the Preston section of the line.

ELECTRICITY SUPPLY.—Within the next few days, the Corporation will inaugurate a supply of electricity to Longton, Hutton, and Howick, distribution being by the overhead system. From the power station electricity will be transmitted by underground cables along the banks of the River Ribble, thence by overhead lines to the transformer station at Longton, and to two other sub-stations. The h.p. lines were erected by Callender's Cable & Construction Co., Ltd., and the l.p. lines by the Corporation. A large number of applications for a supply has been received, and many of the houses have already been wired.

Preesall.—LOAN.—The Urban District Council has applied for sanction to the borrowing of £1,100 for wiring installations and domestic apparatus to be let on hire.

Rawtenstall.—EFFECT OF COAL DISPUTE.—At a meeting of the Town Council on January 20th it was announced that, despite the heavy increase in costs consequent upon the coal dispute, there would be no increase in electricity charges. The advanced price of coal has cost the Corporation approximately £14,000, but a portion of this has been recovered through the coal clause in the contracts with power consumers.

Skegness.—ELECTRICITY SUPPLY.—The Urban District Council has decided not to accept the offer of the Skegness Electricity Supply Co., Ltd., to supply electricity for the bathing pool, orchestral piazza, and the boating lake at 9d. per kWh for lighting and 6d. per kWh for power, but has decided to install its own plant.

Southend-on-Sea.—LINKING UP STATIONS.—The Corporation Electricity Committee has received a report from the electrical engineer, together with estimates for the linking up of the Leigh, London Road and Thorpe Bay power stations. He recommended that the three stations be connected by 11,000-V h.p. mains, and that two 1,000-kW rotary convertors be installed at Leigh and London Road stations, and one of 500-kW capacity at Thorpe Bay station, together with the necessary switchgear, the estimated cost of the scheme being £50,800. The Committee submitted the report to the Electricity Commissioners, and were advised that the size of the mains should be increased from .2 sq. in. to .25 sq. in. The additional cost of .25-sq. in. mains is estimated at £2,000, and the Committee has recommended that application be made for sanction to the inter-connection scheme, and to a loan of £52,800 to cover the cost of the work.

CONSULTING ENGINEER.—The Town Clerk has notified the Committee that he has retained Mr. W. M. Selvey, consulting engineer, to advise the Corporation upon the future supply of electricity in the borough and neighbouring areas.

Sunderland.—ELECTRICAL DEVELOPMENT.—Since the completion of the scheme for laying mains in every street of the borough at Sunderland and the establishment of the hiring and hire-purchase system of lighting installations, new domestic consumers are being added rapidly by the electricity department, and already in the first nine months of the financial year the previous record number has been passed. Many new electrical contractors' showrooms have been opened. The electricity department is now beginning to feel the benefit of the revival of work in the Wear shipyards.

Swansea.—MAINS EXTENSIONS.—The Corporation Electricity Committee is to carry out mains extensions at a cost of £1,250.

PURCHASE OF COOKERS.—The Committee is to purchase 500 electric cookers at a cost of £6,000 for the houses on the Morriston estate.

HEATERS FOR THE MARKET.—The Committee has arranged for the installation of electric heaters at the market stalls.

United States.—ELECTRICAL DEVELOPMENT.—According to *Power*, one of the largest power expansions so far carried out or planned in the greater Pittsburgh area will be undertaken in the near future as a result of the placing of a second contract for a 48,500-kVA turbo-generator to be installed at the Colfax Station of the Duquesne Light Co. by the Byllesby Engineering and Management Corporation. This is the most important plant operated by the Duquesne Light Co., which ordered the two large sets from the Westinghouse Electric and Manufacturing Co. The first order was placed several months ago. In addition to the two turbo-generators, which will have a combined output of approximately 120,000 h.p., the contracts call for two steam condensers of 62,500 sq. ft. each, as well as a 100,000-kVA bank of transformers to operate at 84,300 V. Included in the auxiliary equipment are 26 circuit breakers, 10 of which set a record for this type of apparatus. These, which are said to have the largest interrupting capacity of any breakers ever built, are rated at 2,650,000 kVA at 11,000 volts. Including the main generating units and all auxiliary equipment, the two contracts call for a total outlay of approximately $2,000 000. At the present time there are in operation at the Colfax Station four turbo-generators, totalling 210,000 kVA. When installed next year the two additional units will raise the generating capacity to approximately 300,000 kVA.

West Riding.—ELECTRICITY BILL.—Reporting upon the Yorkshire Electric Power Bill, the West Riding County Council states that many new powers are sought, the chief of which is to apply for Special Orders to supply electricity in bulk outside the company's limits of supply. Under its existing powers the company can only supply electricity for lighting to authorised distributors, and cannot, except in special circumstances, supply it direct to consumers, but if the powers now sought are granted, it will be able to apply for an Order for the distribution of electricity for lighting in any district in which a Special Order is not already in operation. The views of the District Councils' Association have been invited.

Wrotham (Kent).—PROPOSED ELECTRICITY SUPPLY.—The Urban District Council has received a communication from Mr. T. Stevens, of Lincolns Inn Fields, London, asking, on behalf of a client, whether the Council proposed to develop any scheme of electricity supply for the district, and, if not, whether it would support the establishment of a company to carry out a scheme. The matter has been referred to a committee for consideration and report.

Tramway and Railway Notes.

Bradford.—OPPOSITION TO BILL.—Since the approval by a ratepayers' meeting, on January 14th, of the Corporation's Parliamentary Bill for powers to extend its railless-car and motor'-bus services within and without the city, considerable opposition has been raised. Three petitions to be presented in Parliament against the Bill will be (1) from the Bradford Chamber of Trade, Property Owners' Association, and motor-'bus and transport proprietors' associations; (2) the Yorkshire (Heavy Woollen District) Tramways Co.; and (3) a combination of 'bus proprietors already serving areas outside the city which are affected by the Corporation's proposed extended 'bus routes. Several urban and parish councils in the Wharfedale area are opposing the Bill, and the West Riding County Council has declared its intention to oppose it unless terms are come to with the Corporation.

Continental.—SWITZERLAND.—Work on the electrification of the Federal Railway between Puidoux and Rupperswil has been completed, and the electrical supply for the line was inaugurated on January 18th. Electricity is supplied at a pressure of 132,000 V.

The electrification work on the section of the railway between Feldkirch and Buchs in the Tyrol which is being jointly worked by the Swiss and Austrian State Railway authorities has recently been completed, and is now in operation.

ITALY.—A contract has been signed at the Ministry of Communications for the construction of hydro-electric plants in the Borbera Valley to supply electricity to the Piedmont, Ligurian, Lombard, and Emilian group of railways. The contract is the result of an agreement arrived at between the State Railways, the provincial administration of Alessandria, and the Società Elettrica Interregionale Cisalpina, of Milan. The scheme includes the construction of a large artificial lake with a capacity of 160,000,000 cu. m. The lake will yield, by means of two falls of an aggregate height of 220 metres, about 20,000 h.p.—*Reuter's Trade Service* (Milan).

Croydon.—ABANDONMENT OF TRAMWAY.—At a meeting of the Borough Council, on January 24th, it was decided to cease working the Addiscombe tramway route after March 31st next. The track is worn, and complaints as to its condition have been received. The estimated cost of reconstruction was £50,000.

Increase of Charges.—The Minister of Transport has made Orders under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918, authorising certain fare changes by the following tramway and light railway authorities:—The Corporations of Kirkcaldy, York, Maidstone, Colne, Haslingden, Burton-on-Trent, Accrington, Barrow-in-Furness, Preston, Burnley, Luton, Dundee, and Gloucester, the Urban District Councils of Pontypridd, Barking Town, and Aberdare, and the Kidderminster and Stourport Electric Tramways Co., Norwich Electric Tramways Co., Scarborough Tramways Co., Musselburgh and District Electric Light and Traction Co., Ltd., Bath Electric Tramways Co., Hastings Tramways Co., Dundee, Broughty Ferry and District Tramways Co., Llandudno and Colwyn Bay Electric Railway, Ltd., Llanelly and District Electric Supply Co., Ltd., Cheltenham and District Light Railway, and London United Tramways, Ltd. These Orders will remain in force until December 31st next.

India.—RAILWAY ELECTRIFICATION.—According to *Indian Engineering*, the G.I.P. Railway has decided to erect an independent power station in connection with its scheme to electrify the lines between Bombay and Igatpuri and Bombay and Poona. The site has been chosen at Kalyan. The cost of building and equipping the station is estimated at Rs.100 lakhs, of which Rs.90 lakhs will be spent on generating plant and transmission lines. The order for these will be placed in England through the High Commissioner for India.

London.—"UNDERGROUND" DEVELOPMENTS.—The Underground Group has issued a report, giving details of the progress made on its undertakings during the past year, and works in progress or contemplated during the current year. The most important contribution during 1926 was the extension of the City line from Clapham Common to Morden, and the linking up of the Hampstead and City railways between Charing Cross and Kennington. Approximately 16,000,000 passengers have been carried on these extensions since their opening in September last. Lifts at various stations were replaced by escalators, and there are now 61 escalators in use. A number of ticket and change-giving machines were introduced, and passimeters have superseded the old type of booking office at eight stations. New rolling stock included 194 cars, most of which were required for the Morden line service. A general scheme for remodelling the existing C.L.R. rolling stock was commenced, and a few of the reconditioned cars are now in use on this line. On the tramways a new type of car was introduced, fitted with upholstered cross seats, and 46 of these cars were put into service during the year on the M.E.T. and L.U.T. systems. During the present year the reconstruction of Bond Street, Blackfriars, and Temple stations will be completed, and additional escalators installed at a number of stations. There will be 72 escalators in operation by the end of the year. Extensions of the Acton works will be completed during the year, another 25 new cars will be put into service, and all the 300 remodelled cars on the C.L.R. and Hampstead lines will be completed. New tramcars are to be put into service, and an entirely new type of tramcar, of which details will shortly be announced, is to be introduced.

STOKE NEWINGTON.—The Borough Council has received a letter from the chief general manager stating that, having regard to all the circumstances existing at the present time, the London & North-Eastern Railway Co. does not contemplate electrifying the Liverpool Street-Enfield line in the immediate future.

Swansea.—MUMBLES LIGHT RAILWAY.—The Corporation Tramways Committee is urging the Swansea Improvements and Tramways Co. to proceed with the electrification of the Mumbles railway as soon as possible.

United States.—RAILWAY ELECTRIFICATION.—The Electric *Railway Journal* states that the Chicago, South Shore, and South Bend Railroad is to carry out improvements to its system during the present year at an approximate cost of $2,000,000, which will include new cars, construction, and other extensions of facilities. Work carried out during 1926 included the changing-over from a.c. to 1,500-V d.c., the construction of eight sub-stations, four of which are mercury-arc rectifier stations, and the reconstruction of the overhead system.

Telegraph and Telephone Notes.

Italy.—SWEDISH TELEPHONES.—Mr. Piltz, principal of the undertakings of the L. M. Ericsson Co. in Italy, states that progress is being made not only in connection with the concession company in the South of Italy, but also with the Società Ericsson Italiano, which was formed in Genoa last year. The area of the concession comprises a district in the south about a line drawn between Naples and Rome, and since the company took over the concession in July, 1925, the number of subscribers has increased from 17,700 to 20,376 last October. The Genoa company has also obtained contracts for deliveries for the other four concession districts.

Radio at Sea.—RECORD SHORT-WAVE TRAFFIC.—The Cunard liner *Carinthia*, which is at present engaged on a round-the-world pleasure cruise from New York, has just achieved record-breaking commercial communication between ship and shore. When off Cape Leeuwin, Australia, she worked with the New Brunswick station, New Jersey, owned by the Radio Corporation of America, at a distance of nearly 12,500 miles. Before leaving this country, the vessel was fitted with a special short-wave transmitting and receiving installation manufactured by Messrs. Siemens Bros. & Co., Ltd., Woolwich, at the request of the shipowners. The apparatus was specially designed for the ship, and arrangements were made in the installation to permit tests to be carried out with a view to ascertaining the most favourable arrangements and most appropriate wave-lengths. A special single-wire aerial was erected to which the transmitter was inductively coupled, but arrangements were also made so that the ship's main aerial could be employed as an alternative. The transmitter has a wave range of from 25 to 50 metres and employs a specially-constructed 500-watt anode dissipation (intermittent rating) valve, capacity-reaction being employed to control the oscillations. The necessary high-voltage can be obtained either as rectified a.c. from the vessel's long-wave continuous-wave transmitter, or from a specially-designed d.c./d.c. high-voltage machine installed underneath the operating table. Low-voltage for the filament is obtained either from the long-wave c.w. transmitter or from a special winding on the machine referred to above. The whole of the transmitting gear is mounted in a wooden case, which is metal lined for screening purposes. The receiver consists of a simple single-valve circuit thoroughly screened. Special precautions have been taken to minimise any local effects, *e.g.*, the operator manipulating the tuning devices. The instrument covers a range of from 10 to 100 metres, and can be coupled with the ship's low-frequency amplifier in order to intensify signal strength, if necessary. Through the co-operation of the British Post Office, arrangements were made for traffic to be worked through its research station at Dollis Hill, and the Radio Corporation of America also arranged for messages to be transmitted from and received at its stations at New York and San Francisco. During the Christmas season the *Carinthia* despatched 700 greetings by wireless direct to the Radio Corporation's American stations when the vessel was approaching New Zealand, at an average distance of about 10,000 miles. She is the first British vessel to handle commercial messages on short waves (*i.e.*, under 100 metres) with a British Post Office station.

Turkey.—TELEPHONE CONCESSION.—An agreement has been made between the city of Smyrna and the L. M. Ericsson Co., granting a concession for 35 years for the installation and operation of a telephone service in Smyrna and the surrounding district. A special company with a capital of about $212,000 has been formed, says *Commerce Reports*, with the city and the company as shareholders. The first telephone station, which will be automatic, will begin with 2,000 lines, to be enlarged later to 10,000.

Venezuela.—WIRELESS-TELEGRAPHY.—The Government has bought about 118 acres of high-lying land for a radio-telegraph station in the Cutia sub-division of the Federal District (population 140,000), at a cost of 600,000 bolívares (1 bolívar = 9½d.)—*Reuter's Trade Service* (Caracas).

Radio Notes.

Australia.—DISPUTE OVER ROYALTIES.- Wireless dealers in Melbourne and Sydney have formed a co-operative company to contest the demands of Amalgamated Wireless (Australasia), Ltd., which claims a royalty on apparatus covered by 145 patents.—*Reuter* (Melbourne).

Austria.—NEW STATION.—It is understood that the official inaugural ceremony of the Klagenfurt station, wave-length 272.7 metres, will take place on January 30th; this is claimed to be one of the best relay transmitters in Europe.

Germany.—NEW STATION.—The official inauguration of the Langenburg station took place on January 15th, the programme being broadcast from Cologne and relayed from the new station.

POWER RATING.—According to *World Radio*, though the power and range of all the following German stations remain unaltered, their transmitting strength will from now onwards, in accordance with the agreement recently concluded at Geneva, be stated as follows:—

	Wave-length.	Old kW figure.	New kW figure.
Koenigswusterhausen	1,300	10	8
Frankfurt (Main)	428.6	10	4
Hamburg	394.7	10	4
Leipzig	365.8	9	4
Münster	241.9	3	1.5

The low-power stations, Elberfeld (468.8 m.), Bremen (400 m.), Hanover (297 m.), Dresden (294 m.), Dortmund (283 m.), Cassel (272.5 m.), Kiel (254.2 m.), and Gleiwitz (250 m.), hitherto represented by 1.5 kW, will now have each 0.7 kW. Langenberg will have 25 kW, instead of 60 on the old basis.

Licences.—STEADY INCREASE.—The number of licences issued for the use of broadcast receiving sets is still increasing. The total on January 1st was 2,179,000, representing an increase of 48,000 during December, 1926.

Poland.—LICENCES.—The Commercial Secretary at Warsaw (Mr. R. E. Kimens) has forwarded to the Department of Overseas Trade statistics from which it appears that, although the number of licences increased from 4,977 in 1925 to 34,556 in 1926, the number of dealers in, and manufacturers of, wireless plant decreased from 269 to 239, indicating that Poland has also experienced the usual process common to the initiation of a wireless industry, in that numbers of small firms which had gone into the business lacking both experience and capital, have not been able to withstand even favourable conditions.

South Africa.—STATION TO CLOSE DOWN.—It is officially announced that JB, the Johannesburg broadcasting station, is to close down on the 31st inst.—*Reuter* (Johannesburg).

Mr. I. W. Schlesinger has offered, on behalf of African Theatres, Ltd., to undertake the management of a new company to control wireless broadcasting in the Union. This is considered by many to be the only possible solution of the existing financial problem, says *The Times*. Mr. Schlesinger's offer envisages broadcasting as a national concern. The next move therefore lies with Cape Town and Durban, where the other broadcasting stations of the Union are situated. There is some doubt whether they are willing to fall into line, but negotiations are in progress between the three stations and the Minister of Posts and Telegraphs. It is evident that the most stringent regulations affecting the sale and use of apparatus should be laid down, and that the strongest possible measures should be adopted by the Government to eliminate unlicensed listeners before broadcasting can be placed on a really satisfactory basis in that country.

Santo Domingo.—NEW STATION.—A broadcasting station, the first of its kind in the Dominican Republic, is shortly to be erected at Monte Cristy in accordance with plans adopted by the Minister of Promotion and Communications. A preliminary grant of 30,000 dollars has been provided for in the 1927 Budget for the installation of a 1,000-watt station. Broadcasting is to be used for literary, scientific, and other educational purposes, and as a means of propaganda for commercial, agricultural, and sanitary measures.—*Reuter's Trade Service* (Santo Domingo).

Wave-lengths.—MORE CHANGES.—On Sunday, January 23rd, the B.B.C. indulged in another re-shuffle of station wave-lengths, those affected being enumerated below:—

Station.	Old wave-length, metres.	New wave-length, metres.
Birmingham	491.8	326.1
Bournemouth	326.1	491.8
Bradford	254.2	252.1
Edinburgh	294.1	288.5
Hull	288.5	249
Stoke	288.5	249
Dundee	288.5	249
Swansea	288.5	249

The 249-m. wave is the international common wave-length.

Several Continental stations, besides those in this country, have changed and exchanged wave-lengths for test purposes recently.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Armthorpe (Yorkshire).—February 15th. Education Department. Electric lighting installation at new school. Education Committee, West Riding County Hall, Wakefield.

Argentina.—BUENOS AIRES.—March 15th. Ministry of Marine. Machinery in connection with the extension of electrical generation (involving the enlargement of two existing power stations and the construction of two new ones) at the Naval Base, Puerto Belgrano. (B.X. 3140.)*

March 24th. Department of Navigation and Ports. Electric cranes, pumps, &c. (A.X. 4087.)*

Australia. — MELBOURNE.—March 14th. City Council. 6,600-V, 3-phase switchgear. (B.X. 3138.)*

March 8th. Postmaster-General's Department. Induction coils and registers. (B.X. 3136); testing instruments (B.X. 3132.)*

March 1st. Accumulators and plates. (B.X. 3170)*; motor-generator sets. (B.X. 3172.)*

March 7th. State Electricity Commission of Victoria. Paper-insulated lead-covered control cable. (B.X. 3137.)*

March 14th. D.c. switchgear and accessories. (B.X. 3131.)*

SYDNEY.—March 9th. New South Wales State Railways. Two sets of electric overhead travelling crane equipments. (A.X. 4103.)

Belfast.—February 5th. Electricity Department. One induction motor-driven vertical type centrifugal pump. (January 21st.)

February 18th. Electricity Department. Twelve months' supply materials, including electrical accessories, lamps, carbon brushes, cables, &c. (See this issue.)

Bristol.—February 18th. Electricity Committee. Coal and ash-handling plant, and railway sidings; circulating-water screening plant. (See this issue.)

Clacton.—February 2nd. Electricity Department. Two 1,125-b.h.p. Diesel oil engines, direct coupled to 750-kW, 3-phase alternators; two 750-kW alternators, two rotary-convertors, and e.h.p. switchgear. (January 21st.)

Douglas.—February 28th. Corporation. 3½ miles of e.h.p. cable, two synchronous motor alternators. (January 21st.)

Dundee.—February 21st. Electricity Department. Two water-tube boilers with superheaters, economisers, mechanical stokers, and coal-handling plant. (See this issue.)

Eastbourne.—February 21st. Electricity Department. E.h.p. cable, static transformers, and e.h.p. switchgear. (See this issue.)

Edinburgh.—February 14th. Electricity Supply Department. E.h.p. and l.p. switchgear, e.h.p. and pilot cables. (January 21st.)

January 31st. Corporation. Structural steel work for extension of turbine house, Westbank, Portobello generating station City architect.

Greenock.—February 2nd. Corporation. Electric lighting installation at eight tenements (48 apartments). Schedules from Public Works Office.

Huddersfield.—February 19th. Town Council. Electrician's work at maternity home, Greenhead Road. Borough Architect, 26, Ramsden Street.

Ilford.—February 1st. Electricity Department. 660-V, l.p. paper-insulated cables. (January 21st.)

Leeds.—February 18th. Electricity Department. Twelve months' supply of stores, including cables, mains boxes and fittings, jointing and insulating materials, &c. (See this issue.)

London.—LONDON COUNTY COUNCIL.—January 31st. Electrical installation at the Hornsey Rise housing estate (approx. 1,100 wiring points). (January 21st.)

HAMMERSMITH.—February 16th. Electricity Department. Twelve months' supply of stores, including several electrical items. (January 21st.)

SHOREDITCH.—February 23rd. Electricity Department. One 1,500-kW automatic sub-station converting equipment and one 20-ton electrically-operated overhead travelling crane. (See this issue.)

Macclesfield.—January 31st. Rural District Council. Electric generating plant to supply 24 houses at Gawsworth, consisting of engine, battery, switchboards, cable, small motor and pump; wiring for electric light installation, including lamps and meters. Mr. Geo. Clayton, architect, 4, Wellington Street, Stockport.

Manchester.—January 31st. Electricity Department. Two electrically-driven circulating-water pumps, piping, &c. (January 14th.)

January 31st. 12,000 yd. of 3-in. weldless steel spigot and faucet tubes; street lanterns. Mr. H. C. Lamb, chief engineer and manager, Electricity Department.

February 4th. One 1,500-kW and one 750-kW motor convertors, with switchgear. (January 21st.)

New Zealand.—AUCKLAND.—March 22nd. Harbour Board. Electric motors, gearing, shafting, and control gear for the operation of vehicular and passenger gangways at the New Devonport Ferry Wharf. (A.X. 4102.)*

WELLINGTON.—March 4th. Poverty Bay Electric Power Board. Switchgear and transformers. (B.X. 3160.)*

Peterborough.—February 28th. Electricity Department. One 12,000-kW turbo-generator, with foundations, condensers, air and extraction pumps, air cooler, oil cooler, and pipework, e.h.p. switchgear, coal-handling plant, &c. (See this issue.)

Portsmouth.—Electricity Department. Coal-handling plant. (See this issue.)

Salford.—February 4th. Electricity Committee. Steelwork for electricity showrooms, Chapel Street. Mr. C. Swain, architect, 12, Exchange Street, Manchester.

South Africa.—JOHANNESBURG.—February 10th. Municipal Council. Electric cable. (B.X. 3130.)*

Spalding.—February 26th. Urban District Council. 28 sets of centrifugal pumps (for sewage pumping), including electric motors, automatic starters, floats, valves, pipes, &c. Mr. C. F. Murphy, Lloyd's Bank Chambers, Morpeth.

Stoke-on-Trent.—February 9th. Electricity Department. Steam and water piping, valves, &c., constructional steel work, platforms, crane gantries, &c. (January 7th.)

Static transformers, sub-station switchgear. See this issue.)

Tilbury.—February 12th. Urban District Council. H.t. underground cables, l.p. distribution mains, house services, transformers, h.p. and l.p. switchgear and conversion of public street lamps. (See this issue.)

Torquay.—Electricity Department. Two vertical circulating-water pumps for Newton Abbot power station. (January 21st.)

Uruguay.—MONTEVIDEO.—March 2nd. State Electricity Works. Lead fuse wire, silver fuse wire, switches, cable end boxes, compound and insulating type. (B.X. 3159.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Blackpool.—Housing Committee.

Wiring 112 houses on the "J. & P." wiring system.—R. Darbyshire, Ltd.

Brighton.—Lighting Committee. Accepted:—

Turbine with Metropolitan-Vickers alternator and Vickers, Ltd., condenser (£53,840).—Richardsons, Westgarth and Co., Ltd.

Tramways Committee. Accepted:—

120 tons steel girder tram rails (£1,329).—Cargo Fleet Iron Co., Ltd.

Douglas (I. of M.).—Electricity Committee. Accepted: 400 tons fuel oil (92s. 6d. per ton).—Anglo-American Oil Co., Ltd.

Glasgow.—Corporation. Recommended:—

Installation of electric lighting in Govan Registration Office.—J. Cunningham.

Electrical installation at Possil housing scheme (£1,723).—R. J. Sinclair.

Tramways Committee. Recommended:—

Lead-covered cable.—Standard Telephones & Cables, Ltd.; Hackbridge Cable Co., Ltd.

Government Contracts.—The following contracts were placed by various Government departments during December, 1926:—

ADMIRALTY (CONTRACT AND PURCHASE DEPARTMENT).

Aluminium sheets.—British Aluminium Co., Ltd.
Battery fittings.—Chloride Electrical Storage Co., Ltd.
Junction boxes.—Hawkers, Ltd.; Pinnacle Switchgear, Ltd.; General Electric Co., Ltd.
Electric cable.—Enfield Cable Works, Ltd.; General Electric Co., Ltd.; Macintosh Cable Co., Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephone and Cables, Ltd.; British Insulated Cables, Ltd.
Cells.—General Electric Co., Ltd.; Edison Swan Electric Co., Ltd.
Electric heating elements.—Credenda Conduits Co., Ltd.
Table fans.—General Electric Co., Ltd.
Insulating materials.—Connollys (Blackley), Ltd.; Ioco Rubber & Waterproofing Co., Ltd.; McBean & Co
Electric lamps.—General Electric Co., Ltd.; British Thomson-Houston Co., Ltd.; Edison Swan Electric Co., Ltd.; Siemens & English Electric Lamp Co., Ltd.; Metro-Vick Supplies, Ltd.
Micanite.—Micanite & Insulators Co., Ltd.; Mica and Micanite Supplies, Ltd.; Mica Products, Ltd.; R. Whiffen, Ltd.
Motor-generating set.—Harland Engineering Co., Ltd.
Motors.—Laurence Scott & Co., Ltd.
W/t transmitters and keys.—Gambrell Bros., Ltd.
W/t valves.—Mullard Radio Valve Co., Ltd.; General Electric Co., Ltd.; Edison Swan Electric Co., Ltd.
Copper wire.—Ward & Goldstone, Ltd.; Connollys (Blackley), Ltd.; Concordia Electric Wire Co., Ltd.; British Insulated Cables, Ltd.
Enamelled copper wire.—British Insulated Cables, Ltd.
X-ray apparatus.—A. E. Dean & Co.

WAR OFFICE.

Aluminium ingot.—British Aluminium Co., Ltd.
Submarine cable.—Standard Telephones & Cables, Ltd.
Petrol-electric crane.—Ransomes & Rapier, Ltd.
Electric light conduit and fittings.—General Electric Co., Ltd.
Generating sets.—W. H. Dorman & Co., Ltd.

AIR MINISTRY.

Inert batteries.—Siemens Bros. & Co., Ltd.
Storage batteries (Henlow).—Hart Accumulator Co., Ltd.
Dynamometer.—Laurence Scott & Co., Ltd.
Switch boxes.—Plessy Co. (1925), Ltd.

POST OFFICE.

Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; Ericsson Telephones, Ltd.; Peel-Conner Telephone Works, Ltd.; Siemens Bros. & Co., Ltd.
Telegraph apparatus.—Creed & Co., Ltd.
Testing, protective and miscellaneous apparatus.—T. Watson.
Telephone cabinets.—W. A. Collins, Ltd.
Cable.—British Insulated Cables, Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; General Electric Co., Ltd.; W. T. Glover & Co., Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; Standard Telephones & Cables, Ltd.; Union Cable Co., Ltd.
Joint-box castings.—General Foundry & Eng. Co., Ltd.
Loading coils.—General Electric Co., Ltd.
Ebonite.—Sterling Telephone & Electric Co., Ltd.
Flameproof wire.—Macintosh Cable Co., Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.; British Insulated Cables, Ltd.; Elliotts Metal Co., Ltd.; R. Johnson and Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith and Co., incorporated in the London Electric Wire Co. & Smiths, Ltd.
Replacing battery, Grimsby automatic telephone exchange.—D.P. Battery Co., Ltd.
Manufacture, supply, drawing-in and jointing cable (Dewsbury-Wakefield).—British Insulated Cables, Ltd.
Telephone exchange equipment.—Buckhurst, Worcester: General Electric Co., Ltd. Fforestfach (Swansea multi-exchange area), Dunlop Rubber Co., Ltd. (S.W.): Siemens Bros. & Co., Ltd. Sub-contractors: Small Electric Motors, Ltd., for dynamotor. Kay, Son & Co., Ltd. (E.C.), Rochdale: Standard Tele-

phones & Cables, Ltd. Sub-contractors: Chloride Electrical Storage Co., Ltd., for batteries, Crompton and Co., Ltd., for machines. Morrison & Co., Ltd. (Glasgow), Illustrated London News and Sketch, Ltd. (W.C.), Bristol Corporation, W. S. Crawford, Ltd. (W.C.), Crabtree & Co., Ltd. (Walsall), G. & R. Dewhurst (1926), Ltd.: Relay Automatic Telephone Co., Ltd.

Telephone repeater equipment, G.P.O. (South).—Standard Telephones & Cables, Ltd.

Telephone repeater station power plant (Glasgow).—Newton Bros. (Derby), Ltd.

CROWN AGENTS FOR THE COLONIES.

Battery materials.—Siemens & General Electric Railway Signal Co., Ltd.

Telephone switchboard.—Relay Automatic Telephone Co., Ltd.

Train-lighting equipments.—J. Stone & Co., Ltd.

H.M. OFFICE OF WORKS.

Wiring Edinburgh Castle.—A. & J. Morgan, Ltd.

Hamilton.—Town Council. Accepted:—

New switchboard at the burgh electricity works.—Metropolitan-Vickers Electrical Co., Ltd.; cables (£1,229), Edmundson's Electricity Corporation.

Hythe (Kent).—Town Council. Accepted:—

Tenders in connection with the erection of 68 houses:—

Wiring and fittings (£377).—Flack & Johnson.

Cable work (£238).—Folkestone Electric Supply Co., Ltd.

Irish Free State.—DUBLIN.—Commissioners of Public Works.

Heating and electric lighting installation, Ballyconnell House Preparatory College.—Haden's Engineering Co., Ltd.

Vacuum cleaning plant, Custom House, Dublin.—A. H. Masser (Sturtevant Eng. Co., Ltd.).

Extension of electric lighting at the Phœnix Park Ordnance Survey Office.—Handley & Robinson, Ltd.

—Irish Builder and Engineer.

Controller of Stores (Posts and Telegraphs).

Bell sets.—Siemens Bros. & Co., Ltd.

Bells (telephone).—Phœnix Telephone and Electric Works, Ltd.

Cable.—W. F. Dennis & Co.; W. T. Henley's Telegraph Works Co., Ltd.; Victor Zorn (C. J. Vogel, Coepenick).

Electric torches.—Edison Swan Electric Co., Ltd.

Generators (telephone).—Peel-Conner Telephone Works.

Indicators (telephone).—Phœnix Telephone and Electric Works, Ltd.

Insulators, various.—W. F. Dennis & Co.; Litholite Insulators, Ltd.; Goerz Bros. and Kellie (Ireland), Ltd.; General Electric Co., Ltd.

Telephone jacks.—Phœnix Telephone and Electric Works, Ltd.; Ericsson Telephones, Ltd.

Telephone keys.—Sterling Telephone and Electric Co., Ltd.

Monophones, various.—Theodore Gary & Co.

Valves (wireless).—General Electric Co., Ltd.; Marconi (Ireland), Ltd.

Wireless parts.—Marconi's Wireless Telegraph Co., Ltd.

Wire.—Concordia Electric Co., Ltd.; Hayward Co.

—Irish Electrician.

Dublin United Tramways Co.

Traction lamps.—Edison Swan Electric Co., Ltd.

London. — METROPOLITAN WATER BOARD. — Works Committee. Two steam-driven electric generators (one 100 kW and one 50 kW), switchboard, piping, &c., for Kempton Park pumping station:—

E. S. Hindley & Sons	£2,135
Ashworth & Parker. (Accepted.)	**2,283**
W. H. Allen, Sons & Co., Ltd.	2,480
James Howden & Co., Ltd.	2,486
Mather & Platt, Ltd.	2,554
Browett, Lindley & Co., Ltd.	2,549
Belliss & Morcom, Ltd.	2,749
E. Reader & Sons, Ltd.	2,750
Peter Brotherhood, Ltd.	2,792
General Electric Co., Ltd.	2,848

SHOREDITCH.—Electricity Committee.

Electrical installation at Horner House (£1,124).—Electrical Installations, Ltd. (in place of tender of Messrs. Toy & Winslow, £1,042, withdrawn).

STEPNEY.—Electricity Supply Committee.

20 tons pitch (£141).—Gas Light & Coke Co. (Accepted.)

50 cast-iron chambers, frames and covers (£142).—E. and F. Wright. (Accepted.)

Fifty 2-way t c/c disconnecting boxes (£105).—Universal Electrical Mfg. Co. (Recommended.)

Six 1,500-kW motor-convertors and switchgear for sub-stations:—

Ateliers de Constructions Electriques de Charleroi. (Recommended.) ...	**£14,900**
Metropolitan-Vickers Electrical Co., Ltd. ...	52,199
English Electric Co., Ltd.	52,839
General Electric Co., Ltd.	56,367
British Thomson-Houston Co., Ltd.	61,090
Bruce Peebles & Co., Ltd.	67,137

AIR MINISTRY.

"Mazda" metal-filament lamps.—British Thomson-Houston Co., Ltd.

Preston.—Electricity Committee. Recommended:—

Transformer equipment for sub-stations (£4,188); fuses and fittings (£1,000).—English Electric Co., Ltd.

Sheffield.—Electricity Committee. Accepted:—

Three e.h.p. feeder switches and alteration to existing equipment at Neepsend generating station (£4,025).—A. Reyrolle & Co., Ltd.

Tramways Committee. Accepted:—

500 steel tramcar tires (£1,706).—Vickers, Ltd.

Southend-on-Sea. — Electricity Committee. Recommended:—

Meters (£3,227).—Chamberlain & Hookham, Ltd.

Tynemouth.—Electricity Committee. Accepted:—

Six lots of cable.—Macintosh Cable Co., Ltd.

Feeder pillar.—British Insulated Cables, Ltd.

Forthcoming Events.

Junior Institution of Engineers.—Friday, January 28th. London. 7.30 p.m. "Design of High-Pressure Sub-Stations." Mr. C. E. Atkinson.

Friday, February 4th. "Theory of the Gyroscopic Compass." Mr. F. R. Jackson.

Physical Society.—Friday, January 28th. Imperial College of Science, S.W.7. 5 p.m. Ordinary meeting.

Birmingham Electric Club.—Friday, January 28th. Grand Hotel. 7 p.m. Presidential address.

Institution of Engineering Inspection.—Friday, January 28th. Royal Society of Arts. 7.30 p.m. "Manufacture and Uses of Arsenical Copper." Mr. J. Taverner.

Electrical Society of Glasgow.—Tuesday, February 1st. 30, Gordon Street, Glasgow. 7.30 p.m. "Electric and Hydraulic Lifts." Mr. J. H. Meacock.

National Association of Supervising Electricians.—Tuesday, February 1st. Junior Institution of Engineers. 7.15 p.m. "Possibilities of Development of Water Power in Great Britain and Ireland." Mr. G. L. Addenbrooke.

Paisley Association of Electrical Engineers.—Tuesday, February 1st. Town Hall. 7.30 p.m. "Street Lighting." Mr. J. E. Adam.

Roentgen Society.—Tuesday, February 1st. 32, Welbeck Street. 8.15 p.m. Ordinary scientific meeting.

Institution of Mining Engineers.—Wednesday, February 2nd. Institution of Mechanical Engineers, London. 11 a.m. Annual general meeting.

Institution of Electrical Engineers.—Thursday, February 3rd. London. 6 p.m. "Some Recent Advances in A.C. Measuring Instruments." Lieut.-Col. K. Edgcumbe and Mr. F. E. J. Ockenden.

(Wireless Section).—Wednesday, February 2nd. London. 6 p.m. "The Purpose and Design of Broadcast Receivers." Mr. C. F. Phillips.

(Mersey and North Wales (Liverpool) Centre).—Wednesday, February 2nd. University Club. 7 p.m. Annual dinner.

(Scottish Centre, Students' Section).—Wednesday, February 2nd. Royal Technical College, Glasgow. 7.30 p.m. Discussion.

(North-Western Students' Section).—Tuesday, February 1st. Milton Hall, Manchester. 7.30 p.m. "Alternating-current Bridge Methods." Mr. F. W. Fryer.

(South-Midland Centre, Wireless Sub-Section).—Wednesday, February 2nd. University, Birmingham. 7 p.m. "Transatlantic Telephony." Lt.-Col. A. G. Lee.

Edinburgh Electrical Society.—Thursday, February 3rd. Royal Scottish Society of Art. 8 p.m. "Country Distribution." Mr. J. S. Thomson.

Diesel Engine Users' Association.—Friday, February 4th. Discussion on "Report on Heavy Oil Engine Working Costs for 1925-26."

Institution of Mechanical Engineers.—Friday, February 4th. London. 7 p.m. "Engineering Salesmanship." Mr. W. Reavell.

Royal Institution.—Friday, February 4th. "Wireless Transmission and the Upper Atmosphere." Prof. E. V. Appleton.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, February 5th. Annual dinner at Cox's Café, Cardiff.

Notes.

Lecture.

Professor Cramp, of the Electrical Engineering Department of the Birmingham University, who spoke on the subject of cheapening the domestic electricity supply in a mid-day address at the Birmingham Y.M.C.A. on January 19th, gave practical examples of supplying heat through floors for offices, and through stoves which received the heat during the night and gave it off during the day. The principle underlying this cheap supply was that the current must be on during certain hours only, and this was operated, in practice, by automatic switching arrangements. He suggested that consumers ought to ask to be allowed to take electricity for domestic purposes at a very low rate during those hours when the generators were not loaded up.

The Batti-Wallahs' Society.

The Society attains its 21st birthday this month, and the Committee hopes to make 1927 a notable year in celebration of the event. On Tuesday, February 1st, at the Engineers' Club, an informal supper and concert will be held. An additional item is that Past-president M. S. Chambers will emerge from retirement to crack the "Jokes in the Bayeux Embroidery." On Wednesday, February 16th, a luncheon will be held at the Hotel Cecil, when Sir Duncan Watson will address the members on "The Prospects of the Electrical Industry." On Tuesday, March 22nd, the annual dinner will be held at the Hotel Cecil, and this year it will include only one or two short speeches and will be followed by dancing till midnight.

Fatalities.

At the Philadelphia power station of the Newcastle-on-Tyne Electric Supply Co., Ltd., on January 15th, Wilfred Henry, an electrician's mate, received a fatal shock. According to the evidence at the inquest, Henry was testing lamps in the indicator box when one failed to light. It seemed as if he had attempted to remove the lamp and that one of his fingers had come in contact with a live terminal. There was a burn on the middle finger of the right hand. The current was at 250-V pressure. A doctor was of opinion that death was due to cardiac arrest caused by electricity passing through the man's body. A verdict of "Accidental death" was returned, and the company's representative promised to bring before the notice of the company a suggestion by the Electrical Inspector of Factories that when the box was being dealt with in future the current should be cut off.

A verdict of "Accidentally electrocuted" was returned at an inquest at Redcar on January 17th on John Joyce, who was killed at the works of Messrs. Dorman, Long & Co., Ltd. It was stated that the deceased was the driver of an electric crane which ran on the ground level and conveyed steel ends from one part of the mill to another, where they were picked up by an overhead crane. The driver of the overhead crane said that he left his machine to look for the electrician, as he was having trouble with the motor. In his absence Joyce got on to the top platform of the overhead crane, a position of great danger on account of the live wires which ran only about five feet above. He next saw Joyce hanging by both hands from a live wire; he must have closed the main switch to set the crane in motion. It was stated that it was no part of Joyce's duty to drive the overhead crane.

The death took place on January 11th, as the result of injuries received in a motor-cycle accident, of Mr. Norman Arthur Wallis, who was on the staff of Mr. Featherstone, electrical engineer, of Ashford, Kent.

The death occurred recently from injuries received in a motor-cycle accident of Mr. Maurice W. Billcliffe, aged 25 years, who was an assistant shift engineer at the Kingston-on-Thames Corporation electricity works.

Meter Engineers' Technical Association.

At the fifth general meeting of the above Association, held at the Lighting Service Bureau, London, on January 21st, Mr. W. Casson read the second part of his paper on "The Testing of Large-Capacity Meters *in situ*." An interesting discussion followed, in which the practice of *in situ* testing was generally approved.

The first annual dinner of the Association was held at the Engineers' Club, London, on January 22nd, when the chair was taken by Mr. G. F. Shotter, president of the Association. Some 90 members and visitors were seated. "The Meter Engineers' Technical Association" was proposed by Capt. J. M. Donaldson, M.C., M.I.E.E. (North Metropolitan Electric Power Supply Co.), who paid a tribute to the president for the work he had done for the North Metropolitan Co. By means of a rough estimate of the number of electricity meters installed throughout the country, he showed the great amount of work that was done in connection with their manufacture and maintenance. Many meters had been on circuit for over 20 years, and he did not believe they were O.K. He thought the time would come when all meters would be "taken off the wall" after a definite period. In Montreal, where he had spent some time on meter testing, no meter was installed for a period of longer than five years. It was asserted that too much was expected from the electricity meter; but they all expected their watches to be accurate within a minute per day. It was up to the Association to tell the manufacturers to buck up. Although he felt that an association of that sort was bound to come, he would like to see it affiliated with the Institution of Electrical Engineers, which would add to its strength.

Mr. Shotter, in reply, referred to the work that had been done by the hon. sec. of the Association, Mr. Geo. D. Malcolm, during the first stage of the career of the M.E.T.A. The total membership of the Association was now 134, including several members abroad. It was officially recognised by the British Electrical Standards Association, and had a member sitting on a committee of that body. He asked for the full co-operation of all members and the sympathy of the electricity supply authorities and the Press. Mr. E. W. Hill, hon. assistant secretary, proposed "The Visitors," and in a humorous speech referred to the formation of the Association and its work to date.

Mr. W. C. P. Tapper, M.I.E.E. (Stepney), said that it would be necessary to ask the B.E.S.A. soon to set up a committee to standardise associations. He paid a tribute to Mr. Malcolm for the excellent work he had done at Stepney in redesigning the test room. The meter work of a large undertaking was no light task. In referring to his work some years back at Brighton, on the old copper-sulphate meters, he thought it a good thing that there were only 400 instead of 4,000 of those meters.

Mr. P. W. Tucker (ELECTRICAL REVIEW) replied on behalf of the electrical Press wishing the Association success in the future. Mr. Knowles (Evershed & Vignoles) proposed "Absent Members." Items by specially-selected entertainers during the evening added to the enjoyment of the proceedings.

Electrical Association for Women.

A course of six evening lectures is being given at the Lighting Service Bureau, London, from January to April, which began on Wednesday, January 26th, with an opening lecture by Mr. J. W. Beauchamp, M.I.E.E., on the "History and Economics of Electricity Supply." On Tuesday, February 8th, Mr. W. E. Bush will deal with "Electric Light in the Home and in the School." On Friday, February 18th, household engineering and efficiency tests will be the subject, handled by Mrs. Christine Frederick (U.S.A.). On Wednesdays, March 9th and 23rd, simple household repairs, and electric power appliances in the home, will be discussed, and on April 6th, Mr. T. Settle (who has recently returned from America) will lecture on women's place in the American electrical industry. All the lectures will be of a practical nature, and are designed to help those women who are engaged in teaching or instructing other people regarding the uses of domestic electrical appliances.

A Kipling Society.

A society is being formed to study the works of Mr. Rudyard Kipling—"the most patriotic, virile, and imaginative of writers"—and has already gained enthusiastic support. Arrangements are in progress for holding the inaugural meeting. Particulars can be obtained from the hon. secretary *pro tem.*, "Kipling Society," The Milestone, Bath Road, Slough.

The Electricity Supply Rifle League.

The following are the results for the latter part of 1926:—Division 1: Central A, 580; County A, 578. County A, 573; St. James' 545. City A, 575; St. James', 535. City A, 576; County A, 573. Central A, 16 points; City A, 9 points; Shoreditch A, 7 points; County A, 6 points; St. James', 0 points.

Division 2: Shoreditch B, 539; Hackney, 534. Central B, 570; Hackney, 525. Central B, 564; County B, 545. B. and K., 572; Central B, 562. City B, 569; County B, 537. County B, 543; Shoreditch B, 540. B. & K., 573; Shoreditch B, 529. B. & K., 559; County B, 547. County B, 554; Hackney, 504. City B, 20 points; B. & K., 18 points; Central B, 16 points; County B, 8 points; Hackney, 2 points; Shoreditch B, 2 points; K. & K., 0 points.

The hon. secretary, Mr. E. Mathews, 18, Lower Clapton Road, E.5, would be glad to hear of clubs that would like to join in the tourney, in connection with the metropolitan electricity supply undertakings.

Educational.

EAST LONDON COLLEGE (UNIVERSITY OF LONDON).—A course of six lectures on "Short Electric Waves" treated experimentally—ranging from 200 metres down to 1 metre—will be given by Mr. J. H. Morrell, M.A., of the Electrical Laboratory, Oxford, on Mondays, at 6 p.m., commencing February 7th. The fee for the course is 10s. 6d.

Appointments Vacant.

Probationary assistant telegraph engineers, for the Governments of the Gold Coast and Nigeria; assistant electric car shed superintendent (£680), for the Buenos Aires Western Railway, Ltd.; meter fixer for Buxton Corporation Electricity Department. (See our advertisement pages to-day.)

Institution of Electrical Engineers.

FARADAY MEDAL.—The Council of the Institution has made the sixth award of the Faraday Medal to Prof. Elihu Thomson, of Boston, U.S.A., honorary member of the Institution, who is well known as one of the pioneers in the development of electrical engineering.

MEMBERSHIP.—The list of newly-elected members and transfers from one grade to another, which was adopted at the ordinary meeting of the Institution on January 20th, contained the names of no fewer than 497 candidates.

SOUTH-MIDLAND STUDENTS' SECTION.—Mr. G. L. E. Metz, presiding at a meeting last week, declared that the water-

power resources of this country, if fully developed, would be capable of a continuous output equal to approximately one-half the present total output throughout the country by steam stations. Water power could not, however, be considered a serious competitor of coal in the production of electricity at present, as the location of these water-power resources in the north and west was remote from any large industrial centres, and transmission costs, together with heavy capital charges upon storage lakes, &c., offset the advantages of having no fuel costs.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

SIR ANDREW RAE DUNCAN has been appointed to the post of Chairman of the Central Electricity Board. The Minister of Transport issued an official announcement to this effect on January 20th. Sir Andrew, who is 42 years of age, was born in Ayrshire, and after graduation at Glasgow University, he practised as a solicitor as a partner in a firm which specialised in industrial affairs (Biggart, Lumsden & Co.). In this capacity he gained a wide experience of the shipbuilding, engineering, and auxiliary industries. On the reorganisation of the Shipbuilding Employers' Federation and the removal of its headquarters to London, he became secretary of the Federation. He was appointed by Sir Joseph (now Lord) Maclay as secretary of the Merchant Shipbuilding Advisory Committee under the Shipping Controller during the war. In 1919 Mr. Lloyd George appointed Sir Andrew Coal Controller, and he relinquished that office at the end of 1920 on the formation of the present Mines Department. Since 1920 to the present time he has acted as vice-president of the Shipbuilding Employers' Federation. *The Times* states that he has directed the activities of that Federation with conspicuous success during the difficult years of the depression.

Elliott & Fry] [*London.*

Sir Andrew Rae Duncan,
The Chairman of the Electricity Board.

Among his other appointments, Sir Andrew Duncan has acted as Chairman of the Advisory Committee of the Coal Mines Department since 1920, Chairman of the Royal Commission to inquire into the coal industry in Nova Scotia, 1925, and Chairman of the Royal Commission to inquire into grievances of the Eastern Maritime Provinces of Canada, 1926. He recently returned from a three months' stay in Canada in connection with the last appointment. Sir Andrew has also acted as a member of the Royal Commission on National Health Insurance, of the Civil Service Arbitration Tribunal, and of courts of inquiry into labour disputes.

One newspaper report states that the remaining seven members of the board will be appointed before the reassembly of Parliament, which has been fixed for February 8th, and that the chairman will take up his duties as soon as his colleagues have been appointed.

MR. L. MACKINNON, who has been appointed to the position of general manager of the Glasgow Corporation Tramways, entered the service of the Corporation in 1887, so that he has completed 40 years' service. He was first employed in the City Cleansing Department, and in 1892, when Mr. Young was appointed first general manager to prepare for the taking over

Mr. L. Mackinnon,
General Manager, Glasgow Corporation Tramways.

of the city tramways by the Municipality on July 1st, 1894, he appointed Mr. Mackinnon as private clerk and secretary. He was therefore associated with the preparatory work and was successively manager's clerk, assistant traffic superintendent, chief of the purchasing and contracts department, traffic manager, and deputy general manager. Thus he has passed through many grades of the service, and has seen the transition from horse to electric traction and other developments. On many occasions during the absence of the former general manager (Mr. Dalrymple), he has had full control of the undertaking. Mr. Mackinnon was educated at the Glasgow High School and the Royal Technical College, Glasgow.

MR. D. POWELL, charge engineer at the Dover Corporation Electricity Works, has secured an appointment at the Wimbledon Electricity Works at £345 per annum.

The Hull Corporation Electricity Committee has recommended that the salary of Major BELL, the electrical engineer, be increased from £1,108 to £1,500.

MR. A. S. BLACKMAN, general manager and engineer of Sunderland Corporation Electricity Department, has gone on three months' leave of absence, with salary, granted him last year by the Council on his completion of 20 years' service with the Corporation and as a mark of appreciation of the able manner in which he has discharged duties connected with the large extensions of recent years.

MR. W. F. FERRIS received from his colleagues of the English Electric Co., Ltd., at Stafford, a gold watch and gold pencil at a dinner on January 14th. He will shortly be taking up duties for the company in Australia.

The German Elektrotechnische Verein has awarded to Dr. ADOLPH FRANKE, the president of the Siemens & Halske Gesellschaft, Berlin, the Siemens-Stephan Memorial Plate. This is the Union's highest award, and is granted every five years to the person who is considered to have rendered the greatest service to electrotechnical progress in general and to the Union in particular. Dr. Franke has been associated with the Siemens & Halske Co. for 40 years, and is known for his work in connection with high-frequency measurement apparatus for telephony and radio work.

MAJOR G. FETHERSTONE, D.S.O., M.C., has resigned his position as Trade Commissioner at Cape Town, with effect from the end of the current month, to take up a business appointment. Major Fetherstone has been at Cape Town for seven years, and was formerly at Sydney, N.S.W.

MR. J. E. KINGSBURY has changed his office address from Serjeant's Inn to 82, Victoria Street, Westminster, S.W.1. Telephone No.: "Victoria 1225."

The *Financial Times* records that Mr. GEORGE A. PIRELLI, who recently resigned his appointment as Italian Consul-General, has been elected Chairman of the Italian Chamber of Commerce in London.

MR. J. W. NEEDHAM, electrical engineer, has left Rosyth Dockyard to take up a similar post at H.M. Dockyard, Simonstown, South Africa. His successor at Rosyth is Mr. J. C. UGLOW, who has just returned from Gibraltar.

MR. HOWARD A. LEWIS, director and sales controller of Kelvinator of Canada, Ltd., and director of the Electrical Refrigeration Corporation, of Detroit, was to arrive from America on Friday last. He will remain in Europe for a few weeks dealing with matters connected with automatic electric refrigeration, and his address will be 30-35, Drury Lane, W.C.2.

The Dover Corporation has granted a month's leave of absence to the borough electrical engineer owing to illness.

MR. H. P. STOKES, manager and engineer of the Plymouth Corporation Tramways and Transport, is confined to bed as a result of a motor accident.

The marriage took place at Glasgow, on January 19th, of Mr. JOHN W. TORRANCE, partner in the firm of J. W. & R. Torrance, electrical engineers, of Hamilton, and Miss MARY BURNS GRANT.

It is proposed to advance the salary of Mr. F. A. BOND, the borough electrical engineer of Battersea, from £1,250 to £1,300.

Brighton Corporation Lighting Committee has promoted Mr. G. EVERETT, senior shift engineer, to be sub-station superintendent at North Road.

MR. R. A. MALLETT, M.C., sales manager to, and a director of, the Norman Electrical Co., Ltd., was married on 15th inst. at Chelsea to Miss GERALDINE GORDON.

The *South African Mining and Engineering Journal* reports that the Government of the Union of South Africa has made the following appointments to the Electricity Control Board:—Mr. H. PIRON (chairman), *vice* Sir Robert Klotze; Mr. C. MULLINS (Chief Inspector of Machinery), *vice* Mr. C. H. Hearn; and Mr. C. W. H. LANSDOWN (legal adviser), *vice* Mr. L. G. Nightingale.

Obituary.—MR. W. WATTS.—The death took place on January 15th, at the age of 72 years, of Mr. Walter Watts, who was for a number of years, until his retirement about three years ago, on the engineering staff of the Brighton Corporation Electricity Works at Southwick.

MR. G. L. SCOTT.—The death occurred on January 16th, at the age of 77 years, at Sevenoaks, of Mr. George L. Scott, who had been an Associate of the Institution of Electrical Engineers since the year 1901.

MR. A. W. BURCHARD.—The *Daily Mail* reports that Mr. Anson W. Burchard, chairman of the International General Electric Co., and a director of the British Thomson-Houston Co., Ltd., died recently from heart failure.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Electrical Refrigerators and Appliances, Ltd.—Private company. Registered in Edinburgh on January 15th. Capital, £3,000 in £1 shares. Objects: To carry on the business of electrical engineers and contractors, manufacturers of and dealers in tramway, electrical, galvanic and other apparatus, &c. The first directors are:—F. T. Land, Coniston, Woodvale Avenue, Giffnock, Renfrewshire, nail and hardware merchant; T. A. C. Land, Mayfield, Bridge of Weir, Renfrewshire, nail and hardware merchant. Qualification, 100 shares. Secretary, T. A. C. Land. Registered office, 120, Bothwell Street, Glasgow.

Lockett, Lloyd & Statham, Ltd.—Private company. Registered January 15th. Capital, £2,000 in £1 shares. Objects: To acquire the business of electric light and power contractors, carried on by H. Lockett, J. B. Lloyd, and A. Statham, at Green Lane, Wilmslow, Cheshire, as Lockett and Lloyd The permanent directors are:—H. Lockett, Beech Lane; J. B. Lloyd, Thornlea, Lacey Green; A. Statham, Macclesfield Road (all Wilmslow electric light and power contractors). Qualification of permanent directors, 500 shares; of other directors, 100 shares. Solicitors: Lingards, Sutton, Elliott & Co., 24, Fountain Street, Manchester. Registered office, Green Lane, Wilmslow, Cheshire.

W. L. Gray, Ltd. — Private company. Registered January 19th. Capital, £750 in £1 shares. To adopt an agreement with W. L. Gray and to carry on the business of electricians, manufacturers, generators, accumulators, and suppliers of electricity, &c. The first directors are:—W. L. Gray, 9, Victoria Parade, Muswell Hill, N.10, gentleman; Capt. H. J. Round, M.C., "Westfield," Colney Hatch Lane, N.10, engineer. Qualification, £20. Remuneration as fixed by the company. Secretary: E. Nicholas. Solicitors: Sewell, Edwards & Nevill, 35, Bucklersbury, E.C.4. Registered office: 9, Victoria Parade, Muswell Hill, N.10.

Wm. F. Thacker, Ltd.—Private company. Registered January 17th. Capital, £1,000 in £1 shares. Objects: To carry on the business of plumbers, electricians, electrical and radio engineers, &c. The directors are:—W. F. Thacker, "Govan," Manchester Road, Haslingden, sanitary and electrical engineer (permanent governing director and chairman); Mrs. E. A. Thacker, same address. Qualification, 10 shares. Solicitors: Evans & Cotton, Haslingden, Bacup and Rawtenstall. Registered office: 20, Blackburn Road, Haslingden.

Western Wireless and Electrical Co. (Salisbury), Ltd.—Private company. Registered January 19th. Capital, £1,500 in £1 shares. Objects: To acquire the business of a wireless and electrical engineer now carried on by A. G. Williams at 33, Fisherton Street, Salisbury, as the Western Wireless and Electrical Co. The permanent directors are:—A. G. Williams, 98, Fisherton Street, Salisbury; H. A. Dinnage, 33, Fisherton Street, Salisbury. Qualification, 100 shares. Solicitors: Trethowan & Vincent, Salisbury.

Hungerford and District Electricity Supply Co., Ltd.—Registered as a "public" company on January 21st. Capital, £10,500 (10,000 6 per cent. cumulative participating preference shares of £1 each and 10,000 ordinary shares of 1s. each). Objects:—To carry on at Hungerford (Berks.) and elsewhere the business of an electric power and supply company, to adopt an agreement with the Hungerford Electric Light and Power Co., and to acquire the business, undertaking, and rights belonging to that company. The minimum cash subscription is £7. The directors are:—S. W. Albright, J.P., High Street, Hungerford; H. Smith, 73, Fellows Road, N.W.3, electrical engineer; and C. L. de Wilde Reader, "The Elms," Orford, Suffolk, electrical engineer. Qualification, £100. Remuneration as fixed by the company. Solicitors: Ward & Melliar Smith, 35, Queen Victoria Street, E.C.4.

Official Returns of Electrical Companies.

Presteign Electric Co., Ltd.—Memorandum dated December 30th, 1926 (annexed to debenture dated September 25th, 1924), to secure £1,000 and also all sums paid by the guarantors on behalf of the company under a guarantee dated October 4th, 1926, charged on the company's undertaking and property, including uncalled capital. Holders: A. M. Wilson, The Moor, Presteign; and others.

Rhayader Electric Light and Power Co., Ltd.—Capital, £2,000 in £5 shares. Return dated November 4th, 1926. All shares taken up. £2,000 paid. Mortgages and charges, nil.

Radio (Hove), Ltd.—A. C. Gillman, of 103, Cannon Street, E.C.4, was appointed receiver and manager on January 6th, 1927, under powers contained in instrument dated October 2nd, 1925.

Leeds Radio Services, Ltd.—Capital, £2,500 in £1 shares. Return dated November 30th, 1926. 1,227 shares taken up. £1,227 paid. Mortgages and charges, nil.

Rangoon Electric Tramway and Supply Co., Ltd.—Satisfaction to the extent of £9,711, on June 3rd, 1926, of debenture stock dated February 1st, 1906, December 22nd, 1908, November 5th, 1913, and January 25th, 1924, securing £250,000. (Notice filed January 12th, 1927.)

E. Powell, Ltd.—Mortgage dated December 31st, 1926, to secure £1,225, charged on 39, High Street, Tunbridge Wells. Holders: W. C. Cripps and F. S. Harries, Tunbridge Wells.

Macintosh Cable Co., Ltd.—Satisfaction in full on December 31st, 1926, of debentures dated January 29th and March 19th, 1902, securing £6,500.

Dartnoor Electric Supply Co., Ltd.—Capital, £2,000 in 10s. shares. Return dated November 4th, 1926. All shares taken up. £2,000 paid. Mortgages and charges: £4,000 at 4½ per cent.; £3,950 at 6 per cent.; £3,550 held by bank as collateral security.

Weald Electricity Supply Co., Ltd.—Particulars filed of £100,000 debentures authorised December 15th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £50,000.

C. J. Thursfield & Co., Ltd.—Mortgage debenture dated January 8th, 1927, to secure £1,000 charged on the company's undertaking and property, present and future. Holder: B. Park-Hughes, 173, Church Lane, Handsworth Wood.

Electrical and Chemical Ebonite Co., Ltd. — Particulars filed on January 12th, 1927, of £8,500 debentures authorised by resolutions of April 12th and May 17th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Ilfracombe Electric Light and Power Co., Ltd.—Satisfaction in full on December 31st, 1926, of mortgage dated September 10th, 1924, securing £10,000.

Lewis, Thomas & Sons, Ltd.—Debenture dated January 5th, 1927, to secure £1,000, charged on the company's undertaking and property, including uncalled capital. Also mortgage of same date and collateral to the above debenture charged on certain land and premises in Tregaron, Cardigan. Holder: D. L. Doughton, Hengwm Clarach, Cardigan.

Teignmouth Electric Lighting Co., Ltd.—Debenture dated January 11th, 1927, to secure £12,500, constituting a specific mortgage and charge on freehold and leasehold properties at Teignmouth, Kingsteignton, Shaldon, and Bishopsteignton, and a floating charge on the remainder of the company's undertaking and property, present and future, including uncalled capital. Holder: H.M. Treasury Solicitor.

City Notes.

County of London Electric Supply Co., Ltd.

Meetings of holders of the company's first and second 4½ per cent. debenture stock are to be held on February 17th to consider proposals for the exchange of their holdings for Government securities. To the first debenture holders the company offers £115 of the new 4 per cent. Government Consolidated Loan in exchange for each £100 of 4½ per cent. debenture stock, and to the second debenture holders £112 10s. of the new 4 per cent. Government Consolidated Loan for each £100 of 4½ per cent. debenture stock. This offer will give the first debenture holders 2s. per cent. more than they are receiving at present, and the second debenture holders will receive the same rate of interest which they are now receiving (4½ per cent.), but it must be borne in mind that the first debenture stock is redeemable at £115, while the second debenture stock is redeemable at £105 (both at the company's option). The chief advantage of the offer arises, however, from the value of the new Government loan which, in both cases, considerably exceeds the present market value of the first and second debenture stock.

S. Smith & Sons (Motor Accessories), Ltd.

The annual meeting was held on January 20th. Mr. W. Henderson-Cleland, M.C. (chairman), who presided, said that the net profit for the past year was £73,336. The directors had decided to make an issue of 400,000 7½ per cent. cumulative preference shares of £1 each at par. With the proceeds it was intended to repay the company's indebtedness to the banks and other debenture holders, and cancel the debentures. The interest on borrowed money during the past year amounted to £30,500. Out of the profit £62,000 had been placed to reserve (making £140,000), and they proposed to pay a dividend of 7 per cent. on the preferred ordinary shares. The amount which stood to the credit of the reserve represented earnings on behalf of ordinary shareholders not distributed. As soon as circumstances permitted, the reserve would be distributed in cash or capitalised form between the two classes of ordinary shareholders. The company's position was sound, and the future prospects were good. The amount hitherto paid as debenture interest would be sufficient by itself to cover the dividend upon the new shares. The report and accounts were adopted, and at subsequent separate meetings the issue of the new preference shares was approved.

The prospectus was issued later. The shares will rank in priority to other classes for dividend, and for repayment in the event of a winding up. The dividend is cumulative.

Shanghai Electric Construction Co., Ltd.

The directors announce that although the profits of the past year fully warrant the payment of a second interim dividend of 4 per cent., they have decided to postpone payment in view of the unsettled state of Shanghai, which resulted in a suspension of tramway services on January 18th. The first interim dividend was 4 per cent., paid in October last.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159, and they have all been ordered to be officially quoted:—

American Telephone and Telegraph Co.—$10,483,900 capital stock.

Brompton and Kensington Electricity Supply Co., Ltd.—58,496 ordinary shares of £1 each fully paid, Nos. 292,301 to 350,796.

General Electric Co., Ltd.—111,670 ordinary shares of £1 each fully paid, Nos. 2,141,976 to 2,253,645.

Montreal Tramways Co.—$2,217,000 Series "B" 5 per cent. general and refunding mortgage sinking fund gold bonds, due April 1st, 1955, Nos. C1 to 310 ($100), D1 to 372 ($500), and M1 to 2,000 ($1,000).

Traction and Power Securities Co., Ltd.

The report for the past year shows a net revenue of £56,802, to which is added £28,748 brought forward, making £85,550. After paying interim dividends there remains a balance of £68,810. From this it is proposed to transfer £10,000 to reserve, to pay the final preference dividend, and one of 10 per cent. on the ordinary stock, making 14 per cent. for the year (as against 13 per cent.), leaving £29,771 to be carried forward. During the year there was issued a further £146,023 of 4½ per cent. debenture stock. It is proposed to change the title of the company to "Traction and General Investment Trust," and a resolution to effect this will be presented at the annual meeting on February 1st.

Companies Struck Off the Register.

The names of the undermentioned companies have been struck off the Register, and they are thereby dissolved:—

Bennetts (Electrical Engineers), Ltd.
Bloom's (Wireless), Ltd.
City of Wells and District Electricity Supply Co., Ltd.

Marconi's Wireless Telegraph Co., Ltd.

The directors announced last week that the report of the investigations carried out by the company's auditors and Sir Gilbert Garnsey had been presented to them. It is their intention to consider the report at once, and to call a meeting of shareholders at the earliest possible moment, to lay proposals before them.

Dublin United (Electric) Tramways Co., Ltd.

The directors recommend the payment of a dividend on the preference stock at the rate of 6 per cent. for the half-year ended December 31st, 1926, and a final dividend on the ordinary stock at the rate of 7 per cent. per annum (making 5½ per cent. for the year). They also propose to set aside £55,000 for renewal of track; £5,000 for overhead line, standards and cables; £3,500 for power-station plant, and to carry forward £15,188.

Shropshire, Worcestershire and Staffordshire Electric Power Co.

An extraordinary meeting is to be held on February 4th for the purpose of considering a resolution empowering the directors to issue the balance (250,000) of the company's "A" ordinary shares of £1 each.

Columbia Gas and Electric Corporation.

Quarterly dividends of $1.50 per share on the 6 per cent. preferred stock and of $1.25 per share on the no-par-value common stock have been declared.

Enfield Cable Works, Ltd.

An interim dividend of 5 per cent. actual has been declared on the ordinary shares, as in 1926.

Stocks and Shares.

MONDAY EVENING.

THE investment markets of the Stock Exchange have received a powerful stimulus from the success attendant upon the issue of the new 4 per cent. Consolidated Loan. Although subscriptions received allotments in full, the demand for the new stock has been so considerable as to cause the price to hold a useful premium. Stags have done well out of their speculation. The effect is highly advantageous to investment stocks and shares of all kinds. The Bank Rate is expected to be lowered in the Thursday of this week. It has stood at 5 per cent. since December 3rd, 1925. Such gilt-edged securities as London Power 5 per cent. debenture have now reached a price-level at which the return on money invested at to-day's quotations is barely 5 per cent. And the demand for stock continues to be insatiable, despite the expectation of increased taxation in the spring Budget. The gravity of the Chinese news imposed a halt upon undue exuberance.

Normally, the idea of a rise in income-tax serves to direct attention to those stocks and shares the dividends upon which are paid net. We could never quite see why this should be the case, but the fact remains, arguing lack of intelligence in the inquirer who wonders why. The Eastern quartette of cable companies pays the dividends, on its ordinary capital, free of tax. The average yield is now £5 13s. per cent., equi-

valent to a shade over 7 per cent. on the money, with a 4s. tax. There are not many well-secured ordinary shares which return as much as those in the Eastern group, and it is not unreasonable to look for a rise in their prices.

Oriental Telephone and River Plate Telephone shares are also in receipt of what is termed tax-free dividends. A gain of 1s. 6d., to 23s. 6d., has accrued to Venezuela Telephones. The preference strengthened to 24s. No assignable cause being offered for the advance, speculation occupied itself with shrewd guesses as to the likelihood of a resumption of negotiations for purchase of the company's undertaking. The last minute breaking-off of a similar arrangement some months back is still fresh in the memory of everyone interested. Curiosity awaits developments with lively attention. Telephone Manufacturing are easier at 7s. 10½d.

The Metropolitan Railway dividend announcement is due on Thursday in this week. A year ago the company paid 3 per cent., making 5 per cent. for 1925. Last July, however, the interim dividend of 1½ per cent. was 10s. per cent. less than that for the corresponding half-year. The District Railway also paid 1½ per cent. as an interim dividend last August, which was unchanged from the year before. The ordinary stocks of both companies have lost a point, and Underground £1 shares drooped to 13s. No serious hope is entertained of a dividend, yet, on the last-named, British Electric Traction stocks maintain their prices.

Bournemouth and Poole ordinary have been stirring again, and a little demand led to 1/16 rise, at 60s. 9d. The dividend declaration comes next month, but the present hardness is explained by references to renewed hopes of the undertaking being acquired by one or other (or both) of the Corporations named in the company's title. There may, however, be a sounder reason than this for the support rendered by purchasers of the shares. The Egham and Staines report is due shortly, and, on the basis of the 7½ per cent. dividend in each of the last three years, the shares yield £6 16s. 9d. at the present price of 22s. 3d. Sevenoaks Electric new ordinary shares are available at 21s. 3d. free of stamp and fee—which saves threepence per share—and have partial dividend falling due in June. The company paid annually 7 per cent. in 1925 and 1926; the current yield, at this rate, is £6 11s. 9d. per cent. Midland Counties ordinary, now at 21s. 3d., will have a full year's dividend to come in March; last year the company paid 6 per cent. Newcastle-upon-Tyne Electric ordinary are easier this week at 20s; there is some doubt as to whether, in view of last year's coal stoppage, the usual full 7 per cent. dividend can be expected in March. Llanelly ordinary received a 5 per cent. dividend for 1925. The price stands at 16s. 6d., at which a 5 per cent. dividend will give £6 1s. 3d. per cent. on the money. Shropshire Electrics are 1/16 up at 26s. 3d. on the decision of the board to issue 250,000 "A" ordinary shares. Edmundsons and Urbans both yield a shilling or two under 6 per cent. There is a little business doing in the ordinary shares of the Atlas Light and Power Company—the old Argentine Light and Power—and the price is 15s. 6d. middle.

Brussels has taken a violent fancy again to Brazilian Tractions, and, with Montreal also a supporter, the price rose 6 to 118. The advance has been consistent since the board notified its intention to oppose amalgamation in any form with certain other concerns. The preferred are strong at 108. Other Brazilian tramway issues are a good market, on the view that Brazil may be able to re-institute her sinking-fund in the early future.

London electricity supply shares are steady, but uninteresting. No change of any consequence has occurred in the price-list. Of the debenture stocks, South Londons are 1 higher at 97. The appointment of Sir Andrew Rae Duncan as Chairman of the Central Electricity Board has been received with favour. Sir Andrew was at one time Coal Controller, and subsequently had a good deal of experience in connection with coal-mining matters. Shanghai Electrics fell ⅛ to 38s. 9d. because of the present trouble in China. Shareholders in electric supply companies will observe with quiet attention that the Gas Light and Coke Company has reduced its dividend to £5 0s. 8d. per cent., against £5 2s. in the previous year.

Marconis touched 17s., to react to 15s. upon the announcement that the long-expected report is about to be handed to the sub-committee appointed to consider it.

Mexican utility issues remain dull, the Light and Power preferred, with a gain of 1, being the only shares in the group to show firmness. The U.S. Secretary of State at Washington has stated his belief that arbitration should be employed for the settlement of the dispute between America and Mexico. Amongst "dollar" stocks, Montreal Light has risen 4 points to 74½. Shawinigans are down to 277½. The Traction and Power Securities Company has decided to change its name to the Traction and General Investment Trust. The dividend of 14 per cent. on the ordinary stock is 1 per cent. higher than that of a year ago.

The Enfield Cable Works has announced an interim dividend of 5 per cent., the same as before, and the price of the shares is unchanged. British Aluminium shares are dull. Telegraph Constructions have gone up to 29¾. The manufacturing group is quiet, but attracts a fair amount of business. Rubber shares move within narrow limits. Engineering and the iron-coal division are disposed to harden, by reason of the cheery business outlook foreshadowed by various authorities in their recent speeches.

Britain's Foreign Electrical Trade.

Statistics and Comparisons.

HAVING received the Board of Trade returns for December last, we are now in a position to review the course of foreign electrical trade during the whole of 1926. Dealing first with the December figures, we note that although the export total was lower than in the preceding month, it was above that for the last month of 1925. As compared with November, there was a fairly general decrease; only four items rose in value, but these increases were more than counterbalanced by several large falls in other classes. The machinery section was about £90,000 down, and insulated wires and cables were also considerably lower in value. In comparison with December, 1925, the position was altered; the increases predominated, and there were only two notable decreases, one of which was in the case of submarine cables—that ever-varying item.

Imports were slightly higher than in November, although the decreases were equal in number to the increases. The most notable rise was in unenumerated electrical machinery (over £57,000), while batteries and accumulators showed the greatest decline. In the main, the comparison with December, 1925, shows similar results, but although unenumerated machinery was again the leading item so far as increases were concerned, batteries and accumulators recorded a substantial rise, and the greatest fall was in telegraph and telephone apparatus.

In both comparisons, re-exports for December showed increases, the outstanding items being rises in unenumerated goods and apparatus and telegraph and telephone apparatus.

Electrical Exports and Imports during December, 1926.

Totals	£1,534,397	— £190,824	+ £86,985	£540,869	+ £14,991	+ £26,837	£28,987	+ £8,428	+ £6,239

Turning to the annual statistics, it will be observed that there was a definite improvement last year as compared with 1925. Exports rose in value by £636,764, while imports fell by £422,743. Thus the trade balance in our favour (ignoring re-exports) rose from £12,010,216 to £13,069,723—over £1,000,000.

In the export section, cables were responsible for the largest alterations. Insulated wires and cables increased in value by £681,148, while submarine telegraph and telephone cables declined by £771,715. Apart from these, the two most important changes were increases of £295,325 in telegraph and telephone apparatus and £220,410 in unenumerated electrical goods. The decreases, with the exception of submarine cables and railway and tramway motors (£58,141), were all of very small proportions.

With regard to imports, the outstanding feature of the year was a fall of £345,857 in the case of telegraph and telephone apparatus; this overshadowed the other decreases, although some of these were of substantial proportions (*e.g.* glow lamps £91,209). There were only two notable increases, the greater occurring in the case of unenumerated electrical machinery (£68,222).

The re-export list shows decreases mainly and a resultant fall of £24,804 in the total. As in the case of imports, unenumerated machinery showed the greatest rise, and telegraph and telephone apparatus the greatest fall.

Radio apparatus is not shown separately in our figures, but this was dealt with at length in a recent issue of the *Wireless Trader*. Our contemporary's figures show that there was a slight decrease in 1926 as compared with the previous year in the exports of radio apparatus and valves. The totals for the two years were respectively £1,266,384 and £1,289,749, a fall of £23,365. Re-exports were also lower, the value being given as £35,263, as against £45,338.

The curves which accompany these notes require little explanation. The first illustrates the course of our electrical exports during the years 1925 and 1926. In the former year the monthly fluctuations were not very

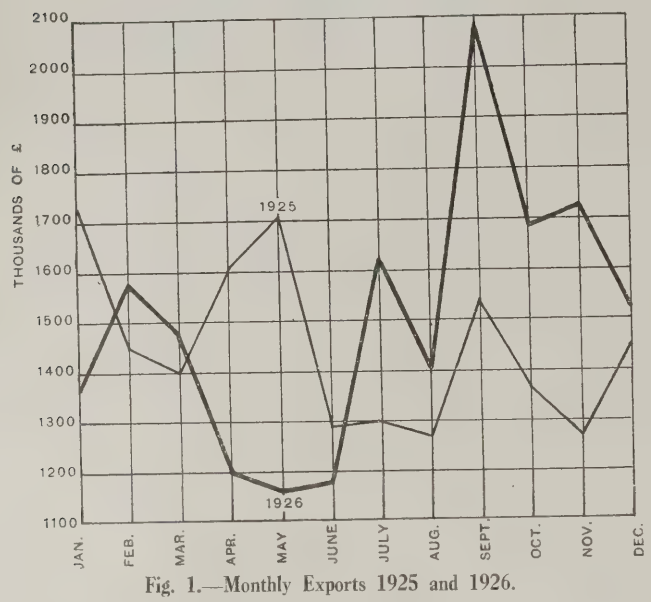

Fig. 1.—Monthly Exports 1925 and 1926.

great and the peak was reached in May. This month is usually a good one from the export point of view. In 1926, the variations were violent ones, and on account

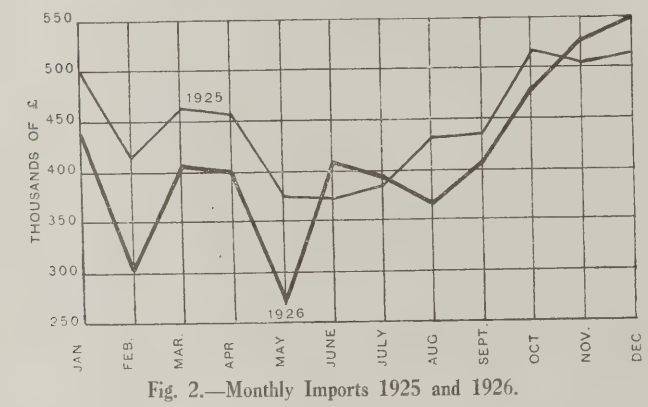

Fig. 2.—Monthly Imports 1925 and 1926.

of the general strike May was the poorest month. It is noteworthy, however, that in eight months out of the twelve, the 1926 figures were above those of the corresponding figures for the previous year. The import curves (fig. 2) reveal the reverse; for eight months the 1926 imports were below those for the corresponding months of 1925. With the exception of the large fall in May last year, and the reaction in June, the two curves are very similar. Fig. 3 deals with three leading export items; for convenience, the term "insulated wires and cables," has been made to include non-submarine telegraph and telephone cables. Submarine cables exhibit too abnormal fluctuations to be included in the figures. In two of the curves, the general strike period is very apparent; but in the case of unenu-

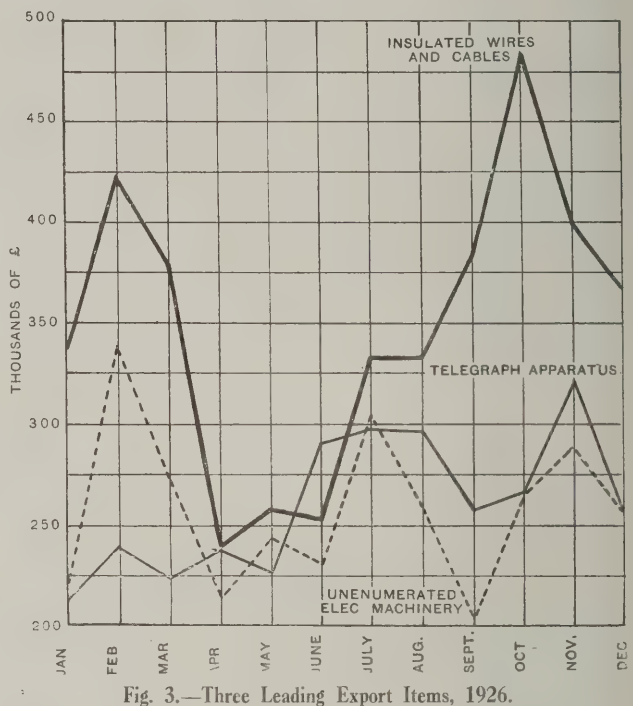

Fig. 3.—Three Leading Export Items, 1926.

merated electrical machinery, a slight improvement occurred in May, and the lowest level was reached in September. Insulated wires and cables, after falling a little from the May figure, rose rapidly up to October, but there was a rather sudden fall in the last two months of the year. The general level of telegraph and telephone apparatus exports was higher during the latter half of the year, the peak being reached in November.

Electrical Exports and Imports during 1925 and 1926.

	Exports.			Imports.			Re-exports.

Fig. 4 exhibits companion curves to those in fig. 3, upon the same scale, showing two further important export items. The heading "motors and generators," includes railway and tramway motors. The curve for these reached its lowest point in June, but made a rapid recovery, and after a slight set-back, continued upward until November, after which it fell to about the January level. The exports of unenumerated electrical goods showed smaller variations, and reached their nadir in May. The last set of curves (fig. 5) deals with the leading classes of imports, and here again the term "insulated wires and cables" includes non-submarine telegraph and telephone cables. All three curves reached low levels in May, but that showing unenumerated electrical machinery fell lower at two periods of the year. In all cases there was a swift recovery from the effects of the general strike, followed by a reaction and a further rise.

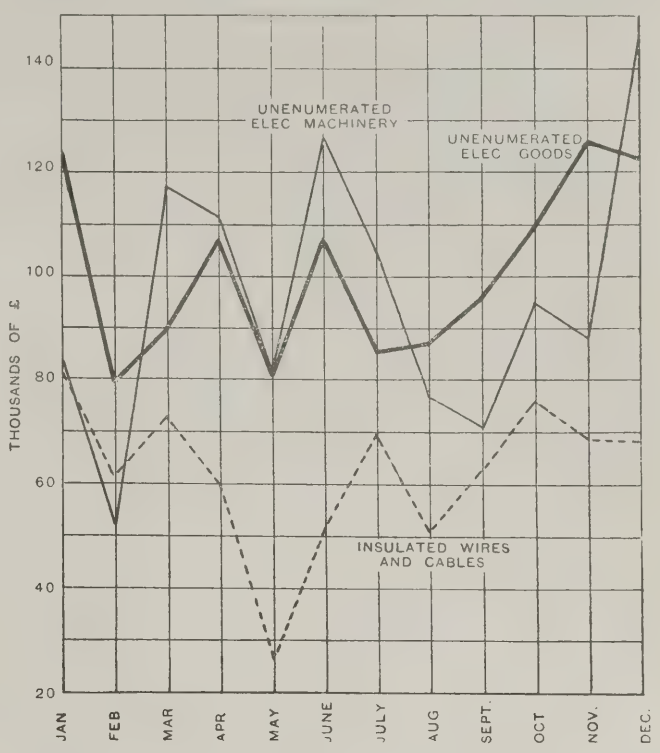

Fig. 5.—Three Principal Classes of Imports.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Continued from page* 110.)

George Kent, Ltd.

Although not definitely electrical, the Kent rotary steam meter will appeal to power engineers, being of novel design. It consists of a fan which is driven round by steam passing through a shunt circuit, the speed of the fan being kept low by a damping chamber. The drive is taken out through a magnetic gland to a counter which reads direct in pounds of steam. The materials of which this meter is made are carefully chosen so as to withstand the corrosive action of steam, and we understand that meters of this pattern have been in use for 12 months without any loss of accuracy; they are essentially suitable for small mains.

Crompton & Co., Ltd.

The "Alltest" instrument, which was exhibited for the first time last January, has had improvements made to it, and the S.M.S. pattern hygrometer has been modified also; it depends for its action on the weight of a hygroscopic body attached to a gravity movement which operates a pointer that moves across the scale, which is calibrated to read from 0 to 100 per cent. humidity. The housing consists of a standard 6-in. dial instrument case, except that gauze sides are provided to allow of the easy entry of the outside atmosphere, which is, of course, essential to the correct reading of the indicator. An entirely new and improved pattern of single-phase, dynamometer type indicating wattmeter, wound for a current of 5 amperes and for any pressure range up to 150 volts, was shown for the first time. The current range, of course, can be extended in the usual way by means of current transformers, and the pressure range by means of external resistances.

The National Physical Laboratory has carefully tested these instruments, and a most satisfying report indicates that the instruments are absolutely independent of change of frequency or power factor. In addition, standard laboratory and test-room apparatus was shown.

Mullard Wireless Service Co., Ltd.

A complete series of "PM" receiving valves was on view; also low-impedance rectifiers for battery eliminators; high-power valves, including the metal-glass and silica types; and the Holweck molecular pump. Amongst the miscellaneous items was a selection of wire-wound anode resistances and grid leaks, and a piece of resistance wire carrying a continuous current of 8 mA. A short-wave oscillator was on view, employing two Mullard DO/40 valves, oscillating on a wavelength of 2.5 metres under working conditions. Two inductances were used, consisting of simple loops of wire joining in one case the anodes of the two valves, and in the other case the two grids; the mid-point of the anode loop was connected to the high-voltage supply, and the mid-point of the grid loop was connected through the grid-leak to the filament. The high-voltage supply was approximately 500 volts, obtained direct from a transformer. The oscillatory current was indicated by a single-turn loop of copper wire forming a circle of 6 in. diameter and including a condenser consisting of two copper plates 5 in. × 3 in. and about $\frac{3}{8}$ in. apart; a small pea lamp in this circuit was kept glowing by the oscillatory circuit. Visitors were able to observe the electron emission of a "PM" filament: a test board was so arranged that, on pressing a push button, the electrical circuits for heating the filament and measuring the total emission were completed; it was thus possible to observe the large emission from these very dull-filament valves. The company also showed one of its low-power rectifiers (the DU/10) working on a resistive load from the alternating-current mains at a voltage of 200, which was transformed to 4 volts for heating the filament; a d.c. output of about 70 mA at 70 volts was obtained, and the total input was roughly 12 watts, less than the power consumed by one average electric lamp connected to the domestic mains, the output being sufficient for running an average 3- or 4-valve receiver.

M.O. Valve Co., Ltd.

This exhibit showed considerable advances in technique and general design of the thermionic valves which the company manufactures. New patterns have been described in our pages recently, one of the latest being illustrated elsewhere in this issue, and finished products were to be seen on the stands of the company's selling agents. The displays embraced practically every type of valve, transmitting, receiving, and rectifying, which is marketed under the Marconi and "Osram" names, as well as some experimental types probably destined to be included in the wide range at a later date. Manufacturing apparatus and machines were shown; also various valves designed specially for operation at high frequencies, and a low-frequency oscillator was seen operating at approximately one cycle per second, showing cyclic variation of oscillatory current, &c.

Nalder Bros. & Thompson, Ltd.

The well-known "N.C.S." and "Ideal" electrical measuring instruments and protective relays were on view, including flame-proof instruments suitable for use in fiery mines; also rotary synchroscopes, circuit breakers, the "Ohmer" insulation testing set, current and potential transformers, and the Turner efficiency indicator, which is a combination of venturi meter and wattmeter for ascertaining the performance of steam turbo-alternators. We hope to say more about the company's latest developments in a later issue.

Dubilier Condenser Co. (1925), Ltd.

This large display included a variety of types of radio condensers and resistances. For smoothing in conjunction with thermionic-valve rectifiers, condensers of considerable capacity are required, capable of withstanding high d.c. voltages; they are fitted with safety spark-gap and discharging resistance to dissipate the energy of the discharge, and are supplied in two main types, the smaller being fitted in wax-filled wooden boxes, while the larger types are in oil-filled steel tanks. The latter type is also employed when the smaller units are required for operating in tropical climates.

The "Duwatcon" variable condenser is specially constructed to overcome the gap in the tuning range which exists when an ordinary type is used in the aerial circuit as a series-parallel condenser. The "Ducon" is a device which enables the electric lighting wires of flats, &c., to be used with safety for the reception of broadcast and other signals. The "Duvolcon" unit employs the same type of resistance as the "Duvarileak," but is intended for use as the means of controlling the volume of sound from a loud-speaker, or, alternatively, as a means of controlling reaction in a radio receiver. The "Dubrescon" protects the valves of a receiving set from destruction by accidental contact with the h.p. pins of the valve-holder or wrong connections, and a simple wavemeter for general experimental work utilises a neon lamp as resonance indicator, thus eliminating the risk of burning out the indicating lamp by excessive coupling to the oscillation circuit.

A compact arrangement of condensers in a metal box for eliminating radio interference due to sparking on dynamos, motors, &c., should be useful, while the "Hiloten" apparatus for supplying all the current required to operate a radio-receiver by direct connection to ordinary electric lighting mains is made in two models: one for use on d.c. and the other on a.c. circuits; this apparatus provides 6 volts with current up to 1.5 amps. and two or more h.p. voltages, one at least of which is continuously adjustable.

Siemens Bros. & Co., Ltd.

The Company's exhibits included a drum-type temperature recorder, which consists of a millivoltmeter calibrated as a temperature indicator, and recording mechanism driven by clockwork. The indicating pointer is fitted with a stylus near its outer end, which swings beneath a chopper bar that is depressed every minute, thus causing the pointer stylus to press down on the chart paper, and the successive dots, lying close together, give a graphical record of the temperature variations. With this arrangement the pointer swings perfectly freely, and there are, therefore, no errors due to friction. The recorder may be calibrated for use with either distance thermometers or thermo-electric pyrometers.

The temperature indicators shown were all of the moving-coil type, with a high internal resistance, so that variations in the resistance of the thermo-couples and connecting leads have little effect on their readings. They may be divided into two classes, namely, precision indicators and base-metal indicators. Often several thermometers or pyrometers are used in conjunction with a single indicator, and in such cases the indicators are combined with selector switches, which are of the press-button type, arranged in a circle; any thermometer or pyrometer may be instantly connected to the indicator by pressing the corresponding button. In the case of thermometer outfits, each selector switch has, in addition, one press-button marked "test," which is required for periodically testing the battery voltage; the necessary battery is contained in the switch case. A simple potentiometer for measuring the e.m.f. of thermo-couples has the following advantages:—It is substantially made and carefully calibrated; there is no mirror galvanometer, and therefore all readings can be taken in broad daylight. It can be easily and rapidly adjusted, and has five ranges, the change from one to the other being made by a simple movement of a lever switch; the accuracy of the apparatus is high, and the ammeter and indicator may be easily and rapidly checked against one another and against a standard cell; resistance of the thermo-couple and its leads does not affect the results when the "null method" is used.

Everett, Edgcumbe & Co., Ltd.

A wide range of electrical measuring instruments was, as usual, exhibited by this firm. Of the "Omni-Range" portable-current transformer a "precision" model is now available. The ratio and phase curves, fig. 16, for such a transformer, as designed for use with sub-standard wattmeters, &c., indicate that the change of ratio from rated current down to one-tenth of rated current is less than 0.1 per cent., and the phase displacement only about 2 minutes; even with a burden of as much as 20 volt-amperes, the ratio error does not exceed 0.2 per cent., or the phase displacement 7 minutes at any point within the range; such figures are believed to be unique. A 44-kilovolt bar-type current transformer was exhibited for a full-load current of only 120 amperes, in which the ratio error was no more than ½ per cent. and the phase displacement less than 90 minutes at any current down to one-tenth of full load. A current transformer having characteristics such as these enables power measurements to be made with accuracy, and yet has all the advantages of the straight-through construction.

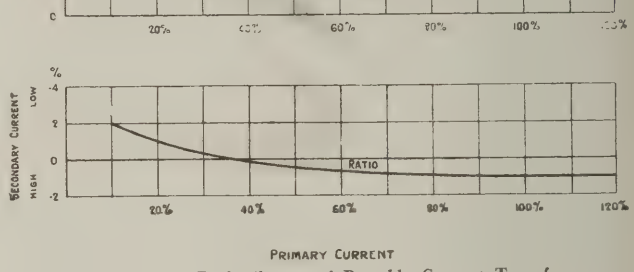

Fig. 16.—Phase & Ratio Curves of Portable Current Transformer.

The phase sequence indicator shown measured only 3 in. across, and consisted of a miniature three-phase motor provided with a rotating disk, which carries an arrow-head showing the order of phase sequence according to its direction of rotation; three spring jaws have merely to be clipped on to the three points to be investigated, and it can at once be seen whether the voltages are coming up in the right order. The windings on these instruments are such that they can be used on any voltage likely to be met with in practice, and those who have endeavoured to check the connections of a two- or three-element wattmeter, or of a power-factor meter, without the help of such an instrument will recognise how useful it will be.

A very compact testing set was exhibited which, although embodying two instruments only, enables a.c. current, voltage, and power to be measured. When a knob marked "amps" is depressed, the pointer indicates the amperes passing; when another knob marked "volts" is depressed, the pointer indicates the voltage between the terminals, and the wattmeter readings are independent of the position of the "volts" and "amps" press switch. These sets are available for single-, two-, and three-phase measurements at any frequency, and measure only 14 in. × 10 in. × 6 in.

Adam Hilger, Ltd.

In addition to optical devices, apparatus for X-ray crystallography and spectrography was exhibited, and also piezo-electric quartz oscillators for controlling radio-transmitters. The demonstration apparatus comprised an oscillating circuit with mounted crystal attached by flexible leads and an auxiliary generator, both of which were tuned to nearly the same frequency (6,666 kilo-cycles per second); the two circuits were loosely coupled together, and the difference in frequency gave rise to the beat note heard.

Weston Electrical Instrument Co., Ltd.

Dynamometer-type laboratory standard instruments with an accuracy of at least 1/10 of 1 per cent. either in d.c. or a.c. circuits of any frequency up to 133 cycles per second form very valuable transfer instruments from d.c. to a.c., and permit a.c. readings to be taken with a great degree of accuracy. Other items included fan-shaped d.c. switchboard instruments and regular type round and sector patterns; also a group of rectangular instruments for a.c. switchboards: the reduced space occupied is the principal feature of this design, and the pleasing appearance and bold scale are noteworthy features.

A new radio panel voltmeter 2 in. in diameter for use upon receiving sets is supplied in single and double ranges of exceptional sensitivity for such small instruments, namely, 125 ohms per volt; they are of the permanent-magnet pivoted

moving-coil construction. A new radio voltmeter, known as the "Pin Jack" and high-range stand are designed so that a radio panel may be fitted with jacks which are connected permanently to the filament terminals; the voltmeter can then be plugged into the pin jacks to measure the voltage at the filament terminals, the instrument having a range of 6 volts and a sensitivity of 125 ohms per volt. By plugging the instrument into the high-grade stand provided, an additional range of 200 volts is obtained for the measurement of anode voltage.

Stonebridge Electrical Co., Ltd.

Besides such items as universal precision instruments, multi-range current transformers and recording power-factor meters (all portable), electrostatic voltmeters for pressures up to 400,000 V are marketed for continuous insulation check, and are frequently combined with an electrical distance indicator on the main switchboard.

An electrical distance indicator and recorder of angular displacement, which is independent of supply pressure variations, has a continuous scale, and employs no step resistances, is suitable as an indicator of the position of turbine valves, discharge and throttle valves, switches, automatic discharge apparatus, water sluices, for indicating fluid level and flow, radio goniometers, &c. Movement is transmitted through suitable gearing to a small spindle projecting from the case of the transmitter; in the latter the magnetic field of a moving coil produces an e.m.f. which influences the position of the moving-coil system in the receiver instrument definitely and continuously, and by suitable regulation of the field current, angles smaller than 90 deg. can be amplified on the indicating instrument to the full available scale angle of 90 deg. For angular displacements of more than 90 deg. reduction gearing (spur, or worm wheels) are inserted between the coupling spindle of the transmitter and the object the angular displacement of which is to be measured, in order to reduce the latter on the transmitter to 90 deg.

Creed & Co., Ltd.

Besides the Murray multiplex printer for Government telegraph and Press service, the Company had a direct printer (start-stop system) on view, which should be of interest to large engineering and other concerns in that it offers, it is claimed, more efficient service than the telephone for intercommunication purposes. It is suitable for the direct communication of telegrams between large business houses and the nearest head telegraph office, thus effecting great economy in time, and it is also suitable for communication between offices and works, or between distant departments. The direct printer has advantages over the telephone, some of which are: A printed record is made of each message at both the transmitting and receiving ends of the line; in the case of transmitted figures, confusion cannot arise between fives and nines, &c. Messages are automatically received on the machines, and remain there until they can receive attention. Telephone messages often arrive when the person at the receiving end is in the middle of other important work, leading to delay, confusion, forgotten messages, or illegible writing, if the message is recorded hurriedly by hand. The printer can be installed in the noisiest workshops, where telephone messages could not be heard, and the apparatus is also ideal for railway telegraphy, and is soon to be installed for one of the largest British railways, we understand.

M-L Magneto Syndicate, Ltd.

Portable peak-voltage measuring devices were shown designed for use particularly when peak values take the form of impulses of relatively short duration, as compared with the time intervals which separate them. Under such conditions the energy available at the moment of occurrence of the impulse is usually small, and it is important that the capacity and energy consumption of the measuring apparatus shall be reduced to a minimum, so as to avoid disturbing the characteristics of the circuit to which it is connected. Two forms of apparatus were exhibited: one suitable for impulsive peaks up to 300 volts, the other for from 2,000 to 15,000 volts. Both forms employ in the first instance a two-electrode rectifying valve and a small condenser charged through the valve to the maximum voltage occurring in the circuit to which it is connected, and the voltage across the condenser is then measured in the first type of apparatus by sharing the charge of the small condenser with a larger one, which controls the grid potential of a three-electrode valve. Measurement of the current in the plate circuit with a definite plate potential gives the grid potential, and hence the potential to which the condenser has been charged. In the second type of apparatus the condenser is shunted by a calibrated spark gap between two brass balls 20 mm. in diameter; one of the balls is fixed, the other adjustable through the medium of a cam fixed on a shaft, which also carries a graduated dial; by suitably shaping the cam, even calibration of the dial is obtained. Each type of apparatus is mounted in a wooden case about 9 in. cube, which also contains the accumulator for heating the filament, and in the first type of apparatus a small motor generator for supplying the plate current.

(*To be continued.*)

High-Voltage "S.L."-Type Cables.

33,000-Volt Cables with Metal-sheathed Cores, each of which is Separately Lead-covered.

By P. DUNSHEATH, O.B.E., M.A., B.Sc., M.I.E.E.

(*Abstract of paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

DURING the past few years the use of 3-core cables for voltages higher than about 22,000 has introduced new and uncertain factors into the field of underground electric transmission; 33,000-volt cables have caused a good deal of anxiety to cable manufacturers and cable users, and the failures which have occurred have involved both sides in financial loss, besides introducing too frequent interference with the continuity of supply on large systems.

The outstanding feature of the breakdowns is the long period which elapses after the cables have been brought into use before failure occurs; the majority of the failures occur during times of light load on the cables. Various explanations have been advanced, but the most probable one seems to be closely associated, though not identical, with that which was first advanced by Hochstädter and supported by more recent investigators. Hochstädter attributed the failures to tangential electrical stresses in the outer layers of the core dielectric; impregnated paper has a higher electric strength in a direction perpendicular to the surface than along the surface, and this would seem to justify the tangential-stress theory, which, however, is not quite sufficient to explain what occurs. It is a common experience, for instance, in examining a piece of cable which has failed under the conditions stated, to find a large proportion of the length still in perfect condition, with no sign of deterioration, although the tangential stresses, on the theory named, must be the same throughout.

If we supplement the tangential-stress theory by considerations of the ionisation of air, or other gas, in a space within the dielectric under stress, then we approach more nearly to an explanation which will cover the recorded phenomena. In other words, if the dielectric is subjected to tangential stresses at a point where the space which should be filled with oil contains air instead, then an electrical discharge may occur over the surface of the paper which will result in the slow destruction of the paper fibres and ultimate total failure of the cable.

The presence of spaces devoid of insulating compound between the cores of a 3-core cable may be accounted for by one or more of the following reasons:—(1) Faulty mechanical construction; (2) imperfect impregnation; (3) distortion and separation of the cores by mechanical stresses during laying; and (4) separation of the cores by thermal expansion during heating under load.

Several suggestions have been made for the design of a 3-core cable in which this destructive action could be pre-

vented. In 1914 Hochstädter took out a patent for covering the individual cores with a tightly-adhering conducting film, so as to level up the distribution of potential in the direction of the layers; later he protected the manufacture of a perforated metallised paper for use as the conducting film, and many cables have been made in which the impregnation has been carried out after the application of this type of coating.

In comparing the relative merits of plain 3-core cables and those with metal-sheathed cores for use at a working pressure of 33,000 volts, it must be admitted that, as regards reliability in operation, the metal-sheathed type has many advantages and practically no disadvantages. The advantages may be summarised as follows:—

(1) The long-time failures experienced on plain 3-core cables have been found to originate in core-to-core faults, not between core and earth; the metal-sheathed-core cable has a larger core-to-core thickness for a given diameter of cable than the plain 3-core type.

(2) The presence of the metal sheath prevents direct core-to-core faults, and in case of failure from any cause the breakdown takes place to earth, which is an advantage from the operation point of view; the fault current can be limited by earth resistance in the neutral.

(3) The electric stress is uniformly radial in all parts of the dielectric and consequently normal to the surface of the paper.

(4) The whole of the dielectric subjected to stress is homogeneous; there are no wormings or packings in the electric field.

(5) Separation of the cores by mechanical distortion of the cable, or by thermal expansion, cannot introduce voids into the dielectric under stress; should the cores become separated from one another by a small fraction of an inch from any cause whatever, the conducting sheath moves with the core, and the space that is formed is outside the field and out of contact with the dielectric.

(6) The metal sheaths facilitate the carrying of the heat away from the centre of the cable, which is the hottest and, therefore, the most dangerous part.

The only practical disadvantage that can be advanced against the metal-sheathed-core cable is that it has a slightly higher inductive capacity than the plain 3-core type. On modern systems, however, this is not a serious point, as the charging current on no-load helps to neutralise the magnetising current of large connected transformers, and on load the leading current is soon lost in connected plant with lagging power factor.

(1) In the S.L. type large-diameter lead tubes are avoided: in view of the plastic nature of lead and the necessity for bending, this results in a better mechanical construction; for a given overall diameter of cable, a given amount of bending results in less distortion of the lead sheaths in the S.L. type than in the other forms of metal-sheathed-core cables.

(2) Owing to the greater mass of metal surrounding the individual cores, the cooling effect and consequently the current-carrying capacity is greater for the S.L. type than for the others.

(3) For use in hilly country, where there may be a considerable head of oil in the cable, the S.L. type with its small-diameter lead sheaths and absence of worming spaces filled with oil has obvious advantages; the whole of the oil inside the lead sheath of the S.L. type of cable, being in contact with the laminated dielectric, is less liable to flow than when it is not so supported as in the non-S.L. type.

(4) The S.L. type makes possible the use of longitudinal steel reinforcing strands, or pilot cables, in the scores between the cores and outside the dielectric.

(5) The S.L. type permits of freer impregnation; each core is impregnated separately, instead of all three cores with their wormings being treated together as in the non-S.L. type.

To illustrate the mechanical advantages of the S.L. cable, a length with the section shown in fig. 1 passed unharmed through a bending test that would have ruined a non-S.L. cable of the same overall diameter. The standard B.E.S.A. test is 6 turns round a barrel 12 times the diameter of the cable, but the S.L. cable was bent the standard number of times backwards and forwards on a barrel only 9 times its own diameter, and the resulting distortion was negligible; a length of plain 3-core, 33-kV cable subjected to the same test suffered considerably. The S.L. type was then subjected to tensile tests, and on a 7-yard length, the three cores being gripped at one end and the three strands at the other, a pull of 1½ tons was required to withdraw the strands. In another test the reinforcing strands were gripped at both ends, the cores being left free, and a pull of 4 tons applied for 15 minutes; the cores did not suffer in any way, showing no sign of corrugation or distortion.

A disadvantage claimed against the S.L. type of cable is the presence of undesirable currents in the lead sheaths, owing to their enclosing the separate conductors and being cut by the rotating magnetic flux. The sheaths may be insulated from one another, in which case it is sometimes

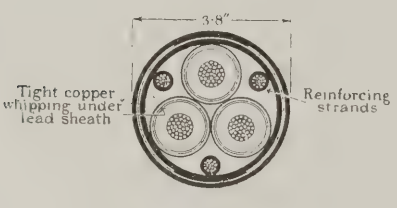

Fig. 1.—SL Steel-Tape-Armoured Cable with Reinforcing Strands.

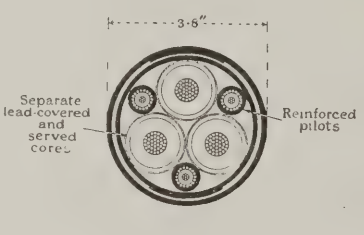

Fig. 2.—SL Steel-Tape-Armoured Cable with Armoured Pilots.

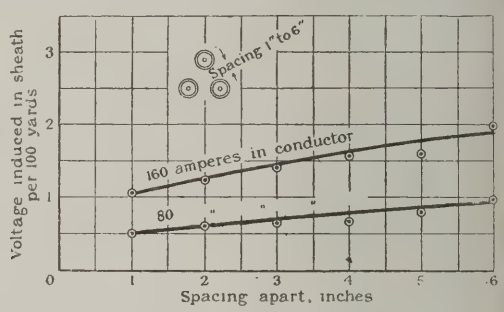

Fig. 3.—Induced Voltage in Sheaths of Three Single-Core Cables.

The various types of metal-sheathed-core cables can be divided into (*a*) cables with a common lead sheath over the assembled cores which are laid up before the impregnation process is carried out, and (*b*) cables in which the individual cores are dried, impregnated and lead-covered before being laid up; this type has no enclosing lead sheath over the assembled cores. The claims of the second type of cable (the S.L. type) for use on 33,000-volt systems were first advanced by the author in a discussion before the Institution three years ago, and since that date he has carried out extensive experiments to resolve certain questions of supreme importance in deciding on the suitability of this type for general use.

Figs. 1 and 2 illustrate two designs of S.L. cable. In the former, three separately lead-covered cores are laid up together with packings to a circular formation for taking the two coats of steel-tape armour with beddings and servings. In order to give the cable longitudinal strength while retaining the maximum flexibility, three steel reinforcing strands are laid up in the spaces between the cores as shown. In the second design, shown in fig. 2, advantage has been taken of the opportunity which this construction affords of housing pilot cores under the one common armouring with the main cores and inside the reinforcing strands. Another feature of importance illustrated in the first figure is the employment of a tight whipping of copper tape over the core papers immediately under the lead. This provides mechanical support to the papers, strengthening the cores and keeping them circular without depending on any restraining effect of the lead tube.

Briefly the relative merits of S.L. and non-S.L. metal-sheathed-core cables can be studied by stating the advantages and disadvantages of the first over those of the second:

stated that dangerous voltages may exist between them, resulting in sparking across and pitting of the lead. If they are bonded together, the circulating currents cause loss of energy and by their heating effect reduce the current-carrying capacity of the cable. It is shown that the voltages generated are very small, that they can be suppressed by bonding the three sheaths together at the ends, that when the sheaths are bonded in this way the sheath losses are negligible, and that the presence of the separate sheaths, instead of increasing the temperature-rise and cutting down the current-carrying capacity of the cable, has the opposite effect to a very marked extent.

In the first investigation three lengths of single-core lead-covered cable were laid parallel to one another on a wooden floor supported by wooden blocks in triangular formation at various distances apart up to 6 in. The induced voltages observed between two lead sheaths at the near end with the far ends bonded for various distances apart are plotted in fig. 3. It will be seen from the actual measured voltage in the sheaths that if three such cables were laid up closely to form a 3-core cable of the S.L. type and the sheaths left unbonded, except at one end, the voltage generated in the individual sheaths would have a value not more than 0.5 volt per 100 yards for every 100 amperes flowing in the main conductor. For 100 amperes in the main conductor the total sheath loss would be about 20 watts per 100 yards; expressed as a percentage of the copper loss, this amounts to about 3 per cent. (*To be concluded.*)

Discussion in London.

Mr. C. J. Beaver initiated the debate by referring to the causes of cable breakdown, remarking that the tangential stress itself was within the factor of safety of the dielectric, the real

danger being the presence of air in the cable. The author had described methods of construction, not manufacture; the "English thing" to have done would have been the examination of methods of preventing the occlusion of gas, his main point being that whatever risks were associated with cables at the lower voltages were increased as the dielectric was increased in thickness. Another way of attacking the problem, which was not new, however, was to pass the sheets of paper individually through the impregnating machine and then cut them up and apply them to the cable in the treated form: each piece and every part of the paper was thereby subjected to the same treatment, and that method allowed of the use of the most suitable compound for impregnation. The next inquiry was how to apply the paper to the cable so as to exclude air? They did that by submerging the whole cable in a bath of impregnating compound while the insulation was being applied: that was an efficient method, and the constituency of the liquid determined the separation of the layers of paper. He laid stress on the dielectric properties because the author had not mentioned them. Economic considerations influenced matters considerably, and the exercise of care was accordingly needed so as not to allow oneself to be carried away by comparisons.

Major A. M. TAYLOR thought figs. 8, 9, and 10 were particularly instructive. From fig. 8 with direct current the temperature of the copper conductor was only 37 deg. C. at 300 amperes, and with a 50-cycle alternating current it was 30 deg. C. at the same current. The mean sheath temperature, however, was 31 deg., as against 28½ deg. with d.c., a rise of 2½ deg., possibly due to the eddy-current losses in the lead sheathing. He suggested that there was a discrepancy between figs. 8 and 9 which indicated that one must only regard those temperatures as rough approximations. On the other hand, the results in fig. 10 which gave a conductor temperature of 50 deg. C. at the same current as before, and a sheath temperature of 23 deg. C., were a most eloquent testimony to the better dissipation of the heat from the copper in the "S.L." cable, as compared with that of an ordinary plain 3-core cable. For an equal conductor temperature of 35 deg. the relative carrying capacities were: plain 3-core cables 227 amps., "H" type 240 amps., "S.L." type 263 amps., from which, according to Dunsheath's experiments, the "H"-type cable had an advantage in current-carrying capacity of 6 per cent. The author's conclusions as regarded the greater dissipative capacity of the "S.L." cables would appear to be warranted by fig. 11, which showed that the "S.L." cable passed 16 per cent. more current (34½ per cent. more heat) than the plain 3-core cable, and 9½ per cent. more current (20 per cent. more heat) than the "H"-type cable. From which it would appear that the heat dissipative capacity of the Henley cable was no less than 34 per cent. in excess of that of the plain 3-core cable. The author had not done full justice to the single-core cable, because he had not put the two lead sheaths in immediate contact; his losses were far in excess of those that would actually occur, deduced from Prof. W. Cramp's formula. However, taking his figures, he made out an advantage of 6 to 8 per cent. on the cost in favour of the "S.L." cable. The speaker believed that it was possible to obtain 25 per cent. more current-carrying capacity out of single-core cables than the author had assumed, which would turn the balance the other way. The employment of 66,000-volt single-core cables at Paris and Newcastle appeared to be quite satisfactory.

Mr. S. W. MELSOM thought the paper a difficult one to discuss. It might be divided under three headings: conjecture, theory, and experiment. They had had enough of the first already, except that the author had hardly pointed out all the factors which influenced cable failures. Tests on cables immersed in water would not indicate the results obtainable when they were buried in soil. How far was the increased current-carrying capacity due to the "intersheath" and how far to difference in dimensions? That was a point on which figures were required. With regard to sheath losses, he agreed with the author's remarks.

Mr. T. N. RILEY expressed surprise that the author had referred to thermal and mechanical characteristics only, and not to electrical ones, for electrical tests were the only ones which revealed the true conditions. Initially perfect impregnation did not settle the matter, as it did not obviate the effects of expansion and contraction on cooling. He differed violently from the author's comparison of "SL" and "H" type cables: when laying-up 3 cores they underwent very severe handling, and the steel-tape armouring which held the 3 cores together bore on one point of each only, so that it was not a good mechanical arrangement. He agreed that better cooling resulted, but it was only 2 per cent., which figure was within the experimental error margin. In hilly country, "SL" cable would have no real support against hydraulic pressure, since again only 3-point support was provided. Although the arithmetic might be simple, there was considerable controversy as to which was the correct method of calculation. Major Taylor's sympathy, he hoped, would not take too practical a form, because there were two ways of making high-voltage cable: one was to make it precisely similar to 11,000-volt cable, and hope for the best, while the other involved spending some money on research in the factory before commencing to manufacture.

Mr. J. K. WEBB referred to sheath circuit losses and Prof. W. Cramp's analysis of the subject. The fierce integral in the author's formula could not be solved, but Prof. Cramp had worked out an example for the worst case, and he found that if the figure "3" were substituted for it the result would be adequate. The divergence between the author's and Dr. Cramp's formulæ was important.

Mr. F. C. RAPHAEL said that he had finished reading the paper strongly in favour of it; the author had done much to reassure them. With regard to longitudinal sheath currents, however, if a fault occurred at one end of the cable would it not be just possible for the cable to be stripped for some length?

Mr. E. BOWDEN thought it a great step forward to have heard it admitted that all was not well with high-voltage cables. Now that they were coming out into the open England might regain her leading position as a cable manufacturer. Impregnation did not present any real difficulty; if any were experienced, it could be got over. If the cores did separate when heated under load, that occurrence could never be avoided altogether; the facts of distortion by mechanical stresses during laying, and the separation of the cores by thermal expansion must be faced. The remedy was to let them distort, and therefore to keep the cores apart: most problems were solved by experience. He had a natural prejudice against internal pilot wires, as it was obviously desirable that the protective devices should be kept as far away as possible from the cables they were intended to safeguard.

Mr. A. RUSHTON was of the opinion that the sheath losses in "SL" cable were low because of the presence of the copper whipping under the lead sheath (figs. 1 and 2). He compared heating curves, drawing attention to a 2 or 3 deg. difference of temperature, and asked whether it might be due to test errors.

The PRESIDENT (Dr. W. H. Eccles), on account of the lateness of the hour, asked others who had intended to speak to send their contributions to the discussion in writing for publication in the I.E.E. *Journal*, and then called upon the author to reply.

Mr. P. DUNSHEATH, remarking that he must be brief, said that all agreed, of course, that the less air was permitted to remain in a cable the better; but when stresses were discussed, he disagreed with most speakers. Who knew what the stresses in a 3-core cable really were? No one knew. The copper tape was applied for certain reasons, but it did not affect the losses. Concerning Mr. Raphael's question, if an "SL" cable failed under large out-of-balance conditions, the same conditions would prevail as those experienced in Paris, and they had had no trouble there. The sheath current was very small in comparison with the conductor current. He agreed that if the figure "3" could be substituted as suggested in the formula, it would be a step forward. Regarding the accusation of indulgence in conjecture, the paper showed that he had supported most of his statements by facts.

Magnetic Testing of Wire Rope.

In a publication issued by the U.S.A. Bureau of Standards, Technologic Papers, No. 315, April, 1926 (10 cents), some details are given of the research work which has been carried out by the Bureau on the testing of wire hoisting rope by magnetic analysis. The investigation has been of a fundamental nature, consisting of a study of the magnetic properties of steel wire of the kind used in the manufacture of wire rope, and the effect on them of deterioration due to various causes, such as stress, wear, and fatigue. The work did not result in the development of a magnetic device for testing purposes, although much experimental apparatus was used. Certain definite results were obtained, however, which have an important bearing on the subject.

The Electrodeposition of Rubber.

Last year, Dr. S. E. Sheppard, of the Eastman laboratories, published the first announcement of his success in the electrodeposition of rubber. On October 28th there was formed at Akron the American Anode, Inc., by the B. F. Goodrich Co., the Eastman Kodak Co., and Anode Rubber Company, Ltd., of Great Britain, for the purpose of manufacturing rubber articles in America under processes patented by Dr. Paul Klein, of Budapest, and Dr. S. E. Sheppard and Dr. L. W. Eberlin, of the Eastman laboratories. The processes involve methods of compounding, milling and vulcanising rubber.

"Under the new processes," one expert said, "the principle involved is the deposition of rubber on the anode of an electric circuit, the anode serving as a mould or form. Methods of suspending compounded ingredients in the latex electrolytic solution also have been perfected and patented, as well as means for maintaining a constant concentration of the mixture."

It now is possible actually to rubber-plate moulds of any shape with rubber of tissue-paper thinness to several inches thick, Goodrich experts say. Arrangements already are being made with insulated wire makers to use the new process in insulating electric wires more speedily and with a far stronger coating.

Rubber bands no thicker than a thread have been manufactured under the new process, and have been found to be so much stronger than ordinary bands as to defy breaking by the bare hand. Other articles, such as thin tobacco pouches, gloves, and hot water bottles, similarly have been found to possess far greater strength and resiliency.—*Science*.

According to *Nature* of January 22nd, it is understood that the Dunlop Rubber Co. has acquired the British rights.

A Large Electrical Export Organisation.

The General Electric Co.'s Facilities and System.

OCCUPYING as it does a leading position among exporters of electrical merchandise, the General Electric Co., Ltd., has built up a very efficient organisation for dealing with the shipping of goods to overseas destinations. In the early days of the company, although the export business was not large, the special arrangements which were necessary led the company to place that branch of its activities in the hands of a special staff. This in itself increased export business, for customers found that their

Fig. 1.—A Large Shipment of G.E.C. Products.

orders were attended to with accuracy and dispatch. Another aid to such business was the circulation of the Company's complete bound catalogue, which was soon recognised as the electrical buyers' *vade mecum*. In the course of a few years the overseas trade has reached gigantic proportions; a concrete example of this development is depicted in fig. 1, which shows a recent shipment to Australia by the steamer *Jervis Bay*. This comprised no fewer than 646 packages destined for various cities of the Commonwealth. Fig. 2 shows the large export depôt at Magnet Wharf, Silvertown, which is most conveniently situated for the dispatch of goods to any of the London docks. Spacious as this depôt is,

Fig. 2.—The Magnet Wharf Export Depôt.

however, it can only deal with a small proportion of the goods exported from the G.E.C. factories, and large shipments are sent daily straight from the works to outgoing steamers. Recently 150 tons of mining machinery for Canada was thus shipped from Liverpool in one lot. This was part of an order for two electric winders (2,450 and 1,400 h.p.), which was obtained in the face of American competition.

Magnet Wharf has every facility for handling large shipments. It possesses a convenient frontage on the Thames and a large railway siding, and is in a position to handle traffic between British ports. Every consignment from the depôt to the docks is accompanied by a special representative with experience in handling the goods, which ensures their arrival in first-class condition.

The Electrical Contractors' Association.

Annual Dinner.

ON January 18th, the Electrical Contractors' Association (Inc.), the N.E.C.T.A., Ltd., and the National Federated Electrical Association, held their annual dinner at the Trocadero, W. There were about 240 members and guests, including many leaders of the electrical industry, and Mr. H. J. Miles (president) occupied the chair.

Col. WILFRID ASHLEY, Minister of Transport, was the principal guest, and in proposing the toast of "The Allied Associations and Honorary Officials," which he professed not to comprehend, he said that during the past two years he had enough of electricity. Now, happily, the Electricity (Supply) Act had been passed and he was sure that it would be considered an excellent measure. Whatever they thought of it they should endeavour to make the best of it, as good citizens, for it was the law. He was very glad that the contractors and municipalities had arrived at an agreement with regard to the sale of fittings, &c. A continuance of the dispute would have led to nothing. After all, their differences were not really so great as was supposed; the main object of both parties was to serve the public. The agreed clause was fair alike to contractors, municipal authorities and consumers. The Government had not rushed into the Electricity Bill without great consideration. The question of reorganisation of the electricity supply industry had already been studied and reported upon by previous committees, but the Government appointed a further businesslike committee to deal with the matter, and that committee's findings, with one important exception, had been adopted practically as they stood. The Act was not a Party measure, as had been proved by the opposition to it of some of the Government's own supporters. The Government was satisfied that the Central Electricity Board, when functioning, would do much for the industry. He had received many letters offering the writers' services to the Government; one gentleman's qualifications were the successful organisation of Scout jamborees. He hoped to announce the names of the chairman and the board shortly. Apart from the generation of electricity, however, merchandising, propaganda and selling had to be improved, for they were of equal, if not greater, importance. The electrical industry had still something to learn from the gas industry, which knew how to push its wares very successfully. If the new Act cheapened electricity and the contractors did their part in development, we would soon be able to look the whole world in the face. Electricity should not be a rarity but a commonplace in the home. In conclusion, Col. Ashley referred with approval to the work which was being carried out by the Electrical Association for Women.

Mr. H. J. MILES responded to the toast and said that although the Association had done important work in the past quarter of a century, there was much more important work ahead. Contractors had found that union was strength, and so had other branches of the electrical industry. It had been the endeavour of the E.C.A. to bring all these branches together in order to discuss problems which affected them all. The conferences which had led to the formulation of the "agreed clause" had done a great deal to further that object. The agreed clause was not the only outcome of the conferences; they had also brought about a feeling of co-operation and goodwill which did not exist before. Mr. J. Y. Fletcher had said that the E.C.A. had raised its status in the eyes of all branches of the industry, especially the I.M.E.A. From being a business conducted separately by individuals, electrical contracting had grown to be a national industry, and their Association had to face that altered state of affairs. They realised that their prosperity was bound up with that of other sections of the industry and that they could not play a solitary part. They stood at the dawn of a new electrical era, and, he hoped, a new industrial era. Prosperity could only be attained by negotiation, compromise and goodwill. While the speaker agreed that wiring costs had to be reduced, he said that it was of no use providing a full installation, however cheaply, if the price of energy was not such as to enable the consumer to use it. So long as the present competition among contractors prevailed, the public had no cause for fear, but they must be upon their guard against shoddiness. He hoped that the Commissioners would be able to afford a little time to deal with that question. He believed that all responsible contractors would welcome compulsory wiring regulations. At present, however, the E.C.A. could not pin its members down to the I.E.E. Rules while others were allowed to do as they liked. A good and safe installation need not be more costly, however. He thought that supply engineers would find it difficult to reconcile the cost of hiring schemes with a low energy cost. Such schemes should be confined to the larger appliances and the smaller houses, and should only be run on a paying basis. It had been asked why the Association had not a membership of five or ten thousand, as there were understood to be that number of contractors in the country. His reply was that the Association was only open to honest men possessing reasonable resources and qualifications. He urged manufacturers to be careful in their dealings with so-called electrical contractors.

Mr. T. E. ALGER proposed the health of "The Guests."

He said that there was an insistent call for standardisation, but that was impossible without regulations. He considered that safety in the home was of greater importance than safety in factories and mines. He referred to the presence of Mr. P. J. Hannon, M.P., a staunch supporter of private enterprise, and Sir Hugo Hirst, and congratulated Sir Duncan Watson upon his knighthood. The Association was particularly glad to welcome Messrs. Phillips, Robinson and Cramb as representing the I.M.E.A. Mr. Alger paid special tribute to Mr. D. N. Dunlop (B.E.A.M.A.), who had presided over the conferences between the contractors and municipal authorities, and had rendered excellent service.

Sir HUGO HIRST, Bt., in reply, said that although the General Electric Co., Ltd., now had many large departments, it still kept in close touch with contractors through its domestic appliance business, and he welcomed the agreement which had been come to. The future depended to a great extent upon the skill and enterprise of electrical contractors. The latter did not always have sufficient capital to finance big developments, but in conjunction with the supply authorities important work could be carried out.

Mr. P. J. HANNON, M.P., who also replied to the toast, expressed his disappointment at the fact that Col. Ashley had not announced the names of the Central Electricity Board. Although he had opposed the Bill during its passage, he thought that it was now the concern of every citizen to make the Act a workable instrument of progress. It was part of the work of the contractor to cultivate public opinion so as to realise the utmost benefits of the Act. Referring to the manufacturing side, Mr. Hannon said that during 1926 we imported electrical goods to the value of £3,000,000. If our electrical industry had been properly safeguarded against unfair foreign competition, more work would have been available for the industry. Although a protagonist of private enterprise, he recognised that municipal supply authorities had done valuable work.

Mr. R. W. L. PHILLIPS, who also made a response, expressed his appreciation of the work done in the cause of agreement by Messrs. Alger, Cramb and Dunlop.

Mr. W. R. RAWLINGS proposed the toast of "The Electrical Trades Benevolent Institution," and Mr. J. Y. FLETCHER replied.

The proceedings concluded with a toast to the chairman, proposed by Mr. H. J. GALLIERS, to which Mr. Miles briefly responded.

Institution of Electrical Engineers.

Annual Dinner of the North-Western Centre.

THE annual dinner of the North-Western Centre was held on January 18th, at the Midland Hotel, Manchester, the chairman of the Centre, Mr. W. J. Medlyn, presiding. About 270 members and friends were present, and the guests included Dr. W. H. Eccles (president of the I.E.E.), the Lord Mayor of Manchester (Alderman J. H. Swales), the Mayor of Salford (Alderman J. Rothwell), Viscount Wolmer, M.P. (Assistant Postmaster-General), Mr. E. A. Radford, M.P., Mr. E. B. Fielden, M.P., Dr. S. L. Pearce, Col. T. F. Purves, Sir Benjamin Longbotton, and Sir Edwin Stockton.

The toast of the "Cities and Trade of Manchester and Salford" was proposed by Viscount WOLMER, who said the election of Mr. Medlyn to the chairmanship of the Centre was much appreciated as an honour conferred on the Postal Service. The Postmaster-General recognised that it was his duty to do all that lay in his power to help the development and increase the prosperity of British trade, but he was restrained by the shackles put on the Post Office by the Chancellor of the Exchequer. A return to the penny post would give a great impetus to trade, but after the disastrous experience of 1926 that was not within the range of practical politics, and the business community would be well advised to ask instead that the Post Office should give a better service. Earlier and later deliveries of letters would be more beneficial to British trade than the restoration of the penny post, and would cost a great deal less.

The Post Office was giving a vastly better telephone service than existed before the war. During the last few years a notable improvement had been made in the trunk system, and the network of underground cables which this country possessed was not surpassed in any other quarter of the world. It had rendered our telephonic system more nearly immune from weather disturbance than any other system elsewhere. Then there had been the amazing development of telephony across the Atlantic. At present that was confined to communication between London and New York, but it was hoped that within a very short time the Department would be able to put Manchester in telephonic communication with any part of America. Critics had said that such telephonic conversations were likely to be overheard, but their engineers were working at a system which, it was hoped, would result in secrecy.

Cheaper inland telegrams could not be granted, but the development of the beam system had brought the Dominions into much closer touch with this country, and would result, he believed, in a cheaper service and in a greater facility of communication, which must be reflected in the prosperity of British trade.

He expected that further improvement would be made in the telephonic system during the next few years. The Department was building in Salford the largest automatic telephone exchange in the country. This would supply Manchester and Salford with an automatic service second to none in Great Britain.

The toast was replied to by the LORD MAYOR OF MANCHESTER and by Mr. E. B. FIELDEN, M.P., who said that he sat on the Committee which examined the Electricity Bill before it became an Act last session. He had to inquire into the conditions of the supply of electricity, and he was satisfied that Manchester was second to none in that respect. Looking forward to the future, it seemed to him the greatest problem would be transportation in view of the way in which the suburbs of Manchester were growing.

In proposing the toast of the "Institution of Electrical Engineers," Mr. E. A. RADFORD, M.P., said it was very pleasant to be able to refer to any branch of British industry—engineering in particular—as being in a state of prosperity, and that could be said of electrical engineering in the Manchester district.

Dr. W. H. ECCLES, president of the Institution, replied to the toast. He said that of the 13,000 members of the Institution nearly 2,000 were in the North-Western Centre. In the area over which they were distributed were great power stations and factories which made the district a microcosm of the whole electrical industry. There was a saying, "What Manchester thinks to-day England will think to-morrow." To a large extent the saying was true in electrical affairs. About a dozen years ago a Manchester firm partially electrified the Southern Railway, and the same firm had now another large order for that railway company. Manchester was electrifying railways in other parts of the world, for instance, India, at a great pace, but he noticed that it was not doing much in the way of electrifying its own railways. He hoped it would not be long before the whole of the British railways were electrified; the full advantages of electrification could not be got until everybody used electricity. In the Barton station, Manchester had the most efficient generating station in Europe, almost in the world. The number of export orders taken in the last few weeks gave promise of a very rosy future; they were the reward of scientific design and of that untiring energy which appeared to be native to the district. The coal stoppage was over, the Electricity Act was on the Statute Book, and the prospects before electrical engineers, especially in the North-Western Centre, were brighter than they had been for some time.

The toast of "Our Guests" was proposed by the CHAIRMAN, and responded to by Mr. B. MOUAT JONES, principal of the Manchester College of Technology, and Dr. H. Levinstein, president of the Manchester Literary and Philosophical Society.

The Manchester Lighting Service Bureau.

Since the opening of this Bureau in October last a steady programme of lectures has been carried out. Up to date there have been eight lectures, with a total audience of four hundred. These have consisted of the Illumination Design Course, similar to that held in London, and also lectures to the Electrical Contractors' Association, the Electrical Association for Women, and the Electricity Committees of several municipal undertakings in the area. Outside the Bureau there have been thirteen lectures, with a total audience of seven hundred. These lectures have been given to Chambers of Trade, the Mill Managers' Association, and general bodies of the public in Blackburn, Liverpool, Southport, Chorley, Glazebury, and Newchurch. In addition to these, the Bureau provided some demonstrations at the recent electrical exhibition held at Padiham under the auspices of the Lancashire Electric Power Co. A large number of lectures have been arranged to take place both inside and outside the Bureau during the next two or three months. The Electrical Association for Women has arranged to visit the Bureau on a number of occasions, and other audiences will include the Manchester Retail Traders' Association and the Rotary Club of Manchester.

Glasgow Corporation Tramway Supply Account.

At a recent meeting of the Glasgow Corporation Electricity Sub-Committee on Finance, the manager submitted an account against the tramway department, amounting to £8,742, for electricity supplied during the period of the coal dispute, based on the price of coal during that period, which the manager of the tramway department had declined to pay, contending that an equivalent quantity of electricity should be supplied to the electricity department by the tramway department. The manager of the electricity undertaking explained that it would take the tramway department over two years to supply an equivalent quantity of electricity. It was decided that a sub-committee of the tramways should confer with a sub-committee of the Electricity Committee on the matter.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

THE tendency of modern practice is to dispense with accumulators and dry batteries and to derive the power required to operate broadcast radio-telephone receivers entirely off the domestic electricity mains. Should the supply be d.c., no great difficulties are met with, but an a.c. supply present another problem. The anode, or valve-plate, circuit can be energised effectively by means of a "high-voltage" battery eliminator connected to the house mains, which rectifies a.c. in sufficient quantity for the purpose; but a rectifier to provide an adequate output of rectified and "smoothed" a.c. for filament heating would need to be large. It is, of course, possible to connect the filament directly to a.c. mains through a suitable transformer, but such an arrangement often introduces an objectionable hum in addition to the difficulty of obtaining stable grid-bias voltages.

The Novel "KL.1" Valve.

We have received samples of a new valve that has been designed to overcome the difficulties referred to. It is made by the M.O. VALVE CO., LTD., and is marketed under the Marconi and "Osram" names, being an entirely new departure which makes it possible for almost any receiver to be

Fig. 1.—The "K.L.1" Valve with Indirectly-heated Filament.

modified to run entirely off a.c. mains. It is the product of considerable research, and uses a new principle in that the actual filament is not the cathode, and it is not connected electrically to the circuit of the receiver itself. It is operated through a step-down transformer, the primary winding of which is connected to the a.c. mains, without any rectifying or smoothing circuit, and develops a high temperature. To obtain a sufficient supply of heat, the energy consumption has to be approximately seven watts; allowing for a drop in the windings of the transformer, it may be assumed that one kWh of electricity will suffice for 100 hours working. Fig. 1 shows that the electron-emitting cathode (which is surrounded by the grid and anode in the usual manner) takes the form of a small cylinder coated with highly emissive material, which contains within it a "heater element" that is connected directly to the transformer secondary winding. There is no connection between the cathode and "heater element," the former being heated by radiation, thereby acquiring a sufficient degree of temperature to enable it to provide a large electron flow. By this method, with a suitable circuit, all traces of a.c. "hum" are eliminated, it is claimed, and the cathodes of a number of these valves may be joined together in a set to form a common return lead for any number of grid-bias valves, without any fluctuation in grid voltage, such as would be caused by the filament of an ordinary valve if it were connected directly to a.c. supply mains.

In addition to these main advantages of the indirectly-heated cathode valves, scope is afforded by the nature of their internal construction for improved characteristics: internal resistance can be reduced if the cathode and grid diameters are nearly equal; with ordinary filaments it is impossible to do this, but in the KL.1 valve, owing to the cylindrical cathode, a very large surface area is exposed for electron emission, and the above ratio is much nearer unity than it can possibly be in an ordinary valve. This makes the new valve very efficient, and at the same time capable of high amplification without distortion, it is claimed. Several seconds elapse before the valve starts functioning after switching on the heater current; conversely, it continues to amplify for quite a noticeable time after switching off, which phenomenon is due to the time taken for the cathode to reach a sufficient temperature to enable it to emit electrons.

The method of connecting up the new valve is quite simple and straightforward; the cathode is joined to a small terminal on the metal cap, fig. 1, and the two "filament" pins, which are connected to the heater element, require to be wired to the low-voltage secondary winding of a transformer of suitable ratio, fed directly from the a.c. supply mains; a special transformer is obtainable for the purpose, which also feeds the a.c. rectifier for energising the anode. The electrodes are placed at an angle as shown in fig. 1 to prevent the heat emerging from the cylindrical cathode (which is closed at the top, but open at the bottom) from impinging

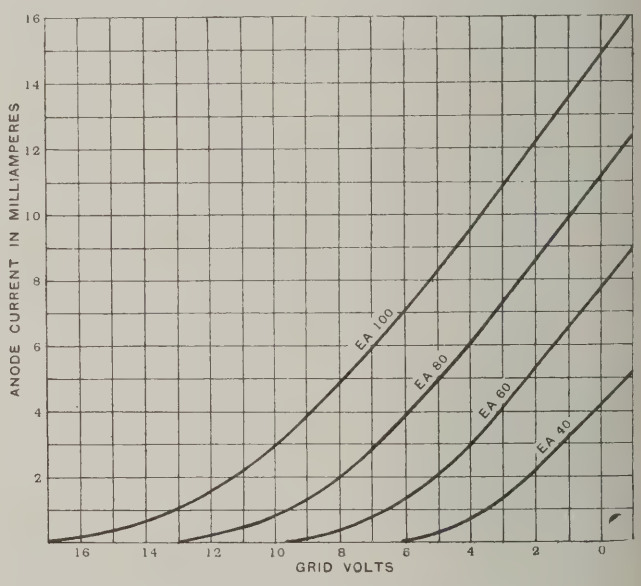

Fig. 2.—Characteristic Curves of the New Valve.

on the pinched foot of the valve. The small disk at the end of the horizontal wire is the "getter"; except for a small patch near the disk, the glass bulb is clear.

The KL.1 valve is suitable for use (1) in h.f. amplifiers when some form of stabilised circuit is employed; (2) as a detector in conjunction with a grid-leak and condenser; and (3) in all stages of transformer- and choke-coupled l.f. amplifiers. Curves of an average KL.1 valve are reproduced in fig. 2; owing to the very large cathode area, the characteristics of the valve are good, and the normal slope of the curve is 1.36 mA per volt, which is very high for a four-volt valve. The impedance is low, being only 5,500 ohms, and at the maximum anode voltage of 100, six volts grid-bias is required. Other data are: heater voltage, 3.5 V; heater current, 2 A; and the amplification factor is 7.5. It is satisfactory to know that the new valve is a British invention.

A Crystal Set Achievement.

By means of a 6-ft. box kite used by Dr. Ellison at the Armagh Observatory, Ulster, for experiments on atmospheric electricity, an unusual reception feat was recently accomplished. Shortly after noon on January 3rd, while the kite was flying at a height of 2,500 ft., the observers received smart shocks from the steel piano wire to which the kite was attached, and strong cracking sparks were drawn from it. The wire was attached to an iron post and earthed, and then connected to a No. 1 crystal receiving set made by the Brownie Wireless Co., which humble instrument enabled the North American broadcast radio-telephone stations to be heard loudly and with ease.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

22,076. "Telephone systems." Siemens & Halske Akt.-Ges. and K. Hartmann. September 3rd, 1925. (262,499.)

22,244. "Telephone exchange systems." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories, Inc.). September 5th, 1925. (262,505.)

22,332. "Switch apparatus for use with telephonic receivers." M. Graham and A. Graham (executors of A. E. Graham, deceased). September 7th, 1925. (262,507.)

22,563. "Automatic switches for use in telephone or the like systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). September 9th, 1925. (262,513.)

22,742. "Electric switchgear." British Thomson-Houston Co., Ltd., and H. Trencham. September 11th, 1925. (262,521.)

22,917. "Secondary batteries." J. Stone & Co., Ltd., and A. H. Darker. September 14th, 1925. (262,528.)

23,072. "Bushes, glands and the like for protecting, sealing and bonding electric cables and the like." F. A. Ross. September 16th, 1925. 262,532.)

23,120. "Supersonic heterodyne receivers." Igranic Electric Co., Ltd., and A. H. Curtis. September 16th, 1925. (262,533.)

23,208. "Electric switches, such as used in automatic telephone systems." Siemens Bros. & Co., Ltd., and H. E. Humphries. September 17th, 1925. (262,534.)

23,212. "Electric furnaces." J. K. B. Raeder and Aktieselskabet Raeders Elektro-Glasovn. September 17th, 1925. (262,535.)

23,321. "Electric heaters or vaporisers for use in vaporising the charges of internal-combustion engines." L. E. Aske. September 18th, 1925. (262,540).

23,589. "High-frequency thermionic valve." Dr. S. Loewe. September 23rd, 1924. (240,455.)

23,846. "Electrochemical processes and apparatus for the extraction of copper and zinc from ores." H. S. Mackay. September 24th, 1925. (Cognate application 27,731/25.) (262,546.)

25,876. "Control systems for electrical apparatus, such as motors." C. T. Scarf, C. H. Last and Metropolitan-Vickers Electrical Co., Ltd. October 16th, 1925. (262,553.)

26,069. "Thermionic valves." H. G. P. Rees and Cleartron Radio, Ltd. October 19th, 1925. (262,555.)

26,760. "Type-printing telegraph receivers." F. McKay. October 26th, 1925. (262,561.)

26,827. "Thermionic valves or electron-discharge tubes, particularly for wireless signalling." Dr. L. A. Levy. October 27th, 1925. (262,563.)

27,528. "Apparatus for providing current for wireless receiving sets from standard electric supply mains." E. K. Cole. November 2nd, 1925. (Cognate application 3,165/26.) (262,567.)

27,882. "Radio signalling systems." Marconi's Wireless Telegraph Co., Ltd. November 6th, 1924. (242,653.)

28,326. "Electric heat radiators." J. C. Vines. November 10th, 1924. (242,679.)

28,884. "Method of reducing inductive disturbances in submarine cables." Dr. U. Meyer. November 15th, 1924. (243,025.)

30,813. "Electric lamps." J. Y. Fletcher and T. J. Sack. December 5th, 1925. (262,593.)

31,215. "Electrical testing." G. F. Shotter. December 10th, 1925. (262,598.)

32,464. "Electric motors." H. Wade (Mills Novelty Co.). December 23rd, 1925. (262,603.)

1,450. "Electric switches." F. B. Cox. October 19th, 1925. (262,698.)

16,081. "Display apparatus of the moving and changing type." F. Pink. June 22nd, 1925. (262,835.)

18,973. "Vibratory systems." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories Inc.). July 25th, 1925. (262,839.)

20,770. "Electric protective systems." Electrical Improvements, Ltd., and L. C. Grant. August 19th, 1925. (Addition to 216,924.) (262,843.)

22,698. "System of transformation and transmission of electrical energy, applicable, for example, in telephony and telegraphy." G. Musso. September 11th, 1925. (262,847.)

23,084. "Electric furnaces, ovens, and other heating chambers." N. E. North. September 16th, 1925. (262,859.)

23,308. "Power-operated propelling rams for railway or tramway systems." A. G. Kershaw and Westinghouse Brake and Saxby Signal Co., Ltd. September 18th, 1925. (262,867.)

23,342. "Apparatus for electrically indicating or measuring the level or variations of the level of a liquid." C. F. Bornmann. November 20th, 1924. (243,318.)

23,440. "Apparatus for transmitting or reproducing sound." S. G. Brown. September 19th, 1925. (262,869.)

23,473. "Wall-boxes for electrical switches." J. B. Tucker. September 21st, 1925. (262,871.)

23,507. "Modulating system for high-frequency signalling." Standard Telephones and Cables, Ltd., and E. M. Deloraine. September 21st, 1925. (262,872.)

23,633. "Electrical terminals or connectors." J. J. Rowe. September 22nd, 1925. (262,877.)

23,684. "Electron-discharge tubes." Siemens-Schuckertwerke Ges., and R. G. Berthold. September 24th, 1925. (262,879.)

24,408. "Paper insulation for electric cables and the like." Felten and Guilleaume Carlswerk Akt.-Ges. May 8th, 1925. (251,931.)

24,459. "Electric switches." A. C. Wynne. October 1st, 1925. (262,882.)

24,958. "Lead-in tube for wireless apparatus." F. C. Rushton. October 7th, 1925. (262,885.)

25,064. "Electrical terminals." R. C. Turner. October 8th, 1925. (262,887.)

26,181. "Electric switches." English Electric Co., Ltd., and F. N. Linstow. October 20th, 1925. (262,892.)

26,666. "Electric switches." Cable Accessories Co., Ltd., F. H. Reeves, and A. Crawford. October 24th, 1925. (262,895.)

28,878. "X-ray tubes." F. Dessauer. November 16th, 1925. (262,906.)

29,180. "Sockets for holding electric lamps or the like." R. F. Baerman. November 19th, 1925. (262,907.)

29,437. "Telephone transmitters and receivers." M. Graham, E. Graham (legal representatives of E. A. Graham, deceased), and L. H. Paddle. November 21st, 1925. (262,910.)

29,921. "Dirigible headlights for vehicles." T. C. Holliday. November 26th, 1925. (262,915.)

30,567. "Distribution boards for use with wireless receiving sets." W. H. White. December 3rd, 1925. (262,923.)

31,483. "Electric switches." G. C. Lundberg, P. A. Lundberg, and G. Pegg. December 14th, 1925. (262,936.)

31,531. "Electrical indicating apparatus." H. C. Widlake. December 14th, 1925. (262,937.)

31,522. "Telautography or photo-telegraphy." H. C. Batholomew. December 17th, 1925. (262,943.)

32,915. "Machines for making bobbins for electric batteries." H. Wade (Yale Electric Corporation). December 30th, 1925. (262,960.)

1926.

109. "Ventilation of dynamo-electric machines." English Electric Co., Ltd., and F. A. Youngmark. January 2nd. 1926. (262,611.)

1,686. "Supports for electric resistances." H. H. Berry. January 20th, 1926. (262,620.)

2,139. "Wireless receiving apparatus and circuits therefor." A. E. Ball. January 25th, 1926. (262,623.)

2,867. "Apparatus capable of indicating distortion or degree of impurity of wave form of an alternating current." A. Graham, M. Graham (legal representatives of E. A. Graham, deceased), and W. J. Rickets. February 1st, 1926. (262,626.)

7,597. "Electrical ignition devices for internal-combustion engines." R. Bosch Akt.-Ges. June 4th, 1925. (253,076.)

14,688. "Signalling apparatus adapted for giving warning in the event of variation or breakdown in electric circuits." Compagnia Italiana dei Segnali. June 10th, 1925. (253,545.)

15,406. "Wireless telegraphy and telephony." Marconi's Wireless Telegraph Co., Ltd. June 19th, 1925. (253,934.)

17,032. "Brush gear, especially for electric meters and the like." International General Electric Co. Inc. July 7th, 1925. (255,070.)

20,612. "Means for cleaning the dust-depositing surfaces of electric gas-purifying chambers." Siemens-Schuckertwerke Ges. August 21st, 1925. (257,283.)

21,540. "Light projectors." British Thomson-Houston Co., Ltd. September 1st, 1925. (257,933.)

24,054. "Electric resistances for heating elements or the like." General Electric Co., Ltd., A. Kinnes, and J. L. Rycroft. September 29th, 1926. (262,696.)

24,202. "Electrical miners' or like safety lamps." F. Weissenfels. November 23rd, 1925. (261,718.)

25,651. "Means for detecting an earth leakage in high-tension cables." Akt.-Ges. Brown, Boveri et Cie. October 14th, 1925. (259,979.)

901. "Electric wire attachments." A. E. Chapman and C. R. Cook. January 12th, 1926. (262,968.)

1,902. "Electric controllers." International General Electric Co. Inc. January 22nd, 1925. (246,494.)

2,424. "Wireless receiving apparatus using current from the supply mains." W. E. H. Humphrys. January 27th, 1926. (262,979.)

2,651. "Process and installation for producing, simultaneously or successively, light of different colours by means of a discharge tube having positive column light." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. February 9th, 1925. (247,180.)

4,888. "Method of and means for balancing cables and land lines provided or not with compensating leads and earth cables." H. Tinsley and D. C. Gall. February 19th, 1926. (262,991.)

6,799. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. March 11th, 1925. (249,133.)

7,835. "Oscillating electric fans." N. W. Gilbert, H. C. E. Jacoby, and A. E. Jabet. March 22nd, 1926. (Cognate application 21,418/26.) (263,003.)

7,932. "Television." C. Baxter. March 23rd, 1926. (263,005.)

9,599. "Electrical power-transmission systems." British Thomson-Houston Co., Ltd. April 18th, 1925. (250,938.)

11,714. "Electric arc welding apparatus." British Thomson-Houston Co., Ltd. May 4th, 1925. (251,672.)

12,104. "Process for the production by electrothermic means of aluminium silicon alloys practically free from carbide." Metallbank und Metallurgische Ges. Akt.-Ges. May 12th, 1925. (252,160.)

12,824. "Electric storage batteries." W. B. Stone. May 19th, 1926. (263,024.)

13,326. "Electric power-transmitting systems." British Thomson-Houston Co., Ltd. May 26th, 1925. (252,721.)

15,263. "Electro-responsive switching devices." British Thomson-Houston Co., Ltd. June 22nd, 1925. (253,923.)

15,740. "Apparatus for sealing wire supports in a glass rod for use in electric lamps." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. June 25th, 1925. (Addition to 230,431.) (254,311.)

16,232. "Electric heating elements, particularly adapted for cooking ranges and the like." A. J. H. Haddan (Moffats, Ltd.). June 28th, 1926. (263,045.)

17,454. "Apparatus for electrodeposition." International Copperclad Co. August 5th, 1924. (Divided application on 238,230.) (255,113.)

19,130. "Magnetic materials." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories Inc.). August 18th, 1925. (Divided application on 20,702/25.) (263,059.)

19,505. "High-frequency electric signalling apparatus." Westinghouse Electric and Manufacturing Co. August 6th, 1925 (256,641.)

29,855. "Electric protective systems." Electrical Improvements, Ltd., and L. C. Grant. August 19th, 1925. (Addition to 216,924. Divided application on 20,770/25.) (263,074.)

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from January 19th :—

Mellodyne. No. 472,378. All goods in Class 8, but not including loud speakers.—Pollock Bros., 6, Exchange Street, Jedburgh, Scotland.

Majestic (lettering and design). No. 474,235. Class 8. Parts and accessories of radio-telephonic apparatus.—Grigsly-Grunow-Hinds Co., Chicago, U.S.A. (British representatives: White, Langner, Stevens & Parry, 88-90, Chancery Lane, W.C.2.)

Neutrosonic. No. 474,786. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—Igranic Electric Co., Ltd.

Petrix. No. 474,894. Class 8. Primary batteries, electric accumulators and parts thereof.—A.F.A. Accumulators, Ltd., 9a, Diana Place, Euston Road, N.W.1.

Mosma. No. 476,054. Class 13. Electric lamps (ordinary).—Moss, Mackay and Co., Ltd., 80, Cannon Street, E.C.4.

Magnet, No. 474,039, and Magnet (design only), No. 474,040. Class 50 Fuse boxes and casing for electric cables, electric insulating material, filaments for lamps (non metallic), &c.—General Electric Co., Ltd.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

BARNET.—49 houses, various sites, for R.D.C.; Arthur Cole, Ltd., Luton.
BARNSLEY.—Waterworks (£350,000); borough waterworks engineer.
BARROW.—Art gallery; Literary Committee of Corporation.
BEDDINGTON CORNER (SURREY).—Conversion of works, New Road, into radio valve factory, for Messrs. Mullard.
BENTLEY (YORKS.).—48 houses; U.D.C. surveyor.
BERWICK-ON-TWEED.—Kinema, café, and shops, Hide Hill; W. Alfred Schofield, for Berwick Theatre, Ltd.
BIDEFORD.—32 houses, Handley Cross, for the T.C.; clerk to the Council.
BIRKENHEAD.—Dock extension scheme for the Mersey Docks and Harbour Board.
BLACKPOOL.—100 houses, South Shore site; Edmondson and Colwell.
BOURNEMOUTH.—Drainage scheme and outfall works (£140,000); borough engineer.
BRADFORD.—New schools (first year programme of a three years' scheme); Bolling Hall secondary (£76,000); Swaine House secondary (£2,250); new Macmillan boys' school (£12,750); elementary schools—Thornbury (£1,050), Bierley (£650), Swaine House (£800); director of education, Town Hall.
CANADA (TORONTO).—Large general store, for the Hudson Bay Co. (several million dollars).
CHIPPENHAM.—Secondary school, for Wilts. E.C.; county architect, Trowbridge.
COVENTRY.—Boiler plant scheme (£12,460), with pumps, &c., for the B.G.; Edwards & Shaw, engineers.
CREWE.—Town central improvement scheme, High Street and Exchange Street; borough engineer.
DERBY.—Laundry (£39,000), for the Midland Co-operative Laundries' Association; secretary, Langley Mills.
DONCASTER.—58 houses at Grange Lane, Rossington, for R.D.C.; W. R. Crabtree, surveyor, Nether Hall. Courthouse, &c. (£20,000); West Riding Standing Joint Committee.
DOUGLAS (I.O.M.).—68 houses, Olympia Estate; J. E. Teare, Corporation architect. Alteration of premises, North Quay; Corlett, Sons & Cowley, Ltd.
ECCLESFIELD (W. YORKS.).—School, Ecclesfield High Green; West Riding County Education Department, County Hall, Wakefield.
ECCLES (LANCS.).—Bazaar premises, Church Street, for F. W. Woolworth & Co., Ltd., Kingsway, London.
EXETER.—102 houses, Buddle Lane; J. Laing & Son, Ltd.
FALMOUTH.—Theatre for Harris Bros.; W. C. R. Corfield.
FARNHAM (SURREY).—Additional 52 houses, for the U.D.C.; surveyor.
FORFAR.—Nurses' quarters at Infirmary (£7,000); Provost Lowson, convener, Extensions Committee.
GLASGOW.—Housing scheme on 200 acres at Carntyne; housing director.
GOOLE.—Railway and wharf; Thorne Colliery and Pease and Partners, Ltd., Darlington.
GOSPORT.—Town wharf reconstruction; borough engineer.
GRAVESEND.—Heating sanatorium, for the T.C.; J. G. Bennett, architect, 4, Woodville Terrace.
HARROGATE.—150 Corporation houses, at Devonshire Place; C. E. Rivers, borough engineer, Municipal Offices.
HAYES.—Extension, Gramophone Factory; Wallis, Gilbert and Partners, architects.
HEMSWORTH.—280 houses; R.D.C. surveyor.
HUDDERSFIELD.—Secondary school at Honley; West Riding Education Committee.
INVERNESS.—Additional 100 houses, for the T.C.; burgh surveyor.
KINSLEY (YORKS).—76 houses; Hemsworth U.D.C. surveyor.
LEEDS.—Works, Elland Road, for W. H. Holdsworth, Tallow and Grease Refining Co., Swillington.
LEIGH (LANCS.).—Adapting Pennington Hall as library and museum; borough engineer.
LONDON (WEST HAM, E.).—Extensions, Goodmayes mental hospital, for the T.C.; borough engineer.
(E.C.).—Alteration, City of London School; A. G. Scott, for School Committee.
(CAMDEN TOWN, N.).—Rebuilding Royal Veterinary College (£85,000); Sir John McFadyean, principal.
(REGENT'S PARK, N.W.).—Block of all-electric flats on Abbey Lodge site, Hanover Gate; Ernest Yates, 37, New Bond Street, W.1.
(ST. JOHN'S WOOD, N.W.).—Block of flats, Abbey Lodge site, Park Road; J. Murray, 11, Suffolk Street, W.
(ST. PANCRAS, N.W.).—Tuberculosis dispensary; borough engineer.
LONDON—(*cont.*)—
(BERMONDSEY, S.E.).—Factory for Crosse & Blackwell, Grimscott Street; Messrs. Joseph's.
(LEWISHAM, S.E.).—Kinema, J. Rayman, managing director of the Prince of Wales Playhouse.
(S.W.).—Reconstruction of Oddenino's restaurant, Regent Street (£250,000); Sir Lindsay Parkinson & Co., Ltd.
(BALHAM, S.W.).—Church, Balham High Road; J. S. Watkins. Fifty-five houses, Park Hill Estate; Swain and Selly.
(FULHAM, S.W.).—Additions, Western Hospital, Seagrove Street; W. J. Marston & Son.
(PUTNEY, S.W.).—Additions, Putney Hospital; H. Simmons Bros. L.C.C. school, Magdalen Road; Halliday & Greenwood, Ltd.
(TOOTING, S.W.).—80 houses, Furzedown Estate; E. Clarke and Sons.
(WESTMINSTER, S.W.).—Theatre, Denman Street; E. Laurillard.
(MARBLE ARCH, W.).—Kinema (corner of Edgware Road and Oxford Street); C. Aish, architect.
LONGBENTON.—30 houses, Benton site; U.D.C. surveyor.
LUTON.—Works extensions, Teagrave, for Electrolux, Ltd.
MANCHESTER.—Bazaar premises (five-storey building), Piccadilly, for F. W. Woolworth & Co., Ltd., Kingsway, London.
MIDDLESBROUGH.—Technical college; Education Committee.
NEWBURY.—80 houses; borough engineer.
ORMSKIRK.—Housing scheme (90), for the R.D.C.; R. Rosbotham, surveyor.
QUARRY BANK.—Housing scheme (75), for the U.D.C.; surveyor, Stevens Park.
RADCLIFFE (LANCS.).—Housing scheme (42), Outwood Road, for the U.D.C.; surveyor.
RAMSGATE.—Houses (100), for the T.C.; Grummant Bros., builders, Grange Road.
RICHMOND-ON-THAMES.—Houses, for the T.C.; builders, Craig & Mace, 208, Windsor House, Victoria Street, S.W. (35), and A. W. Folsham, 37, Sheen Road (28). Twenty flats, for the British Legion Poppy Factory, Ltd.; D. Wood, architect. Corporation housing scheme (63); Messrs. Cory & Cory and Mr. R. Dixon.
ROTHERHAM.—Technical and art schools, and four elementary schools (£140,000), for the borough E.C.; director of education.
SEDGLEY.—Sewage scheme and pumping plant (£29,000); W. Willcox, for the U.D.C.
SHEFFIELD.—Fire station, Rockingham Street (£42,000); city engineer. Waterworks (£160,000); water engineer.
SOUTHEND.—Kinema for Warrior Square Picture Theatre, Ltd.; Barles, Harris & Collings, architects.
STAFFORD.—Further 58 houses, Tithe Farn Estate; W. Plant, borough engineer.
STOCKTON.—Isolation hospital; borough engineer.
STRETFORD.—Extensions, cable shop, Warwick Road North; W. T. Glover & Co., Ltd. Warehouse and offices, Talbot Road; Crittall Manufacturing Co., Ltd. 84 houses, Hancock Street; U.D.C. surveyor.
SWANSEA.—Reconstruction of flour mills, Beaufort Dock; Weaver & Co., Ltd. Isolation hospital, Hellhouse (£84,000); borough architect. Reconstruction High Street Railway Station; G.W.R.
THORNE (YORKS.).—Houses (98), for Leadley, Firth and Whittington, Ltd.
TOTTINGTON (LANCS.).—Housing scheme (72), for the U.D.C.; surveyor.
TROWBRIDGE.—Conversion of Adcroft House into hospital; Cottage Hospital Committee.
URUGUAY (MONTEVIDEO). — Proposed National Freezing Works ($3,000,000); State Executive.—*Reuter's Trade Service* (Montevideo).
WAKEFIELD.—Deeds registry, Bond Street (£10,500); J. R. White, county architect, West Riding.
WALLASEY.—Motor-'bus garage; borough engineer.
WATH-UPON-DEARNE (YORKSHIRE). — 108 houses for U.D.C. at West Melton; Tennant & Smith, architects, Ropergate Chambers, Pontefract.
WHITWOOD.—Mining institute (£40,000); Miners' Welfare Committee and West Riding Education Committee.
WOLVERHAMPTON.—Completion of joint technical college (over £100,000); J. A. Warren, Director of Education.
WORSLEY (LANCS.).—Additional housing scheme (50), Walkden estate, for the U.D.C.; surveyor.
WREXHAM.—Additional 100 houses, for the T.C.; borough surveyor.

The

Electrical Review

VOL. C. FEBRUARY 4, 1927. No. 2,567.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Reflections on the Commissioners' Report.

THE Electricity Commissioners' Annual Report, besides satisfying mild curiosity as to the progress of the industry and providing an additional volume for the office library, may fittingly serve as a stimulus to fruitful thought. The mind of the Commissioners is more or less reflected therein, and a sagacious eye roving over the pages should be able to gather more than one point to turn to account.

Provincial electricity supply companies, for instance, may profitably ruminate on the question of extension of tenure touched upon in the Report. The Commissioners point out that many of the early Provisional Orders will expire in the course of the next few years, or be purchasable by a local authority at some early date. The London Companies have, of course, set their house in order and secured a very satisfactory long lease. It now remains for the provincial companies to follow suit, and similarly stabilise their position. And this would apply not merely to companies which have Orders on the brink of expiry, but also to any others which are within measurable distance of an option, since a party *in extremis* is not always in the best position to bargain. Extension of tenure will be, as is pointed out in the Report, a bargain mainly on the basis of a sliding scale of price and dividend. A company operating under the scale would, of course, exchange speculative possibilities for stability, and have to rely for increased dividends mainly on the extension and development of business. Under the old régime, there was, in many cases, a strictly limited outlook in this direction; but with the possibility of cheap bulk supply under the schemes of the existing Acts and the new Electricity Act, there is a very favourable prospect for many companies to expand, since they will be able to devote their whole available capital to immediately remunerative distribution, instead of having to provide plant which is always in advance of demand. Moreover, the fact, as shown in the present and previous Reports, that the Commissioners favour extensions of supply areas into surrounding districts, has an impor-

tant bearing on the future of many provincial companies. A perusal of the notes in the Report on the Special Orders granted should wake up all companies to consider their position, as there is a very energetic roping-in of unappropriated areas going on. This is shown in the Report by the figures given for the Electricity Districts. In eight districts alone, since 1920 powers have been granted for distributing areas for over 2,000 square miles. The unoccupied areas were shown in the series of maps which we published last year for the express purpose of assisting those who contemplated development of this kind.

Non-statutory undertakings should see a red light in the Commissioners' remarks under the heading "General Observations." Referring to the numerous cases in which public supplies of electricity in villages and small towns are being given by undertakings without statutory powers, the Commissioners gently intimate that such non-statutory undertakings may be ignored, where circumstances require it, and statutory powers may be given to some other undertaker over their area of supply. It might be politic, therefore, for non-statutory authorities to take the warning to heart and regularise their position by applying for Special Orders. It will be remembered that some years ago the Commissioners tried to induce them to do so by simplifying the procedure and cheapening the cost of obtaining the Order.

Undertakers who have not made up their minds on the question of subscribing to the Electrical Development Association may set their minds at rest over the scale of contributions by a perusal of the Commissioners' approving comments.

A glance at the proceedings reported with regard to the Trade Facilities Acts, where it will be seen that only nine applications were made for loans, shows that either the small companies were lethargic in enterprise or else capital was freely forthcoming in the usual way. In the case of Unemployment Grants, the requirements have been tightened up; it must be shown that the need is exceptional, and that the work would not be put in hand in the ordinary course for a considerable period. Consequently the applications for grants for electricity schemes have practically ceased.

Undertakers interested in "fringe" supply will be glad to have the elucidation given in a special case quoted by the Commissioners, where it was ruled that for premises partly in and partly outside the statutory area, supply means "delivery at the consumers' terminals," so that if these are inside the area, the undertaker can ignore the fact of part of the premises being outside that area. This case was reported in our columns a year ago.

An interesting section headed "Mutual Assistance: Bulk Supplies" gives an analysis of the growing number of bulk supplies taken and arranged for, and the figures displayed ought to supply their quota of persuasion to those conservative undertakers who still hold pathetically to the ideal of a self-contained undertaking, irrespective of advantageous outside help.

Electrical Progress in the United States.

The feast of statistics which is annually provided for its readers by the *Electrical World* is always interesting to electrical men on this side of the water, if for no other reason than that it arouses their envious admiration. From the electrical point of view the United States is particularly fortunate in that it is abundantly provided with coal and water-power, that the gas industry never secured the lead which it possesses in European countries, and that the Legislature has not laid its paralysing hand on electricity supply, so that electrical undertakings have been free to till a fertile field untrammelled by the barbed wire of statutory restrictions and limitations of area. That progress should be rapid under such favourable conditions was inevitable: but that comparisons should be instituted between it and the state of electrical affairs in this country, where the conditions are fundamentally different, was very unfair, without the added injustice of using false premises. However, we are confidently assured that when the Central Electricity Board gets to work we shall soon make up for lost time.

What we have to aim at is indicated by our contemporary's jubilant head-line: "A $20,000,000,000 Industry." We read that the total capital invested in the various branches of the electrical industries in the United States is now 19,500 million dollars—say 3,900 million pounds—that the annual gross revenue is about 1,187 millions, and that the new capital annually invested is 314 millions sterling. These are colossal figures, and indeed represent "an industrial development of unparalleled magnitude in commercial history." Electricity supply accounts for an annual gross revenue of 337 millions sterling; the energy generated amounted to 68,732,000,000 kWh last year. The telephone service deals with 70 million calls daily. Electric railways (including tramways) carried 14,400 million passengers on 40,000 miles of track. Manufacturers of electrical equipment employ 400,000 persons, and do a gross annual business estimated at about 475 millions sterling.

The energy sold to consumers for lighting, power, &c., in 1926 was estimated at 55,468 million kWh, or 470 kWh a head. This is still somewhat short of the 500 kWh which was freely but erroneously quoted as attained in 1924. About one-third of it was generated by water-power. Over 68 million people—58 per cent. of the population—are living in electrically lighted dwellings.

Expert Witnesses.

In a case which is now proceeding in the Chancery Division, Mr. Justice Tomlin has made some observations relating to expert evidence which are of interest to those who employ, as well as to those who are called upon to act as, expert witnesses. The action before the learned judge involves an inquiry into the flooding of certain mines in South Wales. The case bristles with technical and scientific questions which the parties, naturally enough, desire to have properly explained to the Court, but having regard to the length of the suit (it has already been before the Court for about six weeks), the learned judge expresses the opinion that he must limit the number of expert witnesses to be called on either side. He pointed out that if suitors were always to be entitled to call an unlimited number of experts, two evil consequences would follow. In the first place, the hearing of a cause would be unduly prolonged—to the prejudice of other litigants who were waiting to be heard; and in the second place, it would load the dice in favour of the wealthy litigant who could call the greatest number of experts. He has, therefore, made a rule for himself to the effect that, except in special circumstances, two expert witnesses only will be allowed. This will not, of course, prevent any witness to fact being called. The distinction between an expert witness and a mere witness to fact may occasionally be somewhat hard to draw; but generally speaking an expert witness may be said to be one who merely expresses a scientific or other opinion on a given set of facts or circumstances. There is probably no kind of dispute in which the technical witness is of greater importance than that in which electrical questions come up for discussion. Even the phraseology of the profession is baffling to the mere lawyer; and the duties of the expert begin long before a case comes on for hearing in Court. When a technical dispute arises, solicitor and counsel have each to be taught enough "electricity" to enable them to advise their client, and if litigation ensues it may be that the judge will have to be taught the elements of the subject. But it is manifest from what has taken place before Mr. Justice Tomlin that one learned judge at any rate does not want to have his Court overcrowded with scientific witnesses.

Modern Electrical Measuring Instruments.

A Review of Recent Developments and Improvements in connection with Electrical Indicating and Recording Instruments, and Protective Relays.

By C. L. LIPMAN.

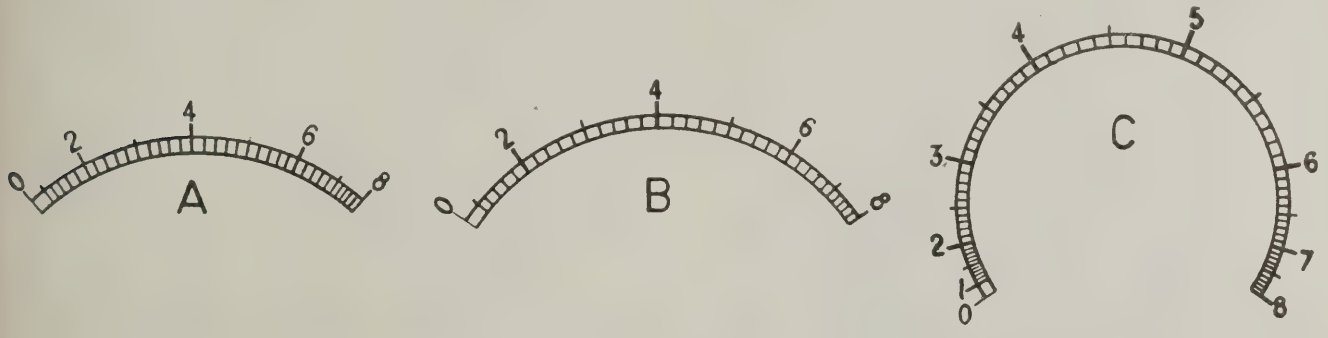
AMONGST the articles that appear in the technical Press, the subject of electrical instruments appears to have been somewhat neglected. The development of this branch of electrical engineering has been very marked in the last few years, and in no part of it have greater improvements been made than in connection with protective relays.

Indicating Instruments.

In the case of indicating instruments, little alteration in the active principles has taken place. The permanent-magnet moving-coil instrument is used for direct current, the moving-iron type for a.c. and d.c., the dynamometer type for a.c. and d.c., the induction type, and the electrostatic, hot-wire, and thermal types for a.c., the two last named being particularly suitable for high-frequency circuits.

Dealing first with moving-coil ammeters of the shunted type, important points have been the standardisation of the voltage drop (75 millivolts) and the drilling of the shunt ends. The length of scale has been considerably increased in these instruments as made by all the leading makers, and some years ago the Record Co. introduced an instrument designated as "Cirscale," in which the angular deflection was practically the same as in induction instruments, namely, about 270 deg. of arc.

In the case of moving-iron instruments, which are very largely used on account of their robust and simple construction, and are the type most largely employed on a.c. switchboards, many important improvements have been introduced. The scale-length of these instruments has been materially increased, so that the length of scale is equivalent to the diameter of the dial. "Long-scale" moving-iron instruments have been developed by Messrs. Record, Martin & Furderer, Nalder Bros., and others; in the case of the Record instrument, the "floating iron" principle is employed. A further development of the "long-scale" moving-iron instrument has been made by Messrs. Nalder Bros., & Thompson, Ltd., which differs from the above-described designs, in that it employs two sets of iron; it is suitably damped, and owing to its simple construction is not liable to oscillate on fluctuating loads.



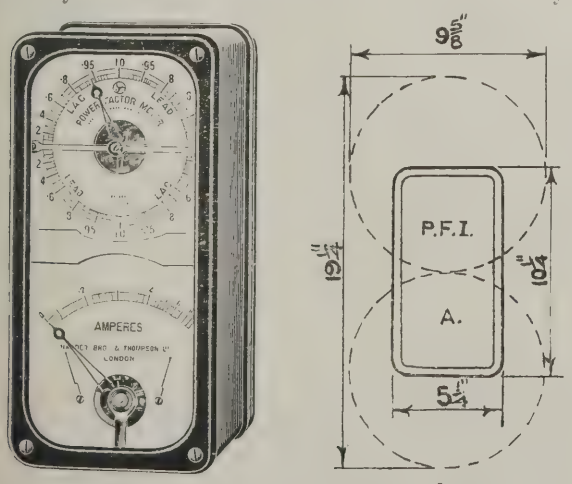


Fig. 1.—Three Stages of Development of Moving-iron Instruments, 8-in. Dial Size.

In the Martin & Furderer type, the angular deflection is about 220 degrees. In this type the damping is electromagnetic, and the instrument is reasonably dead-beat. This instrument employs the scroll-type repulsion iron, but in that it gives a larger angular deflection it is a successful development of the type originated many years ago by Nalder Bros. & Co., Evershed and Vignoles, Hartmann & Braun, and more recently by the Weston Co.

Fig. 2.—Combined Power-factor Indicator and Ammeter.

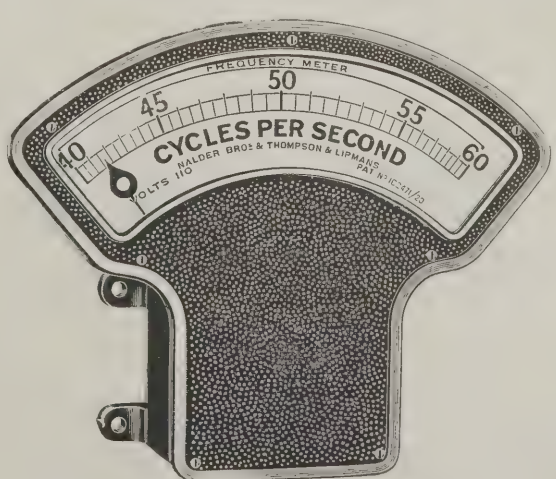

Fig. 3.—Sector-type Deflectional Frequency Meter.

Fig. 1 illustrates the three stages of development of the moving-iron instruments of the 8-in. dial size; for convenience of comparison, one size of instrument is shown: (A) shows the original scale length of about 6 inches, (B) the "Hyper-scale" or "Super-scale," as these are called, in contradistinction to the shorter scales, and (C) the long-scale type.

Apart from the improvements introduced in the instruments themselves, a new style of case has been pro-

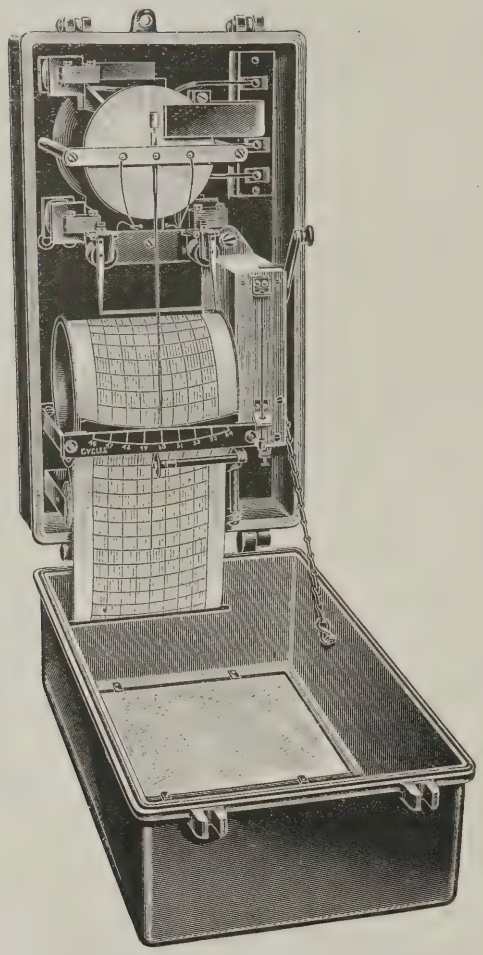

Fig. 4.—Recording Frequency Meter, Tapping Inker.

duced. This is square or rectangular in form, and in many cases leads to great economy in switchboard space. Fig. 2*a* shows the general arrangement of a power factor indicator and ammeter combined. Fig. 2*b* illustrates the space that would have been occupied had two round instruments been employed. This design is particularly suitable for use in the control rooms of large electricity

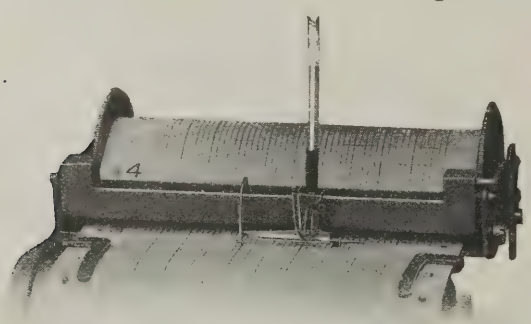

Fig. 6.—Method of Obtaining Rectangular Co-ordinates.

supply undertakings, where space is an important factor.

In the case of 3-phase systems, it is often convenient to fit three ammeters in one rectangular case. A complete line of such instruments has been developed by Nalder Bros. & Thompson Ltd., and by the Weston Electrical Instrument Co.

Single instruments or combination instruments are made in rectangular cases. There has been considerable demand for the following combinations:—

Power-factor meter and ammeter,
Wattmeter and ammeter,
Wattmeter and voltmeter.

Besides ammeters, voltmeters and wattmeters, new types of power-factor meters, frequency meters, and synchroscopes have been devised. Originally frequency meters were mainly of the resonance or vibrating-reed type; now deflectional frequency meters are generally employed. They possess the advantage that they are easier to read from a distance, and the disadvantage of the actual frequency to be measured lying between two reeds, thus reducing the amplitude, is avoided.

Fig. 3 illustrates a sector-type deflectional frequency meter.

Recording Instruments.

Considerable developments have also taken place in chart recording or "graphic" instruments.

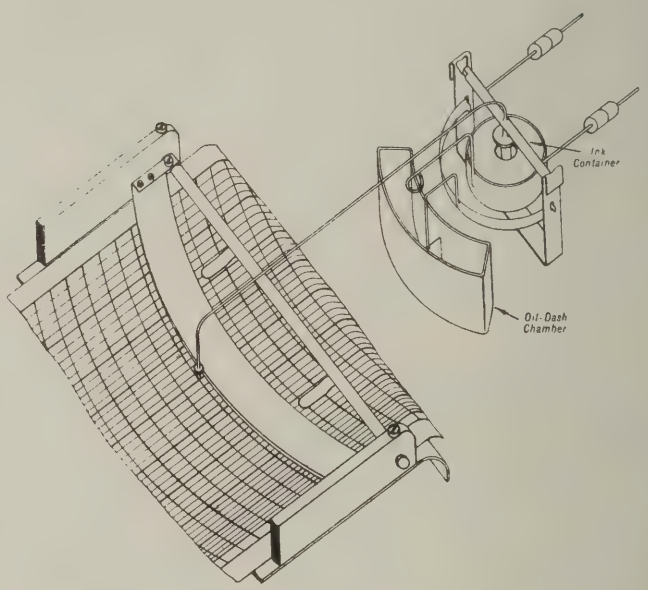

Fig. 5.—Tube-type of Pen Arm.

In addition to recording ammeters, voltmeters, and wattmeters, the details of which are well known, power-factor indicators and frequency meters have been introduced. Combination instruments are also obtainable for such purposes as feeder logs, &c., multiple pen

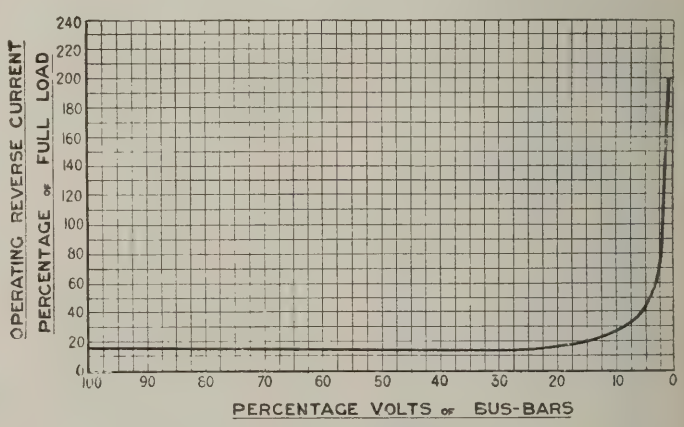

Fig. 7.—Relay Characteristic Curve.

recorders for telephone work, and revolution recorders or speed indicators, which generally consist of a magneto generator and a recording voltmeter.

Recorders have been specially adapted for fitting to electric trains, and a special system of cradle mounting has been devised which protects the instruments from the effects of excessive vibration. These recorders give valuable information, and tend to promote the efficient and economical running of the trains.

With regard to the method of marking the chart, the original method was to fix a pen at the end of the pointer

arm. The disadvantage of this method lies in the fact that errors due to the variation of the amount of ink in the pen can never be wholly eliminated. Various methods of getting over this difficulty have been adopted by different makers, amongst which the following serve as examples:—

A tapping mechanism by which the chart is inked at regular intervals. The inking device consists of a short length of fine tube fixed to the end of the pen arm, one end of which moves in a trough, at the back of which is an inking pad; the other end taps on the chart at regular intervals, generally ¼ or ½ minute, and is depressed on to it by a bar actuated by an electromagnet, thus (simultaneously) causing the ink to flow in the tube from the pad and making a dot on the chart. If the time intervals are sufficiently short, the record differs little from a continuous line.

The advantage of this method of inking is that the pen is not continuously in contact with the chart, and thus "pen to paper friction" is eliminated. This ensures accuracy, and is particularly valuable in the case of instruments wherein the forces are necessarily small, as in recording frequency meters and power-factor indicators. Fig. 4 illustrates a recording frequency meter embodying these features.

Another type of recording instrument which also gets over the error due to variation of ink in the pen was originally introduced by the Esterline Company of Indianapolis, and has since been further developed in this country by Messrs. Everett, Edgcumbe & Co., Limited, and others. In this type the pen arm consists of a fine tube which is normally full of ink, one end moving in a vessel containing the ink and the other end over the chart; the error due to variation of the amount of ink is thus eliminated. Fig. 5 illustrates the general arrangement of such a recorder.

With regard to charts, there has been little alteration in these in the last few years. Generally speaking, the hour, or time, lines are curved. Some time ago a recording instrument was patented by Murday, and is manufactured by Messrs. Evershed and Vignoles, which gives rectangular co-ordinates. Fig. 6 illustrates the method by which rectangular co-ordinates are obtained.

Protective Relays.

The problem of the protection of electrical plant, feeders, etc., against faults or abnormal conditions is of growing importance at the present time. The success of any protective scheme depends largely on the reliability and suitability of the relays employed.

The trend of development in the design of modern protective relays is along the line of making the operating element of the relay more sensitive and stable, and the tripping part more robust and reliable.

Sensitive relays permit lower fault settings to be obtained, are more accurate in calibration, and at the same time consume a smaller amount of volt-amperes for their working.

The development of super-sensitive relays enabled known and well-tried protective schemes to be extended and applied to modern extra-high-pressure systems, on which bushing-type current transformers of limited ampere-turns are invariably installed. Messrs. Nalder Bros. & Thompson, Limited, in particular, amongst others have developed a complete line of super-sensitive relays suitable for all forms of protection and for all purposes.

Protective relays are generally classified according to the functions they perform, or according to the principles on which they are constructed.

Most of the "over" and "under" current or voltage relays at present in use are of the electromagnetic or of the induction type, and a large proportion of these are fitted with some form of time-delay device.

Amongst directional relays the reverse-current relay is perhaps the most important. Until recently this class of relay has been manufactured by various makers in the dynamometer type, and has been arranged to give a characteristic curve approximating to that illustrated in fig. 7.

The dynamometer-type relay is in process of being superseded on account of the excessively high volt-ampere consumption under normal conditions. The total consumption of the current element at 5 amperes and the voltage element at 110 volts 50 cycles generally exceeds 100 VA.

In the most modern development of reverse-current relays, an almost negligible amount of power is required for their working; they give the same performance curve as shown in fig. 7, and operate with greater reliability, particularly in the region of low voltage. This feature is of the greatest importance in cases where the relay has to operate from bushing transformers.

A new class of protective relay is now coming to the front termed the "impedance relay." The time of operation of this is directly proportional to the impedance or the distance from the relay to the point of short circuit.

In order to prevent interruption of supply due to a sudden surge or high-frequency transient effect occurring on the system to be protected, special forms of anti-surge relays have been designed and are manufactured by various firms. Messrs. Nalder Bros. and Thompson, Limited, have also developed a series of special relays such as frequency and power-factor relays and automatic synchronising relays.

Electricity Supply Tariffs.

Some particulars of the various deferred-payment agreements and electric light and power tariffs in force at Basle, Switzerland.

By Professor W. CRAMP.

(*Concluded from page* 127).

It is difficult to compare this power tariff with a straight m.d. system, but instances will show how low are the terms. For example, an engineering works might have a load factor of 20 per cent. and an m.d. of 1,000 kW. The price on the Basle basis would be 0.86d. per kelvin; most English undertakings would charge at least 1.2d. I was recently instructed to negotiate the supply of electric power to a works requiring four million kelvins per annum, with an estimated load factor of 50 per cent. and power factor of 80 per cent. The best terms I could obtain were £5 5s. per annum per kVA of m.d., plus 0.35d. per kelvin, the basis price of coal being 6s. 6d. per ton. The coal clause was at the rate of .033d. per 1s. per ton. This tariff for the load in question, and with coal at 12s. 6d. per ton, works out at 0.91d. per kWh. The corresponding charge in Basle would be *at the most* 0.68d. No more need be said.

The foregoing are normal tariffs; but to attract the householder and tradesman alike, and to improve their own load factor, the Swiss supply authorities hold out all manner of special temptations. Some of these are annual charges without meters, as, for instance, B (9), (10), &c., below; others involve the use of special time meters and switches.

I.—Special Tariffs with Meters.

B (4) *Electricity for Cooking.*—(*a*) If the householder has adopted the double tariff under B (2) above, and has connected his cooker to the lighting system, then each month as many kelvins are reckoned on the lower tariff as are shown on the higher. All beyond these are supplied at 10 cents (0.96d.) in winter, and 8 cents (0.768d.) in summer. The kelvins per month for cooking must not be less than 10. This is an exceedingly cunning device, since it first tempts the householder to reduce his demand during peak hours and then to cook during off-peak hours, and moreover to cook more in summer than in winter. It may be commended to English supply authorities.

(*b*) The householder may rent a special meter for his cooker at about 1s. per month. He then gets energy for cooking from 6.30 to 9 a.m. and from 4.30 to 8 p.m. at 25 cents (2.4d.); and during other hours at 8 cents (0.768d). Who would cook by gas if we had such a tariff here?

B (5) *Electricity for Bakers' Ovens.*—Bakers' ovens are evidently a coveted load in Switzerland, and moreover some of these are equipped with an alternative system of heating. Tariffs are provided for each kind, and the period of energy supply is from 10 p.m. to 7 a.m. and from noon to 1.30 p.m. The following are the prices of energy:—(*a*) Electric bakers' ovens, from October 1st to March 31st, 4 cts. (0.38d.) per kelvin; from April 1st to September 30th, 3 cts. (0.3d.) per kelvin; (*b*) bakers' ovens with alternative methods of heating, from October 1st to March 31st, 3 cts. (0.3d.) per kelvin; from April 1st to September 30th 2 cts. (.19d.).

If the annual consumption per rated kW connected falls below 45 fr. (36s.) for class (*a*) or 35 fr. (28s.) for class (*b*), the difference must be made up. For class (*b*), however, there is a further provision to the effect that the annual minimum is reduced in the ratio of the number of days on which energy is at the disposal of the baker to the total number of days in a year. This seems to me to be a particularly generous concession.

B (6) *Electricity for Industrial Heating during the Day Time.*—This includes laundry irons, apparatus for drying hair or for coffee machines, and other trade devices. The basis is a double tariff like B (2) above, and the same hours are adopted, but the prices are:—(*a*) Less than 1,500 kelvins p.a.: upper rate 55 cts. (5.3d.), lower rate, summer, 8 cts. (0.768d.), lower rate, winter, 10 cts. (0.96d.). (*b*) More than 1,500 kelvins p.a.: upper rate 20 cts. (1.92d.), lower rate, summer, 8 cts. (0.788d.), lower rate, winter, 10 cts. (0.96d.).

The minimum is 84 fr. (67s. 6d.) per kW per year, and if the yearly demand exceeds 2,000 kelvins, the consumer has the option of adopting the ordinary power tariff (see B (3) above).

To simplify wiring for such installations, the purchaser may have his lighting connected to the same meter, except in those cases where the lighting load during the off-peak hours is likely to be large compared with the heating load, as, for instance, in public houses. This concession, however, does not hold if the power tariff is chosen.

B (7) *Electricity for Window Display and Advertisements.*—For this purpose a double tariff (with the appropriate meter) is offered. The terms are:—From 6.30 to 9 a.m. and from 4.30 to 7 p.m., 55 cts. per kelvin (5.28d.); all other hours, 15 cts. (1.44d.).

The object of the tariff is obvious, and since few such installations would be likely to be required from 6.30 to 9 a.m., the terms are more advantageous than at first sight appears. The supply authority is willing to provide an automatic clock-controlled switch which closes each day at dusk. The circuit can also be controlled by hand, so that the owner can switch off when he pleases. The hire of the automatic switch costs 1.5 fr. (1s. 2½d.) per month.

B (8) *Electricity for Heat Storage Systems.*—This is encouraged in certain cases for the heating of rooms, &c. The current heats a storage system (*e.g.*, special floors or panels) during the night, and these keep the rooms warm during the day. The tariff is 4 cts. (.384d.) per kelvin, with a minimum of 45 fr. (£1 16s.) per annum per kW connected. Such a system may have two "heats." The larger may be three times the smaller, and automatically brought into use from Saturday midday until Sunday evening. For this period the charge is 2 cts. (.19d.) per kelvin! A single heat system may also be used during these extended hours at 4 cts. (.38d.) per kelvin.

II.—Annual Tariffs (No Meter Reading).

B (9) *Electricity for Small Boilers.*—The conditions for the supply, on deferred payment, of two sizes of boiler have been quoted above, A (2). Now either of these sizes may be connected through an automatic switch to the mains, so that current is on from 10 p.m. to 7 a.m. If this is done, then the householder pays an inclusive charge of only 4 fr. (3s. 3d.) per month for the 30-litre boiler and 6 fr. (5s. 10d.) per month for the 50-litre size. Imagine a good continuous hot-water supply for a small house at £3 10s. per year! An additional switch will enable these boilers to be used continuously from Saturday midday until Sunday evening at a monthly charge of 1 fr. (9.6d.) for the smaller and 1 fr. 25 (1s.) for the larger.

B (10) *Electricity for Lighting Premises in General Use.*—Provided metal-filament lamps are used, the charges are as follows:—For lamp c.p. of 16, 25, 32, and 50, the annual charges for energy per lamp are 8 fr. (6s. 5d.), 12.5 fr. (10s.), 16 fr. (12s. 10d.), 25 fr. (£1).

B (11) *Electricity for Lighting Staircases, Corridors, Sign Boards, &c.*—For these purposes the supply authority offers a time switch which automatically closes at dusk and opens at 9 p.m. After this time the light can be switched on by a push-button at the house-door, or the doors of the various flats. Having thus been switched on, the light remains on for three minutes, and then is automatically extinguished. Of course, the latter arrangement is omitted in the case of signboards. The following table gives the annual charges for different numbers of metal-filament lamps, inclusive of rent and maintenance of the time switch:—

Metal-filament lamps connected.	Candle-power of each lamp. Sixteen.		Twenty-five.		Thirty-two.	
	Frs.	Shillings.	Frs.	Shillings.	Frs.	Shillings.
1	36	29	36	29	36	29
2	36	29	47	37.6	56	44.6
3	46	37	62.5	50	76	61
4	56	45	78	62.5	96	77
5	66	53	93.5	75	116	93
6	76	61	109	87	136	109
7	86	69	124.5	104	156	125

These figures are increased by 20 per cent. if the light is kept continuously burning until 10 p.m., and a further 10 per cent. is added for any further time up till midnight. Payments are half-yearly, and as a precaution against cheating, new lamps must be obtained from the electricity works.

There is little doubt that such a tariff as this would tempt many a landlord of flats, especially in London.

B (12) *Electricity for Bells and Door Opening.*—Finally a tariff is provided for a purpose little known in this country. It is very common abroad not only to have electric bells for the outer doors of offices and flats, but also to have a device whereby the latch can be withdrawn and the door opened by remote control from within. For these purposes the electricity authority allows special transformers and provides a special tariff. The transformer must conform as regards construction to the rules of the supply authority, and the

no-load power must not exceed 1 watt. The following is the tariff:—

Cost of energy per annum.

	Bells only.		Bells and door opening.	
	Frs.	Shillings.	Frs.	Shillings.
House of 8 rooms	3	2.4	5	4
House with more than 8 rooms...	5	4	6	4.8
Buildings of maximum 3 flats ...	4	3.2	6	4.8
Buildings of more than 3 flats ...	5	4	7	5.6

How gladly would the English householder get rid of the nuisance of his bell batteries for 3s. a year!

Principle of the Tariffs.

In the preceding paragraphs I have emphasised the benefit to the consumer arising from the very low tariffs, but these are only possible *because time switches improve the load factor.* The principle underlying this improvement is the combination of two rates with a time switch. This is very different in its effect from the two-part tariff. It definitely discourages the consumer from taking power except during those hours which best suit the supply authority, and it achieves the result by a liberal use of time switches. To meet these conditions, the consumer's apparatus must embody the principle of energy storage, entailing the equivalent of the gas-holder. The difference between the gas supply and the local storage system is that in the latter case the consumer pays for his share of the storage required, and for his share only; but he pays for it in a shorter period.

Supply authorities to whom I have mentioned this plan invariably reply with Lieut.-Col. W. A. Vignoles: "Expenditure on meters is unproductive, and should be kept down to the bare minimum." In Switzerland this is not the case. An economic rent is charged for the meter and time switch, and the business becomes profitable. The consumer does not object because the benefits accruing to him are usually out of all proportion to this rent; and if they are not, he can adopt some other tariff. The general effect of the whole policy is shown in the "Jahresbericht des Elektrizitätswerke Basel."

The load factor, though high in 1916, is now higher than would exist in any but the most favourable electrochemical industry, such as the manufacture of carbide of calcium or of carborundum. It is higher than that of some flour-mills. This result, it is claimed, has been brought about by fostering that load which is generally considered to be the worst, *viz.*, the domestic load; and the method of approach is in principle that of local energy storage in the form of heat, rendered possible by engineering initiative in the design of heaters and boilers and of time switches, combined with appropriate tariffs.

Conclusion.—The lessons to be drawn from the foregoing analysis are two. First, it is evident that Swiss engineers, combining their well-known faculty for reliable time-mechanism with the modern necessities of electricity supply, have produced a wonderful series of automatic time switches, which can be supplied at a relatively small cost and can be used even on 6,600-volt circuits. By means of these switches and the principle of energy storage, they are able to offer electrical power at very low rates, far below those in this country, which rates are framed in such a way as to increase the station load factor. It seems clear that we also should adopt similar expedients as rapidly as possible.

Secondly, the electricity authority goes out of its way to be of service to the consumer—especially the small consumer. This policy is clearly shown in the deferred-payment systems for wiring and apparatus, and the many discriminating tariffs for various loads; but it is even more evident in the consideration given to such apparent trifles as bells and door-opening appliances. Surely there is a lesson here also for us—a lesson which is very appropriate at a time when the E.D.A. and the E.L.M.A. are conducting a campaign to advertise the use of electricity. The best possible advertisement for electricity supply is that which results from a meeting between A and B on their way to town in the morning, when A casually remarks: "I arranged a month ago to put such and such an apparatus on the new tariff. It's saving me pounds a year!"

Tests for Resultant Economy.

The Calculation of the ultimate gain resulting from the heating of boiler-feed water by means of steam "bled" from the main Turbines.

By "ESSAYE."

POWER station engineers generally are well aware that considerable economy, in operation, may be obtained by the heating of the boiler feed-water by means of steam "bled" from one or more stages of the main turbine units. That the operating cycle is thereby improved is unquestionable. If, say, 5 per cent. of the total heat in the steam delivered to the turbine is returned, by means of a "bleeder" heater, to the condensate (feed water), it is obvious that 5 per cent. less heat transfer will be required in the boiler plant.

In most stations, however, this will not mean a 5 per cent. reduction in the fuel bill, and the question that arises is: How much of this saving will ultimately be realised?

First, then, the steam consumption of the turbine will necessarily be somewhat increased, due to the "bleeding" of some of the steam before all the turbine stages have been passed. Secondly, where the innovation of "bleeder" heating is made in a station in which the usual large economisers have already been installed, it will be apparent that the higher inlet water temperature to these economisers will render the water unable to extract the same amount of heat from the gases as heretofore. The consequent rise in the gas outlet temperature will, therefore, result in a decrease in the percentage efficiency of the boiler and economiser as a whole.

As the composition and lay-out of the boiler plant must have a largely varying effect on the overall saving, the writer will confine these notes to the problem as met with in a station where economisers only are installed in the flues. The following calculations are therefore put forward as being a simple and straightforward means of arriving at the ultimate gain in such a station. The data for these have been obtained from a great number of turbine and boiler tests taken in a large

modern power station, and the accuracy of these tests is as great as is possible.

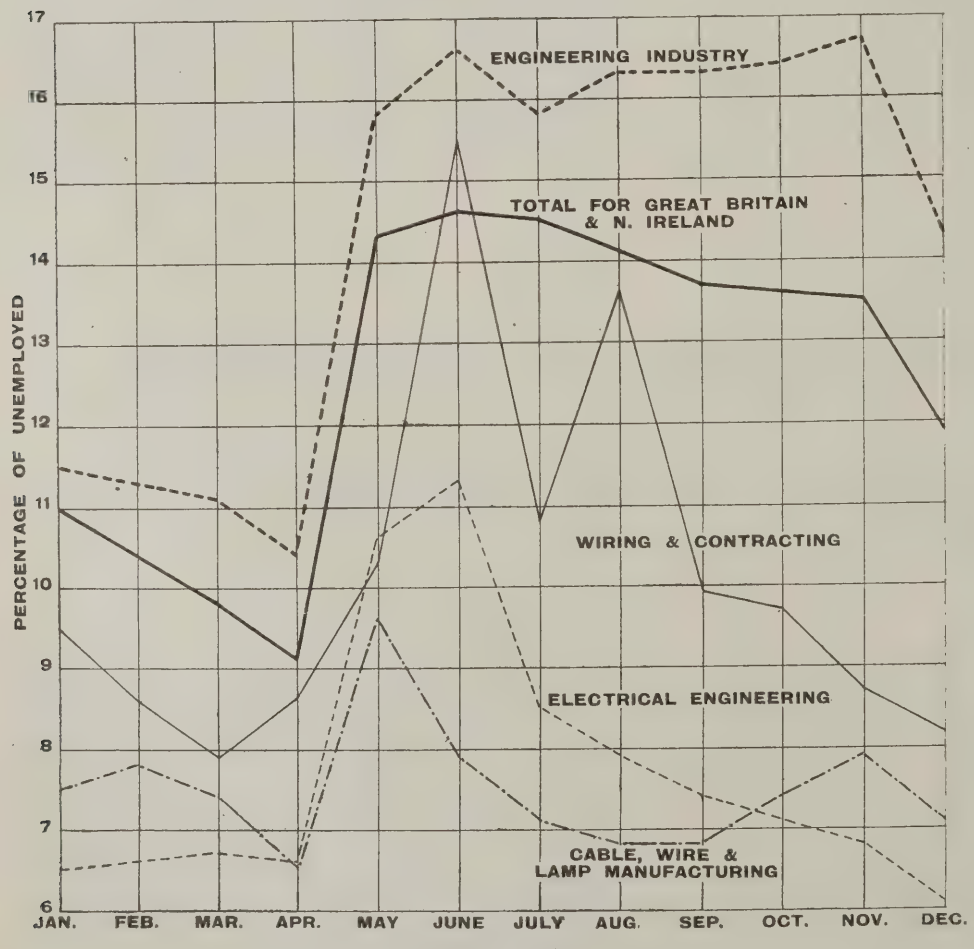
The following is the method stated briefly:—

The total steam consumed by the turbine in one hour was obtained from two similar tests, first without "bleeding," and secondly with "bleeding." In each case a figure of 5 per cent. (representing boiler make-up) was added, and the resultant gave the total steam demand from the boilers. The two different feed temperatures (at the economiser inlet) were also noted.

From the boiler tests the evaporation figure, *i.e.*, lb. of water (actual) evaporated per lb. of coal, was obtained for the two different feed temperatures. Then, by dividing these "evaporation figures" into their corresponding steam demand, the total coal required in each case was obtained. The overall gain due to "bleeder" heating was then easily obtained on a percentage basis.

The following are the actual test figures obtained:—

	Without bleeding.	With bleeding.
Load in kW	18,000	18,000
Turbine steam consumption (1 hr.), lb.	188,856	191,160
Total steam demand, lb. ...	198,299	200.718
Temperature of feed, deg. F.	91	150
Evaporation figure, lb. ...	8.182	8.617
Coal required, lb.	24,238	23,300



The difference of 938 lb. represents an overall gain due to "bleeder" heating of 3.78 per cent. The figures in the table have been corrected for the inevitable small dissimilarities which occurred in the tests.

Unemployment during 1926.

The Favourable Position of the Electrical Industries in a Troubled Year.

As was indicated in the foreign trade tables which appeared in our last issue, while British exports generally were very badly affected during 1926 by the industrial troubles which marred the year, electrical exports continued to progress, and were in excess of those of 1925. Even in the months affected by the general strike and its aftermath, all sections of the electrical industry compared well with other industries.

If further testimony is needed, the curves which accompany these notes will provide it. For the particulars from which they are prepared we are indebted to the *Ministry of Labour Gazette*. The statistics of general unemployment are based on the returns of the Employment Exchanges, and these (as well as the others dealt with) are for Great Britain and Northern Ireland. The percentages are derived from the total number of insured persons as at July, 1925 (11,892,000), for the first six months, and from the total as at July, 1926 (12,041,000), for the latter half of the year. This change of basis also occurred in the individual industries, necessitating the use of percentages rather than numbers.

Unemployment during 1926.

Dealing with the curve showing the state of unemployment as a whole, it will be seen that during the first quarter of the year the percentage fell at a regular rate from 11 to just over 9. Then came the general strike and the commencement of the coal stoppage, which sent the figure up to 14.3 per cent. In June it went slightly higher, and then gradually fell until December, when it made a sudden descent, which continued during January. The level of unemployment in the engineering industry as a whole was above the general figure during the whole of the year, and for the greater part experienced similar fluctuations; the improvement towards the close of the year was very marked. The curve indicating the state of employment in the electrical engineering industry stands out in marked contrast to the others. Commencing at 6.5 per cent., it kept well below the general and engineering figures, and at its highest (in June) was only 11.3 per cent., when the national figure was 14.6 per cent., and that for the engineering industry was 16.6 per cent. The section least affected by the industrial upheaval in May was the

electric cable, wire and lamp manufacturing group. Unemployment in this section went to 9.6 per cent. in May, but there was a swift recovery, and the position remained comparatively satisfactory until October and November, when there was a rise to 7.8 per cent. In common with the other groups, however, there was a decided improvement in December, and the final position was better than at the beginning of the year. The most violent fluctuations occurred in the wiring and contracting industry. Opening in a satisfactory manner, the percentage of unemployment rose enormously in April, May and June, and after a great improvement in July, again went up. In September there was another large fall in unemployment, and this was maintained at a slower rate for the rest of the year.

To afford the reader some idea of the magnitude, as distinguished from the proportion, of unemployment in the groups with which the curves deal, we may give the actual numbers upon which the last points of the curve are based; these are as follows:—General, 1,431,840; engineering industry as a whole, 143,503; electrical engineering industry, 4,686; electrical wiring and contracting, 1,141; and electric cable, wire and lamp manufacturing, 6,274.

Legal.

British Thomson-Houston Co. Litigation.

IN the Chancery Division, on January 28th, Mr. Justice Astbury granted an injunction until the trial of the action, the British Thomson-Houston Co., Ltd., against Green & Co., Leeds, restraining the defendants from infringing plaintiffs' letters patent relating to the gasfilled lamp. The defendants did not appear.

His LORDSHIP also granted an injunction *ex parte* in the case of the British Thomson-Houston Co. against P. M. Braidwood, Barnet, restraining the defendant from infringing plaintiffs' leading-in wire patent and the gasfilled patent. Leave was given to serve defendants with notice of motion for February 4th.

Mr. Trevor Watson appeared for the plaintiff company in both cases.

The West Yorkshire Electric Co. and Mr. J. G. Ritchie, of Leeds, were defendants to a motion before Mr. Justice Tomlin, in the Chancery Division on January 28th, by the British Thomson-Houston Co., Ltd., which claimed an injunction restraining alleged infringements of its leading-in wire and gasfilled lamp patents.

Evidence was read that a dozen lamps were bought by an agent of the plaintiff company at the back door of the defendants' premises, Mr. Ritchie producing them from a cellar.

Mr. RITCHIE denied that he had done anything wrong, and he asked for time to consider the plaintiff company's evidence.

His LORDSHIP adjourned the motion for a week for this purpose, but continued in the meantime the *ex parte* injunction restraining the defendants from parting with any infringing lamps still in their possession.

A Wiring Contract Dispute.

IN the Mayor's and City of London Court, before the Common Serjeant, Sir H. F. Dickens, K.C., on January 25th, a claim was made by Messrs. Margolis Fulberg & Budd, electrical engineers, 163, Wardour Street, against Mr. C. T. Colpitts for £41 15s., balance due in respect of electrical wiring and fittings supplied to a flat at 53, Lancaster Gate. The defendant admitted in respect of alterations to wiring a sum of £23 15s., also £21 15s. of which total of £45 10s. a sum of £40 had been paid, leaving a balance of £5 10s. The plaintiffs' case was that they were engaged by the landlord of the premises at 53, Lancaster Gate to do electrical wiring work when arranging for the house to be converted into a number of flats. That job was practically completed at the time the contract in the present case was made. Before that contract, plaintiffs had fitted certain of the electric wiring for the installation to lath and plaster partitions which were afterwards condemned. The defendant, a tenant of one of the flats, agreed with the plaintiffs to carry out alterations to the wiring. In the course of carrying out that work, the lath and plaster partitions were demolished, and breeze slab partitions re-erected in their place. In carrying out the defendant's instructions, the plaintiffs said, the flat had to be entirely rewired. It was also much more difficult to deal with a breeze slab partition than with one of lath and plaster. The defendant contended that some of the work claimed for by the plaintiffs was not necessary.

Mr. COLPITTS said that he did not know anything about scrapping the lath and plaster partitions in the building, and replacing them by breeze blocks. He had told the plaintiffs' representative, when the partitions were pulled down, that he (witness) would have to pay for re-instating the electrical wire, but he was never told that the flat would have to be rewired throughout. He put the amount he was liable for at £23 15s.

Mr. R. F. HAYDEN, F.S.I., considered that the cost of work rendered necessary by the removal of partitions was £20 5s., and for sinking switch boxes into breeze blocks he thought £3 10s. would be sufficient.

Mr. F. FIELD, manager of the electrical department of Messrs. Sims & Sims, electrical engineers, Gloucester Gate, said that in his opinion £20 was the cost of work rendered necessary by the alterations in the partitions. For ordinary slip tube installation work, whether chased into walls or not, a normal price would be 22s. per point, but for first-class screwed barrel work the price was 30s. to 32s. per point.

The COMMON SERJEANT said that the plaintiffs had failed to satisfy him that the work which they did was necessary, or that the price of £2 10s. per point was reasonable. He found that the sum allowed by the defendant of £23 10s. was the outside price to charge, and therefore the amount which had been paid was sufficient. Judgment was entered for the defendant, with costs.

Damages Awarded Against the Cork Tramways Company.

IN the Circuit Court at Cork, before Judge Kenny, on January 26th, Mr. A. P. Morgan, proprietor of the Cork Motor 'Bus Services, sued the Cork Electric Tramways and Lighting Co., Ltd., for £100 for damage to one of his 'buses, by reason of negligence and the reckless driving of one of the company's cars, and for consequential loss suffered owing to the collision. There was a counter-claim for £1 16s. 10d. in respect of damage to the tramcar, in the collision with the 'bus. After hearing the evidence at great length, Judge KENNY said he was satisfied that the collision with the 'bus was due to the negligence of the tramcar driver. He was strongly of the opinion that the driver of the tramcar did it maliciously, but he certainly did it negligently, and therefore the defendant company was liable for £35 damages. Judgment was given for that amount with costs and expenses. The counter-claim was disallowed.

Alleged Fraudulent Use of Electricity.

IN the Falkirk Sheriff Court, last week, a local licence-holder was charged at the instance of the Corporation with fraudulently altering the index of an electricity meter and preventing it from registering the quantity supplied, and fraudulently using 71 kWh of electricity. He pleaded "Not guilty," and evidence was heard at great length, the witnesses including Mr. T. M. Climie, the burgh electrical engineer, and Mr. R. J. Taylor, superintendent of the testing laboratory of Glasgow Corporation. For the defence it was denied that there was any interference with the meter. The Sheriff adjourned the case until February 7th.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Wattmeter Calculations.

Referring to the objections raised by your correspondent, Mr. D. Robertson, under the numbers which he gave them:—

1. In order to allow for the power consumed by the volt-coil "by simple subtraction," it is obviously necessary also to know the p.d. across the volt-coil, which is the same (in this case) as the load voltage, and Mr. Robertson, under (4) states quite correctly that this "is very troublesome, even when possible." It appears, therefore, as if he refutes his own argument.

2. This again depends on knowing the load voltage, and thus comes under the same heading as the above.

3. It is not desirable to allow the coils of a precision wattmeter to attain a 50-degree Centigrade temperature rise, necessary to produce the 20 per cent. change in resistance mentioned by Mr. Robertson, and in any case, the figure refers to *an error in an error*, and so is less formidable than might appear.

4. It is somewhat difficult to see in what sense this statement applies to the one method more than the other, seeing that the end of the current-coil to which the volt-coil is connected has no bearing whatever on the difficulty or otherwise of measuring the load voltage.

5. It would hardly be thought necessary to point out that figs. 1 and 3 are theoretical circuit diagrams, and do not supply the information regarding the precise disposition of the leads which Mr. Robertson appears to extract from them. Apart from that, he does not appear to have noticed that currents heavy enough to warrant consideration of contact resistance are specifically ruled out in the first paragraph of the article, as the errors in question are then negligible.

As pointed out in the article, the accuracy of the graphical corrections was not allowed to depend on mere theory, but was

carefully checked by experiment with standard apparatus representing a large variety of conditions. It is not always appreciated that in work of this kind the introduction of any ordinary form of a.c. voltmeter or ammeter completely alters the circuit conditions, and that therefore methods legitimate in general electrical practice do not apply.

Blackheath, *January 25th*, 1927. **Marcus G. Scroggie.**

Power Supply for Wireless Sets.

I was very much interested in the letter published by you, dated January 15th, from Mr. A. O. Griffiths, the more particularly as my own experience has been entirely different to his.

I changed over from so-called "dry batteries" to an accumulator six months ago. Under advice I was careful to have my accumulator recharged frequently, and at the end of four months I came to the conclusion that I preferred the dry battery, which gave me no trouble from recharging, and which, when exhausted, I was able to renew at a moderate expense.

I am satisfied in my own mind that a dry battery is cleaner, freer from trouble, and less expensive than an accumulator for the high-voltage supply.

Enfield, *January 24th*, 1927. **E. Rowbotham.**

I have read the letter of "Interested" in your issue of January 28th. It is a little difficult for me to reply adequately to this letter, for its writer does not commit himself to definite statements. He *thinks* that some statements of mine should be challenged: he *thinks* that the human ear . . . . . should be the final judge: *to his mind* his apparatus is distortionless, &c. Of course, he is entitled to his opinions, whatever they may be, but, since he has published them, perhaps I may be permitted to discuss them.

I will take first his statement: " . . . I am now using instruments which, to my mind, give absolutely distortionless reproduction of both speech and music. . ." As I have said, it is not for me to discuss the state of "Interested's" mind: I can only deal with facts. Putting aside the extreme improbability that there ever has been or ever will be an "absolutely distortionless" receiver, let me ask "Interested" on what facts or tests he bases his opinion?

Has he had the opportunity to take these instruments up to Savoy Hill, and listen to the performance with an instantaneous change-over to its reproduction on his set? If not, any claim for complete absence of distortion is simply ridiculous.

It is probable that about the nearest approach to distortionless reproductin at the present moment is the set at the South Kensington Museum, which has been built regardless of space and expense: but I know that its designer will be the first to admit that some distortion still exists in it. In fact, most of the distortion can be calculated from the circuit diagram.

Again, in his opinion "that the human ear, provided it be competent, must be the final judge as to whether a broadcast receiver is distortionless or not," he begs the whole question, for it is a fact undisputed by those who have studied the subject that there is no record of any human ear being competent in this sense. All the tests which have been made go to show that even at the easy task of judging the strength of a pure note, when the strength is changed instantaneously (the easiest test of all), the ear can hardly ever detect a change of less than 10 *per cent.*, and that the ear passes as correct complex sounds of which some components may be proved to be 50 *per cent.* below their proper amplitude.

Certainly the ear is the final judge as to *whether certain reproduction pleases that ear's owner*: but that is a totally different matter, which I have not discussed in my contributions.

It is notorious that some people prefer a distorted reproduction; for example, many prefer their music made "mellow" by having the high harmonics cut down. But since there is no hope of forecasting in advance what the majority will prefer, I have always gone on the principle that the nearest possible approach to a true reproduction is the best thing to offer.

It appears to me that "Interested" shows such a complete lack of appreciation of what "distortionless reproduction" really is that it is unnecessary for me to discuss the methods by which he claims to have achieved it.

P. K. Turner.

Blackheath, *January 29th*, 1927.

For an amateur my experience has been a fairly extensive one; I have had several sets and many different types of valves, and have used both dry batteries and accumulators for h.p. Many months ago I finally discarded the latter as being far too messy and troublesome. I am now a confirmed believer in the dry battery, as no attention at all is necessary for months on end, and in 90 per cent. of the sets used it is certainly less expensive in operation.

Where a few enthusiasts go wrong is in changing their valves for the modern high emission power valves; these are, no doubt, excellent in their way, but in my opinion the extra running costs are not compensated for by the little advantage obtained.

If you must have these, see that a dry battery of ample proportions is used. You do not expect to run an 80-h.p. car with the same petrol consumption as that taken by the more modest "ten." Apply the same reasoning when you select your high-voltage dry batteries.

Your correspondent himself condemns the use of accumulators in his second paragraph.

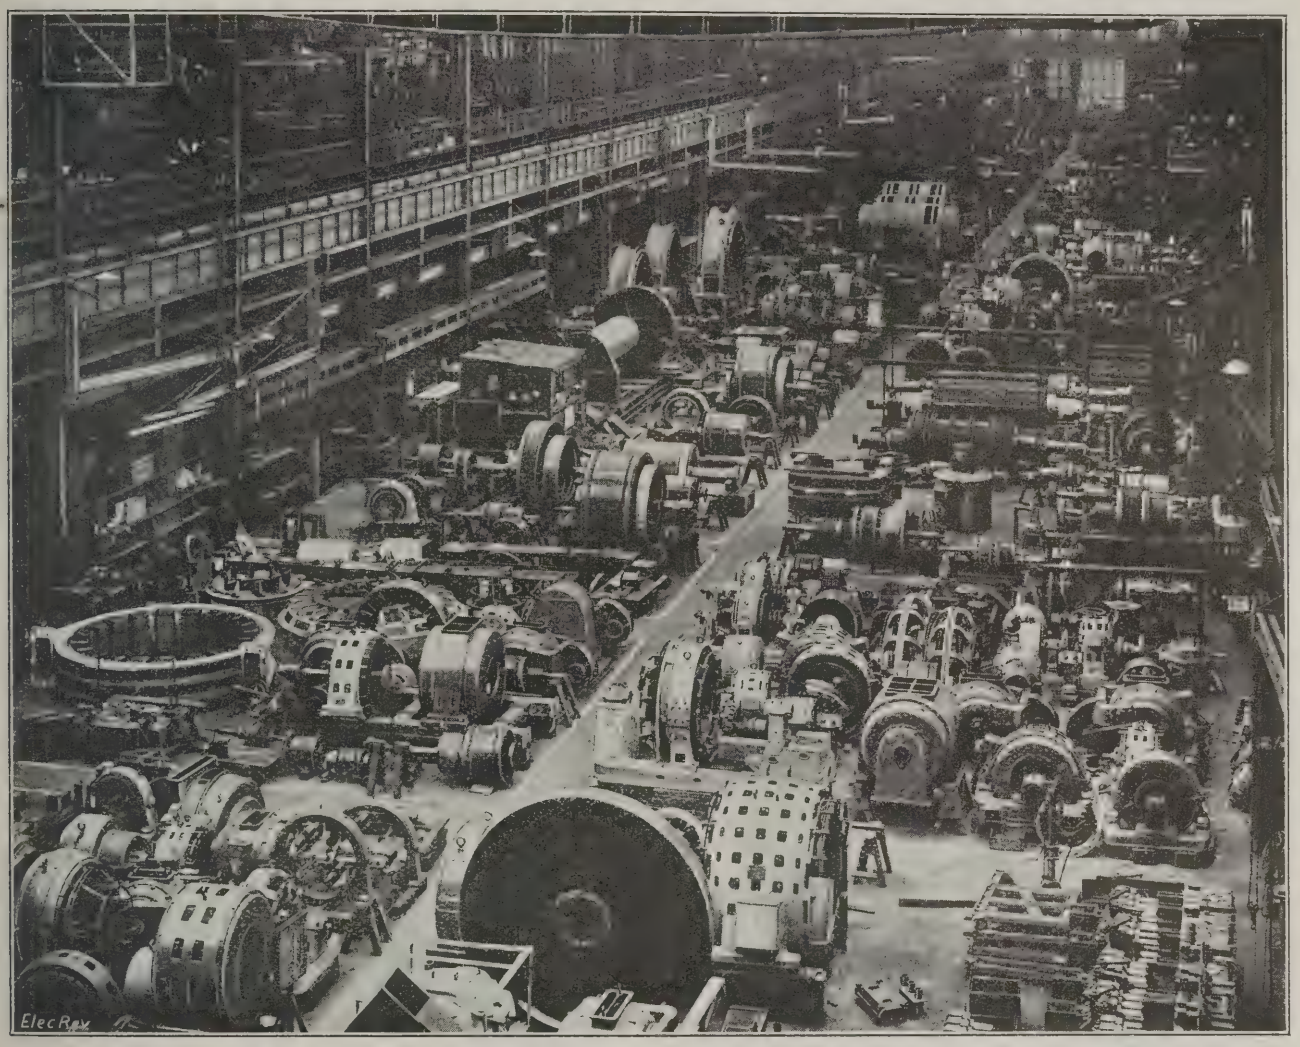
London, *January 25th*, 1927. **R. S. Stanley.**

River Water—or Cooling Towers?

In his letter in your issue of January 28th, 1927, Mr. R. J. Kaula doubts if the values assigned to vacua in the article on "River Water—or Cooling Towers?" could be substantiated by calculations. If the values assigned to the basis of vacua in the article, namely, an average recooled water temperature of 75 deg. F., and an average river water temperature of 50 deg. F., are admitted as being reasonably accurate values, then Mr. Kaula may find his doubt removed if he will refer to fig. 2 in the book on "Condensing Plant," the joint authors of which are R. J. Kaula and I. V. Robinson. The values assigned in the article to vacua corresponding to given inlet temperatures are based upon the results of tests on many makes of modern condensing plant by the writer, and fig. 2 in Mr. Kaula's book gives values substantially in accordance with those in the article. The differences between the values given by fig. 2 in the book referred to, and those assigned in the article are too small to affect the main issue.

In passing, Mr. Kaula comments that the article neglects to make any allowance for the power required to pump the circulating water to cooling-tower level, and states that this power will be practically 1 per cent. of the steam consumption of the main unit, thus implying that there is a debit of 1 per cent. against the cooling-tower station on this account. It needs little consideration to show that that is not the case. There is a difference in the circulating-water quantities in the two cases, for which due allowance was made in the article in assigning the values of vacua, and if this difference of water quantity is taken into account, the difference in the power taken by the circulating pumps falls to about 0.5 per cent. as a maximum. In most practical cases, owing to reasons outside our present scope, the difference would be less than this maximum value of 0.5 per cent. This point was investigated when writing the article, and the writer arrived at the conclusion that the difference in pump power for most comparative cases would be of the order of about 0.3 per cent., with a maximum value of 0.5 per cent. It was therefore deemed to be not worth while introducing this detail, for, if it were introduced, then to do full justice to both cases it would be necessary to compare relative capital and running costs, and it was desired to keep all reference to costs out of the article.

Mr. Kaula points out that the half-load figures in fig. 1 prove that practically the whole of the theoretical gain can be achieved, given a correctly designed low-pressure end. The writer would point out that the corollary to this is that to achieve the same result at full load would necessitate increasing the low-pressure blade area by about 90 per cent.—practically double. At the present time turbine designers find it impracticable to do this in a commercial turbine.



Mr. Kaula states that turbine builders all over the world are prepared to guarantee their ability to build turbines which will utilise the heat energy efficiently down to 0.9 in. Hg., and even below. If the word "relatively" were inserted before "efficiently," the writer could agree, but would point out that this is not the same thing as guaranteeing a definite gain accruing from lowering the terminal pressure from, say, 1.8 in. Hg. to 0.9 in. Hg. abs., which is the basic requirement from the point of view of the article. The writer makes bold to state that no such guarantee has ever been given in this country for modern plant. It may, or may not, be news to Mr. Kaula that if a prospective turbine purchaser drew up a turbine guarantee schedule calling for guaranteed steam consumptions at, say, 0.9 in. Hg. and also at 1.5 in. Hg., then not one of the turbine builders in the B.E.A.M.A. would give such a guarantee. The writer has tried to obtain such a guarantee, and every firm in the B.E.A.M.A. has refused to give it. The writer does not infer that turbine builders do not know the value of altered conditions—they obviously must know, or they could not give their ordinary guarantee—but the writer does believe that they are not particularly anxious that the purchasers should know the true value of conditions. The remedy is in the hands of the purchasers and consists in following the example of the writer by determining these values for themselves.

The article did not state or imply that turbine builders, as a body, were mistaken in the results they could obtain for given conditions, as inferred by Mr. Kaula; to do so would obviously be absurd. Neither did it state or imply that the results presented could not be improved on in the future. Bleeding the turbine for feed heating will tend to increase the difference between the two cases. The article presented the case as it stands to-day, and made no speculations to what the position would be years hence. As realised by Mr. Kaula, the article stands or falls by the test results given in fig. 1. To disprove the results arrived at in the article, it is necessary to produce authentic test results, showing immensely improved performance *at full load* over the range of vacua assigned. Mr. Kaula produces no such results, but merely a blind faith in the ability of turbine builders. The writer prefers to put his faith in reasonably accurate test results.

Stoke-on-Trent, *January 28th*, 1927. **J. N. Waite.**

Electrical Activity at Trafford Park.

MUCH has been said recently regarding the greatly increased volume of business that is receiving the attention of British electrical and allied manufacturers. The accompanying picture will convey more readily than many written paragraphs the real state of affairs at one big factory at Trafford Park. It shows the large electrical aisle at the works of the Metropolitan-Vickers Electrical Co., Ltd. The photograph speaks eloquently of the large amount of work in progress in the shop, and also to some extent indicates the size of the aisle, though we have not been able to include the full view of the galleries. At the time of the Manchester Civic Week we gave some notes regarding the big work that was in hand at this factory (see Elec. Rev., October 15th, 1926). Since that time we have recorded the placing of many further large contracts with the company for railway electrification and other operations.

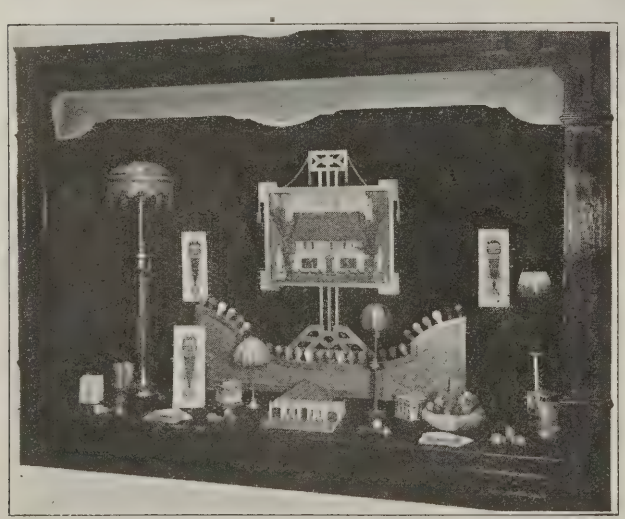
The Electrical Aisle at the Metropolitan-Vickers Works at Trafford Park.

Among the latest orders received by the company is one for electric winding equipment to be installed at the Bedlay Colliery, which is part of the important group of collieries, coke-ovens, and ironworks of Messrs. William Baird and Company, Coatbridge, near Glasgow. The winder will be of the a.c. geared type, with a motor of 280 h.p., operating at 570 r.p.m., and driving through double helical single-reduction gear, giving a speed of 61.8 r.p.m. on a cylindrical drum of 10 ft. 6 in. diameter. The depth to be worked is 1,188 ft., and the winder is to deal with a gross load of about two tons during the sinking operations, and a net load of one ton when carrying men when the shaft is put into work. The equipment will include a Metropolitan-Vickers liquid controller with automatic accelerating gear, and pillar-type switchgear; a Lilly overwind and overspeed device will be fitted. The mechanical parts and equipment for oil braking will be supplied by Messrs. Robey & Company, Ltd. The consulting engineers for the installations are Messrs. Stevenson & McCuffie, of Glasgow. It is of interest to note that the group of collieries and works of Messrs. Wm. Baird & Co. generates its own electric power at the Company's main station at Gartsherrie, which is equipped with two 3,000-kW Metropolitan-Vickers turbo-alternator sets. From this station power is transmitted at 11,000 volts to Bedlay and the collieries and works in the Kilsyth area. Metropolitan-Vickers electric winders are already in use at collieries on the system.

Sir P. Nash on the Electrical Industry.

Sir Philip Nash lectured on January 25th to the Metropolitan-Vickers College Apprentice Association, consisting of over 100 men selected from the principal universities at home and abroad. He said that in less than 100 years over £750,000,000 had been invested in the electrical industry by this country alone, and to-day there was hardly any phase of modern life that did not materially benefit from the extended use of electricity. In 1880 the largest electric generator was of 60-kW capacity, and to-day a single unit generator of 60,000-kW capacity was at work, and designs had been made for a set of 200,000-kW capacity. He anticipated that for this country alone over 30,000,000-kW capacity of turbines, generators, transformers, and motors, besides switchgear, would be required as a result of the developments expected to result from the new Electricity Act. Referring to the Metropolitan-Vickers Company, he said that more than half of its business came from abroad, and that much apparatus for export had to meet more onerous conditions than those met with in this country. He looked to the apprentices to fit themselves to play their part in maintaining the progress of the industry, and strongly advised them to develop the human side by studying very carefully their duty to each other and to the workmen.

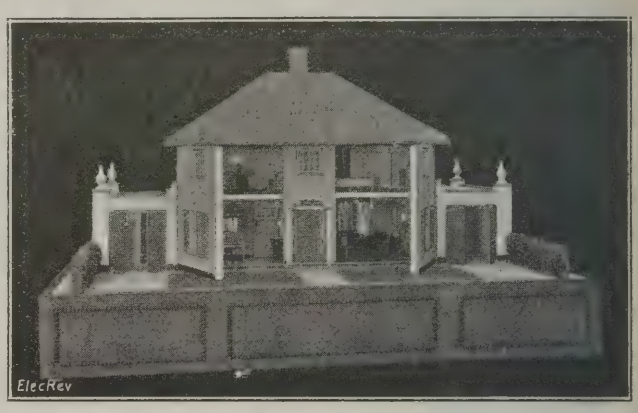
Business and Industrial Notes.



The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

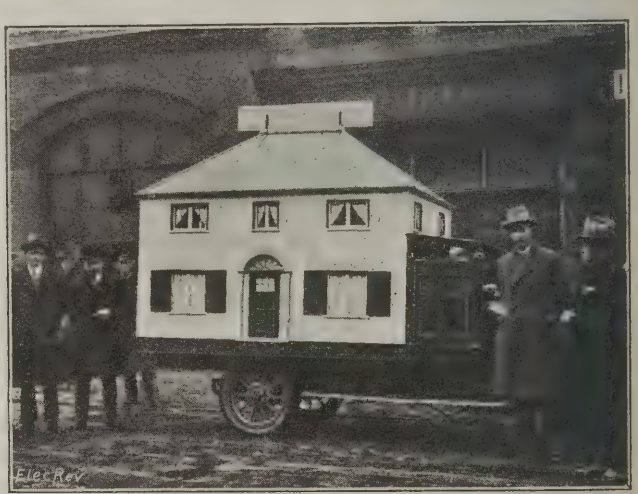
The E.D.A.-E.L.M.A. Campaign.

The official report for the week ended January 29th states that the Sheffield demonstration house was opened by the Lord Mayor, and a full electrical page with photograph of the house appeared in the *Sheffield Daily Telegraph* on January 25th. The Leicester demonstration house has been a great success; the average daily attendance has been 300, and a large number of genuine inquiries have been made and actual orders have been received for wiring houses. Bristol is considering running two demonstration houses in the suburbs, and another will be opened at Bath on February 7th. Competition books are being distributed and tramcar advertising is taking place in Douglas, Isle of Man. Southport is making preparations to increase the amount of campaign publicity. Bradford, as a result of a special window display, has increased the number of applications for competition booklets. A special window display in a London contractor's window has produced the following results:—Applications for competition book from commencement of campaign until January 24th, 12; during five days ended January 31st, 280. The display is of a very simple character, and particulars will be sent to any supply undertaking or contractor upon application to the E.D.A., 15, Savoy Street, Strand, W.C.2. On all hands there is evidence that immediate and good business is accruing as a result of the booklet applications. Very satisfactory reports are also coming to hand with regard to the amount of business being done and inquiries being received at the demonstration electric houses.



The total number of visitors to Glasgow demonstration house during the first week was 4,126. Owing to the stormy weather experienced in Glasgow during last week, only about 2,100 people attended. It will interest organisers to know that a telephone has been installed free of charge, and free insurance was also given by the Ocean Accident and Guarantee Corporation. Four transparent posters have been put on every tramcar in Glasgow. Apart from the Wolverhampton Exhibition referred to below, an electrical exhibition was opened on January 31st, at the new showroom of the Corporation Electricity Department, Paisley.

One of the most active centres in the campaign is the North-East Coast area, to which these notes have made frequent reference. An illustration of one phase of the work being done in that area is reproduced herewith. It shows a special window display arranged by the Newcastle-upon-Tyne Lighting Service Bureau. The poster depicting the prize house is the dominant feature, and a model of the house is also given prominence. These are supported by lamps and cartons of various makes and colours, while the actual employment of electric lamps is exemplified by four different standards. Copies of the competition booklet also appear.



A Newcastle Lighting Service Bureau Window.

In our last issue we reported that Headquarters had had a model of the prize house constructed and fitted for exhibition in the provinces. We are now able to reproduce a photograph of the model, from which it will be seen that a great deal of work has been put into it. The model should certainly stimulate public interest in the competition and inculcate a desire to be the possessor of such an excellent residence.

A Model of the Prize House.

Another model house is being used by the Birmingham Circle. It is fully equipped for electric lighting and heating, and, in the hands of a capable demonstrating staff, it is to tour Birmingham and suburban districts for a period of several weeks. It is mounted on a motor lorry, and will be flood-lighted at night. The scheme was discussed at a special meeting of chairmen and officials in the South Midlands Area of the Campaign, which was held at Dale End, Birmingham, last week, Mr. R. A. Chattock presiding, and it was decided that after a period of service in Birmingham and district the model house should be loaned out to other circles at a nominal charge. The Birmingham Committee also has in view the opening of about five more demonstration houses in various parts of the city in the near future, and the beneficial results of the previous houses was referred to by Mr. Chattock at the meeting mentioned above. The Campaign is being warmly supported by the Wolverhampton Corporation, which is collaborating with local traders in an exhibition; a special meeting under the auspices of the Electrical Association for Women was held during the exhibition, at which Lady Bird presided and Mr. V. W. Dale (E.D.A.) lectured.

A Model Prize House at Birmingham.

A further, illuminated, model of the house appears in the window of the Ludgate Hill showroom of the City of London Electric Lighting Co., Ltd.

The Hendon Electric Supply Co., Ltd., conjointly with the Hendon Circle, is organising an electric house. The house will be fully furnished, and electrically equipped throughout. The General Electric Co., Ltd., has undertaken to supply a large number of fittings and appliances. It is intended that this demonstration house shall be open for a period of three weeks, but this period may be extended if the circumstances warrant. It is proposed to erect a special two-way electric sign on the house—which will be readily seen from the railway—in order to draw attention to it.

An electrical exhibition, promoted by the Wolverhampton Corporation Electricity Department, with the co-operation of local contractors, was held at the Baths Assembly Rooms last week. At the opening ceremony on January 27th there were present the Mayor (Alderman F. A. Willcock), Sir Robert Bird, M.P., and Mr. G. R. Thorne, M.P., the first-named declaring the exhibition open.

Mr. Ernest Morgan, the Wolverhampton borough electrical engineer, who presided, referred to the assistance of the electrical contractors, and said that the exhibition was almost entirely domestic in its appeal, because the industrial world had learnt the benefits to be derived from the use of electrical energy years ago.

The Mayor said that Wolverhampton had one of the finest power stations in the country, and the aim of the Corporation was to supply current to consumers at as cheap a rate as possible. The exhibition would demonstrate what could be saved by the use of electricity in the home. Sir Robert Bird, M.P., remarked that Wolverhampton had already taken steps to do what the Electricity Act was out to do for other parts of the country. Mr. G. R. Thorne, M.P., also spoke.

During the three days the exhibition, which proved of great interest, was well attended by the public. The following contractors co-operated in the display:—Messrs. Coley and Swinnerton, H. Cooper, W. H. Podmore, C. Gordon Smith, H. H. Speke, Smith & Bellhouse, E. Wilson, and the Midland Electric Power Installation Co.

An Effective Advertising Van.

The accompanying illustration shows one of the new type of delivery vans recently put on the London streets by the MULLARD WIRELESS SERVICE CO., LTD. These are examples of an effective method of impressing a company's name and

A New Mullard Delivery Van.

product upon the minds of the public. The idea is, of course, not entirely novel—one or two electric lamp makers already have vans of this type in service—but that does not lessen its value as a propaganda medium.

Social Events.

The staff of Le Carbone held its annual dinner on January 21st, at the Boulogne Restaurant, London. A concert and dance followed, which were very much enjoyed by a large party.

A whist drive and dance were held on January 27th, at the Parade Café, organised by the Bradford Corporation Electricity Department. About one hundred of the staff and friends attended. Alderman and Mrs. Longley were present, and the alderman presented the whist prizes. After supper, conducted by Mr. C. E. Allsopp, the company took part in community singing.

The annual dinner of the Engineering Staff Association of the Fife Electric Power Company was held at Dunfermline on January 27th, when Mr. T. C. Hunter, chairman of the Association, presided.

On January 28th 50 couples attended the annual dance of James Scott & Co., electricians, Dunfermline.

The annual Bradford Corporation Tramwaymen's concert took place on January 26th, at the Eastbrook Hall, and was attended by a very large audience. The Deputy Lady Mayoress of Bradford (Mrs. David Walker), the chairman of the Tramways Committee (Mr. Irvine Smith), and the general manager of the tramways (Mr. R. H. Wilkinson) were among those present. The artistes were Miss Mavis Bennett (soprano), Miss Enid Cruikshank (contralto), Mr. Dennis Noble (tenor), of the British National Opera Company, Mr. Frank Webster (baritone), Miss Almena Marshall (flautist), Miss Belle Davidson (violin), and Mr. Charles Stott, accompanist and organist.

The second annual dinner of the staff of the West Gloucestershire Power Co., Ltd., was held at the Swan Hotel, Lydney, on Saturday, January 22nd. The general manager and chief engineer, Mr. H. S. Ellis, was in the chair, supported by Mr. M. F. Carter, Supt. Shellswell, and other guests. Mr. M. F. Carter, of Newnham, proposing a toast to the company, said that the company's area of supply was some 600 square miles, in which it had made steady and satisfactory progress. The chairman, in replying, referred to the substantial progress made during the past year in spite of the industrial trouble in the country. During the evening Mr. Ellis presented (on behalf of the whole of the employés) a leather expanding suitcase to Mr. G. A. Harrison, district engineer, who has resigned, having obtained a position abroad. The concert included the first performance of the company's Amateur Dramatic Company.

The British Industries Fair.

Many new matters of interest will be seen at the Birmingham section of the Fair this year. As we have reported, an additional area of 120,000 sq. ft. has been enclosed at Castle Bromwich, and some hundreds of workmen are engaged on the installations for lighting, heating and power for exhibitors' use. A "perfect boiler house," one of the principal exhibits in the new Steam Power Section, alone occupies 15,000 sq. ft. Among the working exhibits will be the "cheapest power pump in the world," single- and three-phase motors with special high-torque rotors of a type not previously made in this country, electric drills of special design for use in confined situations, automatic electro-plating plant, electro-medical appliances which have hitherto been imported, apparatus for the critical matching of colours and for testing their "fastness," and the manufacture of electrical porcelain from the raw clay to the finished article. The domestic side will also be well represented, and we are promised "gas and electric fires with no visible metalwork"; an "electric kettle which reduces the boiling time to half that of other kettles, while using less current"; and "new electric geysers with interlocked switchgear, absolutely foolproof, however careless the user."

Ideal Homes Exhibition at Norwich.

Considerable interest is being aroused in Norwich and district in the Ideal Homes Exhibition which has been arranged to take place at Norwich from February 8th to 19th, inclusive. It is hoped that an appreciable stimulus will be given to the idea of electricity in the home as a result of it throughout the Norwich area. Messrs. Mann, Egerton & Co., Ltd., are making a special display, and the General Electric Co., Ltd., is supplying that company with a complete range of "Magnet" household electrical appliances, together with "G.E.C." fittings, for this purpose.

For Sale.

Norwich Corporation Electricity Department has for disposal three Babcock & Wilcox drum marine type boilers, each 27,000 lb. per hour capacity, fitted with chain grate stokers, B. & W. oil-burning apparatus with pumps, heaters, &c., and one induced-draught fan and motor. Reigate Corporation Electricity Department has for disposal surplus generating plant installed at the Electricity Works, Wray Common Road. Ilford Corporation Electricity Department invites offers for the dismantling and removal of two 500-kW, d.c., Willans-English Electric generating sets, condensing plant, switch panels, &c. Edinburgh Corporation Electricity Department invites offers for 55 tons of battery plates, 11 tons sheet lead, and 7 tons peroxide of lead. Mr. H. J. Shaw will sell by auction on February 9th and following day, at 13, High Holborn, W.C., various wireless and electrical trade stocks and plants. By order of the liquidator of Seagull, Ltd., Mr. G. R. Lightfoot will sell by auction on February 11th, at 5, Newcastle Place, Edgware Road, W., the lease, plant, stock, &c. (See our advertisement pages to-day.)

Chinese Notes.

The Eastern Radio Supply Co. recently commenced business at 6, Pu An Lee, Rue Colbert, Shanghai. It deals in all kinds of radio supplies and manufactures minor accessories.

The Shanghai-Paoshan Electric Co. is being organised with a temporary office at A112, Peking Road, Shanghai. The company has a capital of $1,500,000, and intends to construct street-car lines to connect the Shanghai and Paoshan districts.

Electrical Plant for Mexico.

The National Irrigation Commission, appointed to inquire into existing plant and the provision of future electricity works, mainly for irrigation purposes, in northern Mexico, has presented its report to the Government. It is understood that it contains strong and unanimous recommendations for the expenditure of further large sums on development over a large area. If the report is acted upon, a strong demand will arise for construction material and electrical plant and equipment, stocks being at present unusually low. In view of the present relations between Mexico and the United States it is thought that British manufacturers of electrical machinery having representatives on the spot would have a good chance of securing orders, apart from the particular favour with which British manufactures are regarded in Mexico.—*Reuter's Trade Service* (Mexico City).

D

Recent Contracts.

In connection with the large contract awarded by the Southern Railway to the Metropolitan-Vickers Electrical Co., Ltd. (*vide* Electrical Review, December 31st, p. 1076), the latter company has given an order to the Westinghouse Brake and Saxby Signal Co., Ltd., for 232 motor-driven air compressors and a similar number of air-pressure governors for use in the motor coaches which the Metropolitan-Vickers Co. is supplying.

Among the orders recently executed by the Chloride Electrical Storage Co., Ltd., is one for six large batteries, each consisting of 114 cells for six locomotives at a mine in Chili, high up in the Andes. The climate is a trying one; no rain has fallen in that part of the country for hundreds of years. The company has recently shipped to another South American customer 13 locomotive batteries consisting of 100 cells each.

Civic Week at Fulham.

The Fulham Borough Council is organising a Civic Week to be held from February 5th to 12th. During the week there will be held at the Town Hall lectures, concerts, and an exhibition of local arts and crafts. At the Public Baths an Industrial Exhibition is being arranged; this will be opened by the Lord Mayor of London. The stalls will be arranged and supervised by Fulham manufacturers and producers, and the Electricity Department has taken a large stall, on which it is setting up a dining room, bedroom, and kitchen. In the last compartment electric cooking demonstrations will be given twice daily.

Calendars and Diaries.

We have received from the Enterprise Manufacturing Co., Ltd., Grape Street, Shaftesbury Avenue, W.C.2, a calendar bearing a humorous illustration and monthly date sheets.

The 1927 calendar of Messrs. Petters, Ltd., Yeovil, has a large sheet for each month bearing illustrations of examples of the company's engines and generating sets.

The principal feature of a calendar received from the Consolidated Pneumatic Tool Co., Ltd., 170, Piccadilly, W.1, is a picture of a "Little Giant" portable electric drill. There are monthly date sheets, each of which bears a calendar for the previous and succeeding months.

Trade Announcements.

Mr. Oscar Beabey, late manager of Messrs. Troup, Curtis and Co., Ltd., Liverpool branch, has started in business and will trade as O. Beabey & Co., electrical and general engineers, 13-15, Carlton Street, Liverpool. He asks for copies of catalogues.

The London office address of Messrs. Ransomes, Sims and Jefferies, Ltd., as from February 7th, will be Dashwood House, 69, Old Broad Street, E.C.2. Telephone No.: "London Wall 2422."

The Walsall Hardware Manufacturing Co., Ltd., has opened a new store at 20, New Street, Leicester, where a full range of its conduits, ironclad switchgear, &c., will be stocked. Mr. J. Lea is in charge.

New Catalogues and Lists.

British Electric Lamps, Ltd., Spencer Hill Road, Wimbledon, S.W.19.—An illustrated pamphlet advertising "Maxtrip" tubular lamps and a leaflet dealing with candle lamps. Both are priced.

Mr. Percy Pitman, 25, Victoria Street, S.W.1.—A detailed and illustrated description of the Pitman automatic deflector for the speed regulation of impulse turbines, hydro-electric plant, &c.

Messrs. J. W. Brooke & Co., Ltd., Adrian Works, Lowestoft.—A folder describing the new "Dominion" 5-7-h.p. motor-boat engine.

The English Electric Co., Ltd., Queen's House, Kingsway, W.C.2.—Publication No. 305A, illustrating numerous examples of "English Electric" locomotives for industrial purposes. A general description is also included.

Marconi's Wireless Telegraph Co., Ltd., Marconi House, Strand, W.C.2.—Leaflet No. 1061, containing an illustrated description of a 500-W fixed wavelength telephone set for operation by unskilled telephonists.

Messrs. A. P. Lundberg & Sons, 477-489, Liverpool Road, Holloway, N.7.—List S 30, containing illustrated details and prices of plug connectors, adaptors, and accessories.

Higgs Motors, Witton, Birmingham.—An illustrated catalogue of a.c. and d.c. motors for industrial purposes. Full specifications and prices are given.

Messrs. Crompton & Co., Ltd., Chelmsford.—List No. A.12, dealing in some detail with "Tru-Wat" three-phase autosynchronous motors for power factor improvement. Fully illustrated.

The Visco Engineering Co., Ltd., 162, Grosvenor Road, S.W.1.—A brief description of the "Visco" air filter and a list of electricity supply authorities, manufacturers and others who have installed these filters.

Mr. J. S. Plumtree, 90-91, High Holborn, W.C.1.—A standard list of motors and dynamos made by the Electrical Power Engineering Co. (Birmingham), Ltd.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Leaflet O.S.4347, illustrating and describing the floodlighting of the Hearts of Oak Benefit Society building, Euston Road, N.W.1, carried out with G.E.C. projectors, which are also described.

Messrs. Herbert Morris, Ltd., Loughborough.—A coloured illustrated folder advertising the company's gravity conveyors.

The Sun Electrical Co., Ltd., 118 & 120, Charing Cross Road, W.C.2.—Two illustrated and priced folders dealing, respectively, with domestic appliances and electro-medical apparatus.

Messrs. Vlies & Benson, Ltd., 1, Brazennose Street, Manchester.—Pamphlet 201A, describing equipotential surface cables made by the Forges et Ateliers de Constructions Electriques de Jeumont.

Bankruptcy Proceedings.

W. H. Dickson and A. J. Solomon, Tavistock Street, Devonport, electrical and radio engineers.—The public examination of these debtors should have taken place at Plymouth Bankruptcy Court on January 28th, but only Dickson put in an appearance, he stating that he had not seen his partner since Christmas. The Official Receiver (Mr. A. N. F. Goodman) said that the business was bought from a man named Kingdon, who absconded, and apparently Solomon had now absconded, while he (the Official Receiver) was the principal creditor by virtue of his position as trustee in the bankruptcy of Kingdon. The statement of affairs showed liabilities of £388, and a deficiency of £270. Dickson stated that in 1925 he answered an advertisement by Kingdon for a partner. The latter wanted him to invest £500 in the business, but he put in £200 only, and became a traveller instead of a partner. Solomon was also employed in the business, and the two of them later took an option to purchase it, each agreeing to find £250. They exercised their option, agreeing to become equal partners, but the only money received by Kingdon was £50 from debtor and £10 from Solomon. Kingdon then became bankrupt and absconded. Subsequently debtor paid the Official Receiver, as trustee in Kingdon's bankruptcy, a further £150. The business was unsuccessful. The case was adjourned until February 25th, the Official Receiver stating that if Solomon did not appear on that date it would be necessary to adjourn the examination *sine die*.

R. P. Reeves, trading as the Luxray Spotlight Projector Co., 5, Say's Corner, North Quay, Great Yarmouth, electrician.—The adjourned public examination of this debtor was fixed to be held recently at the Town Hall, Great Yarmouth, but he did not attend. It was stated that the liabilities amounted to £1,041, and there was a deficiency of £954. The registrar directed that the case should be adjourned with leave to the Official Receiver to apply for a warrant if necessary to secure debtor's attendance.

S. T. Hosken, radio accessories manufacturer and factor, 153, Fleet Street, E.C.—This bankrupt, who failed in May, 1925, applied on January 28th to Mr. Registrar Francke for an order of discharge. The Official Receiver reported that the probable debts amounted to £953 and the assets had realised £66. The applicant commenced business in March, 1923, and attributed his insolvency to bad trade, insufficiency of profits to cover expenses and loss in connection with a periodical. The discharge was suspended for one year on statutory grounds.

P. W. Horne (Horne Bros.), electrical engineer, 260, Linthorpe Road, Middlesbrough.—First and final dividend of 6¾d. in the £, payable February 10th, at the Official Receiver's offices, 80, High Street, Stockton-on-Tees.

J. G. Sandell, electrical contractor, 20, Hart Road and Ansell Road, Dorking.—First meeting February 9th, at 29, Russell Square, W.C. Public examination February 17th, at the County Court, Croydon.

H. Milnes (H. Milnes & Son), plumber and electrical engineer, 6, Trinity Street, Huddersfield.—Last day for proofs for dividend February 28th. Trustee: Mr. A. Pontefract, 6, New Street, Huddersfield.

A. F. Webb, electrician, Ashdown, Regents Road, formerly of 102, Duke Street, St. Helens.—Last day for proofs for dividend February 12th. Trustee, Mr. E. D. Symond, Official Receiver, 11, Dale Street, Liverpool.

J. G. Scott, electrical engineer, late of 5, Blackwood Place, Leven.—Meeting of creditors at County Buildings, Cupar, February 7th. Agent, Mr. I. W. McInnes.

Company Liquidations.

Cleartron Radio, Ltd., wireless manufacturers, London and Birmingham.—A meeting of creditors was held on January 26th, at the Institute of Chartered Accountants, E.C. The chair was occupied by Mr. C. A. Worssam, 9, Bedford Row, W.C., the liquidator in the voluntary liquidation of the company. The chairman read a balance sheet which showed liabilities of £133,700, including share capital £55,000 and debentures £30,000.

The liquidator reported that the company was registered on July 29th, 1925, with a nominal capital of £55,000. The sale and purchase agreement provided mainly for the acquisition of the British and Colonial rights, excluding North and South America, in a valve, and the goodwill and effects of a valve business carried on at Birmingham, whilst there was a factory which was to be equipped for an output of 10 000 valves a week. The consideration payable to the vendor (Mr. Carlisle) was £20,000, payable as to £10 000 in preference shares and £10,000 in cash. The vendor also had an option for the subscription at par of 50,000 deferred shares, which

was exercised, and a further option to subscribe to any fresh capital. It was further provided that there should be a deposit with the company of 10,000 shares in an American concern so that any dividends payable on the stock should be available for Cleartron Radio, Ltd. He understood that the shares were now in the possession of the company. The vendor was to be the managing director for a period of three years. All the shares in the company were subscribed for in cash, except the £10,000 worth allotted to the vendor, with the result that the company received £45,000 in cash. The vendor was apparently liable to equip a factory capable of an output of 10,000 valves a week, but it was not clear whether that was done. At any rate, that number of valves was never produced in any one week. In December, 1925, the company agreed to purchase the European rights in the valve for £20,000. It had paid £11,000 of that amount. Negotiations took place between Mr. Carlisle and the company regarding the claim of £9,000. That claim was to be reduced, but the company was to waive any claim it might have against Mr. Carlisle in respect of any non-equipment of the factory up to the capacity of 10,000 valves a week. The liquidator said he understood that that arrangement was not actually carried out, and there was some doubt as to whether the rights in the valves had been assigned to the company. In addition to the valves, the company entered into agreements for the purpose of acquiring other rights and processes. Last October the company entered into an agreement with another concern to purchase the rights in the "Lodge" set for £6,000. As far as he could gather £1,500 was paid. In May, 1926, the board agreed to the taking over of an additional factory in Birmingham at an estimated cost of £6,500. Presumably something like £4,000 was spent on the factory and equipment, and a deposit of £100 was paid on the land and buildings. In December, 1925, negotiations began with the object of the company being wound up and a fresh company formed with a capital of £50,000, to be later raised to £100 000, but the scheme fell through. The company started to manufacture valves in August, 1925. The sales from that date up to March of last year steadily progressed, but in April, 1926, they fell. In August last the company joined the British Radio Valve Manufacturers' Association, and that involved an increase in the retail prices, and less favourable discounts and terms to dealers and factors, and a royalty of 7 per cent. to the Marconi Company. In November last the company produced a new gasfilled valve, which went very well for a time. Last June the company's account at the bank was overdrawn, and by August £10,000 was owing. An overdraft of £15,000 was then obtained, which was guaranteed by some of the directors. Negotiations were then entered into with another bank, which advanced £30,000 on the security of a debenture over the company's assets. On December 28th last the bank appointed a receiver, and the directors then decided to go into voluntary liquidation.

The chairman agreed that on the figures appearing in the balance sheet there was a total deficiency of £35,000; he did not think that it was as much as £120,000. The unsecured liabilities were £58,000, and there would not be a penny for the unsecured creditors if the assets only realised £20,000, which included an amount of about £12,000 offered for the business. The offer for the business was from one of the guarantors.

Mr. Boult (Messrs. Wake, Wild & Boult) remarked that the most satisfactory way of dealing with the matter would be to present a petition, if any creditor would find the money. It was decided to confirm the voluntary liquidation of the company with Mr. Worssam as liquidator, whilst an advisory committee was also appointed, consisting of the representatives of Messrs. Bertram Day, Ltd., the London Press Exchange, Darling & Son, the Sterling Telephone & Electric Co., Ltd., and Brauen, Ltd. The principal creditors are:—

	£		£
Chloride Electrical Storage Co., Ltd. ...	537	Robinson, E. S. & H., Ltd.	947
Carlisle, A. H.	2.000	Sterling Telephone and Electric Co., Ltd. ...	803
Bertram Day, Ltd. ...	3,800	Darling & Son	645
London Press Exchange	1,902	Brauen, Ltd.	563
Magneto Syndicate, Ltd.	754	Plessy Co.	1,460
Melin & Co.	1,690	Davis & Co.	2,250
		Wolverhampton Box Co.	671

SPANISH & GENERAL WIRELESS TRUST, LTD.—A meeting of members is called for February 28th, at Marconi House, Strand, W.C., to hear an account of the winding up from the liquidator, Mr. S. Pears.

RADIO (HOVE), LTD.—Winding up voluntarily. Liquidator, Mr. A. C. Gillman, 103, Cannon Street, E.C. Meeting of creditors February 15th, at the liquidator's offices. Particulars of claims to the liquidator by February 28th.

The Belgian Telephone Reorganisation.

The *Industrie und Handelszeitung* (Berlin) states, on the authority of a Belgian official announcement, that the programme of reorganisation of the Belgian telegraph and telephone system has been settled in principle. It will take several years to carry out, and details will be made known shortly. In electro-technical circles in Belgium it is reported that it is intended to place contracts for fifty per cent. of the necessary material with German firms on reparation account.

The contracts which are likely to be placed in connection with this reorganisation and the great electrical projects of the French, Soviet-Russian and Turkish Governments have brought forward a suggestion from the United States electrical manufacturing industry that an international arrangement should be made by which this work should be shared. A representative of the Westinghouse Company is said to be visiting Europe in order to approach the French, Belgian, and German groups.

The Swedish Radio Trade.

Statistics forwarded to *Commerce Reports* by an American Consular officer show that during 1925 Sweden imported radio apparatus valued at 4,488,026 crowns, as compared with 2,993,445 cr. in 1924. Germany was the principal supplier (to the extent of 2,440,569 cr.), but Great Britain supplied apparatus to the value of 601,839 cr. During the same year Sweden exported radio goods valued at 439,918 cr. (as against 691,787 cr. in 1925). Norway was the principal customer (88,055 cr.), while Great Britain's share amounted to 13,902 cr.

Hungarian Foreign Electrical Trade.

According to the *Board of Trade Journal*, during the first eleven months of 1926 Hungary imported electrical machines and appliances valued at 7,876,000 gold crowns. During the same period the exports of similar products reached the value of 13,993,000 gold crowns.

Book Notices.

"Circuits for Building Radio Receivers." Pp. 48; illustrated and priced. London: Marconiphone Co., Ltd.—The object of issuing this publication No. 446 is to assist those who derive entertainment from building their own receivers; but no layout suitable for a cabinet has been included, as it is felt that the pleasure of construction is enhanced by the knowledge that the design is original. It is understood that since January 1st, 1927, the company has had 20,000 applications for the booklet, and that two editions have been exhausted; as the demand is still considerable a fifth edition of 10,000 copies has been put in hand—an interesting commentary on the liveliness of the interest taken in the subject at the moment, no less than on the instructiveness of the booklet itself.

"The Director System of Automatic Telephony," by W. E. Hudson. Pp. xi+156; figs. 72. London: Sir Isaac Pitman and Son, Ltd. 5s. net.

"Principles Underlying the Design of Electrical Machinery," by W. I. Slichter. Pp. v+312; figs. 152. Price 18s. 6d. net. "Elements of Heat-Power Engineering," by W. N. Barnard, F. O. Ellenwood, and C. F. Hirshfeld. Part I. "Thermodynamics and Prime Movers." Pp. xii+493; figs. 251. Price 22s. 6d. net. London: Chapman & Hall, Ltd.

"Makers of Science, Electricity and Magnetism," by D. M. Turner. Pp. xv+184; figs. 65. London: Oxford University Press, Humphrey Milford. Price 7s. 6d. net.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLVI. No. 1. January, 1927. New York. Price $1.

"*Journal* of the Institute of Wireless Technology." Vol. I, No. 1. October, 1927. Price 5s.—The first number of this quarterly publication contains extracts from the rules of the Institute and the first membership list (56 names), besides three technical papers. The membership is steadily growing, which indicates that the Institution is proving to be of use.

"Faraday House Journal." Vol. XII, No. 2. Pp. xii+48.—The Lent term issue of this house organ, always of interest and not only to old students, contains an article on "The Existence of a Minimum Sparking Voltage" by the principal; other contributions include "Notes on the Phenomena of Arcing and Switching," by H. Rainford.

"The Elements of Radio-Communication." By O. F. Brown. Pp. viii+216; figs. 146. London: Oxford University Press, H. Milford. Price 10s. 6d. net.

"Circular of the U.S.A. Bureau of Standards," No. 17. "Magnetic Testing" (15 cents).—This publication briefly discusses the quantities and characteristics of magnetic materials and outlines the various methods used by the Bureau for magnetic testing.

"Technologic Papers of the U.S.A. Bureau of Standards," No. 325 (15 cents).—Simplified methods which have been devised for integrating the light output and efficiency curves of lamps derived as a result of the photometric measurements during life are outlined.

"Scientific Papers of the U.S.A. Bureau of Standards," No. 536 (10 cents).—This paper describes the development of a portable radio direction finder with only two controls, balancing and tuning, which operates over the frequency band from 90 to 7,700 kilocycles (3,300 to 39 metres).

An Electricity Committee and Dutch Cables.

At its meeting on January 24th the Salford Electricity Committee adopted a resolution that the whole of its members should visit Holland for the purpose of obtaining particulars as to wages, hours, and conditions of service of craftsmen and general workers in the electric cable-making industry in that country.

The Census of Industry.

It is stated that the work upon the returns sent in for the Census of Industry has been nearly completed by the Board of Trade. The first results are expected to be published in a week or two, and these will be followed by others at short intervals.

A General Utility Machine.

THE GENERAL ELECTRIC CO., LTD., announces that at the forthcoming Ideal Home Exhibition it intends to display an electrically-operated machine which will not only wash and iron clothes, but will mince meat, make sausages, and supply ice-cream, to say nothing of sharpening knives. We await further details with keen curiosity.

New Swiss-Bulgarian Company.

A company has lately been formed in Zurich with a capital of £200,000 and the title La Société pour Entreprises Electriques et Industrielles en Orient, to acquire an interest in the Société Bulgare d'Entreprises Electriques, Sofia, and the collieries at Pirin, Bulgaria.

American Electrical Vehicle Exports.

Only 93 electric motor vehicles, valued at £26,072, were exported from the United States during the eleven months ended with November last, as compared with 114, valued at £35,120, in the corresponding period of 1925.

Electricity in Bulgaria.

According to a recent French official report the electrical trade in Bulgaria dates back only for a few years, except, perhaps, in Sofia. At present, however, it is extending fairly rapidly. Several syndicates have been formed for exploiting the water power of the country, and these are now supplying electricity for lighting and factory use in a number of Bulgarian towns. The electrical equipment of mills and other industrial establishments has led to a considerable advance in the demand for electrical material, none of which is manufactured locally. The trade for the most part is confined to the sale of lighting material, heaters and domestic appliances only being within the scope of the rich families. There is, however, a small scope for hot plates, kettles and irons. The Germans have obtained a firm footing in the market, and have popularised copper or brass finish rather than nickel. Three to six months' credit is usually granted against draft, guaranteed by a bank of standing. The channels of advertisement are chiefly the newspapers and the curtains of theatres, kinemas, &c. Some of the more important rates of Customs duty are as follows:—

Dynamos, motors, transformers, fans, together with spare parts and accessories: (*a*) Above 25 kg. inclusive, 100 gold leva per 100 kg.; (*b*) below 25 kg., free of duty.

Electrical apparatus and spares:—(*a*) Telegraphic and telephonic, 800 leva per 100 kg.; (*b*) meters and measuring instruments, 300 leva per 100 kg.; (*c*) irons, hot plates and heaters, 200 leva per 100 kg.; other heating appliances, 600 leva per 100 kg.

Cables, 60 leva per 100 kg.; wire covered with silk, 200 leva per 100 kg.; wire covered with other textiles, 120 leva per 100 kg.; and wire covered with material other than textiles, 60 leva per 100 kg.

On articles used in electrical installations not elsewhere specified, such as switches, contacts, and sockets, 200 leva per 100 kg. is levied, while ordinary electric lamps pay up to 400 leva per 100 kg. In addition, 20 per cent. of the Customs duties should be added for local duties and about 5 per cent. for other small taxes.

(£1=45 leva, approx.)

Polish Tariff Reduction.

By an order made in February, 1926, and subsequent orders, a reduction of 80 per cent. was made in the duty upon certain machinery and apparatus imported into Poland if such articles were not made in that country. The *Board of Trade Journal* now reports that this concession is to be continued until June 30th next.

The Electrical Contractors' Conference at Scarborough.

In amplification of the announcement made in our last issue we print the following particulars regarding the Second Annual Conference of the E.C.A. Allied Associations which is to be held at Scarborough:—

Wednesday, June 22nd.—Meeting of the Council. Arrival of delegates; reception by the president, Mr. H. J. Miles, and Mrs. Miles; music and dancing.

Thursday, June 23rd.—Welcome by the Mayor; presidential address; annual general meeting; papers and discussions; smoking concert.

Friday, June 24th.—Papers and discussions; address by president-elect; garden party in Peasholm Park; ball.

Saturday, June 25th.—Golf, drives, &c.

The Conference fee will be the same as last year, namely, 25s., and hotel arrangements will follow the same lines. The Conference headquarters will be at the Prince of Wales Hotel, and the Conference meetings will be held at the Olympia, Scarborough. The Conference secretary is Mr. C. V. Fisher (chairman of the E.C.A., Scarborough Branch), 1, Harcourt Place, Scarborough; Conference treasurer, Mr. R. Robson, "Electricity House," Haymarket, Newcastle-upon-Tyne; members of the Conference Committee (in addition to the above), Messrs. E. M. Parsons, 38a, Brook Street, Hull; F. Greathead, 9, Huntriss Row, Scarborough; S. S. Paley, 129, Victoria Road, Scarborough; and J. G. Appleyard, 1, Hanover Road, Scarborough.

Wages in the Contracting Industry.

The National Federated Electrical Association states that in accordance with the existing wages agreements the net hourly rates of wages in the electrical contracting industry, as from the second pay-day in February until the first pay-day in June, will be as follows:—Grade A, 1s. 10¾d. (including travelling allowance); Grade B, 1s. 8¾d.; Grade C, 1s. 7d.; and Grade D, 1s. 5¼d. The new rates represent an increase of ¾d. per hour in the cases of Grades A, B and C, and ¼d. in the case of Grade D.

Swedish Electrical Industry in 1926.

A symposium of the views of Norwegian electrical concerns upon the conditions of the past year appeared recently in an official publication. In this the A.S. National Industri refers to the continued depression experienced during the year, stating that the uncertain exchange conditions and the economic difficulties of the public bodies, which form a large section of the company's customers, added to the burden. The efforts of foreign competitors, particularly the Germans, to capture the home market, caused prices to fall to a level just sufficient to meet production costs, and it was impossible to make reasonable provision for depreciation. The prospect for the current year is not viewed with hope, although the currency position has improved. A similar report is made on behalf of the telephone industry by the A.S. Elektrisk Bureau. This company states that the abnormal exchange situation, high taxation, and high wages, placed overhead expenses on too high a level. In spite of that the company was successful in securing two important home orders in the face of external competition. The radio industry, it is stated, placed its expectations from broadcasting on too high a plane, with the result that a number of firms were unable to meet their obligations. With one exception, the broadcasting stations (main and relay) were erected by foreign firms. Further broadcasting developments are expected to improve the business. The home industry has retained the lead in the supply of ordinary receiving sets. The electric heating and cooking apparatus industry is favoured with an extensive home market, and the experience thus gained has enabled Norwegian firms to compete favourably in the foreign field.

The Sydney Plant Contract.

As we have already reported, the Commonwealth Shipping Board has been restrained from manufacturing power plant for the Sydney City Council. The Council has now decided, in view of this, to place the order for mechanical draught plant (valued at £99,898) with the Clyde Engineering Co.

Unemployment in Germany.

The Berlin correspondent of *The Times* says that unemployment in Germany again increased during the first fortnight of the year. On January 15th the number of men and women unemployed was 1,834,000, as compared with 1,747,000 on January 1st.

Scottish Electrical Traders.

A large number of members were present at the annual general meeting of the Scottish Electrical Manufacturers' and Factors' Association, which was held on January 10th, at 13, Dundas Street, Glasgow, in the offices of Messrs. McMillan and Henderson, accountants to the Association. The secretary, Mr. H. C. McMillan, reported that there had been a large increase in membership during the year. The Status Inquiry and Debt Recovery Department had been well supported by the members. The Debt Recovery Department had been most successful, 96 per cent. of the debts handed in for collection having been recovered in full. Owing to the unique method of obtaining and circulating information amongst the members, their losses in insolvencies during the year were greatly reduced as compared with former years. With a view to consolidating the interests of the trade, the meeting recommended the benefits of membership of the Association to all manufacturers and wholesalers in England who were still outside it. Mr. Ames, of the British Electrical and Manufacturing Co., having served his tenure of office as chairman for the year, retired in accordance with the regulations of the Association, and he was heartily thanked for his services. Mr. A. F. Stevenson (the Macintosh Cable Co., Ltd.) and Mr. A. C. Ross (Falk, Stadelmann & Co., Ltd.) were unanimously appointed chairman and vice-chairman, respectively, for the current year. Mr. H. C. McMillan and Mr. P. S. McMillan were reappointed secretary and treasurer, and assistant secretary and treasurer, respectively. Mr. Laidlaw (Andrews & Co.) presided in the absence of Mr. Ames.

Australian Tariff Decisions.

The following classifications have been approved by the Commonwealth Tariff Board:—Tungsten disks and resistance alloys for use in the manufacture of electrical apparatus, Item 404; electrical contact clocks and mercury arc rectifiers (including transformers and switchgear), Item 415A; and remote control switches and switches operated by clockwork mechanism, Item 415A(2).

The Dinner of the Commercial Travellers.

The annual dinner of the Electrical Trades Commercial Travellers' Association is to be held on Friday next, February 11th, at the Holborn Restaurant, W.C., at 7.30 p.m.

New Australian Companies.

Philips Lamps (Australasia), Ltd., was recently registered in Sydney (N.S.W.) with a capital of £50,000, to carry on the business of manufacturers of and dealers in electric lamps, radio apparatus, &c.

Amplion (Aust.), Ltd., has been registered with a capital of £10,000 to carry on business as electricians, manufacturers, &c.

The Telephone Development Association.

The second annual meeting of this Association was held at Aldine House, Bedford Street, W.C.2, on Friday last, Sir Alexander Roger (chairman) presiding. In moving the adoption of the report, the chairman stated that the total revenue for the year under review amounted to £15,962, as compared with £8,964 in the previous year. Seventy-nine per cent. of that amount had been expended in widely differing forms of advertising and propaganda, and 15 per cent. had gone in administration costs. The membership of the Association had increased during the year from 54 to 95; there was, however, still considerable room for development. The direct advertising had produced inquiries respecting the telephone service from 19,200 residents in every corner of the country, and the Association's film had been exhibited at 52 kinema theatres. They had a contract with a company to flash messages every few minutes from an electric screen in Shaftesbury Avenue, and the Association's essay competition had proved very successful. With regard to the future, he felt fully justified in expecting to see a steady volume of orders coming to all, and a distinct acceleration in both the growth of demand and the rate of supply. The report and accounts were adopted, and the chairman, retiring directors, and auditors, were re-elected. At a subsequent extraordinary general meeting a resolution was passed modifying the articles of association, making future meetings yearly instead of half-yearly.

Fire.

Last week a fire broke out at the works of the Premier Electric Control Co., Harrow Road, N.W., causing considerable damage.

A Polyglot Wireless Pamphlet.

British manufacturers are constantly being reminded that printed matter distributed in foreign countries should, as far as possible, be in the languages of those countries. The Brownie Wireless Co. (of Great Britain), Ltd., has made a laudable attempt to meet this requirement in producing a booklet containing instructions for working its "No. 2" receiving set, which is printed in 16 different languages. These comprise not only all the European tongues (including Russian and what looks like Czech), but also Chinese, Japanese, and Arabic. The booklet is one of the most comprehensive in this direction that we have seen.

Unemployment.

There was a further decrease, 41,000, in the number of unemployed during the week ended January 17th. The total at that date was 1,391,000, as compared with 1,432,000 on January 10th, and 1,215,900 on January 18th, 1926.

Prices of Raw Materials.

Messrs. F. Smith & Co. report, February 1st: No change in the prices of electrolytic copper.

Messrs. James & Shakespeare report, February 1st: Copper bars (best selected), sheet and rod, £88, £2 dec.; English pig lead, £28 5s., 5s. inc.

Messrs. Edward Till & Co. report, February 1st: India-rubber, Para fine, 1s. 4d., ¼d. dec.

Messrs. James Forster & Co., reporting on January 29th, stated:—"Closing prices yesterday were £26 16s. 3d. for January, and £27 2s. 6d. for April, against £27 7s. 6d. and £27 12s. 6d., respectively, at the end of last week. A flat tone was in evidence on Monday, when prices fell 10s. a ton, while a further 8s. 9d. was lost on Tuesday. There was then a rally of 7s. 6d. a ton. The general position is unchanged, with supplies ample and only a moderate demand. As far as the market is concerned the position is healthier. Realisation of speculative commitments has continued, and a short account been opened which will add strength to the market later on. This week's fall in values seems to be due more to sympathy with the weakness in other metals than to any change for the worse in the position, which, in fact, is improving. Stocks in this country are probably not more than 10,000 tons, which is only about a fortnight's normal supply."

Accumulator Makers' Association.

The annual dinner of this Association is to be held at the Savoy Hotel on Monday, February 21st, at 7 p.m. Mr. B. M. Drake, M.I.E.E., will preside.

Conditions in Brazil.

Commerce Reports states that Brazilian trade prospects have been improved by the projected stabilisation of the milreis at $0.125 and the subsequent adoption of a new currency unit, the "cruzeiro" (about four milreis). Transactions in electrical goods have recently indicated considerable improvement both as regards direct importations and sales from stocks. Two American companies have been awarded contracts for the electrification of the Paulista Railways. The radio business is said to be dull in Rio de Janeiro, but satisfactory in Sao Paulo.

The E.D.A. Annual Dinner.

The annual dinner of the British Electrical Development Association is to be held at the Savoy Hotel, London, on Thursday, March 17th. Tickets are 25s. each.

Opposition to Municipal Trading at Leeds.

The President of the Leeds Chamber of Commerce (Mr. J. R. Portway), who was re-elected last week for another year of office, expressed opposition to the Corporation's proposed extensive scheme of wiring houses and selling electrical fittings. He condemned the proposal as undesirable municipal trading, and hoped it would be strongly opposed in the city.

Lighting and Power Notes.

Australia.—CAIRNS (Q.).—According to *Tenders*, the Cairns Hydro-electric Board has received a report by Mr. P. A. W. Anthony in which he recommends the harnessing of the Barron Falls without delay. The cost of power plant is estimated at £180,000; transmission line and reservoir, £19,500; and line to Cairns, £3,000, making a total of £202,500.

Braintree.—POWER STATION BREAKDOWN.—The electricity supply for the town failed during a thunderstorm on January 27th. It was ascertained later that the power-station at Messrs. Lake & Elliott's, which supplies the town, had been struck and the plant temporarily put out of action. The fault was remedied during the day, and no great damage appears to have resulted.

Brightlingsea.—ELECTRICITY IN BULK.—The Urban District Council has decided to ask the County of London Electric Supply Co., Ltd., the East Anglian Electric Supply Co., Ltd., and the Colchester Corporation by what time they will be in a position to give a supply of electricity in bulk, and upon what terms.

Brighton.—LOANS.—The Corporation Electricity Committee is making application for sanction to loans to defray the cost of the following works:—One 6,000-kW turbo-alternator and accessories, £39,360; new reinforced concrete roadway, £5,000; steam turbine rotary feed pumps, £400; water softening plant, £962; 1,000-kW motor convertor, North Road, £10,220; extension of boiler plant and buildings, £64,966; switchgear for supply to Portslade, Southwick, and Shoreham, £690.

Continental.—NORWAY.—The budget proposals of the Government Water Power Department for 1927-28 contain a survey of the works carried out and still to be executed in connection with the State hydro-electric works which are being established on the Nore. The works are to be ready to supply electricity by July, 1928, and a sum of over 48,000,000 kr. has already been granted for the purpose. Contracts have been entered into for the delivery of 43,000 kW, and it is anticipated that the demand will reach 55,000 kW by the time the works are in operation. Consideration is now being given to possible extensions in the event of the demand further increasing.

AUSTRIA.—The Styrian Water Power and Electricity Co., of Gratz, has issued its report for 1925, in which it states that during the twelve months the main constructional work which has occupied nearly five years has been completed. The Teigit hydro-electric station and the long-distance transmission line to Gratz and the Gratz-Sud transformer station have been put into operation. The 60,000/100,000-V transmission line from Gratz to the North and the Murzzuschlag transformer station was put into operation early in 1926. During the year about 112 miles of 20,000-V transmission lines were erected in West, East and Northern Styria.

Coventry.—OPPOSITION TO ORDER.—The City Council has decided to oppose the application of the Leicestershire and Warwickshire Electric Power Co. for a Special Order authorising it to supply electricity in a large area in central Warwickshire, including parishes which the Corporation is seeking to include within its area.

Croydon.—CHANGE-OVER.—Having discussed with the Electricity Commissioners the question of alteration of the pressure of supply, the Corporation Electricity Committee has decided to seek an Order to enable it to change over the supply to consumers to 230 V as and when convenient.

WIRING OF SMALL HOUSES.—The Committee is preparing a scheme for the provision of electrical installations on the hire-purchase system, the work to be done by local contractors, and a sum of £10,000 is being allocated for this purpose.

LOAN.—Application is being made for sanction to a loan of £23,000 for electricity purposes.

Dunfermline.—GALE DAMAGE.—Serious damage was caused by the gale at the generating station of the Fife Electric Power Company, on January 28th, when two of the cooling towers fell and were completely wrecked. The staff was able to maintain a supply of electricity.

Eastbourne.—LOAN.—The Town Council on January 19th decided to apply for a Special Order to supply electricity to the parishes of Pevensey, Westham, and Hailsham. The estimated capital expenditure is £54,000.

Epsom.—Loans Sanctioned.—The Urban District Council has received sanction to the borrowing of £2,000 for wiring installations, and £2,000 for domestic apparatus to be let out on hire.

Falkirk.—Electrical Development.—The burgh electrical engineer reports that in 1926 the number of new consumers connected up was 339, and that the maximum demand during December was 2,800 kW, which was carried by the 3,000-kW set. At the present rate of expansion, by the winter of 1928 additional generating plant will be required, and it will be necessary to make provision for future requirements. A sub-committee has been appointed to take up the matter with the Electricity Commissioners.

Frickley (Yorks.).—Colliery Power Plant.—The *Manchester Guardian* states that the Carlton Main Colliery Co. has completed an electrical power plant costing £200,000. Four villages and three thousand houses will be supplied with electricity for lighting, householders being charged a flat rate allowing of unlimited consumption with a certain number of lights.

Glasgow.—Electrical Development.—The number of houses wired in November last under the Corporation Electricity Department scheme was 155, and appliances let out on hire 888. For December the figures were 124 and 499, bringing the respective totals up to 3,130 and 14,028.

Grays.—Loan.—The Urban District Council has applied for sanction to a loan of £4,000 for the purchase of a 750-kW rotary-convertor and transformer.

Fringe Order.—The Council has consented to the application of the County of London Electric Supply Co., Ltd., for a fringe Order to supply electricity to a new cement factory in the district. The company will pay £200 per annum provided the Order remains in force for 15 years.

Hornsey.—Loans.—The Electricity Committee is applying for sanction to loans of £20,000 for mains and £10,000 for services.

Horsham.—Electrical Development.—The Lighting Committee has received a report from the electrical engineer with regard to the extension of the Urban District Council's area of electricity supply, in which he states that the electrical requirements are outgrowing the present plant and system. He has suggested that the first consideration should be the complete reorganisation of the power station and the introduction of the a.c. system. Considerable capital expenditure would be involved, and for this reason he is of opinion that the services of an independent expert are desirable. The Committee has decided that Mr. W. M. Selvey, consulting engineer, be invited to report to the Council on the whole matter.

Ilford.—Loan Sanctioned.—The Electricity Committee has received sanction to a loan of £5,000 for the purchase of domestic apparatus to be let out on hire.

Electrical Progress.—The borough electrical engineer reports a steady increase in the hiring of installations, apparatus, &c. Hire agreements now number 4,754, and represent an additional installed load of about 8,000 kW.

India.—Calcutta.—According to the *Indian Engineer*, a supply of electricity from the new generating station of the Calcutta Electric Supply Corporation was given to Calcutta on December 22nd. This supply was given from the first of the three turbines to be started up. The other two sets already installed will be brought into commission as soon as they pass their tests. The new station is designed for an ultimate capacity of 150,000 kW, and there are installed there at present three sets, with a continuous rating of 7,500 kVA, each with the necessary boilers and auxiliary plant. This station is interconnected with the power station at Cossipore, the total capacity of installed plant in the two stations being 75,500 kW. The maximum load on the system up to the present time is 37,200 kW. In order to meet the constant demands for electricity, another 6,000-kW set has already been ordered for the southern station, which is expected to be in commission before the end of this year. Further additions are already under consideration for increasing the plant at both stations to meet the expected winter demands for 1928.

Irish Free State.—Limerick.—Dr. Sothman, technical engineering adviser to the Free State Government on the Shannon scheme, recently attended a meeting of the Corporation Electric Lighting Committee with reference to the question of a supplementary supply of electricity from Messrs. Siemens-Schuckert's power station at Ardnacrusha. He gave a brief outline of the scheme, and explained the system of overhead transmission cables. It is understood that when the way-leave agreements have been completed the work of the erection of standards to carry the transmission lines will be undertaken.

Lexden and Winstree.—Opposition to Scheme.—The Rural District Council is to oppose the application of Colchester Town Council for a Special Order to supply electricity in the district on the ground that only Dedham and a portion of Stanway are included in the proposals for the first two years. It is also considered that the maximum price, 11d. per kWh, is excessive.

Lincoln.—Electricity Scheme.—The Corporation Electricity Committee proposes to supply electricity in the south-west part of the town, which includes Moorland Park Estate, Swanpool, &c., the estimated cost of the scheme being £40,000.

Liverpool.—Electricity Supply.—Mains are to be laid by the Corporation to the housing estates at Crosby on similar terms to those for the Liverpool housing estates. Negotiations are proceeding for a bulk supply to Maghull.

Maidstone.—Electricity Supply.—The Rural District Council has decided to support the application of the Weald Electricity Supply Co., Ltd., for power to supply in part of the Council's area, provided that Hunton, as well as Staplehurst, Marden, and Yalding, are included in the Order.

Mansfield.—Electricity in Bulk.—As a result of the experimental running of the bulk supply of electricity from the Derbyshire and Notts. Electric Power Company, the Electricity Committee has recommended that the Council take the supply under the terms of an agreement already drawn up. It has been decided that the present plant shall be kept in commission and sufficient staff retained for the purposes of giving a supplementary supply.

Newcastle-on-Tyne.—Progress of Supply.—During the last 12 months 12,000 consumers have taken advantage of the Newcastle-upon-Tyne Electric Supply Co.'s hired wiring scheme for dwelling houses. Many villages are being supplied with electricity under this scheme and at Shildon nine hundred slot meters have been installed since last March. The company intends to survey and canvass the West Auckland district with a view to providing a supply, and the Parish Council has promised its support.

Ollerton.—Street Lighting.—The Parish Council has accepted the offer of the Butterly Colliery Co. for electric street lighting at £4 per lamp per annum, including maintenance.

Pembrokeshire.—Proposed Hydro-Electric Scheme.—The Works Committee of the County Council has recommended approaching the Government to consider a scheme for the construction of a barrage across the upper end of Milford Haven with the object of supplying electricity to the surrounding country.

Port Bannatyne.—Inauguration of Supply.—An electricity supply for the district was formally inaugurated by the vice-chairman of Bute County Council on January 21st.

Seaham Harbour.—Special Order.—The Ministry of Transport has confirmed the Urban District Council's Special Order, but with the addition of the "Northumberland" clause, which was asked for by the Seaham Harbour Gas Company. Under the "Northumberland" clause the Council is prohibited from drawing from the rates to meet any loss that might be incurred in the conduct of the proposed electricity undertaking.

Scunthorpe.—H.P. Cables.—The Urban District Council is to duplicate the h.p. cables at a cost of £2,842.

Shipley.—Change-over.—The Electricity Committee is to change over the supply of electricity in the Redburn district from d.c. to a.c. and erect a sub-station at Northcliff Woods at a total cost of £1,900.

South Africa.—Johannesburg.—The Town Council has decided to ask the Victoria Falls and Transvaal Power Co., Ltd., whether and at what time it will provide a partial supply of electricity to supplement the Council's own supply. The resolution has followed protracted negotiations with the Electricity Supply Commission, which some time ago reported against the Town Council's application to the Administrator for permission to erect a new power station at a cost of £500,000.

Southport.—Electricity Extensions.—Following an interview by the borough electrical engineer with the Electricity Commissioners regarding the Council's application for sanction to borrow £35,000 for electricity extensions, the Commissioners have intimated that the extension of the mains can be proceeded with, and that the requisite sanction will be given at an early date. With regard to the extension of plant, the Commissioners intimated that the Council should apply to Preston and Liverpool Corporations for their terms for giving a bulk supply, and if such a supply could be obtained on more economical terms then the Commissioners would not sanction any extension of plant. In the event of Preston and Liverpool being unable to give a bulk supply on economical terms, the Commissioners requested the electrical engineer to communicate with them again.

Special Orders.—Applications have been made to the Electricity Commissioners for a Special Order by Watford Corporation authorising it to supply electricity in certain parishes in the rural districts of Berkhamstead and Hemel Hempstead.

The Commissioners have submitted to the Minister of Transport for confirmation, a Special Order made by them authorising the Lancashire Electric Power Co. to supply electricity within the rural district of Leigh.

Stourport.—New Power Station.—Work on the new power station which has been erected by the Shropshire, Worcestershire and Staffordshire Electric Power Co. is now practically completed, and the plant is now undergoing extensive trial runs. The erection of overhead lines has been put in hand, and work is proceeding on a line to Tewkesbury, where several local industries are waiting for a supply. The new station is to be connected with the Birmingham Electricity Depart-

ment's service in order to cope with the increasing demand which is anticipated before the station which the Corporation is to erect at Hams Hall will be ready for service.

Tendring.—OPPOSITION TO ORDER.—At a meeting of the Rural District Council, on January 26th, it was decided to oppose the application of Colchester Town Council for a Special Order to extend its area of electricity supply on the following grounds:—(1) That the maximum price is excessive; (2) that the promoters do not propose to cover an adequate and reasonable area of supply within the first two years; (3) that the Colchester plant will not be ready to afford a supply for some considerable time; and (4) that by granting the Order, the Electricity Commissioners will be giving a monopoly of supply which might prove detrimental to the district, and prevent, or postpone, a supply being afforded by some other undertakers.

Tynemouth.—LOAN.—The borough electrical engineer (Mr. C. Turnbull) has submitted a report to the Electricity Committee in which he states that considerable developments are anticipated during the coming year. He has therefore recommended that application be made for sanction to a loan of £30,600 for the following purposes:—Sub-station at Cullercoats, £2,000; extension of Preston Village sub-station, £800; sub-station at Dock Road, North Shields, £1,700; supply to Commissioners' docks, £8,300; five transformers, £1,800; and cable extensions, £16,000.

Tramway and Railway Notes.

Bradford.—OPPOSITION TO BILL.—Wharfedale Rural District Council has decided to oppose the Corporation's Transport Bill, which includes a service along roads in the rural area which are considered unsuitable for such traffic.

PROPOSED ABANDONMENT OF TRAMWAY.—Councillor J. A. Guy has given notice to move at the City Council meeting on February 8th, that the Corporation's decision to renew the tramway track in Barkerend Road at an estimated cost of £23,000, be rescinded, and that the trams to Bradford Moor be replaced by a motor-'bus service.

Continental.—ITALY.—At a recent railway conference, held in Padua, it was announced that the Italian State Railway authorities had decided to commence the work of electrifying the railway between Bozen and the Brenner frontier early next year.

SWITZERLAND.—Good progress is being made with the electrification of the Winterthur-St. Gall-Rorschach section of the Swiss Federal Railways, and it is expected that it will be in operation by May next.

Edinburgh.—TRAMWAY EXTENSIONS.—A sub-committee of the Tramways Committee has recommended that steps be taken to obtain the necessary powers to extend the tramway to Farmilehead by Stenhouse Mills, Gorgie.

Increase of Charges.—The Minister of Transport has made Orders under the Statutory Undertakings (Temporary Increase of Charges) Act., 1918, authorising certain fare charges by the following tramway and light railway authorities:—The Urban Electric Supply Co., on its Camborne and Redruth, and Glossop Tramways, the Worcester Electric Traction Co., Ltd., the Bristol Tramways & Carriage Co., Ltd., South Lancashire Tramways Co., Swansea Improvements & Tramways Co., the Great Orme Tramways Co., Rawtenstall Corporation, and the Bexley and Dartford Urban District Councils.

Japan.—PROPOSED ELECTRIC RAILWAY.—It is reported that an electric railway from Inariyama station on the Government Central Line to Yawata is proposed. The chief promoter is Mr. S. Kamijo, member of the Nagano Prefectural Assembly.

London.—MORDEN STATION GARAGE.—The new garage at Morden station, the first of its kind in this country, has been completed, and was opened for business on January 31st. It has an area of 7,600 sq. ft., and will provide accommodation for 200 cars and cycles. Although it is intended primarily for the convenience of Underground passengers, it will be at the disposal of local residents. If the experiment is successful, it is probable that similar garages will be erected at other outlying terminal Underground stations.

Worcester.—PROPOSED ABANDONMENT OF TRAMWAY.—The *Birmingham Post* states that the Public Traffic Committee of the City Council has prepared a report which will be considered by the City Council in which it recommends, after the lease expires, the scrapping of the present tramway system, the removal of the track, and road reinstatement at a cost of £75,000. The Committee states that provisional terms have been arranged with the Birmingham and Midland Omnibus Co. to run an omnibus service in the city in substitution of the trams and a service to areas on the borders of the city. The committee considers that this method of transport is preferable to the Corporation's incurring a large outlay in acquiring omnibuses and garage accommodation of its own. It is suggested that an agreement should continue for 21 years.

Telegraph and Telephone Notes.

Australia.—"BEAM" RADIO-TELEGRAPHY.—Marconi's Wireless Telegraph Co., Ltd., has issued the following statement with regard to the "beam" radio-telegraph stations it has built on behalf of the British Post Office for communication between England and Australia, official seven days tests of which were recently carried out:—

"The tests . . . have demonstrated that the wireless link between the beam stations in England and Australia is capable of working at high speed each way for more hours than are called for in the terms of the contract with the Post Office, but defects developed during the tests on some of the auxiliary apparatus. The company has informed the Post Office that it requires further time to correct these defects, and it is therefore not applying to the Post Office to accept the stations until such defects are remedied."

Belgium.—REORGANISATION.—The Belgian telephone and telegraph reorganisation programme has been completed in its main lines and will extend over several years. It is expected in the Belgian electrical industry that half of the orders for the supply of material will be placed with German firms on reparations account. Government circles have suggested to the Belgian electrical industry the conclusion of a working agreement with German, and eventually other foreign, electrical undertakings for the reorganisation of the systems. The cost is estimated at 12,000,000 fr.—*Reuter's Trade Service* (Berlin).

Persia.—NEW RADIO SERVICE.—A general local and foreign wireless service was established at Teheran on January 28th for the first time.—*Reuter's* (Teheran).

The Telephone Service.—YORKSHIRE DEVELOPMENT.—We have received from Mr. T. B. Johnson, M.I.E.E., superintending engineer, North-Eastern District, Post Office Engineering Department, a copy of the annual report to the Telephone Advisory Committee, which shows that, in spite of industrial unrest, marked advance was made in all directions in 1926. New lines connected totalled 4,722, a net increase of 2,298, or 6 per cent.; the total number of lines was 38,119 on September 30th, 1926. In the Leeds area the satellite exchanges of Chapeltown, Headingley, Roundhay, and Stanningley have been converted from magneto to automatic working; at Halifax an automatic exchange, it is hoped, will be completed early this year, and at Wakefield the installation of automatic equipment is in hand. The Brighouse exchange is to be converted from magneto to central-battery working and transferred to new premises; at Dudley Hill and Low Moor new c.b. exchanges are in course of construction. At Keighley, Armley, and Sandal, and other places building has commenced for housing new automatic exchanges, and at a number of existing exchanges additional switchboard equipment has been installed. A rural exchange has been opened at Cracoe.

Considerable progress has been made in the provision of public kiosks throughout the district; there are over 200 actually available or on the point of completion. It is the intention to introduce in the near future "Hall multi-coin" boxes at kiosks and call offices connected to the larger exchanges. Calls effected during the year were as follows:—Trunk calls, 5,231,959; local and junction calls, 38,208,568; telegrams passed by subscribers by means of the telephone, 388,825. The value of private automatic exchange switchboards at subscribers' premises is being increasingly recognised.

During the year satisfactory progress has been made with the laying of trunk and local underground cables; the gross mileage of wire existing at the end of September was 202,895 miles, an increase of 22,184 miles.

The closing down of the generating station at the Leeds Head Post Office has been completed, and electric light and power are now obtained from the Leeds Corporation electricity works; the annual consumption is about 360,000 kWh. At the Leeds Head Post Office alterations have been carried out to provide room for a new repeater station to work in connection with the underground cable from London to Glasgow; the temporary station has a capacity of 43 repeaters, 35 of which are working, but the ultimate capacity will be approximately 1,000 repeaters.

NEW EXCHANGES.—At Lytham-St. Annes, on January 13th, a new telephone exchange was opened at the Post Office. The local Shipley exchange was transferred on January 15th from the old quarters at Saltaire Road to a new building of the Post Office in Otley Road.

The following are among the telephone exchanges completed by Siemens Brothers & Co., Ltd., Woolwich, during 1926:—

Automatic: Chesterfield, Edinburgh area (four exchanges), East Hartlepool, West Hartlepool, Morriston, Stavely, and Albion exchanges; Newmarket (Australia), Winnipeg West (Canada), Stratford (New Zealand), Cairo (Egypt), Port Elizabeth extension (South Africa), Baku (Russia), and also extensions to Grimsby, Swansea, and Sketty.

Manual: Bexley Heath, Camberley, Dumfries, Popesgrove, Seven Kings, Shipley, and Southend.

Radio Notes.

Australia. — Royal Commission. — The Commonwealth Government has decided to appoint a Royal Commission of Inquiry in Australia. In making the announcement, the acting Prime Minister said the question had been for some time engaging the attention of the Federal Government. The *personnel* of the Commission, which will be composed of experts, has not yet been announced; it will consider broadcasting within the Commonwealth, and will examine alterations suggested as desirable in policy and practice. The Postmaster-General said that the Government was following the steps of Great Britain, though on a smaller scale, as the Australian Commission would consist of only three members; everything, including a suggestion of Government control of broadcasting stations, would be determined according to the findings of the Commission.

Exhibition.—Such was the success of the radio exhibition held in Melbourne last year that it has been decided to hold another about next March or April. Larger accommodation has been secured in the Exhibition Building, Melbourne, and all interested in wireless are giving enthusiastic support.

Relay Stations.—Following the successful practice in Great Britain, the Melbourne broadcasting station (3 LO) is to erect relaying inland stations at three different centres, probably at Ballarat, Bendigo, and Sale, or Bairnsdale. One station will be provided in Gippsland, as there is a large population to be served in that area, and observations have shown that fading is worst there. The power used will probably be half that of 3 LO, which works on five kilowatts. —*Reuter's Trade Service* (Melbourne).

Finland.—New Station.—The wave-length chosen for the projected 25-kW station is 1,500 metres, and the Union Internationale de Radiophonie, Geneva, has drawn attention to possible difficulties on account of the fact that the Moscow station uses 1.450 m.

Haiti.—Since the commencement of broadcasting in August, 1926, the station at Haiti (call sign HHK), has received a large number of complimentary communications from listeners. It is a 1-kW station operating on a wave-length of 361.2 metres, and financial support is obtained by the Government in the form of appropriations to the Department of Public Works. Atmospherics give very little trouble in Haiti, and in winter are almost unknown, so that from November to March the reception of foreign stations is admirable. Station HHK is of "Western Electric" design, and was installed by the International Standard Electric Corporation.

Hungary.—New Station.—The Government has just substituted a 3-kW transmitter for the 2-kW plant on Csepel Island, says *World Radio*, and is also contemplating the erection of a 60-kW transmitter.

Japan.—New Station.—An order is said to have been placed for a 600-kW station, which will be ready in 1928, says *Eastern Engineering*. It is to be entirely the property of the Japanese Wireless Telegraph Co., an official concern enjoying the support of Parliament.

New Daventry Station.—Short-wave Plant.—A new station at Daventry, which is to operate at high power on a short wave-length, is being installed by the B.B.C. It is intended to supply an alternative service for users of crystal sets, and will utilise a power equivalent to that of 5XX. The masts are to be only 100 ft. high, and are to be built in sections, so as to facilitate their removal to another site if it is found to be desirable to do so. Experimental transmissions, which will be conducted out of the regular broadcast hours, are likely to begin in a few days' time.

South Africa.—State Control Probable.—The Johannesburg broadcasting company has received the following telegram from Mr. Madeley, the Minister of Posts and Telegraps:—"The general tendency in broadcasting is increasingly in the direction of public control. A private profit-making control would be a retrogressive step. I cannot therefore agree to sanction the transfer of the licence." This is regarded as an indication that the Government intends to take over control of broadcasting, says *The Times*, which has reason to believe that State control will be generally welcomed in the Transvaal, and the Free State and Durban will probably fall in willingly with the proposal. Cape Town may raise objections, but the Government will be able to assume control when the present licence expires.

Wave-lengths.—Correction.—In the list of new wave-lengths published last week it was stated that the Hull, Stoke, Dundee, and Swansea stations' wave-length was 249 metres; this figure is incorrect, as the stations named are now working on a common wave-length of 294 metres. We regret the transposition of the figures.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Armthorpe (Yorkshire).—February 15th. Education Department. Electric lighting installation at new school. Education Committee, West Riding County Hall, Wakefield.

Argentina.—Buenos Aires.—March 24th. Department of Navigation and Ports. Electric cranes, pumps, &c. (A.X. 4087).*

Australia.—Melbourne.—March 8th. Postmaster-General's Department. Accumulators and plates. (B.X. 3170)*; motor-generator sets. (B.X. 3172.)*

April 5th. Cordless switchboards. (B.X. 3184.)*

Sydney.—March 9th. New South Wales State Railways. Two sets of electric overhead travelling crane equipments. (A.X. 4103.)*

April 6th. One 7,500-kW turbo-alternator. (B.X. 3179.)*

Belfast.—February 5th. Electricity Department. One induction motor-driven vertical-type centrifugal pump. (January 21st.)

February 18th. Electricity Department. Twelve months' supply of materials, including electrical accessories, lamps, carbon brushes, cables, &c. (January 28th.)

February 8th. L.M. & S. Railway, Northern Counties Committee (Ireland). Twelve months' supply telegraph ironwork, wire, electric lamps, porous pots, &c. Mr. F. J. Martin, Stores Superintendent, York Road Station, Belfast.

Bexley.—Electricity and Tramways Department. One 1,400-kVA bank of Scott-connected transformers. Two 140-kVA single-phase induction regulators, e.h.p. and h.p. switchgear and cable connections. (See this issue.)

Bristol.—February 18th. Electricity Committee. Coal- and ash-handling plant, and railway sidings; circulating-water screening plant. (January 28th.)

Canterbury.—February 21st. Electricity Department. L.p. lead-covered and armoured feeder cables. (See this issue.)

Cardiff. — February 23rd. Electricity Department. Twelve months' supply paper-insulated cables. (See this issue.)

Croydon.—March 3rd. Electricity Department. 12,000 tons of coal suitable for use on chain-grate mechanical stokers. (See this issue.)

Douglas.—February 28th. Corporation. 3½ miles of e.h.p. cable, two synchronous motor alternators. (January 21st.)

Dundee.—February 21st. Electricity Department. Two water-tube boilers with superheaters, economisers, mechanical stokers, and coal-handling plant. (January 28th.)

Eastbourne.—February 21st. Electricity Department. E.h.p. cable, static transformers, and e.h.p. switchgear. (January 28th.)

Eccles.—February 12th. Electricity Department. Two 500-kVA, 3-phase oil-cooled transformers. Borough Electrical Engineer, Cawdor Street, Patricroft.

Egypt.—Cairo.—March 3rd. Ministry of Public Works. Two internal-combustion engines and accessories for the Egyptian Army Flour Mills, Tura, near Cairo. (A.X. 4187.)*

Harrogate.—February 28th. Electric lighting installation for St. Mark's Church, Leeds Road. Particulars from the Verger.

Huddersfield.—February 19th. Town Council. Electrician's work at maternity home, Greenhead Road. Borough Architect, 26, Ramsden Street.

Hull.—February 14th. Tramways Committee. Stores for 12 months, including car-lighting fittings, lamps, cable and switches, &c. General manager.

Inverlochy.—February 5th. Village Society, Ltd. Electrical installations in 100 houses. Messrs. Matheson and Mackenzie, surveyors, 197, St. Vincent Street, Glasgow.

Leeds.—February 18th. Electricity Department. Twelve months' supply of stores, including cables, boxes and fittings, jointing and insulating materials, &c. (January 28th.)

London.—HAMMERSMITH.—February 16th. Electricity Department. Twelve months' supply of stores, including several electrical items. (January 21st.)

SHOREDITCH.—February 23rd. Electricity Department. One 1,500-kW automatic sub-station converting equipment and one 20-ton electrically-operated overhead travelling crane. (January 28th.)

LONDON COUNTY COUNCIL.—February 14th. Electrical installation at the undermentioned schools:—Barrett Street Trade School Extension, Oxford Street, W., lighting, power, telephones, bells, &c.; County Secondary School, Eltham, S.E., lighting, power, telephones and bells; Crondall Street Elementary School, Shoreditch, lighting; Drayton Park Elementary School, Islington, lighting. (See this issue.)

H.M. OFFICE OF WORKS.—February 17th. Electrical accessories. (See this issue.)

METROPOLITAN ASYLUMS BOARD.—February 23rd. Carrying out the installation of electric lighting at Millfield, Rustington, near Littlehampton, Susesx. (See this issue.)

Long Eaton.—February 24th. Electricity Department. One 500-kW convertor set and one switchboard platform. (See this issue.)

Manchester.—February 15th. Tramways Committee. General stores, including electrical materials, &c. Mr. H. Mattinson, general manager.

New Zealand.—AUCKLAND.—March 22nd. Harbour Board. Electric motors, gearing, shafting, and control gear for the operation of vehicular and passenger gangways at the New Devonport Ferry Wharf. (A.X. 4102.)*

WELLINGTON.—March 4th. Poverty Bay Electric Power Board. Switchgear and transformers. (B.X. 3160.)*

April 26th. Public Works Department. Secondary battery for the Lake Coleridge scheme. (B.X. 3202.)*

Peterborough.—February 28th. Electricity Department. One 12,000-kW turbo-generator, with foundations, condensers, air and extraction pumps, air cooler, oil cooler and pipework, e.h.p. switchgear, coal-handling plant, &c. (January 28th.)

Portsmouth.—Electricity Department. Coal-handling plant. (January 28th.)

Spalding.—February 26th. Urban District Council. 28 sets of centrifugal pumps (for sewage pumping), including electric motors, automatic starters, floats, valves, pipes, &c. Mr. C. F. Murphy, Lloyd's Bank Chambers, Morpeth.

Stoke-on-Trent.—February 9th. Electricity Department. Static transformers, sub-station switchgear. (January 28th.)

Tilbury.—February 12th. Urban District Council. H.p. underground cables, l.p. distribution mains, house services, transformers, h.p. and l.p. switchgear and conversion of public street lamps. (January 28th.)

Torquay.—Electricity Department. Two vertical circulating-water pumps for Newton Abbot power station. (January 21st.)

Tynemouth.—Tynemouth Gas Co. 70-h.p. electric motor at gasworks.

Uruguay.—MONTEVIDEO.—March 2nd. State Electricity Works. Lead fuse wire, silver fuse wire, switches, cable end boxes, compound and insulating tape. (B.X. 3159.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Australia. — VICTORIA.—Postmaster-General's Department.
Switchboard and instrument jacks (Sch. C.80).—British General Electric Co., Ltd. (£490); New Systems Telephones Pty., Ltd. (£845); Phœnix Tel. & Elec. Works, Ltd. (£539).
Telephones and dials (Sch. C.105).—Phœnix Tel. and Elec. Works, Ltd. (£2,956); Ericsson Tel. Mfg. Co., Ltd. (£65,277); Siemens (Aust.), Ltd. (£17,003); British General Electric Co., Ltd. (£9,881); New Systems Telephones Pty., Ltd. (£1,012); Automatic Telephone, Ltd. (£15,783).

NEW SOUTH WALES.—Government Railways.
Storage battery for Randwick sub-station (£3,110).—Tudor Accumulator Co., Ltd.

—TENDERS.

Guildford.—Sewage Committee. Accepted:—
Pumping plant, &c., at Drummond Road pumping station (£650).—Worthington-Simpson, Ltd.

Hornsey.—Lighting Committee. Recommended:—
Electric lighting installation at 121 Council houses.—E. Wright & Co.

Hull.—Telephone Committee. Accepted:—
Wires and cables (£230).—General Electric Co., Ltd.

LONDON & NORTH-EASTERN RAILWAY.
Four electrically-driven hydraulic pressure pumps for pumping station, Hull.—Pulsometer Engineering Co.

Ilford.—Electricity Committee. Accepted:—
Cable (£2,385).—Union Cable Co., Ltd.
One e.h.p. feeder cubicle (£235).—Crompton & Co., Ltd.
Cable (£709).—Power and Lighting Cables, Ltd.

Irish Free State.—DUBLIN.—Dublin United Tramways Co., Ltd.
12 months' supply of Siemens vacuum lamps.—Siemens and English Electric Lamp Co., Ltd.

Leeds.—Tramways Committee. Accepted:—
Rail clips and bolts (£212).—Bayliss, Jones & Bayliss, Ltd.
Cables.—Greenwich Cable Works, Ltd., and W. T. Glover and Co., Ltd.

London.—BATTERSEA.—Electricity Committee. Accepted:—
Electric lift (£674).—Express Lift Co., Ltd.

ADMIRALTY.—Accepted:—
"Cosmos" flashlight lamps.—Metro-Vick Supplies, Ltd.

GREAT WESTERN RAILWAY CO.
Twelve months' supply of vacuum lamps.—Omega Lamp-works, Ltd.

LONDON COUNTY COUNCIL.—Highways Committee. Accepted:—
Four diaphragms for Westinghouse 8,000-kW turbine at Greenwich power station.—Metropolitan-Vickers Electrical Co., Ltd.
Steel bars (£1,100).—Lillieshall & Co., Ltd.
Gear wheels and pinions (£745).—Equipment & Engineering Co.
Steel axle bars (£835).—Steel, Peech & Tozer, Ltd.
Eight motors as spares (£2,140).—Metropolitan-Vickers Electrical Co., Ltd.
Nine armatures (£765).—English Electric Co., Ltd.
Repair of motor generators (net cost, plus 15 per cent., about £1,000).—English Electric Co., Ltd.

Manchester.—Paving Committee. Accepted:—
Motor for driving machinery.—Metropolitan-Vickers Electrical Co., Ltd.

Tramways Committee. Accepted:—
Steel tramway axles.—J. Baker & Co. (Rotherham), Ltd.
Copper trolley wire.—R. Johnson & Nephew, Ltd.
Cadmium copper trolley wire.—Elliott's Metal Co., Ltd.
Block tin.—French & Smith.
Destination indicator.—English Electric Co., Ltd.
Special track work.—Edgar Allen & Co., Ltd.

Electricity Committee. Accepted:—
Supply and laying 33,000-volt cable.—Callender's Cable and Construction Co., Ltd., and Pirelli-General Cable Works, Ltd.
Modification of existing switchgear.—British Thomson-Houston Co., Ltd.

Salford.—Health Committee. Accepted:—
Electric wiring at 143 and 147, Regent Road (£122).—W. Anderton & Co., Ltd.

Sheffield.—Electricity Committee. Accepted:—
Transformers (£5,771).—British Electric Transformer Co., Ltd.
Air pump at Blackburn Meadows generating station (£646).—Mirrlees, Watson Co., Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Accepted:—
Polyphase testing meter (£274).—South African General Electric Co., Ltd.
Steam piping for turbo set (£496).—Babcock & Wilcox, Ltd.
Cables (£1,035).—British Insulated Cables, Ltd.
Switchgear (£6,119).—A. Reyrolle & Co., Ltd.

Streets Committee. Accepted:—
Motors for electrification of plant at quarry (£1,528).—F. W. Searle.

Drainage Committee. Accepted:—
Electrical plant at sewage works (£690).—British General Electric Co., Ltd.

Germany-Sweden.—The Reich Ministry of Posts and the Swedish Postal Administration have in conjunction placed an order with the Felten & Guilleaume Company for a new cable for German-Swedish communication. It is to be laid next August between Zarrenzin, Pomeranis, and Kampinge, Sweden, and will have a length of 78 miles, plus 24 miles of land cable for connection with Stralsund and Malmo.

Uxbridge.—Works Committee. Recommended:—
Electrical water-indicating instrument (£84).—Glenfield and Kennedy, Ltd.
Electrical sirens at market house and waterworks (£208).—Walters Electrical Mfg. Co., Ltd.

Forthcoming Events.

Junior Institution of Engineers.—Friday, February 4th. 39, Victoria Street, S.W. "The Theory of the Gyroscopic Compass," by Mr. P. R. Jackson.

Friday, February 11th. At 7.30 p.m. "The Physiology of Work under High Air Temperature Conditions," by Prof. K. N. Moss.

Diesel Engine Users' Association.—Friday, February 4th. Discussion on the "Report on Heavy Oil Engine Working Costs for 1925-26."

Electrical Power Engineers' Association (Southern Division).—Friday, February 4th. Institution of Electrical Engineers, London, W.C. "Pulverised Fuel and its Application to Boilers." Mr. R. B. Potter.

(Glasgow Section).—Friday, February 11th. Reids Restaurant, Glasgow. 7.30 p.m. "The Policy of the Association." Mr. G. E. Smith.

Society of Engineers.—Monday, February 7th. 5.30 p.m. Presidential address by Mr. D. C. Fidler.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, February 7th. London. 7 p.m. "Some Interesting Features in Modern Installation Work." Mr. R. Grierson.

Thursday, February 10th. Hotel Cecil. 7.15 for 7.45 p.m. Annual dinner.

(North-Eastern Centre).—Tuesday, February 8th. Central Station Hotel, Newcastle-upon-Tyne. 7 p.m. Annual dinner.

(North-Midland Centre).—Tuesday, February 8th. Hotel Metropole, Leeds. 7 p.m. Informal discussion on "Electric Heating and Cooking."

(North-Western Centre).—Tuesday, February 8th. Engineers' Club, Manchester. 7 p.m. "Electrical Equipment of Track on the Underground Railways of London." Mr. A. R. Cooper.

(Scottish Centre). — Tuesday, February 8th. McLellan Galleries, Sauchiehall Street, Glasgow. 7.30 p.m. Faraday lecture, "What is Electricity?" Prof. W. M. Thornton.

(South-Midland Centre).—Wednesday, February 9th. Midland Institute, Birmingham. Faraday lecture, "What is Electricity?" Prof. W. M. Thornton.

British Electrical Development Association.—Wednesday, February 9th. Sopwith's Lounge, Newcastle-upon-Tyne. 7.15 p.m. "Industrial Heating." Mr. S. E. Monkhouse.

Institution of Heating and Ventilating Engineers.—Wednesday, February 9th. Holborn Restaurant, London. 2.30 p.m. "The Effects of Weather Conditions upon the Heat Requirements of a House." Dr. Margaret Fishenden; and Presidential address by Mr. J. L. Musgrave.

Institution of Engineers-in-Charge.—Wednesday, February 9th. St. Bride Institute, E.C. 7.30 p.m. "The Use of Oil Engines for Private Installations." Mr. B. P. Dean.

Institution of Welding Engineers.—Wednesday, February 9th. Milton Hall, Manchester. 7 p.m. "The Welding of Cast Iron." Mr. P. L. Roberts.

Royal Institution.—Thursday, February 10th. 5.15 p.m. "Acoustic Problems—Echoes." Sir William Bragg.

Electromobile Association.—Friday, February 11th. Royal Society of Arts, London, W.C. 7 p.m. "The Use of Storage Battery-type Electromobiles." Mr. J. C. Elvy.

Electrical Trades Commercial Travellers' Association.—Friday, February 11th. Holborn Restaurant, W.C.1. 7 p.m. Annual dinner.

British Electrical and Allied Industries Research Association.—Friday, February 11th. At the Savoy Hotel, London, W.C. 12.45 for 1 o'clock. Luncheon—Annual general meeting.

Association of Mining Electrical Engineers (North of England Branch).—Saturday, February 12th. Neville Hall, Newcastle. 3 p.m. "Failures in 3-phase Windings." Mr. R. G. Morgan.

(South Wales Branch).—Saturday, February 5th. Cox's Café, Cardiff. 6.30 p.m. Annual dinner.

(London Branch).—Tuesday, February 8th. Junior Institution of Engineers, London, S.W. 6.30 p.m. "Auto Synchronous Motors for Colliery Use." Messrs. H. O. Burge and C. S. Buyers.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

LUSTRAL glassware.

HOUGH watertight fittings.

Notes.

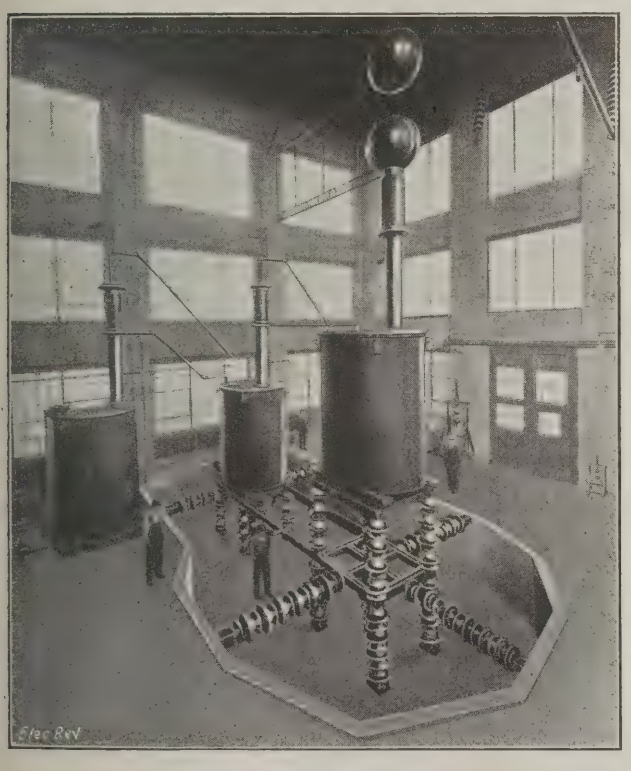
Registration of Engineers.

At a meeting of the Institution of Production Engineers, on January 26th, Mr. Richard Hazleton, Secretary of the Society of Technical Engineers, explained the aims of the Bill for the Registration of Engineers which is expected to be introduced again in this session of Parliament, and also the objects which the Society had in view. On the general question of the desirability of registration for engineers as a means of improving their status and protecting the public, Mr. Hazleton did not believe there was any difference of opinion among engineers; it was on the details for securing that end that the scheme was likely to meet with serious opposition. He reminded his audience that the Bill of the Institution of Civil Engineers, which was introduced about five years ago and was eventually withdrawn, practically provided that the Council of the Institution of Civil Engineers should be the Registration Authority, and it was because the other leading engineering institutions objected to this that the scheme failed. Discussing the reasons why the practically unknown and new Society should have introduced the Bill now, Mr. Hazleton said they were solely with the object of ensuring that some serious action should be taken in the matter. It was the hope of his Council that the Joint Engineering Council would take the matter up in an authoritative manner, and in that event the Society of Technical Engineers would be only too pleased to hand it over. The general scheme of the Bill was that there should be a General Registration Authority, but that the Councils of various engineering institutions, which would be scheduled to the Bill, should act as the registration authority for their particular members. A registration fee of £4 per annum was suggested, of which £1 would go to the Central Registration Authority and the remaining £3 to the particular institution under which the member became registered. It was proposed that the Central or General Engineering Council should consist of representatives of the Government, scientific institutions, universities and technical colleges, and engineering employers' and employés' organisations. The Bill had been framed, generally, on the constitution governing the General Medical Council. The object of making the Councils of the Engineering Institutions the actual registering authorities was to prevent a person registering with the General Engineering Council without being a member of any of the engineering institutions. Practising members of the institutions would be entitled to registration within two years of the passing of the Act. Persons who were not members of the institutions would be able to apply for registration on bringing satisfactory evidence that they had been engaged in responsible positions in the engineering industry for a period of not less than five years.

Mr. Hazleton pointed out that registration of engineers had been the law of the land for several years in many of the States of America. A similar measure had been in force in Italy for two years, and in New Zealand the registration of engineers had been in force since the middle of last year. He believed that if the Society of Technical Engineers was compelled to go ahead without the support of the leading engineering institutions, and was successful in getting a place in the Private Members Ballot, there were sufficient members of Parliament in favour of the general scheme of registration of engineers to ensure a second reading of the Bill and its committal to a Standing Committee, and then the leading engineering institutions would have to justify their position in not supporting the proposals.

Appointments Vacant.—Assistant mains engineer ($400 per month+dollar=2s. 4d.), for the Penang Municipal Commission Electricity Supply and Tramway Department. General, filing correspondence and shorthand clerks, for the West Midlands Joint Authority. Showroom salesman and two canvassers, for the Beckenham Urban District Council. Engineer and manager, for the Borough of Loughborough Electricity Department. (See our advertisement pages to-day.)

New Accumulator Separators.



The subject of a recent demonstration at the Northampton works of the Electrical and Chemical Ebonite Co., Ltd., was the process of manufacture of a new accumulator separator which has been devised by Dr. Meyer Wilderman, and which is to be produced commercially by the above company. The invention is based on the necessity for increasing the concentration of the acid at the surface of the electrodes, and for this purpose introduces an automatic mixing and circulation of the electrolyte. This is brought about by means of a diaphragm of special construction and porosity for creating between the electrodes a hydrostatic and an increased electro-osmotic pressure. The separator, which is constructed in such a way that the electrolyte is unequally distributed between it and the electrodes, is made entirely of ebonite and is highly porous. This latter and essential feature of the device is brought about by treating a specially-prepared ebonite powder with pressure and heat. In each separator two porous diaphragms are held in ebonite non-compressible separating frames. These are stamped from sheets of the soft ebonite preparation before vulcanising, and by means of a horizontal press are made to adhere to lead-tin sheets, twelve being applied at one time. The frames are accommodated in grooves in the sheeting, which is stamped out

beforehand so as to give the required design and thickness to the diaphragms. The special powder referred to is then "spread" on the sheets so that it just fills up the spacings within the frames. This operation is performed by a somewhat complicated and ingenious piece of machinery of the firm's own design. The "spreading" of the powder is a delicate performance which, we understand, owing to the peculiar nature of the preparation, cannot be done by hand. A second sheet, suitably pressed to cover the frames and diaphragms, is placed in position, and the whole is clamped tightly together between suitable templet facings on the same machine which incorporates the spreading equipment. Held thus firmly and accurately in position between the sheets, the complete separators are vulcanised, after which the lead-tin foil is easily detached from the ebonite. After vulcanising, a surface tension exists between the diaphragm surface and the fluid, and this is removed by a special chemical treatment which leaves the diaphragm with an absorbing capacity somewhat approaching that of blotting paper. After a final grinding and polishing process, the separators are ready for immediate use.

Equipped with Wilderman separators, it is claimed, the efficiency of an accumulator will be considerably increased, its life substantially lengthened, and the volt-drop during discharge appreciably decreased. It is further claimed that the non-compressible frames counteract the bending and buckling of the electrodes in both the vertical and horizontal directions, thus constantly maintaining the correct conditions for the required distribution and circulation of the electrolyte. An important advantage of the separators is that they can be stored dry, either in or out of the accumulators. They can be made in any size, shape, or form.

A High-Pressure Testing Laboratory.

To ensure that the electrical equipment offered for sale will meet the severe conditions imposed on it by the super-power transmission systems in the United States, it is necessary to subject it to severe factory tests. A testing laboratory constructed by the Delta-Star Electric Company, Chicago, Illinois,

High-Voltage Transformers.

U.S.A., for the use of its designing engineers is shown in the accompanying illustration. The three transformers are each of 250 kVA capacity, and weigh approximately 18 tons. They are wound for a primary pressure of 2,000 V and a secondary pressure of 250,000 V, and are arranged for cascade or chain connection. Excitation and control of the transformer bank is secured by a synchronous motor-generator set, the 2,000-V winding of the first transformer being connected directly to the alternator. With the three transformers in series there is a pressure of 750,000 V between the high-pressure terminal of the third transformer and earth.

International Conference on High-Pressure Networks.

Preliminary arrangements have now been made for the 1927 session of the Paris E.H.P. Conference. It will be opened on Thursday, June 23rd, and will close on Saturday, July 2nd. During the interval the proceedings of the three Sections will be allotted two days each, from 9.30 a.m. to 4.30 p.m., and time will be found for visits to the power station of Eguzon (50,000 kW), the Paris-Orleans electric railways, and the transmission lines of that system, operating at 150,000 and 90,000 volts; there will also be excursions to Fontainebleau or Chantilly, and tours will be organised to the principal works and lines of the Alps and (alternatively) to the 150,000- and 90,000-V installations of the Midi railways in the Pyrenees.

Already 23 countries have arranged to participate in the proceedings; the list of subscribers will close on May 1st, but it is urgently desired that applications for membership shall be sent to the secretary as soon as possible, as the addition of large numbers during the last weeks upsets the organisation of the meetings. The cost is 250 francs, which covers copies of all the reports and participation in the sessions and fêtes.

An addition to the programme, at the request of an important member company, is the study of the measurement of energy at very high pressure; communications on this subject can be received (exceptionally) up to March 1st in one language. As decided in 1925, not more than 60 papers will be discussed this year. Papers submitted in both French and English can be received up to March 1st.

Amongst those already received are the following from British authors:—

Messrs. A. R. Everest, A. C. Michie, and E. B. Wedmore: Review of researches on insulating oils.

A nominee of the Cable Makers' Association: High-pressure cables.

E. T. Painton: High-pressure lines of aluminium-steel cable.

F. H. Riddle: The raw materials of porcelain.

R. Borlase Matthews: Distribution lines on farms.

V. Ferranti: Suppression of pressure waves in h.p. networks.

W. W. Lackie: The Electricity (Supply) Act in Great Britain.

The following papers have been received from the United States:—

C. Mailloux: The rational use of combustibles.

H. W. Young: Open-air installations.

J. T. Barron: A distribution network in New York.

Apart from the Sectional activities, Mr. C. Le Maistre has contributed a paper on national standardisation in various countries and the co-ordination of effort towards international unification.

The "Phonoscope."

The Westinghouse Electric and Manufacturing Co.'s "Osiso" is a single-element oscilloscope which may be used as an oscillograph. The instrument is remarkably light and portable, and will operate off dry cells. For electrical engineering work, it can be used to show alternating-current waveforms and phase relations and, by adding a synchronously-driven film holder, it may be used to photograph six different a.c. wave-forms and phase relations. Also, it may be used as a "phonoscope" to enable totally deaf persons to understand speech by viewing the audio-frequency waves of the output of any good radio receiving set or telephone. A spot of light, reflected from the mirror of the galvanometer, moves back and forth on the ground glass of the "Osiso," following the instantaneous changes in the current; a rotating polygon of mirrors gives a time component to the moving spot of light so that an observer may see waves of light. Each sound has a different wave shape: a pure note appears as an endless repetition of a "sine" wave. The height of the wave is a function of the loudness of the sound; the length of the wave, from crest to crest, is inversely proportional to the frequency; thus, with each sweep of each mirror, the number of oscillations that appear stretched out in a record of light are proportional to the frequency of the note. When a high note is being viewed many oscillations are apparent with each sweep of each mirror; when a low note is being viewed, only a few oscillations appear for each sweep of each mirror. The waves change with pitch and with different voices, but certain similar characteristics remain for each vowel sound. Any ordinary telephone microphone may be connected in series with dry cells and the vibrator ribbon of the "Osiso"; one may speak into the microphone and see the voice waves dance in the rotating mirrors. A single step-down audio-frequency transformer is used between any radio receiving set and the vibrator ribbon, any signal that will operate a loud speaker giving sufficient deflection; if the primary of the transformer is connected in series with the loud-speaker coil, one may hear and see the audio-frequency at the same time. No photographic action is required to receive the audio-frequency waves. A deaf person may be taught to understand speech by sight in a class and though such instruction would take much time, it seems probable that it would be more successful than the method of reception by feeling.

Electrification and the Electricity Act.

In the *Quarterly Review* for January, Sir Charles Bright, F.R.S.E., discusses the subject indicated in the title, from the standpoint of the onlooker who accepts without question the statements of the supporters of the Government scheme, and is ready to attribute our industrial difficulties mainly to our backwardness in the use of electricity. In the space of 16 pages it is, of course, impossible to take account of all relevant considerations, but without doing so it is equally impossible to draw fair comparisons between the progress made in this country and that made abroad. For instance, Switzerland has no coal and perforce must use her water

power, which means that she *must* use electricity lavishly—there is no alternative. We, on the other hand, have developed gas lighting to a remarkable degree, and electricity is heavily handicapped in the race, but nevertheless is making extraordinarily rapid progress. As for the statistics freely quoted by the author, we have repeatedly shown how unreliable they are. Belgium, for instance, is said to put "England far behind her in the matter of electricity." In point of fact, as we recently showed, there is very little difference. However, the author takes a hopeful view of the future.

A Colour-Lighting Demonstration.

On January 11th, the members of the General Council of the Cinematograph Exhibitors' Association attended a lecture on "Colour Lighting and its Future Application to the Kinema" in the miniature theatre attached to the showrooms of Messrs. Holophane, Ltd., when the effects of colour on the stage and film were demonstrated in conjunction with the use of a new range of stage-lighting equipment, "Duo-Phantom," which has been introduced by the company, and which we hope to describe in a later issue. The lecturer outlined the theory of colour, explaining and demonstrating the formation of the many colours from combinations of the basic ones. Some very striking and curious effects were shown. A man on the stage was made to appear as a negro, and the costume of a girl was represented as something entirely different to that which she was wearing It was also shown how, by a pre-selection of the material, the stage curtain could be made to appear in many entirely different colours and designs. A film was projected and made to float in a surround of colour which changed as the film went on to suit the emotional change of the various scenes a little in advance, suggesting to the audience what was shortly coming in the story. The title of the film was shown on a coloured, instead of a black, background, with the effect that it was much easier to read. The value of colour-lighting the kinema entrances, lobbies, vestibules, and waiting rooms was emphasised, and it was pointed out that if it definitely paid to increase the intensity of light in shop windows, then the practice could with benefit be applied to the kinema entrances.

The Shannon Scheme.

It is reported that the three turbines for the partial development of the Shannon scheme are being built by the firms of Voith and Escher, Wyss, sub-contractors to Messrs. Siemens-Schuckert, the German contractors for the scheme. Survey parties are engaged in surveying the route of the 110,000-V line between Limerick, Dublin, and Cork. The line will be carried by steel poles of an average height of 50 ft. The final survey of the cable routes *via* Dublin-Wexford-Waterford-Kilkenny-Carlow-Maryborough will soon be completed. Both main and auxiliary lines will be completed next summer. The latter line will have a voltage of 38,000. Distant towns from the main line will be linked up by 10,000-V lines radiating from transformer stations.

The Electromobile Association.

An informal meeting of the above Association will be held on February 11th at 7 p.m. at the Royal Society of Arts, John Street, Adelphi, Strand, when a general discussion will be opened by Mr. J. C. Elvy on "The Use of Storage Battery-type Electromobiles." The chair will be taken by Mr. J. H. C. Brooking, M.I.E.E. Tickets may be obtained on application to the Association, 3-7, Southampton Street, Strand, W.C.2.

Service Notes.

Vacancies for Navy Electricians.—The quarterly schedule of recruiting for the Royal Navy and Royal Marines shows increases in certain of the technical grades, and *The Times* points out that the outstanding feature of the list is the decision to enter 56 electrical artificers, more than double the usual quota. This is an attractive branch of the Service. Candidates must be efficient fitters and turners, or instrument makers, with at least five years' practical experience. No electrical knowledge is necessary on joining, a long training course being given. Pay begins at £2 16s. a week, with rations, accommodation, free kit, &c., and rises to £4 0s. 6d. a week according to rating. On promotion to warrant rank the pay is from 14s. 2d. to 17s. a day; to commissioned warrant rank, 18s. 10d. to 24s. 6d. a day; and to electrical lieutenant, 26s. 6d. to 34s. a day if promoted to electrical lieutenant-commander with the necessary qualifying service.

Those who do not reach warrant or commissioned rank may earn a pension after 22 years' qualifying service of approximately £100 a year. Warrant officers can earn up to £170 per annum retired pay, commissioned warrant officers up to £236, electrical lieutenants up to £284, and electrical lieutenant-commanders up to £331. The present openings are due to an unusually large number of time-expired men leaving the Service.

Vacancies for Aircraft Apprentices.—Five hundred aircraft apprentices, between the ages of 15 and 17, are required by the Royal Air Force for entry into the Schools of Technical Training at Halton, Bucks., and at Flowerdown, near Winchester. They will be enlisted as the result of an open competition and of a limited competition held by the Civil Service Commissioners and the Air Ministry respectively. Full information regarding the aircraft apprentice scheme can be obtained on application to the Royal Air Force, Gwydyr House, Whitehall, London, S.W.1. One of the trades open to boys is that of wireless operator-mechanic.

Swiss Electricity Exporters' Union.

Under the title of the Union des Exportateurs d'Energie Electriques, a body has lately been formed in Switzerland with headquarters at 29, Avenue de la Gare, Lausanne, to protect the interests of the Swiss undertakings "exporting" electrical energy.

Amplifiers for Community Singing.

The *Daily Express* community singing movement has met with an enthusiastic reception, and we learn that arrangements are being made for it to be extended to open air meetings all over the country. The problem of how to address the large audiences has been solved by the use of Marconiphone "Public Address" amplifiers, which were employed for the purpose in the Albert Hall, at Birmingham on January 1st, and at Swansea and Reading on January 8th, and will be a feature in future arrangements.

Chiswick Power Station.

It is reported that the Bill promoted by the London and Home Counties Joint Electricity Authority, seeking powers compulsorily to acquire land at Chiswick (Duke's Meadows), on which to erect a super-power station, will probably not be proceeded with in the coming Parliamentary session. The examiner of private Bills, after hearing allegations on behalf of the Barnes Urban District Council, that the Standing Orders of Parliament had not been complied with, gave his decision on January 26th, to the effect that the allegations had been sustained in several important respects. The promoters will therefore have to consider whether it is worth while to apply to the Standing Orders Committee for dispensation.

The Engineers' Club (London).

The fifth annual general meeting of the Engineers' Club (London) was held at the Club premises, Coventry Street, on January 26th, when the president, Sir Joseph W. Isherwood, Bt., occupied the chair. Reviewing progress during 1926, he pointed out how, in spite of the extreme difficulty of the period, the results exhibited very substantial support, and proved that the Club itself was a well-needed rendezvous of both the professional and the commercial engineer. The report and accounts were received and approved. Sir J. Fortescue Flannery, Bt., M.Inst.C.E., past president Institute of Marine Engineers, was unanimously elected president of the Club for the year 1927. Messrs. Vizard, Oldham, Crowder and Cash were re-elected honorary solicitors, and Messrs. Chantrey, Button & Co. were re-appointed auditors.

During February thirteen meetings are to be held at the Engineers' Club by 11 associations, mainly of engineers, including the Batti-Wallahs' Society, the I.E.E. Wireless Section, the Associated Municipal Electrical Engineers, and the Institute of Wireless Technology.

Lecture.

Mr. S. Gordon Monk, B.Sc., Department of Engineering, Plymouth Technical College, lectured to the members of the Plymouth Institution on January 27th, on electric furnaces, particularly with regard to iron smelting and refining, and steel production. The advantages of electrical treatment were the avoidance of contamination, minimum loss of heat, more compact and cleaner plant, precise control of temperature, and the fact that the exact composition of the final steel was known and specific samples could always be reproduced. Mr. Monk illustrated his lecture with lantern slides and demonstrations. A model of an induction furnace was shown, and Mr. Monk mentioned that the idea was in use at the Compton depôt of the Plymouth Corporation tramways for expanding steel tires for shrinkage on to wheels.

Fatality.

Whilst working at Blackburn Infirmary, on January 25th, Thomas Austin, apprentice electrician, was killed. At an inquest on January 27th a witness said that to secure a light he plugged one adaptor to another, and placed a bulb into the lampholder. He then received a shock which threw him against the hoardings. Recovering, he told another man something was wrong with the lamp. Another workman said he switched off the current at the main before the deceased fixed the bulb in the holder. Witness heard him shout, and saw him holding the wires with both hands. The workman thereupon tore the wires from the switchboard, and Austin fell to the floor. John Holliday, electrical foreman, said temporary cables had been run to enable the plasterers to work overtime. The holder and the lamp were in perfect order. He thought that the interior of the lampholder had been turned round when the lamp was put in, causing one of the screws to touch the case of the holder. He could not account for the wire being alive; the current could not have been switched off. The Coroner returned a verdict of "Accidental death."

National Association of Supervising Electricians.

The twelfth annual dinner and musical evening is to be held at the Holborn Restaurant, London, on February 26th, 1927. The President of the Association, Mr. A. M. Sillar, M.Inst.C.E., will preside, and will be supported by many other distinguished engineers.

Educational.

FARADAY HOUSE SCHOLARSHIPS.—The annual examinations for a Faraday and a Maxwell scholarships, each of fifty guineas per annum and tenable for two years in college and one year in manufacturing works, will be held on April 5th, 6th and 7th, 1927. Exhibitions may also be awarded to candidates who acquit themselves creditably but do not qualify for a scholarship. Particulars are obtainable from Faraday House, 62, Southampton Row, London, W.C.1.

Bauxite.

According to a German metallurgical journal, the world production of bauxite in 1926 amounted to 1,475,000 tons, as compared with 928,000 tons in the previous year, the French mines again occupying the first position with 440,000 tons last year.

Electrical Association for Women.

The first meeting in the new year of the Manchester District Branch was held on January 12th in the Lecture Hall of the Y.M.C.A. The Singer Sewing Machine Company gave a very interesting demonstration of its electric sewing machine, and entertained the members at tea. On January 19th members visited the all-electric house at Denton, which is open in connection with the "Wiring the Homes of Britain" campaign.

The lecture given earlier in the winter by Mr. R. C. Hawkins, of the Lighting Service Bureau, on "Lighting in the Home," proved so useful that it was decided to repeat it for members who were unable to attend the last meeting. This lecture was given on Monday evening, January 24th, and was very much appreciated.

Institution Notes.

Institution of Electrical Engineers.

ANNUAL DINNER.—Applications from members to attend the annual dinner on February 10th have been received in such large numbers that all the tickets have been disposed of, and it will not be possible to issue any tickets for non-members other than the official guests. Arrangements have, however, been made for additional accommodation in the Oak Room (immediately adjoining the Grand Hall). At the conclusion of the dinner the boxes and gallery in the Grand Hall will be thrown open to those who will have dined in the Oak Room, to enable them to hear the after-dinner speeches. Those wishing to avail themselves of the accommodation in the Oak Room are requested to communicate with the secretary of the Institution immediately.

Institution of Public Lighting Engineers.

CHANGE OF ADDRESS.—We have been notified by the hon. secretary of the above-named Institution, Capt. W. J. Liberty, that its address has been changed to: General Buildings, Aldwych, London, W.C.2.

Junior Institution of Engineers.

On Friday last, a paper on the "Design of High-Pressure Sub-stations" was delivered by Mr. C. E. Atkinson, A.M.I.E.E. The lecturer held that self-cooled 3-phase transformers should be used wherever the size and transport facilities permitted, and metal-clad switchgear for voltages up to 35,000 V. He considered that outdoor switchgear should be used for higher voltages.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

MR. R. WILSON JONES, A.M.I.E.E., A.M.Inst.M. & Cy.E., electrical engineer, Locomotive Superintendent's Department, Federated Malay States Government Railways, is at present in England on eight months' furlough. His temporary address is, c/o The Engineers' Club, Coventry Street, London, W.1.

A presentation has been made to Mr. R. P. JONES, district representative of the Kidderminster Lighting and Traction Co., Ltd., who is leaving Kidderminster to take up a post at Halesowen.

MR. R. B. LEACH has resigned the post of borough electrical engineer to Loughborough Corporation owing to ill-health, after 11 years' service.

The Manchester Corporation Electricity Committee has recommended the appointment of Mr. W. H. DUNCAN, of Newcastle-on-Tyne, as chief mains engineer.

A correspondent states that Mr. R. GREGORY, formerly a member of the Mold Council and chairman of the Electricity Committee, has been appointed electrical engineer to the Mold Council, at a salary of £300 per year.

It is reported in the Press that Captain W. J. LIBERTY, the Lighting Inspector to the City of London Corporation, has retired after 30 years in charge of the street lighting of the City.

Mr. T. H. WILLIAMS, electrical engineer to the Hoyland Silkstone Coal and Coke Co., who has become mining representative in the Yorkshire and Lancashire coalfields for the Marconiphone and Sterling Telephone and Electrical Companies, has been presented by the electrical staff with a fountain pen.

The Kingston-on-Thames Town Council has granted the borough electrical engineer, Mr. T. A. KINGHAM, six weeks' leave of absence, as he is suffering from the effects of overwork and strain to which he has been subjected during the past year. He has left for the Canary Islands, and during his absence Mr. P. C. SIMPSON is acting borough electrical engineer.

CAPT. I. MACKINTOSH, consulting engineer, Midland Bank Chambers, Wigan, closed his office on January 31st on taking over the general managership of the Corlett Electrical Engineering Co., Wilcock Street, Wigan. He asks that all correspondence for him should now be sent to the latter address.

The Leeds City Council has been recommended to grant salary increases to eleven principal municipal officials, including Mr. C. N. HEFFORD, city electrical engineer (from £1,600 to £1,650), and Mr. W. CHAMBERLAIN, tramway manager (from £1,500 to £1,600).

Cape Town Electricity Committee recently recommended that the salary of the city electrical engineer should be increased from £1,500 to £1,750 per annum.

Mr. G. A. HARRISON, district engineer to the West Gloucestershire Power Co., Ltd., has been presented by the employés with a suitcase on his resignation to take up a post abroad.

The Long Eaton Urban District Council has adopted the minimum salary scale of the Associated Municipal Electrical Engineers (Great Britain and Ireland) for the purpose of fixing the salary of its electrical engineer and manager, Mr. F. NEWEY.

A reference to the presentation made to Mr. CHARLES VERNIER on his leaving to take up his new appointment appears below.

Mr. G. L. PORTER, A.M.I.E.E., late of Messrs. Merz and McLellan, has joined the staff of Ferranti, Ltd., as advisory engineer.

Obituary.—MR. J. T. RAMSAY.—We regret to record that on January 25th Mr. John Thomas Ramsay, assistant superintendent of traffic in the Telephone Department of Glasgow Post Office, was knocked down and killed within 100 yards of his home by a motor-'bus.

MR. W. H. GUY.—We regret to learn that Mr. W. H. Guy, who was at one time connected with electrical and other technical publications, passed away on January 22nd, after a very brief illness.

MR. C. E. ELDER.—We deeply regret to record the death, which occurred with tragic suddenness last Saturday evening, of Mr. Charles E. Elder. He was one of a happy company assembled at the Savoy Restaurant, Newcastle, to make the farewell presentation of testimonials to Mr. Charles Vernier, for many years chief mains engineer, Newcastle-upon-Tyne Electric Supply Co., Ltd., who is joining the Macintosh Cable Co., Ltd., of Liverpool, as chief engineer. Mr. Elder was one of the soloists, and he expired suddenly after singing a song. Mr. Vernier received a silver coffee service from his colleagues in the company and a silver cigarette-case and a crystal cut-glass flower vase from the contractors who undertake work for the company from time to time. The presentation ceremony was necessarily of a formal character on account of the sad occurrence, and the proceedings came to an abrupt termination. Sincere sympathy with Mr. Elder's widow and relatives was expressed. Mr. Elder, who was about 57 years of age, was Mr. Vernier's chief assistant in the mains engineering section, and had been in the company's service for nearly 38 years. He was popular with all the staff. He had been in indifferent health for some time.

MR. A. J. WILKINS.—We regret to announce that Mr. A. J. Wilkins died suddenly on January 27th. He was associated with Messrs. G. E. Taylor & Co., as engineer and manager, from the commencement of the firm in 1899. Previously he was connected with Messrs. Laing, Wharton & Down, Ltd., for about 10 years. He was well known throughout the contracting industry, and will be greatly missed.

MR. C. G. VALLANCEY.—*The Times* records the death, in his 62nd year, of Mr. Charles George Vallancey, late of the Western Telegraph Co., Ltd.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Lisburn Electric Supply Co., Ltd.—Registered in Belfast January 18th. Capital, £100 in £1 shares. Objects: To carry on business as indicated by the title. The directors are:—E. S. Dashwood, Laurel Bank, Windsor Avenue, Belfast, electrical engineer; A. E. Salmon, Browne End, Bucks; Sir Robert J. Lynn, Kt., Belfast; Edward S. Clarke, Lisburn. Qualification, 20 shares. Secretary: J. G. Megaw. Registered office: Coates Buildings, Belfast.

Archibald Bryce & Co., Ltd.—Private company. Registered January 25th, in Edinburgh. Capital, £3,000 in £1 shares. Objects: To carry on the business of general manufacturers, merchants or traders, agents for and dealers in electrical and mechanical supplies, engineering and colliery supplies and furnishings, &c. The first directors are:—A. Bryce, 16, Whitehill Street, Dennistown, Glasgow, electrical engineer; J. Kinloch, 5, James Street, Whiteinch, Glasgow, electrical engineer. Qualification, one share. Secretary: G. Gibb. Registered office: 257, West Campbell Street, Glasgow.

Alldays & Onions, Ltd.—Registered as a private company on January 24th.. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in fans, blowers, furnaces, power or other hammers, forges, cranes, and lifting tackle, &c. The subscribers (each signing for one share) are:—A. T. Cocking, J.P., Hartopp Court, Four Oaks, Warwickshire; H. C. Chambers, Kerri, Blakesley Road, Yardley, Birmingham, solicitor's managing clerk. No share qualification necessary. Solicitors: Pinsent & Co., 6, Bennett's Hill, Birmingham.

Chromium Plating and Development Co., Ltd.—Private company. Registered January 28th. Capital £15,000 in £1 shares. Objects: To acquire from E. V. Hayes-Gratze, M. Fink, and A. Hurter the benefit of certain existing inventions of processes relating to the electro-deposition of chromium, and to carry on the business of chromium miners, electro-platers, metallurgists, &c. The first directors are:—E. V. Hayes-Gratze, 1, Gledhow Gardens, South Kensington, S.W.5, engineer; A. Hurter, 27, Soho Square, W.1, engineer; S. D. Kittel, address not stated. Qualification, 400 shares. Solicitors: Kenneth Brown, Baker, Baker, Lennox House, Norfolk Street, W.C.2.

Electric Fans, Ltd.—Private company. Registered January 29th. Capital, £500 in £1 shares. Objects: To adopt an agreement with S. J. Flatau and B. Freedman, to acquire the registered trade mark "Manda." No. 452,496, Class 7, and to carry on the business of manufacturers of, and dealers in electric fans, electric motors, mechanical signs, &c. The first directors are:—S. J. Flatau (chairman), 4, Kidderpore Gardens, Hampstead, N.W.; B. Freedman, 549, Finchley Road, N.W.; and V. Delebecque, 26a, St. Peter's Square, Hammersmith, W. The first two named are permanent. Solicitors: M. A. Jacobs, 73 and 74, Jermyn Street, S.W.1. Registered office: 53 and 54, Royal Mint Street, E.1.

Ruud Manufacturing Co., Ltd.—Private company. Registered January 29th. Capital, £20,000 in £1 shares. Objects: To carry on the business of manufacturers and suppliers of automatic and other types of water heaters, mechanical and electrical engineers, machinists, smiths, founders and fitters of brass, iron, and other metals, &c. The first directors are:—E. Ruud, 240, South Graham Street, Pittsburgh, gas engineer; A. P. Brill, 712, St. James Street, Pittsburgh, secretary; E. J. Horton, 330, Gross Street, Pittsburgh, U.S.A., mechanical engineer; E. C. A. Bliault, 5, Carlton Gardens, Ealing, W.5, merchant; A. J. Greenop, 6, Riverview Mansions, East Twickenham, solicitor. Qualification: 5 shares. Remuneration (except managing director, if any), as fixed by the company. Solicitors: A. J. Greenop & Co., Bush Lane House, Cannon Street, E.C.

E. A. Dale, Ltd.—Private company. Registered January 31st. Capital, £1,000 in £1 shares. Objects: To carry on the business of factors of, agents for and dealers in electrical goods and appliances, and materials, and plant for manufacturing wireless goods, wires and cables, lamps and shades, &c. The first directors are:—E. A. Dale, "Caledol," Tennis Court Drive, Leicester, electrical agent; A. Dale, 47, Devonshire Road, Sherwood, Nottingham, surveyor. Qualification, 100 shares. Solicitors: Whetstone & Frost, Leicester.

Official Returns of Electrical Companies.

British Electric and General Insulators, Ltd. (197,340).—Capital, £1,000 in £1 shares. Return dated May 16th (filed October 18th), 1926. Two shares taken up. £2 paid. Mortgages and charges, nil.

Refty Electrical Appliances, Ltd.—W. E. Fisher, of 12, Old Square, Lincoln's Inn, W.C.2, ceased to act as receiver or manager on January 8th, 1927.

Neutron, Ltd.—H. Hackett, C.A., of 448, Strand, W.C.2, was appointed receiver on January 18th, 1927, under powers contained in instrument dated September 29th, 1924.

H. L. Wood & Son, Ltd.—Mrs. L. O. L. Wood, of 7, Tasswell Road, Southsea, was appointed receiver and manager on January 13th, 1927, under powers contained in debentures dated November 17th, 1925.

Stensigns, Ltd.—A. B. Burbridge, of 32, St. James Street, S.W.1, was appointed receiver and manager on January 17th, 1927, under powers contained in debenture dated January 30th, 1926.

Deansgate Electro-Radio (Manchester), Ltd.—Debenture dated January 10th, 1927, to secure £775, charged on the company's property, present and future, including uncalled capital. Holder: C. Leeming, 10, Merton Road, Cheadle Heath, Stockport.

Wireless Experts, Ltd.—D. V. L. Craddock, of 2, Forbury, Reading, ceased to act as receiver on December 29th, 1926.

A. E. Acton-Burnell, Ltd.—G. Sunley, of 9-11, Copthall Avenue, E.C., was appointed receiver and manager on January 11th, 1927, under powers contained in debenture dated July 31st, 1923. R. Paiba, of 73, Basinghall Street, E.C., ceased to act in the above capacities on January 11th.

Atlas Light and Power Co., Ltd.—Particulars filed of £2,089,757 debenture stock (inclusive of £1,200,000 secured by trust deeds dated March 12th, 1909, February 10th, 1922, and July 16th, 1923), plus premiums relating thereto, authorised by resolution of December 31st, 1926, and covered by supplemental trust deed of same date, the amount of the present issue being £889,757 5 per cent. debenture stock. Trustees:—Col. C. W. Trotter, C.B., W. K. Whigham, Earl of Dunmore, V.C., M.V.O., and N. G. Touche. The present issue of stock is redeemable at 105 per cent. ranking *pari passu* (except as regards interest and redemption) with the debenture stock already authorised. The company has power to issue further stock ranking *pari passu* with the above 6 per cent. and 5 per cent. stocks at varying rates of interest, but so that such further stock with the £889,757 debenture stock shall not exceed half the nominal capital of the company beyond 1,925,211 £1 shares now issued).

Hall Telephone Accessories, Ltd. — Debenture dated January 6th, 1927, to secure £25,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: British Stamp and Ticket Automatic Delivery Co., Ltd., 70, Dudden Hill Lane, N.W.

New Phonopore Telephone Co., Ltd.—Debenture dated January 19th, 1927, to secure £100, charged on freehold factory at Southall, and company's undertaking. Holder: A. F. Liddell, 26, Austin Friars, E.C.2.

Buenos Aires Town and Docks Tramways, Ltd.—Trust deed dated December 31st, 1926, to secure £100,000 7 per cent. debenture stock, charged on the company's undertaking and property, present and future, including uncalled capital, with power to create any mortgage or charge ranking *pari passu* with or in priority to the stock, except as provided in the trust deed. Trustees: Law Debenture Corporation, Ltd., 2, Old Broad Street, E.C.

Shenton & Co., Ltd.—W. B. Pearson, of 5, John Street, Bedford Row, W.C.1, was appointed receiver and manager on February 25th, 1926, under powers contained in first mortgage debentures dated July 16th, 1925. (Notice filed January 21st, 1927.)

Pickvance, Ltd.—Issue on January 21st, 1927, of £25 debentures, first part of a series already registered.

City Notes.

Singapore Traction Co., Ltd.

The report which is to be presented at the annual meeting on Wednesday next covers a period of 14½ months (ended September 30th last) from the date of the company's incorporation. The undertaking was acquired from the receiver and manager of the Singapore Electric Tramways, Ltd. (in liquidation). After transferring £5,000 to depreciation and renewals account and carrying forward £7,028, there remains a sum of £20,000, one-half of which is payable to the managers, the remaining half being available for dividend. The directors recommend the payment of a dividend of 5 per cent. on the 7 per cent. cumulative preference shares. The profits for the first year of operation include £10,180 from the power station, derived mainly from the supply to the Municipal Commissioners, which was discontinued in October last. At the date of the accounts, 35 trolley-'buses had been put into service on a route of 6¼ miles, and a further 20 were in hand. The company has made an agreement with the Municipal Commissioners to take a supply from the municipal power station, thus avoiding expenditure upon the power plant.

Fife Tramway, Light and Power Co., Ltd.

The subsidiaries of this company earned a trading profit of £75,605 during the past year, as compared with £114,098 in 1925. The company receives a sum of £65,436 and, after meeting expenses, has a balance of £54,348. To this is added £9,694 brought forward, making £64,042. It is proposed to pay a dividend of 3 per cent. on the ordinary shares (against 6 per cent.) and to carry forward £6,145. In 1925 £10,500 was transferred to reserve. The meeting is to be held at Edinburgh to-day (Friday).

A Franco-Swiss Investment Bank.

The Banque Général pour l'Industrie Electrique is the title of an investment undertaking which has been formed in Geneva, with a share capital of 20,000,000 Swiss francs, for the purpose of carrying out financial operations in connection with the examination, establishment, and working of electrical undertakings. The bank has been constituted under the leading of the Union Financière of Geneva in Switzerland, and in France under that of the Credit Commercial de France and the Compagnie Générale d'Electricité.

Melbourne Electric Supply Co., Ltd.

The recently-issued accounts cover a period of 9 3/5 months. Against the receipts is charged a sum of £345,000 under the agreement made with the State Electricity Commission. The balance on trading account is thus reduced to £216,142, as compared with £567,610 in the previous period (14⅖ months). After meeting debenture interest, &c., and crediting interest received, there remains a balance of £102,989. The reserve for income tax receives £18,000, and to the balance is added £14,254 from general reserve. A final dividend of 5 per cent. actual is recommended on the consolidated ordinary stock, making 10 per cent., free of British income tax, for the year, and the balance of £3,195 will be paid over to the State Electricity Commission. The directors state that it is intended to continue to pay 10 per cent. on the ordinary stock. The rate is fixed at 7 per cent., but the balance is made up from income from investments.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Smith (S.) & Sons (Motor Accessories), Ltd.—400,000 7½ per cent. cumulative preference shares of £1 each partly paid and fully paid, Nos. 1 to 400,000.

The undermentioned securities have been ordered to be officially quoted:—

Perak River Hydro-Electric Power Co., Ltd.—£1,250,000 5 per cent. guaranteed debenture stock, 1951.

Tottenham District Light, Heat and Power Co.

The directors recommend the following dividends in respect of the half-year ended December 31st last:—At the rate of 5½ and 5 per cent. on the preference stocks; at the rate of 7⅝ per cent. on the "A" stock; and at the rate of 6¼ per cent. on the "B" stock. Similar dividends were paid for the previous six months.

Westinghouse Brake and Saxby Signal Co., Ltd.

The net profit for the year was £157,922, and the amount available, after meeting debenture interest, &c., and adding £7,866 brought forward, is £138,177. Of this £10,000 is put to reserve, £30,800 is written off expenses, and it is proposed to pay a dividend of 8 per cent. (against 6 per cent.), leaving £10,254 to be carried forward.

Companies Struck off the Register.

The names of the undermentioned companies have been struck off the register, and they are thereby dissolved:—

Borra Magneto Repairing Co., Ltd.
Multi-Electrode Radio Valve Co., Ltd.
Savoy Electric Construction Co., Ltd.
Woodhouse & Baillie Riviera Electricity Co., Ltd.

Companies to be Struck Off the Register.

The names of the undermentioned companies will be struck off the Register at the expiration of three months unless cause is shown to the contrary:—

B. Barnett (Electrical Engineering), Ltd.
British Generator Co. (1922), Ltd.
British Homo Wireless Co., Ltd.
Broadcasting Installations, Ltd.
Eclat Electrical Accessories (Paddington) Co., Ltd.
Electronic Devices, Ltd.
Hull Wireless Co., Ltd.
Prior's Television (Parent Company), Ltd.
Radio Products, Ltd.
Reynard Electrical Co., Ltd.
Wilmore's Wireless, Ltd.

Metropolitan Railway Co.

A final dividend of 1½ per cent. has been declared on the ordinary stock, making 3 per cent. for the year, as against 5 per cent. for 1925. £100,000 has been taken from the reserve. The final dividend on the Surplus Land stock is 2⅛ per cent., making 3⅝ per cent., as against 3½ per cent for the previous year.

United Alkali Co., Ltd.

At a recent board meeting, Mr. Holbrook Gaskell (one of the existing directors) was appointed a managing director, and the following gentlemen were appointed additional directors of the company:—Sir Alfred Mond, Sir Harry McGowan, Mr. J. G. Nicholson, and Lieut.-Colonel G. P. Pollitt.

City of Buenos Ayres Tramways Co. (1904), Ltd.

A final dividend of 1¼ per cent., making 5 per cent. for the year (as in 1926), has been declared. It is proposed to transfer £5,500 to amortisation and general fund and to carry forward £15,114.

New Issue.

Ascot Gas and Electricity Co., Ltd.—Last week the company's agents invited tenders for 3,000 6-per-cent. preference shares of £10 each, to rank with the existing preference shares.

The A.E.G.

It is reported that the net profit of the Allgemeine Elektricitäts Gesellschaft for the past year was 10,761,000 marks, and a dividend of 7 per cent. has been declared.

Western Union Telegraph Co. (Inc.).

The gross revenue for 1926 was $136,445,900, and the net surplus, after providing for debt interest, &c., was $15,223,143.

Cable, Telephone and General Trust, Ltd.

The dividend has been declared for 1926 on the 6 per cent. cumulative preference shares.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets suffered from disappointment at the retention of the Bank Rate at 5 per cent., consequent upon the Chinese riots and the dispatch of troops from this country to the scene of action. There was a temporary check to the pleasant cheerfulness that had previously prevailed, and a drop in the new Consols spread general dullness amongst investment stocks. But neither investor nor speculator permitted the foreign disturbances to ruffle for long his confidence in the financial prospect, and therefore the Stock Exchange price lists show long strings of rises—substantial in many cases—in to-day's quotations as compared with those of the beginning of the year. The Home Railway sections are amongst the few that reveal losses, but these are mostly confined to the ordinary stocks, for the pre-ordinary issues are firm as a rule, improvements being registered in some instances.

Had not a nominal fall occurred in Edmundson's ordinary, caused by the marking of the price ex dividend, the particular section in which the shares are quoted would be void of alteration this week. Debenture stocks are better, the chief changes being gains of 4 points in County of London Electric first and second debenture stocks. The company has formulated an interesting plan, details of which appeared last week (ELECTRICAL REVIEW, page 147), under which the proprietors of the 4½ per cent. first debenture stock are offered £115, and of the

second debenture stock £112 10s., in the new 4 per cent. Consols. The first debenture is redeemable at 115 and the second at 105, at the option of the company. Meetings of proprietors are called for February 17th to consider the necessary resolutions. The latter must be passed by a 75 per cent. majority for them to become effective. The Board has given proprietors ample time to think over a matter that requires serious attention. Most proprietors will elect, we imagine, to accept terms which are undoubtedly attractive.

Brazilian Tractions remain amongst the most volatile shares in Stock Exchange markets. The price went ex 1½ dollars dividend last week, and had been up to 119. The present quotation of 117 is not far short of the recent best, allowing for the dividend. Rumour declares that the struggle for control has been renewed, and mentions the name of Mr. Alfred Loewenstein in this connection. It was this gentleman's offer that drew from the president of the Brazilian Traction Board such an extremely definite snub some few months back.

Marconis have been undergoing a series of abrupt transitions between firmness and weakness. After their jump to 17s. the price reacted to 15s. The movements are supposed to be actuated by bull and bear anticipations of the forthcoming issue of the report that has reached the sub-committee's hands. However great has been the vigilance exercised to stop any possibility of leakage, it is difficult to suppose that no information at all has been permitted, perhaps almost unconsciously, to filter through. Marconi Marines are 1/16 lower at 22s. 6d., notwithstanding the attention drawn to the shares in some directions, as a good speculative investment.

Cable stocks and shares are steady, but exhibit little vitality. Anglo-American preferred and deferred have gained small amounts. Indo-Europeans are down 1 to 46½. The telephone group is somewhat easier; United River Plates fell ⅛ to 8¼. In the Home list, International Automatic B have drooped to 42s. 6d., but Automatics hold their price at 55s. General Electrics, while nominally unchanged at 31s. 6d., have attracted support at that level. Metropolitan Vickers ordinary went ahead with an eighteenpenny rise to 28s. 3d. on account of the contracts which the company is known to be securing. Callenders improved to 48s. 9d. Siemens at 30s. 6d. are 9d. lower on the week. Business in the cable construction and equipment shares remains moderately active, but has become more of the investment type, the speculators being now busy with interests in other markets. Ever Ready shares touched 4½, and then reacted to 4⅜.

Home Railway ordinary stocks are weak. This is due to the declaration by the Metropolitan Railway of a final dividend of 1½ per cent., making 3 per cent. for the year 1926, as against 5 per cent. in the previous twelve months. Anticipation had looked for a probable 4 per cent., and the announcement led to a fall throughout Home Rails. Metropolitans are 3½ points lower on the week, and Districts shed 10s., Underground Electrics also being dull.

The Mexican Utilities group has strengthened noticeably. News from Mexico—direct—suggests that the country is about to make a payment of interest upon certain of the Mexican Railway national bonds, and this brought about rises ranging from 1 to 3 points in Mexican Light and Power descriptions. Mexican Electric Light 5 per cent. bonds advanced to 58½. British Columbia Electric stocks further increased their values. Kalgoorlie Electric Power and Light shares gained a few pence at 5s. 3d. In the dollar stocks, Shawinigan common shares are 6 points better at 283½.

Fife Tramway Light and Power shares, which were standing at 16s., fell back to 12s. 6d. on the cutting in half of the previous dividend of 6 per cent. The report says that the power and lighting properties were seriously affected by the complete dislocation caused by the coal dispute in Fife, and that the transport department suffered severely from the unfavourable industrial situation during the last eight months of the year. The working costs and output of the two former sections are now, says the report, "almost back to normal conditions." It is significant to read that the Power Company's generating station is being interconnected with the Scottish Central Electric Power Company by a trunk transmission line. Holders of shares in provincial electric supply companies will note this with especial interest.

Rubber shares lack lustre and activity. The exportable allowance is reduced to 70 per cent. for the three months that start with the Tuesday in this week, but this failed to energise the market. Iron and steel shares lean to the lower side, Vickers easing off to 8s. 7½d., Armstrongs being 3s. 4½d. The prices of the best-class shares are well maintained, however, and Babcocks continue to be steadily absorbed by the investor who looks well ahead.

High-Voltage "S.L."-Type Cables.

33,000-Volt Cables with Metal-sheathed Cores, each of which is Separately Lead-covered.

By P. DUNSHEATH, O.B.E., M.A., B.Sc., M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

(Concluded from page 154.)

In the next series of tests two lengths of steel-tape-armoured cable, one of the plain 3-core type and the other of the S.L. type, were buried in the ground at a depth of 2 ft. and subjected to steady loads in turn, each run being continued for several days to ensure ultimate conditions. The point at issue is illustrated in the comparative figures

TABLE I.

Cable.	Current, amps.	Temperature. Conductor, deg. C.	Outside surface, deg. C.	Rise, deg. C.
S.L. type ...	256	58.1	44.7	13.4
Plain 3-core ...	256	61.8	44.7	17.1

in Table I, from which it is evident that in spite of eddy-current losses in the sheaths the temperature-rise in the S.L. cable is less than in the plain 3-core cable. As the heating is proportional to the square of the current, under conditions in which the external thermal path has negligible resistance (with the cables lying in flowing water) the S.L. cable would have a current-carrying capacity of over 12 per cent. in excess of that of the plain 3-core cable. In order to simulate practical conditions, the cables were subjected to a variable load, and fig. 4 shows the variation of temperature in the two cables for the last three days. Throughout the run the S.L. cable remained considerably cooler than the plain 3-core cable.

In a more complete set of tests an experimental 75-yard length of 0.2 sq. in., 3-core, 33,000-volt, S.L.-type cable with a dielectric thickness of 0.34 in. and having the section shown in fig. 2, was tested. The main armouring is a double layer of steel tape, and over the individual cores is applied a coat of impregnated cotton tape for protection against corrosion and to form bedding. Laid out on the ground and covered with a few inches of earth to avoid the effects of air currents, varied d.c. up to 300 amperes was passed through the conductors, each run being maintained for 24 hours in order to reach steady conditions. The d.c. tests were followed by a.c. tests at 50 and then at 25 cycles.

Fig. 5 shows that no danger need be anticipated from the magnitude of these voltages; even if the effect on the pilots is considered, transposing at each joint would easily eliminate all interference. Fig. 6 shows that the magnitudes of the longitudinal sheath currents amount to about 7 per cent. of the main cable current. Fig. 7 demonstrates how insignificant are the sheath losses; even allowing for the less important sheath eddies not measured in this test, the total loss expressed as a percentage of the copper loss at the full working current of the cable is only of the order of 3 or 4 per cent. Comparison of the values in figs. 8 and 9 is illuminating as it shows the negligible heating effect of the sheath losses (the outside surface being maintained at 20 deg. C.); the temperature rises under a.c. conditions are only very slightly higher than those under d.c. conditions. In order to obtain a straightforward assessment of the S.L. type, it must be credited with the advantage of the cooling due to the sheaths, as well as being debited with the additional heating caused by them. In fig. 10 are given the sheath and conductor temperatures for various 50-cycle currents noted in a load test on a 200-yard length of 0.2 sq. in., plain 3-core, single-wire-armoured, 33,000-volt cable. The important comparison to show up the merits of the S.L. cable is between figs. 9 and 10; if both cables were laid in water, the S.L. cable for the same temperature rise would carry 14 per cent. more current than the plain 3-core cable.

In order to obtain a still more practical comparison, heating tests have been carried out on three 50-yard lengths of 0.2 sq. in., 33-kV cable, a plain 3-core cable, an "H"-type cable and the S.L. type; the same paper and compound were used on all three, and the same manufacturing process adopted in all. The results are briefly summarised in fig. 11, which show the ultimate temperatures attained by the conductors.

Full appreciation of the merits of the S.L. construction for 33-kV transmission raises the question of using single-core

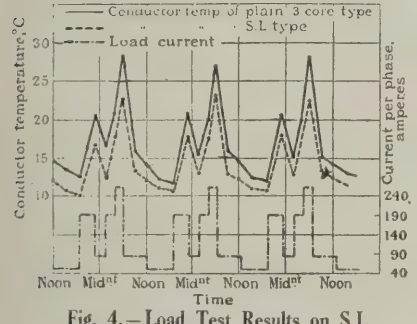

Fig. 4.—Load Test Results on S.L. and Plain 3-Core Cables.

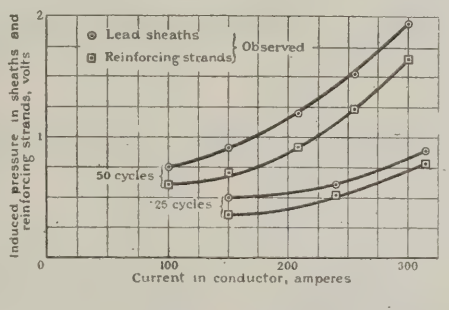

Fig. 5.—Induced Voltages on Open Circuit, S.L. Cable.

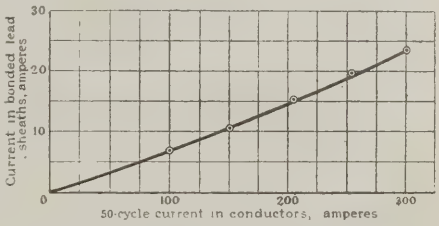

Fig. 6.—Longitudinal Sheath Currents, both ends Bonded.

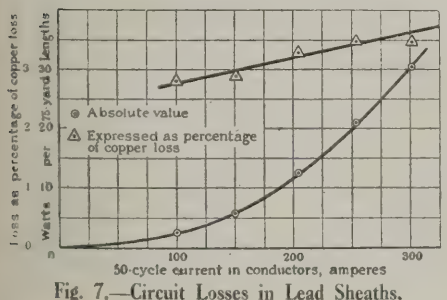

Fig. 7.—Circuit Losses in Lead Sheaths, Bonded, S.L. Cable.

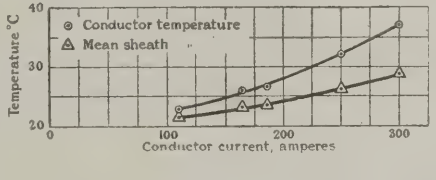

Fig. 8.—D.C. Heating Tests, S.L. Cable.

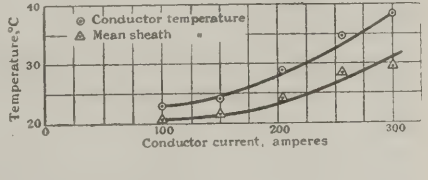

Fig. 9.—A.C. Heating Tests, S.L. Cable.

cables for the same purpose. If they can be laid in triangle formation close together, there is no reason why the losses with single-core, lead-covered, unarmoured cables should be any greater than those with the S.L. cable. From the point of view of mechanical protection, the S.L. cable can be laid direct in the ground as manufactured; the use of single-core, armoured cables for a.c. transmission is impracticable both from the point of view of losses and that of current-carrying capacity, and their use in place of S.L. cables for 33-kV systems must allow for at least equal mechanical protection. As regards convenience, small single cores are admittedly easier to handle, but this ease is a danger; the less a super-voltage cable is bent during laying the better are its chances of a long life. Whenever single-core cables are used, interference with external telegraph and telephone circuits must be watched. The cores in the S.L. type are twisted together with a lay of only a few feet, while the equivalent single cores are laid together side by side without any twist; therefore, with the former interference would be absent, while with the latter it might be very pronounced.

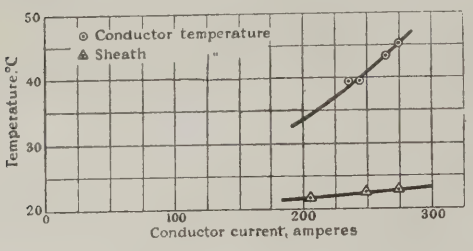

Fig. 10.—A.C. Heating Tests, Plain 3-Core 33-kV Cable.

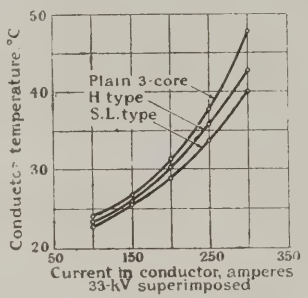

Fig. 11.—Heating Tests, Various Loadings and Types of Cable.

Comparison of a number of cases of different sizes shows that, taking into account the cost of cable, excavation, laying, jointing and reinstatement, the advantage is with the S.L. cable. A single-core installation for the same thickness of dielectric costs slightly more than an S.L. installation. If pilots be included in the comparison, the advantage in favour of the S.L. type may amount to as much as 6 or 8 per cent. on the cost.

The general conclusions are that metal-sheathed-core cables have many important advantages over plain 3-core cables, and practically no disadvantages. Of the two types, the S.L. has important advantages, but has been considered to have disadvantages because of the voltage generated and losses incurred in the sheaths surrounding the separate cores. A wide range of tests shows conclusively that these fears are groundless. The voltages are very small, even when not suppressed by bonding, and when the cables are bonded together the losses due to eddy currents are negligible. Also, contrary to the previous supposition that the losses reduce the rating of the cable by the heat generated in the sheaths, the cooling effect of the sheaths carries the balance far in the opposite direction, resulting in the S.L. type of cable running very much cooler than the plain 3-core cable. Considering also that the S.L. cable is lighter in weight than the plain 3-core cable and carries with its use a very simple joint construction, in addition to the known electrical advantages, it seems that an unanswerable case is made for its use as a solution of the 33,000-volt cable problem.

A Large Cable Armouring Machine.

50-h.p. Plant Made and Recently Installed by Messrs. Johnson & Phillips, Ltd.

THE accompanying illustration shows a large cable armouring machine which has recently been installed in the paper cable shops of Messrs. Johnson & Phillips, Ltd. It is some 220 feet long, over all, and is intended to armour cables with outside diameters up to 5½ in. Two armouring cages containing 96 floating bobbins and 24 fixed bobbins, each measuring 18 in. by 9 in., provide for serving the cable with 120 wires in all. The capacity of each bobbin is about 3½ cwt. of wire. The jute is served by means of six disks, each carrying 64 spools of the material. There are ten compound tanks, which are provided with special exhausting gear for the removal of the fumes. The machine is also arranged for steel-tape as an alternative to steel-wire armouring. The diameter of the draw-gear wheel is 9 ft., and the take-up stand will receive drums up to 12 ft. in diameter and from 15 to 20 tons in maximum weight.

The drive is by a 50-h.p. centrally placed motor directly coupled, through friction-clutch gear, to the main shaft, an arrangement which enables the heaviest load to be picked up gradually and easily. The wire cages run on ball bearings, and are provided with a loading gantry. The two wire sections can be coupled together by means of a coupling tube and the centre serving plant removed, the cages being synchronised so that the 120 wires can be put on in one layer if required: It is of interest to learn that the machine was manufactured entirely in the Johnson & Phillips' engineering shops.

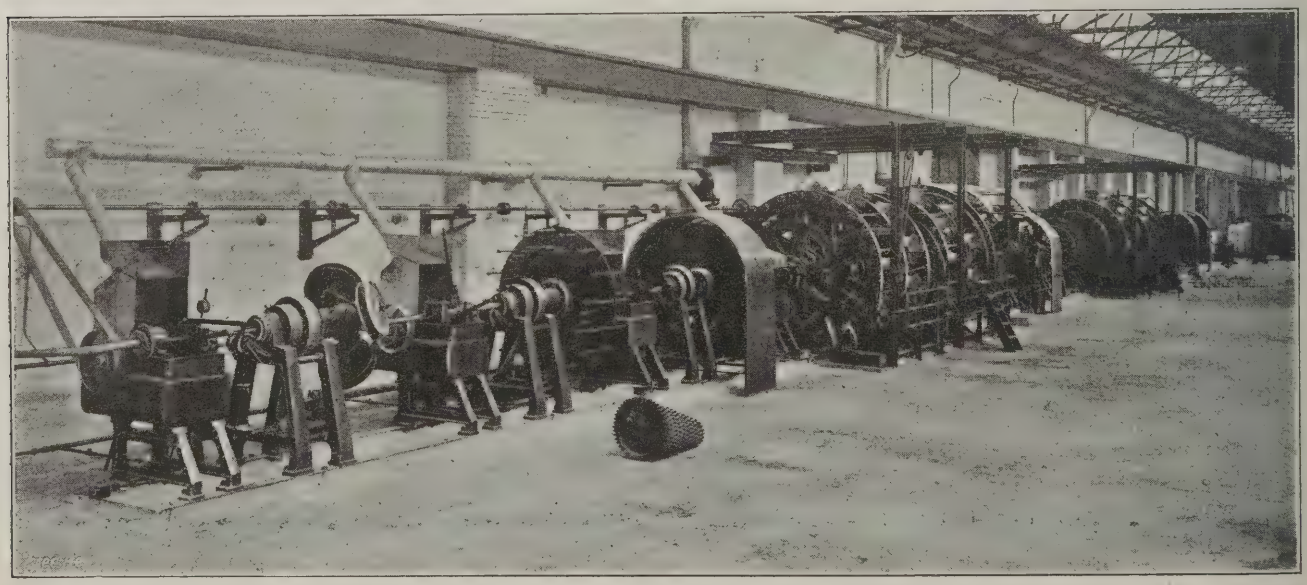

Fig. 1.—"J. & P." Electric Cable Armouring Plant, 220 feet in length.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Concluded from page* 153.)

Klaxon, Ltd.

The Company's chief exhibit was the "Audiwave" used for applying the new Eldred method of relieving deafness. The machine's action is the same in principle as that of the radio loud-speaker; in front of it is a rigid vibrating cone which is operated by mechanism similar to that of an electric bell, but designed to produce vibration of the required characteristics. The instrument is driven off a 6-volt battery, and a rheostat controls the amplitude of the vibration, this quantity being indicated simply by a mark on the cone. Patients may apply the treatment themselves at home.

New Oscilloscope Co., Ltd.

Improved models of the Elverson oscilloscope, or flashing-lamp stroboscope, are more robust and compact than the earlier ones; in addition to the usual method of operation by direct connection to mechanisms to be examined, the new types can be used for cursory examinations in exactly the same manner as hand tachometers, the oscilloscope gear-box being held in one hand and the lamp for the examination of the mechanism in the other hand.

The vibrating-wire stroboscope, by Prof. A. Guillet, is a new form of stroboscope, which has a field of utility supplementary to the oscilloscope, and can be used for quantitative tests on various electrical applications besides its utility in instances of tests on mechanical plant where it may not be convenient or possible to obtain a direct connection (and thus absolute synchronism) between the stroboscope and the mechanism to be examined. The instrument is suitable for tests at all frequencies or speeds from 1,000 to 12,000 r.p.m., and is compact and easy to operate. In principle, it consists of a metal strip of wire, the vibration of which is sustained electrically by means of a small electromagnet suspended over its centre and actuated by the current from a small battery; the current is cut off by the wire itself at the moment of its passing through the position of equilibrium. The frequency of vibration of the wire can be regulated by imperceptible degrees, through varying its tension by means of a screw on which is engraved an accurately divided scale. This vibrating wire opens and closes the primary circuit of an induction coil, across the secondary of which is connected a special form of neon lamp, the flashing frequency of which coincides exactly with that of the cord, and thus it is possible at any moment to follow the movements of a mechanism.

Radio Communication Co., Ltd.

This exhibit consisted of an automatic signal call device; a continuous-wave radio transmitter with an input rating of 1.5 kW, of the standard type for wave-lengths of from 500 to 3,000 m.; and a "Polar Four" broadcast receiving set, consisting of a detector and three resistance-capacity coupled l.f. stages, the outfit having been designed for operation by a simple method of remote control.

Other Exhibitors.

Other exhibitors in the trade section of the show included the Zenith Electric Co., Ltd. (resistances and rheostats). R. M. Catterson-Smith and K. S. Mills (electric resistance laboratory and other furnaces). Damard Lacquer Co., Ltd. ("Formite" and "Bakelite" synthetic resin products). Darimont Electric Batteries, Ltd. (two-fluid primary cells). W. Edwards & Co. (vacuum pumps, cathode-ray oscillograph, photo-electric cells, quartz mercury-vapour lamps, and other laboratory apparatus). A. Gallenkamp & Co., Ltd. (electric furnaces, electro-titration apparatus, &c.). Gambrell Bros., Ltd. (cable and other testing apparatus, fire-alarm call box, and wireless gear). John J. Griffin & Sons and Baird and Tatlock, Ltd. (calorimeters, CO_2 indicators, laboratory ovens, oil-testing and other measuring instruments, pyrometers). The India Rubber, Gutta Percha & Telegraph Works Co., Ltd. (telegraph apparatus and wireless accessories). Isenthal and Co., Ltd. (resistances and motor mercury starters, automatic voltage regulator, regulating transformer, &c.). Kelvin, Bottomley & Baird, Ltd. (quartz mercury-vapour lamps, and artificial daylight lamps). P. J. Kipp & Zonen (optical and electrical instruments). Laboratory Equipment Co. (electric lamps). Baird & Tatlock (London), Ltd. (electrometric titration apparatus). W. H. Pettifor (electrical aids for the deaf). W. G. Pye & Co. (electrical laboratory apparatus). Schall & Son, Ltd. (high-voltage transformer for X-ray research on crystals, which is also useful for cable testing). Venner Time Switches, Ltd. (street-lighting automatic switches).

Research and Experimental Section.

Group A of this section was representative of typical results of recent physical research of general interest, and examples of new or improved laboratory methods.

Amongst the 19 exhibitors, the British Photographic Research Association showed a phonometer for the measurement of the opacity of photographic negatives. The selenium cell used in the original instrument has been replaced by a special gasfilled photo-electric cell, constructed by Mr. T. C. Keeley, of the Clarendon Laboratory, Oxford. The current is magnified by means of a valve and recorded by a comparatively insensitive galvanometer which is extremely dead-beat and very quick in action. In order to obtain sensitivity, the whole of the light which passes through the negative is collected by the photo-electric cell, the negative being placed in contact with the cell window; this creates a practical difficulty, in that usually the comparison beam (which passes through the calibrated optical wedge) enters the cell through the same window. The difficulty is overcome by providing a second window, so that the two beams enter the cell at right angles to one another.

Amongst the Admiralty Research Laboratory's exhibits was a sub-standard for the determination of frequencies above the range of tuning forks. A metal rod, set into longitudinal vibration by a blow on one end, emits sound waves which influence a microphone placed near the other end; the alternating current whose frequency is to be measured flows through the microphone, and a note is heard in a telephone receiver connected in parallel with the microphone, having a frequency which is equal to the difference between the rod and current frequencies, which can be measured by means of a sonometer.

For the determination of the strength of wireless signals on wavelength greater than 6,000 metres, a meter was shown which is operated thus: a small e.m.f. is introduced periodically into the aerial circuit, and its magnitude and frequency are altered till the signal is matched.

The Air Defence Experimental Establishment (Major W. S. Tucker) had an instrument on view for training sound locator operators indoors, *i.e.*, where actual aeroplane flights are impracticable. It consists of an addition to the ordinary sound locator whereby a.c. is produced in telephones worn by the operators. When the trumpets are manipulated, the phase displacements between these currents are altered, and the operators experience binaural sensations, whereby they are enabled to point the locator at a dummy target running on a track.

Mr. J. L. Baird's model of the transmitting portion of his original "television" apparatus was lent by Messrs. Television, Ltd.

Prof. W. Cramp's magnetic balance for measuring field intensities is capable of reading below 50 lines per sq. cm., and is based on the principle of balancing by a weight the force which deflects a short conductor carrying a current and placed in a magnetic field.

The research laboratories of the General Electric Co., Ltd., demonstrated a circuit devised by Boucherot, which gives a constant-current supply from a fixed a.c. voltage supply: an inductance and capacity were connected in series across the mains and tuned to the supply frequency, the load being connected across either the inductance or the capacity. The network has the remarkable property that the current through the load is entirely independent of the load impedance; in contrast with a constant-voltage supply, the load terminals may be safely short-circuited, but may not be left open-circuited.

Other items included a sensitive electroscope, the moving system of which consists of an inverted loop of tungsten wire of such length in proportion to its other dimensions that it is nearly unstable, so that the restoring force is made very small: the use of tungsten wire allows the moving part to be made very light, so that air damping is effective, and sensitivity may be controlled by rotating the instrument. A machine which enables the voltage rating of electric lamps (gasfilled or vacuum) to be determined automatically and rapidly to a high degree of accuracy employs colour matching by means of two photo-electric cells, one being more sensitive to red light and the other to blue; vacuum lamps can be rated with a mean error of 0.13 per cent. in voltage at a rate of about 200 per hour. In a sector photometer designed for the rapid measurement of polar distribution of large lighting units or light sources, a Lummer-Brodhun contrast head is used, and the brightness of the comparison field is controlled by a stationary variable aperture sector and rotating prisms

as in the Weber photometer. The photometer and mirror gear can be so arranged that a single observer can make all necessary adjustments, and take all readings.

The structure of opal glass was illustrated, and apparatus for determining the absolute expansion coefficient of glass. Three specimens showing stages in the making of the flat annular hard-glass type of photo-electric cell were on view; also electric ovens of a type developed for use particularly in the pumping of large valves of light weight and very low heat capacity for their size.

Mr. A. F. Hallimond's contribution was a magnetic separator for research on powdered minerals, rocks, &c.

In the Henley Research Laboratories (Capt. P. Dunsheath) a covering power tester has been devised for the purpose of discriminating between one yarn and another from the point of view of the manner in which a given quantity of the yarn will cover a wire; the principle of the machine consists in winding the yarn to be tested on to a rotating mandril with a continuously varying pitch, the gear ratios of the machine fixing the pitch at the moment that the yarn just covers the mandril. A machine has been designed to compare the softness of any particular sample with the softness of perfectly annealed wire: by the release of a fixed spring load, a centre anvil deflects the wire through an amount given by the dial indicator, which is a direct measure of the softness.

One of the most important tests of an insulating oil is its electrical breakdown, and the apparatus used in the Henley Research Laboratories for this purpose was shown. One of the samples illustrating the breakdown of impregnated paper under electric stress indicated the combination of the tangential discharge on two opposite sides of a sheet connected by a puncture through the paper. The cheeselike formation found in certain insulating oils used for impregnating paper cables, when subjected to prolonged high electrical stress, appears to be a highly polymerised product of certain constituents of the oil, and is quite inert. Apparatus has been in use for some time for testing this property of impregnating oil, a sample of the substance being subjected to a high dielectric stress between two electrodes.

Dr. E. W. Marchant's apparatus for comparing the conductivities of metal plates and for determining flaws in metal surfaces was exhibited.

The Metropolitan-Vickers Electrical Co., Ltd. (Research Dept.) exhibits were illustrative of the "shortpath" principle of thermionic valve construction, which gives reduced ionisation and low impedance. A molybdenum-wound resistance furnace which can be operated up to 1,800 deg. C. was shown, in which a hydrogen atmosphere is used.

The National Physical Laboratory's many exhibits included a demonstration of the production of standard telephonic frequencies directly from the seconds given by the pendulum of a clock (Mr. D. W. Dye):—(*a*) A tuning-fork, adjusted to a frequency as nearly as possible 50 cycles per second, was provided with an electromagnet; impulses of current through the magnet, caused each second by a contact on the pendulum, maintained the fork in vigorous vibration at its frequency of exactly 50 cycles per second. (*b*) A two-valve "multivibrator" provided sudden impulses of current at intervals of 1/50th of a second, which were kept rigorously uniform in rate by the tuning-fork. (*c*) The impulses provided by the multivibrator maintained oscillations in a tuned resonant circuit, which could be adjusted to any frequency within limits: whenever the frequency had a value which was an integral number of times that of the impulses, large forced resonant oscillations of this exact frequency were built up and maintained.

The British Thomson-Houston Co., Ltd. (Engineering Laboratory) had a model which represented mechanically the electrical action in an oscillating valve circuit. The Company also showed how, by the use of a gasfilled photo-electric cell working at its ionisation point, rapid determinations of the percentage flicker of light emitted from lamps on a.c. circuits can be made. The lamp under test is fed at normal voltage, and the light intensity reaching the cell is adjusted (by diminishing the distance) until the cell suddenly ionises, and a large increase of current occurs; this point is very sharp and well defined. The lamp voltage is carefully observed at this point; d.c. is then substituted for a.c., and the voltage slowly raised until the ionisation point is again reached: from the relative voltage readings the variation in light may be calculated.

The effect caused by the liberation of a dose of tungsten vapour into an argon discharge tube was shown, using a type of discharge described by Dr. Langmuir. The tungsten vapour thus produced caused the discharge to pass through a characteristic series of changes.

Models.

Group B of the experimental section, which consisted of some eleven exhibits, was intended to illustrate some little-known and effective lecture experiments of interest to teachers of physics. Amongst the items on view were the following:—

Mr. G. G. Blake, a model designed to illustrate the action of a three-electrode valve, employed for instructional purposes by the Royal Air Force.

Mr. A. E. Bowyer-Lowe, a model for demonstrating beat notes in connection with super-heterodyne wireless receivers: it consisted of six organ pipes.

Prof. G. B. Bryan showed a valve-characteristic model designed by Prof. C. L. Fortescue for the purpose of showing the relationship between three independent variables of a thermionic valves, *viz.*, grid voltage, anode voltage, and anode current.

Prof. W. Cramp, apparatus for the measurement of capacity by analogy.

Mr. J. F. Gill's model illustrated the principle of synchronous and induction motors.

Dr. Edward Hughes, a model for demonstrating three-phase currents, the whole arrangement being mounted so that it can be placed in a projector instead of the usual slide carrier.

Mr. J. Paley Yorke's models for use of teachers assist in demonstrating some of the fundamental principles of magnetism and electro-magnetism, designed for projection by means of a demonstration lantern; also some working models demonstrating the principles of some instruments.

Mr. L. G. Vedy and Mr. G. Gowland demonstrated the rotation of bodies with dielectric surfaces in electrostatic fields: the bodies are usually charged during rotation, and the phenomenon appears to be due to the effect of the discharge on the non-conducting surface layer.

In Group C, famous historical experimental apparatus was shown.

Electrical Notes from Canada.

The Development of Power on the River St. Lawrence.

[By Our Special Toronto Correspondent.]

THE outstanding event of recent weeks has been the presentation of the report of the Joint Engineering Board appointed in 1925 by the Governments of Canada and the United States to report on the feasibility of developing the St. Lawrence River for both navigation and power. This report reveals that the engineers representing the two countries are fully agreed as to the desirability of making use of this great waterway for both purposes, but on the question of how the power development should be carried out they differ. Their attitude with regard to the latter is unfortunate for it will no doubt cause considerable delay.

The situation is a little peculiar in that the works necessary to provide a deep waterway for navigation will, unless they are to be ineffective for some years, have to be carried out on the whole stretch of the river from Lake Ontario to Montreal, a distance of 183 miles, which includes the international section of the river and a portion which lies entirely within Canada. The United States is, of course, vitally interested in the entire scheme, since it would provide both countries with an outlet to the sea for ocean-going ships. On the other hand, so far as power development is concerned, while the two countries must work together on the international section, the all-Canadian portion has nothing to do with the United States.

It is interesting to note from the report of the Joint Engineering Board that navigational works carried out in conjunction with power development will be less costly than if carried out alone, so that not only will the power development be a source of revenue, but it will actually be the means of reducing the capital cost of the navigational works. The report states that there will not be more than 25 miles of canal navigation and not more than nine locks and eight bridges, and that the waterway can be kept open for traffic during eight months each year—ice, of course, will close it for the other four months.

The Canadian engineers believe that it would be better to build two dams and develop power at two different sites, while the Americans favour a single dam and the utilisation of the entire available head at one site. The advantages of the Canadian plan appear to be that considerably less land would be flooded, that power could be made available in about three years' time, instead of six, after the date of actually commencing work, and that although the capital cost would be higher this would be offset, at least to some extent, by the fact that the interest charges during the construction period would be less. The disadvantages are that not only would the total capital cost be somewhat higher than for the American scheme, but the actual power made available would be slightly less.

Another difference in the views held on the two sides of the river, though this is not a matter dealt with in the above-mentioned report, is that, so far as the development of power on the international section is concerned, public ownership is favoured in Ontario and private ownership in the United States. This fact may possibly introduce some difficulties in the two countries arriving at satisfactory agreements for the carrying out of the work which would not exist if both sides favoured the same plan of ownership.

Further progress towards the realisation of this great project has just been made by the issuing of a report by the St. Lawrence Commission, some details of which have appeared in the daily Press. This body, with Mr. H. Hoover as chairman, was appointed by the Federal Government of the United States to consider the several proposals which have been made to provide outlets to the sea, and to report which it considered to be the best. The Commission's report favours the St. Lawrence route.

The other proposals referred to had many supporters in New York State. One of these, known as the "All-American" route, involved the construction of a great system of canals linking the lower end of Lake Erie with the Hudson River. The other scheme would have run from the eastern end of Lake Ontario to the Hudson River. It is said that each of these would have been much more costly in construction, and also in maintenance, than the St. Lawrence scheme.

Before leaving this subject, some figures given out by a prominent American engineer and quoted in the Canadian *Electrical News* may be of interest. In the distance (120 miles) between Lake Ontario and Montreal, the St. Lawrence River falls 220 ft., carrying all the discharge water from the Great Lakes system, which comprises 200,000 sq. miles of catchment basin, of which 90,000 sq. miles is lake area. The present shipping, representing about 6,000,000 tons of freight, can be increased to about 100,000,000 tons per annum—this will greatly lessen the cost of shipping grain from the immense wheat-growing areas of the west. The St. Lawrence will produce about 5,400,000 h.p., 1,200,000 h.p. of which will belong to the United States and the rest to Canada.

From the foregoing, it is easy to realise why Canadians, and particularly those in Eastern Canada, take such an interest in the question of the St. Lawrence River development.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A 'Bus Lighting Lamp.

A recent development of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2, is the production of the internally frosted "Pearl Osram" lamp for the interior lighting of 'buses. The outer surface of the lamp is quite smooth so that it can readily be cleaned with a duster. Compared with the clear lamp the new model has many advantages claimed for it, one of the chief being that its enclosure in globes or well-glasses is unnecessary. In this respect it is interesting to learn that the G.E.C. recently carried out certain tests to ascertain the amount of light lost by and through the use of various forms of well-glasses. It was established that a thin, clear well-glass absorbed as much as 8 per cent.

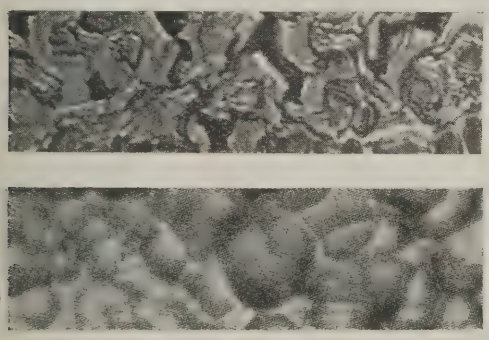

Fig. 1.—Bulb Surface, before and after Final Treatment.

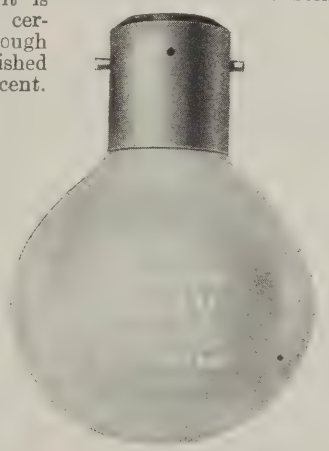

Fig. 2.—"Pearl" Osram 'Bus Lamp.

of the light emitted from the lamp, and that an elaborate pattern of opal well-glass was responsible for a loss of light of approximately 40 per cent. These tests resulted in a decision by a 'bus company to use the internally frosted lamp, which, it is claimed, absorbs scarcely 2 per cent. of the light emitted from the filament, with efficient diffusion. The first process employed for internally frosting lamps made the bulb so fragile that it was unfit for practical lighting purposes. The method weakened the wall in the same way as a metal bar is weakened by notching it with a file. The acid used for internal frosting, by its chemical action, actually cuts innumerable notches in the glass. It is a well-known fact that a notched metal bar increases in mechanical strength when the notches are filed down until they disappear. A somewhat similar principle is employed for the lamp frosting, the sharp grooves cut by the acid being rounded off by a further acid treatment. Fig. 1 shows photo-micrographs of the internal surface of a bulb before and after the second acid treatment, the latter or lower illustration being highly magnified. Fig. 2 shows the "Pearl" 'bus lamp.

An Electric Iron Safety Stand.

With a view to the prevention of fires or other accidents due to the overheating of an electric iron, Messrs. BRUCE, DAWSON & Co., 70, Finsbury Pavement, London, E.C.2, have recently placed on the market their "Itur" safety stand, fig. 3. This is in the form of a convenient iron rest of a similar shape to that of the iron itself, and carries an internally arranged switch which is operated automatically to the "off" position by the depression of the top plate, under the influence of the weight of the iron. The supply to the iron is taken through the stand switch, suitable inlet and outlet connections being provided. If it is desired that the current should remain on, the iron is placed crosswise on the stand so as not to depress the top plate. The standard article is suitable for all makes of electric iron and for any of the voltages in use. Practice has shown, it is claimed, that the use of the device has resulted in a considerable saving in energy.

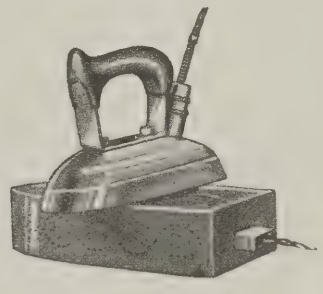

Fig. 3.—Electric-Iron Safety Stand.

An Electric Bedwarmer.

The "Thermal" electric bedwarmer, fig. 4, is a recent production of the LONDON AND RUGBY ENGINEERING CO., LTD., 36-7, Queen Street, London, E.C.4. It is made for voltages of 100/110 and 200/250, and consumes 300 W. It is not intended for connection to the supply during use, being capable, it is

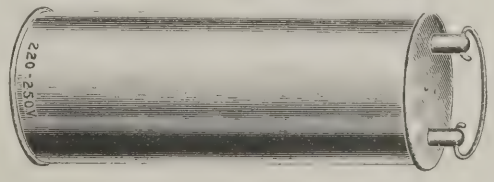

Fig. 4. An Electric Bedwarmer.

claimed, of retaining its heat for from 6 to 8 hours after being "on circuit" for only 10 minutes. It is suitable for use in other connections where local warmth is required. It is 9 in. long by 3½ in. wide, and has a nickel-plated finish.

A New Electric Geyser.

The accompanying illustration, fig. 5, shows a recent addition to the "Gee-Gee" products of Messrs. George Green and Co., 40, Aybrook Street, London, W.1, the instantaneous geyser. It is constructed of cast aluminium, and is complete with a swivel spout and lugs for wall fixing. The heating equipment is enclosed in tinned-copper sheaths and is entirely electrically insulated from the water. To comply with the I.E.E. regulations, the switch is arranged as a separate unit, and has been so combined with the cold water inlet valve that it can only be "on" when the water is running. The construction and finish of the apparatus gives it an attractive appearance.

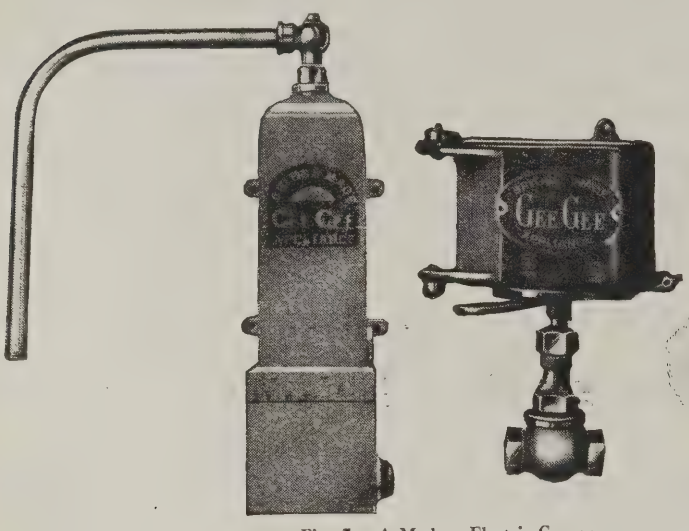

Fig. 5.—A Modern Electric Geyser.

"Morganite" Heaters.

Since the general description of the "Morganite" resistor and its applications in our issue of June 13th, 1924, p. 958, the Morgan Crucible Co., Ltd., Battersea Works, Church Road, London, S.W.11, has developed several models of wall and floor radiators. Fig. 6 shows a "Morganite" imitation luminous heater which has been designed to produce the psychological effect of a glowing fire, while preserving the essential feature of low-temperature radiation. The result is achieved by concealing lamps within a sheet-metal scroll which reflects the light on to the glazed or coloured surface of the heating element. The wall-fixture radiator shown in fig. 7 is particularly suitable for public halls, dining rooms, and so on, the mounting being ornamental and self-contained, while a guard in front of the element can be supplied in various designs to suit different styles of decoration.

Fig. 6.—Imitation Luminous Heater.

Fig. 7.—A Wall Radiator.

Industrial Electric Heating.

The Fourth E.D.A. Salesmanship Conference.

Mr. R. W. L. PHILLIPS (electrical engineer to the Bedford Corporation and president of the I.M.E.A.) was in the chair at the conference of the Electrical Development Association, on Friday, January 21st, when Mr. S. E. Monkhouse, of the Newcastle-upon-Tyne Electric Supply Co., Ltd., read a paper on the above subject.

Mr. Monkhouse said that as a first step in the direction of developing this class of load, the Newcastle Company had detailed an engineer some months ago to deal exclusively with industrial electric heating, and, as a result of his efforts, Mr. Monkhouse was convinced that considerable propaganda was necessary if the business were to be stimulated with the minimum of delay. He disagreed with the view that industrial heating business would be developed only if electricity were sold at a price which was competitive on a heat basis with that for other classes of fuel. To develop the business with profit supply engineers would require to discriminate between a competitive price on a heat basis and an economic price, between which there was a great difference; there was always a market for the superior commodity. Many cases had come to his notice during the last few months where processes could be dealt with more efficiently and completed more economically by employing electricity than by employing other media, after paying a price remunerative to the supply authority. The author said that one important feature of a furnace heated electrically was its high efficiency when working at high temperatures. At temperatures round about 2,400 deg. F., gas, coal and oil had efficiencies of from 10 to 20 per cent.; in the case of electricity it was 75 per cent. Other advantages of electric heating were close temperature control; the ability to apply heat just where it was wanted, avoid cold spots, and arrange the rate of heating to suit the process; the absence of fumes and soot; automatic stopping and starting; elimination of coal- and ash-handling and banking losses; uniform rate of heating; and reduced maintenance costs, owing to the absence of corroding fumes and the scouring action of gases. There were numerous installations of electrical heating processes in operation in this country, and it was a matter for regret that the existence of those installations was not made more generally known to the manufacturers. To illustrate the variety of purposes for which electricity had been applied in this country, the author mentioned steel annealing, linseed-oil burning, bitumen heating, paint drying, vacuum drying ovens, and many other uses. He also gave a list of typical installations in operation in the United States, giving a comparison of the cost when using electricity as compared with the fuel used previously, as well as the reasons why electric heating was adopted. This produced many points in favour of electricity.

One direction in which he considered a development might be expected was in the application of electricity for the heat treatment of colliery drills and coal-cutting picks used in mechanical coal cutters; it seemed probable that in the future it would become common practice for each colliery where coal cutters were employed to have a furnace in which to treat the cutting tools periodically. Many mines in South Africa were already so equipped. Another application of electrical industrial heating might be cultivated in works where a small quantity of steam was required intermittently in different parts of the factory. In such cases, if independent electrically heated steam-raising boilers were installed, a saving in cost would result, first because the cost of providing and maintaining long lengths of steam pipes could be avoided, and, secondly, for the reason that steam could be raised quickly as and when required, and need not be maintained constantly. There were a few installations in operation in this country in which the circulating water for heating large buildings was heated electrically during off-peak hours, a system of thermal storage being provided for maintaining the water at the required temperature during the day. The Newcastle Electric Supply Co. has this system in operation in one of its buildings, and it was being installed in another now in the course of erec-

tion. In both cases an electrode system of heating was employed, and the high pressure supply was used without resort to transformers. The demand made by these installations was 800 kW and 1,800 kW, respectively.

A recent important development was an apparatus which made use of high-frequency currents for the production of intense local heat. Many furnaces of this type were already in operation in this country, and very high temperatures were being obtained with considerable accuracy. The frequency usually adopted was 25,000 cycles per second, but in one case a frequency of 50,000 cycles per second was being used for heating a material having a comparatively high resistance.

With regard to the conversion of existing heating appliances, he said that so far as technical considerations were concerned he was in sympathy with the view held by competent engineers that this was not a practice to be recommended. From a commercial point of view, however, he felt that there was a good deal to be said against it. It was a question for serious consideration within the industry as to whether every effort should not be made to meet the users' dictates in this connection. Conversions might be troublesome to effect, and might lead to indifferent efficiency, but if they provided a means for encouraging the adoption of electricity for heating purposes, surely they were justifiable. He had heard of cases where considerable ingenuity had been shown by the engineering staff of various works in converting steam and other heating apparatus to electricity; it was doubtful whether all or any of these would have been working electrically to-day if it had been necessary to discard the whole of the existing equipment. As an example he mentioned a case in which, in order to overcome the cost involved in maintaining steam at night for the purpose of heating a large vacuum drying oven, the steam pipes were insulated from the oven and a current passed through them from the secondary of a special low-voltage transformer, so that the oven was heated during the day by steam and at night electrically, and considerable saving had been effected.

In conclusion, Mr. Monkhouse said that the industry would benefit greatly by an active publicity campaign on behalf of industrial heating.

Discussion.

Opening the discussion, Mr. T. SETTLE (General Electric Co., Ltd.) said that while, so far as he knew, the Newcastle Electric Supply Co. was the first and only supply authority in this country to appoint a qualified engineer to deal with electric heating problems, in the United States a very active policy had been adopted. Lectures were given, to which everybody interested in industrial heating was invited. As electric heating, when using apparatus of the resistance furnace type, had an inherent high power factor, and often a high load factor, it might appeal to the Electricity Commissioners to appoint a committee to deal with industrial heating. His own company had decided to go in wholeheartedly for developing industrial heating, and proposed to install electric ovens in some of its own works in order to convince intending users that satisfactory results could be obtained under practical conditions. In the United States he had seen works in which electric furnaces were used for enamelling watch dials in large quantities, for the coating of pipes with asphalt, for softening bakelite for moulding purposes, electric sherardising ovens, ovens for coating wires with enamel, and plant for electrically sterilising milk cans, &c. The water heating problem was entirely in the hands of the supply authorities; everything depended upon the rate charged for energy. If the future lay entirely with "off-peak" load, that would lead us automatically towards thermal storage. The conversion of existing apparatus would not, in the majority of cases, justify the trouble and expense involved.

Mr. F. W. LEEVERS (British Thomson-Houston Co., Ltd.) drew attention to a few of the difficulties in the way of industrial heating. There was first the question of capital cost, and if there was difficulty in getting firms to go in for complete new plant, then the conversion of existing apparatus should be advocated. Then there was the cost of operation, which called for the collaboration of the supply authorities, and in this connection the better quality of product in industrial processes when electricity was used should be stressed to the manufacturer. Finally, there was the psychology of the user, which meant that some sort of guarantee as to results must be given by the manufacturers.

Mr. H. MARRYAT (Messrs. Marryat & Place) said that the better quality of the product with electric heating in some industrial processes was so great that competition hardly entered into the question. There were other applications, however, in which other fuels could do the work practically as well, and there was a large field in this direction. There the cost of energy was important. A case in point came before his notice recently when a proposal was made to a supply authority for a 20-hour load with four hours off for what was conceived to be the peak. Unfortunately the rate quoted was such that the transaction fell through. No mention had been made of spot welding, but there was a large amount of work to be done in displacing the riveting and seaming in shipbuilding.

Mr. H. T. SULLY (Marylebone) referred particularly to water heating, and said that in Switzerland there were installations using up to 10 million kWh per annum for this purpose, the rate being extremely low. As another special application of electric heating he mentioned the new reptile house at the Zoo, where the consumption would ultimately be two million kWh.

Mr. H. J. ADAMS (Metro-Vick Supplies, Ltd.) spoke of the large extent to which electricity was used for steam raising in Canada, Newfoundland, and the United States, especially in paper mills.

Mr. R. D. GIVEN said he had gone into the question of steam raising by electricity, but had found that unless the rate was exceedingly small it would not pay. The policy in Canada was for the hydro-electric plants to sell their excess energy at exceedingly low rates on the understanding that the amount would be reduced at short notice if an ordinary customer came along.

Mr. LESSERS (City of London Electric Lighting Co., Ltd.) said that architects designed buildings so that 80 per cent. of the heating was by central heating from fires, leaving only 20 per cent. for electric heating. That did not give a good load factor. His company had special rates for water heating.

Mr. J. W. BEAUCHAMP (E.D.A.) said there were many installations of industrial heating of which no information was published, and he asked manufacturers and others not to keep this to themselves, but to let the technical Press or E.D.A. have it for propaganda purposes. A recent inquiry had been for the use of electricity for drying hops.

Mr. A. R. BROWNE (Woolwich Electricity Department) mentioned one or two hot water electrical installations which had shown considerable economies over other methods.

The CHAIRMAN, referring to Mr. Marryat's remarks, said the supply undertaking had several difficulties in fixing a suitable tariff, and one of them was to avoid preferential treatment. Another was that in dealing with so-called "off-peak" loads care must be taken that another peak was not being created. It might be found that the natural peak and the artificial peak would overlap.

Mr. MONKHOUSE, winding up the meeting, again pleaded for greater publicity and propaganda in connection with industrial electric heating.

Domestic Refrigeration.

An E.D.A. Conference at Newcastle.

AT a conference held under the auspices of the British Electrical Development Association at Newcastle, on January 12th, Mr. N. E. Barber read a paper on "Domestic and Small Capacity Refrigeration." Mr. H. J. Miles (president of the Electrical Contractors' Association) was in the chair.

Mr. Barber said that the main use of refrigeration was the preservation of food; it was the best preservative method because it permitted the retention of the food's natural flavour and its nutritive qualities. An effective refrigerator must possess adequate heat-insulating material; must be arranged so that the air was continually moving; and should be constructed with a view to easy cleaning. Compressed granulated cork had been found to be an efficient and convenient insulating medium. A very difficult problem was the proper fitting of the door; that had been largely overcome by the use of substantial teak frames and labyrinth seals. To facilitate the movement of air the shelves should be of an open mesh type and not solid; they should also be removable. Another feature which a refrigerator should possess was lightness and a size which would allow it to be taken through doorways easily. The author proceeded to deal with the three means of refrigeration, *viz.*, ice-thawing, mechanical and chemical. Generally speaking, the first method was not satisfactory. Mechanical refrigerators utilised condensable gases possessing a high latent heat combined with a high ratio of latent heat to specific heat, a low boiling point, a low-pressure condensing temperature, and a low ratio of

compression, while being non-corrosive, non-inflammable, and non-injurious to health. The three agents most favoured for small-capacity machines were sulphur dioxide, ethyl chloride, and methyl chloride. Refrigerating machines all operated on a common cycle, *viz.*, compression and condensation of the refrigerant and the expansion of the liquid into gas. Generally, the compressors were run at low speeds. There were several machines of the intermeshed gear type running at electric motor speeds and at least one of turbine form. It added to the efficiency to have the machines hermetically enclosed; such machines were of stationary and revolving types. The stationary forms were usually operated by a squirrel-cage motor, the rotor being within the hermetically-sealed enclosure, but in other forms the complete motor was within the sealed envelope, the necessary leads being conducted through the enclosure by a type of sparking plug. The most prominent machines on the market were of American manufacture, but European makers had produced small machines showing marked advance in design. British refrigerators were usually on orthodox lines, but two makes were hermetically enclosed. The principal difficulty in compressor design appeared to be the gland through which the operating shaft projected; some form of disk packing backed by a spring system to compensate for wear appeared to have met with success. Those glands had to be gastight under considerable pressures, and remarkable efficiency had been attained in many small machines. The electric motor had been found to be the most suitable and convenient driver, but i.c. engines had proved satisfactory. Mr. Barber proceeded to explain the working of a mechanical refrigerator and the cycle of compression, condensation and expansion. He then dealt with the control of the machine, making special reference to direct and indirect thermostatic and non-automatic control. "Service" in connection with refrigerators was an important matter. The author quoted from a report of the National Electric Light Association, which showed that for 262 machines studied 411 service calls were made in a year; of those 119 were in respect of control, 44 related to expansion valves, and 15 to compressors; 60 were "false alarms" and the rest related to routine matters. The study indicated room for improvement in design, but "service" still had to be regarded as a factor in the sale of the appliances. Non-automatic control eliminated the cause of trouble and operation could become a matter of routine. The author said that greater economy of energy was obtained with non-automatic control. He then proceeded to explain the chemical method of heat extraction, and said that recent inventions had greatly improved the system. With regard to the application of refrigeration, he said that some thousands of ice-cooled refrigerators had been supplied to retail shopkeepers in this country, but very few had been converted to mechanical operation. The new Pure Food Regulations should do much to stimulate the sale of refrigerators. In conclusion, he said that there were British-made refrigerators which would fulfil all the requirements.

A discussion followed, and Mr. Barber, in reply to questions raised, said that to protect meat against bacterial action the temperature should be below 50 deg. There were advantages in the employment of a brine tank which acted as an "accumulator of cold." He did not think that glass insulation was satisfactory, even from a display point of view. There was a lack of standardisation, and there were many ways of converting ice-cooled refrigerators to mechanical operation. Any attempt to reduce prices by using inferior and inadequate materials would be unsafe. He thought that manufacturers should get together and share the credit to enable people to purchase refrigerators. The absorption type of machine was certainly preferable to the motor-operated pattern, but at present the scale of operation was restricted. It was generally accepted that we were only at the beginning of things in refrigeration. Mr. Barber thought, however, that a demand had been created, and that anyone who spent time and money in research stood a reasonable chance of being compensated for it.

The Telephone Service.

Statistics which Reveal Progress and Development in the London Area during 1926.

A STATEMENT of the progress made in the London telephone area during 1926, prepared primarily for the London Telephone Advisory Committee, and signed by Mr. W. A. Valentine, Controller of the London Telephone Service, and Mr. R. McIlroy, superintending engineer, London Telephone District, indicates that the boundaries of the area remained unaltered during the year; it covered 750 square miles and extended from Reigate to Waltham Cross and from Tilbury to Hayes (Middlesex).

With the opening of seven new exchanges and the closing of Bank and Latchmere, the number of exchanges reached 112 (including the trunk and toll exchanges), as compared with 107 in the previous year. The number of exchange lines connected at the end of 1926 was 298,766, the net increase for the year being 28,965, or about 10.7 per cent. The demand for private wires connecting subscribers' offices (not connected to the public exchange system) continued, the total number being 15,400. The total number of telephones (exchange and private) was 519,969, the net increase being 43,156, or about 9.0 per cent.; the 500,000th London telephone was installed on July 16th, 1926, in the Press Gallery of the House of Commons.

During the year there was an increase in the number of private branch exchanges, which totalled 22,970, as compared with 21,000, of which number 97 are automatic; orders were placed for 18 new automatic installations and schemes formulated in 10 other cases. Approximately 30,000 removals were effected during 1926. The number of call offices working was 4,686, the increase being 283. There were 418 kiosks in public thoroughfares and on private sites in the London area at the end of the year, and local, toll and trunk calls may now be made and telegrams dictated from them. The new prepayment coin boxes being fitted in call offices accept different classes of coins; 2,000 of the new instruments will be in service within the next 12 months.

Development in the business areas of London has not been so great as was anticipated, but there was a marked increase in the rate of development in the suburban areas; the extraordinary building development in the outer London areas made it specially difficult to determine the anticipated growth in those areas and to provide spare plant economically in advance of the requirements. Seven new exchanges were opened, providing an increased capacity of 11,000 lines; three new ones were also provided to replace exchanges already existing, and, together with extensions to 47 existing exchanges, provided additional accommodation to the extent of 33,000 lines. Plans were approved for five new manual exchanges to replace existing equipment, and consideration was being given to schemes for a further increase in capacity of 91,000 lines. Eleven new exchange buildings were in process of construction, and sites for 29 additional ones had been obtained.

The preliminary work incidental to the conversion of the London area to automatic working was well advanced, and specifications for exchanges to accommodate more than 100,000 automatic lines had been issued; the installation of automatic equipment was in progress at the Holborn, Western, Sloane, and Bishopsgate exchanges, and some of them should be available for service during 1927. The equipment at the "Tandem" exchange (the new junction exchange) was rapidly approaching completion, and a further essential preliminary was the changing of the numbers of subscribers connected to exchanges in the automatic area to four figures The anticipated rate of growth during the next five years would necessitate the construction of 60 automatic exchanges within 10 miles from Oxford Circus and 25 manual exchanges outside that radius, but within the London telephone area, to replace worn-out plant as well as provide for growth.

Much progress was made during the year with schemes for improving the standard of speech, which involved the provision of a large number of cables with conductors of larger gauge than that previously employed; "loading" was also extensively utilised to improve speech transmission. The total mileage of single wire provided for subscribers' lines and local junctions was 2,030,000, an increase of 225,000 miles, the greater proportion in underground cables which contain from 20 to 2,000 copper wires, are lead sheathed, and are drawn into 7,402 miles of earthenware ducts or iron pipes, an increase of 1,000 miles. The total length of pole lines in London was 5,533 miles and the length of single wire carried on them 59,250 miles; while the total length of wire increased by 225,000 miles during the year there was an actual decrease in the length of overhead wire. In addition to existing repeater stations at Fenny Stratford and Derby, others were completed at Leeds, Catterick, Newcastle, Jedburgh, Edinburgh, Gloucester, Newport, and Birmingham, and work was in progress on stations at Taunton and Tavistock. During the year communication with Germany was provided by means of repeater circuits, nearly all underground, with the exception of the submarine cable between England and Holland. Repeater stations were under construction at Marks Tey and

Halesworth in connection with the London-North Walsham route, and the Aldeburgh underground and submarine route to Holland and Germany, as well as at Canterbury in connection with the London-Canterbury cable, which will connect with submarine cables to Belgium and France. In certain cases additional trunk circuits were provided by means of the high-frequency carrier-current system, sometimes referred to as "wired wireless," thus avoiding the cost of the erection of additional wires.

The number of calls originated during 1926 was 499,473,766, an increase of about 4.9 per cent., which was not quite commensurate with the growth of subscribers, and it appeared that the average number of calls made per subscriber was decreasing. The acquisition of the telephone habit requires time for its development and the new subscriber does not, at the outset, make use of the telephone facilities at his disposal with that freedom which characterises the more experienced user. In a rapidly developing system the accession of blocks of new subscribers with low calling rates tends appreciably to depress the average calling rate over the whole system; trade depression also had an adverse effect on the calling rate. The number of calls outgoing daily from London at the Trunk exchange was 14,700, and at the Toll exchange 15,200, representing increases of 10 and 16 per cent., respectively. Traffic over the Anglo-Continental routes continued its upward tendency, and the outgoing effected calls for 1926 showed an increase of 20.2 per cent. At the end of 1926 there were 53 international circuits, of which 21 terminated in France, 8 in Belgium, 12 in Holland, and 12 in Germany. During the early part of 1926 a preliminary night service to Germany was opened with three circuits—Berlin, Hamburg, and Cologne; later, continuous service was available to Berlin and Hamburg, and to other towns reached through them. Four circuits were available to Berlin, four to Hamburg, and one each to Cologne, Frankfurt, Dusseldorf, and Bremen; Anglo-German traffic was increasing rapidly, and additional circuits to France and Belgium were nearing completion. A new French cable containing 42 pairs of wires, with the appropriate land lines, will improve the existing Anglo-French service and provide direct Swiss and Italian services. A new submarine cable laid between England and Belgium provided 21 additional circuits, and there is a possibility of obtaining circuits later to Vienna and Prague *via* this cable. Proposals are also in hand for the provision of a circuit to Stockholm. A transatlantic (London-New York) radio-telephone service was inaugurated on January 7th, 1927.

To the Phonogram exchange at the Central Telegraph Office, equipped for the reception and transmission of telegraph messages direct from and to telephone subscribers, 100 lines from local telephone exchanges were added, making a total of 480 lines; sixty-eight telephone exchanges have direct circuits to the Phonogram exchange, at which 234 operating positions are staffed during busy periods. The number of phonograms dealt with during 1926 was 1,616,784, the increase being about 13.5 per cent.

The operating staff in the exchanges within the London telephone area numbered about 9,400 telephonists and supervisors; over 1,200 new entrants passed through the Telephone Operating School during the year, and 61 telephonists employed by subscribers for the operation of their private branch exchanges were trained. Over 7,000 engineering workmen were employed in the London area.

The average time of answer to the subscribers' calling signals for the year was 5.7 seconds, and the average time from the commencement of a call until the called subscriber answered was 38.6 seconds. The difficult conditions during the period of the general strike affected the figures to some extent; also the strike resulted in increased traffic at some of the exchanges by nearly 50 per cent., the Trunk and Toll exchanges being very heavily pressed. The percentage of calls completed on first application was 82.4, which figure has remained almost unaltered for five years. The proportion of telephones to population was 1 to 14.96.

Sulphur Mines Electrification.

Sulphur is one of the few minerals that Italy possesses and exports in large quantities. Her mines in Sicily afford employment for some 18,000 persons; they are therefore of great economic importance to the island, but hitherto they have laboured under the disadvantage of antiquated equipment and working organisation. It has long been felt that the electrification of the mines is essential for their economic recovery, and now at last comes the news that a decisive step has been taken in this direction. The Corporation for the Technical and Economic Development of the Sulphur Industry has signed a contract with the General Electric Company, of Sicily, for the electrification of all the services connected with the Sicilian sulphur mines. The power will be produced by a steam-operated station at Catania, which will transmit it to all the sulphur mining districts over a main line at 40,000 volts running between Catania, Caltanisetta, and Campo-Franco, with a subsidiary line at 10,000 volts for the Caltanisetta-Sommatino district. The cost of the installation is estimated at from 34 to 35 million lire, of which the Corporation is to contribute eight millions. The total length of the lines to be installed is over 300 miles.

Electric Floodlighting.

Review of Illuminating Society Paper and Discussion.

A PAPER on the above subject was read recently by Messrs. W. J. Jones, H. Lingard and T. Catten, at the meeting of the Illuminating Engineering Society, held at the Lighting Service Bureau. Mr. C. W. Sully presided.

The paper was illustrated with numerous lantern slides and examples of apparatus, and contained an excellent review of the subject. In the introduction, reference was made to the many applications of floodlighting, for illuminating posters, lighting up monuments, and revealing the outsides of buildings. Attention was drawn to the great importance of the surfaces of buildings illuminated. White glazed brick, when clean, reflected 85 per cent. of light, very dirty stone and concrete only 5 per cent., and in this extreme case the absorption of light was practically prohibitive. The smoke-begrimed surfaces of buildings in many industrial cities presented one of the greatest obstacles to flood-lighting. With white glazed brick from 2 to 5 foot-candles illumination, according to the surroundings, might suffice; with fairly clean granite, reflecting 10-15 per cent. of light, from 13 to 33 foot-candles was specified. For ordinary posters in poorly lighted districts 5 foot-candles might be allowed, but in very brightly lighted areas 15 or even 25 foot-candles might be necessary to cause the surface to "show up" satisfactorily.

The next section of the paper dealt with the optical principles underlying floodlighting equipment. The formation of the beam by a parabolic mirror was explained and it was pointed out that at moderate distances the inverse square law applied. An interesting feature of the paper was the description of sectional mirror floodlights, the author pointing out that in this case the maximum beam candlepower depended primarily on the candlepower of the source, whereas with a polished parabolic mirror the intrinsic brightness of the filament was the determining factor. Some very interesting curves showing the distribution of candlepower in the beam were presented; they showed that with a bare lamp there were usually marked "kinks," a fact that was evident from inspection of the various floodlights on view. The curves might, however, be smoothed out by using frosted lamps, or light-diffusing cover-glasses, though they naturally diminished the maximum beam candlepower and tended to greater dispersion angles. Asymetric light-distribution, which was occasionally desirable, might also be obtained by applying specially designed "spreading glasses." Effects were also illustrated by "isolux" diagrams.

A very useful table contained particulars of the utilisation efficiencies of various types of floodlighting units. The maximum utilisation efficiency recorded was 55 per cent. with a deep parabolic plain mirror, the same value being reached with a ribbed-mirror square-pattern flood lantern; at the other extreme the efficiency of the diffusing glass front and plain mirror was only 35 per cent. Mr. Jones described the use of anti-glare shields and methods of confining the beam to the object to be lighted, and referred to the influence of "spill" light (which passed by the edge of the building, or area to be lighted, and was thus wasted). This loss was not taken into account in the coefficient of utilisation, and naturally depended on the local conditions.

In the concluding part of the paper a number of floodlighting installations were described and illustrated, and the special problems met with in each case discussed.

The paper led to an animated discussion, which was opened by Lt.-Commander Haydn T. Harrison. Mr. J. W. T. Walsh, who followed, pointed out that in several respects floodlighting units differed from searchlights and suggested 40 ft. as the minimum distance at which the inverse square law could be utilised. The suggestion was made that the use of a special front-mirror, directing back part of the light received, might have advantages in eliminating undesirable effects of direct rays from the source. Various technical points were discussed by Mr. Milner, Mr. Ritchie, and others.

Mr. L. G. Applebee demonstrated a number of projectors which had been used for stage lighting, &c., illustrating his remarks with views of the scenes in the searchlight tattoo at Wembley, &c. Others who took part in the discussion included Mr. Morton, Mr. Long, Mr. Cunnington, Capt. W. Liberty, and Mr. J. S. Dow. The chairman (Mr. Sully) joined with others in complimenting the authors on their paper, and Mr. Jones briefly replied to a number of the points raised.

Electricity on the Poultry Farm.

Poultry farmers in the Preesall district, near Blackpool, have adopted the system of utilising electric light for increasing the production of eggs. A large poultry farmer states that the fertility of the eggs used for hatching has increased 20 per cent. In October he installed electric light, and was rewarded by an increase of 60 eggs per day at a time when eggs were 3s. 2d. per dozen; he thus made an extra 15s. daily, and in a short time paid off his initial outlay of £15, and £2 cost of electricity. The light gives the hens a 16-hour day in the depths of winter, and so long as there is light they will take exercise, feed, and lay.

Reviews.

Principles of Electric Power Transmission and Distribution.
By L. F. Woodruff. Pp. 340; 112 illustrations. London: Chapman & Hall, Ltd. Price 20s. net.

According to the preface this volume is intended primarily as a text book for senior and graduate students in electrical engineering in the American Universities and Institutes of Technology. As is so often the case with volumes of this kind, the text has been elaborated from notes used in technological courses on the subject, and quite naturally the requirements of the particular Institute with which the author is connected are reflected in the treatment of the work.

Chapter I gives a very brief survey of the general problem of electric power transmission and distribution, with special reference to the progress made in the United States. On page 8 the author is not very consistent, for he says: "the efficiency of a transmission system is not of much importance in itself," &c., while a little lower down on the same page he says: "the power losses in lines and machinery are but one item, albeit an important one, of the total annual cost." The power losses and, therefore, the efficiency of a system are distinctly important, but what the author does not make clear is that reliability should not be sacrificed in efforts to obtain what often are unduly high efficiencies.

Chapter II is merely a three-page note purporting to give an idea of the electron theory and of the general electromagnetic circuit; it is, however, so scanty as hardly to have been worth including.

The really serious part of the volume commences with Chapter III, which studies the characteristics of the electromagnetic circuit and of its natural property, inductance. This chapter presupposes an elementary knowledge of the calculus and of the symbolic method of vector notation.

Chapter IV is companion to the preceding one and deals with the dielectric circuit and its natural property, capacitance. The treatment also is similar to that of the preceding chapter.

In Chapter V the author considers the efficiency and voltage regulation of short and medium-length transmission lines, dealing first with very short single- and three-phase lines, neglecting the effect of capacitance. He then studies what would be the general effect of allowing for capacitance, and shows the two well-known methods of treatment, namely, the nominal T and the nominal π circuits.

Chapter VI is another very short chapter which could with advantage have been eliminated; it deals with the mechanical principles of overhead transmission lines. The only part in this chapter of any real interest is a short analysis of the sag and stress in an overhead line. When we consider the tremendous amount of matter that has been published dealing with the mechanics of overhead lines, it will be realised how futile it is to include just a few pages on the subject in a book of this description; moreover, it is disappointing to the student and does not tend to enhance an author's reputation.

Chapter VII deals with the all-important subject of skin effect in conductors carrying alternating currents; the author mentions first the cause of skin effect and then passes on to an elaborate study of alternating-current distribution in an isolated round wire. He then gives expressions for the skin-effect resistance ratio for round wires and also a table of skin-effect resistance and inductance ratios for solid round wires.

Chapter VIII, which is concerned with the subject of corona, opens with a general description of what the term is intended to convey and an explanation of it in terms of the electron theory.

Having in mind the increasing tendency to raise already high transmission-line pressures and the importance that insulation must of necessity play in the transmission of electrical energy, it is particularly disappointing to find this subject dismissed in Chapter IX with a mere 12 pages. In these the author indicates very briefly the latest theories of insulation breakdown, the variation of breakdown voltage with insulation thickness, the potential gradient in single-core cables, with homogeneous and multiple dielectrics, and finally the distribution of voltage stress on suspension line insulators. The whole treatment in this chapter in inadequate.

Chapter X is a study of hyperbolic solutions of long-line, steady-state problems concerning which the general considerations are first enumerated.

Chapter XI is mostly a reprint of a paper contributed by the author to the *Electrical World*, and is a very cursory survey of the subject of power-factor correction and voltage control of long lines. The comments put forward are very brief, and we cannot imagine them adding appreciably to any student's technical equipment.

Chapter XII is an anlysis of the steady-state performance of long transmission circuits and accessory apparatus. It opens with a short analysis of equivalent star (called by the author "wye") and delta connections, in which the very reprehensible practice has been adopted of writing "same numerator" and "same denominator" in an expression where the numerator or denominator is the same as in an immediately preceding expression; we think there is no excuse for such slovenly composition.

The interesting subject of inductive interference with telephone and telegraph circuits is covered by Chapter XIII.

Chapter XIV deals with the solution of the current and voltage values in a.c. networks under normal operating conditions and under fault conditions of short circuit.

In Chapter XV commences the most interesting part of the book. This deals with transients in circuits with lumped constants, and simple d.c. excited circuits are first investigated. The author then passes on to considerations of the transients in simple a.c. circuits, and after having shown the utility of Heaviside's and Carson's expansion formulæ for d.c. and a.c. transients respectively, passes on to consider the transients in circuits containing iron. For this purpose the switching-in phenomena of a static transformer are investigated in a manner similar to that already covered by Steinmetz.

Chapter XVI studies current and voltage transients on transmission lines, a preliminary solution being given by differential equations. The treatment is extended to cover mathematically and diagrammatically the transient conditions when an overhead line is short-circuited at one end, and when it is open. The reflections that occur at transition points, and the attenuation due to resistance and leakage, are investigated, and some interesting oscillograms are given of representative tests made in the laboratory on artificial lines.

The volume is concluded by three appendices, an index, and examples to be worked out, at the end of each chapter, bearing upon what has immediately preceded them.

While the work evidently meets the requirements of those for whom primarily it has been written, we think the author would be well advised to recast it in a more generous mould for a future edition, in which case we feel confident it would appeal considerably to a much wider section of the electrical engineering profession.—S. Austen Stigant.

Overhead Electrical Transmission Lines: Wade's Tables.
Revised and Enlarged Edition, 1926. Hull: Richard Wade, Sons & Co., Ltd. Price 15s. net.

The production, in 1906, by Messrs. Richard Wade, Sons and Co., Ltd., of that little handbook of tables of wooden-pole strengths which has been the standard of reference on the subject ever since, was, at the time, regarded as an achievement, and the engineer in this country who is not familiar with "Wade's Tables" has certainly not been in touch with overhead-line construction. New requirements, new ideas, and new legal regulations have come into being since then, and, although the basic facts still remain unchanged, they are now differently applied. The new "Wade's Tables" give not only the old information in a form suited to the altered requirements, but also include a great deal of supplementary information, and the authors are to be complimented on their compilation.

One of the first things to be determined in designing an overhead line is the size of pole. This is so bound up with the span and the sag of the conductor that one cannot be decided without a knowledge of the others. The new edition of the tables provides all three: it gives them in a useful and concise form; it gives full details of the methods by which the figures have been calculated, and states clearly the physical constants and values on which they are based—a most important point and one that is frequently overlooked.

The choice of sizes of solid and stranded conductors displays a tendency to cling to the old standards rather than the new ones of the B.E.S.A., but the range covered is in line with present practice, and has wisely been extended at both ends to beyond the normal requirements. It is rather a pity that the B.E.S.A. standards of tensile strength were not adopted in drawing up the sag-tension tables instead of the minimum allowed by the Electricity Commissioners, as considerably smaller sags are thereby obtainable. The sags given for 22 deg. F. with ice and wind loading, it should be noted, are not vertical sags. The vertical sag with ice and without wind, which is what is required for determining ground clearance at 22 deg. F., is appreciably less than the figures given for the longer and more usual spans of medium-sized conductors.

The values given for both sags and tensions are well within the attainable limits, and are consequently useful and safe figures for the mains engineer, but not for the competitive contractor. The table on page 64, showing the deflection of poles under load, is both interesting and useful. Too often is the capability of a pole to withstand a given load with safety taken as a final indication of its suitability without any consideration of what the pole will look like when loaded! A table of pole weights and cubic capacities would enhance the value of the book in the eyes of the erecting engineer and would form a desirable addition to future editions. The notes and illustrations on foundations of Rutter and A-type poles are quite in order, but would have been more complete had the comparison been extended to Anchora and other types of poles with improved foundations.

Perhaps it is not too much to hope that Messrs. Wade will be able in the next revision to amplify their excellent tables by coupling the correct sinking depth and area of kicking baulk (or other details of substructure) with each size of pole, so that the most economical use of the materials may be obvious at a glance. In the meantime every line engineer will find the present edition well worthy of a place on his bookshelf.

Published Specifications.

31,729. "Hand-tool for adjusting and cleaning the sparking terminals of ignition plugs for internal combustion engines." W. D. L. Busby. December 16th, 1925. (263,294.)

32,191. "Condenser telephones." P. G. A. H. Voigt. December 21st, 1925. (263,300.)

16,094. "Electromagnetic apparatus for recording sound and record produced thereby." A. F. Sykes. June 22nd, 1925. (Cognate application 21,011/25 and 10,645/26.) (Addition to 210,956.) (263,302.)

21,399. "Electrical resistance units." American Resistor Corporation. August 29th, 1924. (239,216.)

21,430. "Process for the cooling of internal-combustion engines and electric transformers." T. Popescu, A. Pais, and C. Pais. August 26th, 1925. (263,511.)

22,129. "Automatic and semi-automatic telephone systems." Siemens Bros. & Co., Ltd., and W. G. Patterson. September 4th, 1925. (263,514.)

23,857. "Acoustic horns." Standard Telephones and Cables, Ltd. December 31st, 1924. (245,415.)

24,154. "Fine-adjusting devices for radio and like instruments having a rotary part." Igranic Electric Co., Ltd., and A. H. Curtis. September 28th, 1925. (263,531.)

24,258. "Alternating-current commutator machines." Siemens-Schuckertwerke Ges. October 4th, 1924. (240,831.)

24,402. "Protective arrangement for electrical machinery." T. W. Ross and Metropolitan-Vickers Electrical Co., Ltd. September 30th, 1925. (263,544.)

24,411. "Means and method for controlling or preventing oscillations in vacuum tube circuits." R. E. Thompson Manufacturing Co. October 13th, 1924. (241,185.)

24,542. "Recording of sound." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories Inc.). October 1st, 1925. (263,550.)

24,629. "Submarine cable core and insulation therefor." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories Inc.). October 2nd, 1925. (263,553.)

24,630. "Inductance coils." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories Inc.). October 2nd, 1925. (263,554.)

24,842. "Wireless circuits." M. A. Robinson. October 6th, 1925. (263,560.)

24,905. "Apparatus for compensating or regulating the power factor of dynamo-electric machines." J. L. Matabon and C. M. Foucault. December 24th, 1924. (Addition to 240,158.) (245,067.)

25,360. "Circuit-breakers, current-limiters, and the like for electric wiring installations and supply distribution systems." M. S. Hoban. October 12th, 1925. (263,565.)

25,532. "Operating mechanism for wireless apparatus." C. Holt. October 13th, 1925. (263,567.)

25,580. "Apparatus for compensating or regulating the power factor for asynchronous dynamo-electric machines." J. L. Matabon and C. M. Foucault. February 17th, 1925. (Addition to 240,158.) (247,913.)

25,624. "Electrical wiring systems." W. Shaw and G. Hoptonstall. October 14th, 1925. (263,568.)

26,467. "Dynamo-electric machines with series excitation." Maschinenfabrik Esslingen. October 23rd, 1924. (241,924.)

26,669. "Filtering arrangement for direct current." Dubilier Condenser Co. (1925), Ltd. October 24th, 1924. (241,944.)

27,504. "Electro-magnetic apparatus for collecting electric currents from space." J. E. Christofleau. December 19th, 1924. (244,723.)

27,961. "Process for making electric batteries." Dr. F. Melms. November 6th, 1925. (263,587.)

29,713. "Electrically-driven lawn-mowers." H. Watson & Sons, Ltd., and E. Watson. November 24th, 1925. (263,597.)

29,895. "Electric circuit-protecting devices." English Electric Co., Ltd., and R. A. R. Bolton. November 26th, 1925. (263,598.)

29,945. "Electric vacuum cleaners." H. Ascher. December 3rd, 1924. (244,084.)

30,987. "Interrupting devices for electric circuits." British Lighting and Ignition Co., Ltd., and J. C. Hutton. December 8th, 1925. (263,609.)

31,735. "Single-phase induction regulators." Switchgear & Cowans, Ltd., G. H. Neep, and D. Firth. December 16th, 1925. (263,615.)

31,769. "Protection of rotary convertors." English Electric Co., Ltd., and R. A. R. Bolton. December 16th, 1925. (Addition to 237,730.) (263,616.)

1926.

1,293. "Electric solenoids." S. L. Glenn and E. E. Pierce. January 16th, 1926. (263,315.)

2,996. "Motor driven electric current rectifiers." H. Gottschlich. February 2nd, 1926. (263,326.)

6,978. "Apparatus for the electrification of gases." C. H. Shearman. March 13th, 1926. (263,356.)

9,107. "Cooking stoves with thermo-electric storage." S. Sacerdote. April 6th, 1926. (263,365.)

10,401. "Electric batteries." M. Turnauer. April 20th, 1926. (263,374.)

11,386. "Electromagnetic sound-reproducing apparatus." Brandes Laboratories, Inc. February 16th, 1926. (263,382.)

14,023. "Electricity meters." P. R. Kuehnrich. June 3rd, 1926. (263,399.)

15,513. "Tungsten arc lamp." General Electric Co., Ltd. February 3rd, 1926. (263,405.)

15,900. "Electric motor controllers." R. H. Barbour and J. R. Walton. June 24th, 1926. (263,408.)

17,458. "Diaphragms." Standard Telephones & Cables, Ltd. (Bell Telephone Laboratories, Inc.). September 22nd, 1925. (Divided application on 23,664/25.) (263,411.)

17,712. "Electric batteries of the flash-lamp and similar type." T. Winston. July 15th, 1926. (263,413.)

18,000. "Electrical socket connectors." J. W. Barber and Brownie Wireless Co. July 19th, 1926. (263,415.)

20,865. "Combined altimeter and telemeter." Soc. d'Optique et de Mécanique de Haute Précision. January 26th, 1926. (263,437.)

21,937. "Combined electric table lamp and alarm clock." F. Halstrup. April 26th, 1926. (263,447.)

26,679. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). August 25th, 1925. (Divided application on 263,210.) (263,467.)

30,775. "Magnetic materials." Standard Telephones & Cables, Ltd. (Bell Telephone Laboratories, Inc.). August 18th, 1925. (Divided application on 263,207.) (263,476.)

1,166. "Electrical resistance devices." Igranic Electric Co., Ltd., and J. H. Abbink-Spaink. January 15th, 1926. (263,634.)

4,095. "Electric switches." Metropolitan-Vickers Electrical Co., Ltd. February 12th, 1925. (247,593.)

4,756. "Adjustment of vehicle searchlights." R. Bosch Akt. Ges. March 16th, 1925. (249,090.)

5,725. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. February 28th, 1925. (248,308.)

6,798. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. March 11th, 1925. (249,132.)

6,805. "Electric motors." British Thomson-Houston Co., Ltd. March 11th, 1925. (249,134.)

6,917. "Contact body for crystal detectors." S. Berglund. March 12th, 1926. (Convention date not granted.) (249,145.)

7,178. "Thermionic valve amplifier circuits." W-K Electric Co. May 13th, 1925. (252,128.)

7,204. "Junction box or pull-box for electric wiring." D. Houtman, jun. March 14th, 1925. (249,165.)

7,320. "Electric transformers." A. B. Cooper. March 21st, 1925. 249,524.)

7,649. "Electric elevator systems." Waygood-Otis, Ltd. May 21st, 1925. 252,329.)

7,852. "Loud speakers or earphones for wireless reception and other applications." Soc. Anon. des Brevets Kornfeld. March 23rd, 1925. (Patent of addition not granted.) (249,558.)

8,863. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. April 25th, 1925. (251,252.)

9,703. "Electrical water-heaters." H. W. Woodgate and F. W. Slade. April 13th, 1926. (263,664.)

10,222. "Earthing bush attachment for electric conduits." J. C. Davidson. May 1st, 1925. (251,610.)

10,619. "Rotary sparking devices for converting three-phase supply currents into high-frequency energy for induction furnaces." G. M. Ribaud. May 13th, 1925. (252,138.)

10,869. "Radio receiving system." Hazeltine Corporation. May 26th, 1925. (252,691.)

11,801. "Differential frequency relays." British Thomson-Houston Co., Ltd. May 6th, 1925. (251,994.)

11,809. "Automatic regulator systems for dynamo-electric machines." Metropolitan-Vickers Electrical Co., Ltd. May 11th, 1925. (251,995.)

11,870. "Electric current-converting systems." British Thomson-Houston Co., Ltd. May 9th, 1925. (252,003.)

11,920. "Electrically-illuminated signs and display apparatus for advertising and other purposes." F. Biggin and G. H. Biggin. May 7th, 1926. (263,667.)

12,172. "Method of transmitting electric charges through a gaseous medium." L. Levy. May 14th, 1925. (252,167.)

13,265. "Machine for electric welding, soldering, or the like." J. E. J. Languepin. May 23rd, 1925. (252,411.)

13,842. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. June 1st, 1925. (252,746.)

13,848. "Electric switches and systems of motor control employing the same." British Thomson Houston Co., Ltd. June 1st, 1925. (252,748.)

15,595. "Thermo-electric generators." British Thomson-Houston Co., Ltd. June 22nd, 1925. (Addition to 250,188.) (253,942.)

16,582. "Tautening devices for stretched filaments in electric lamps and discharge tubes." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. July 2nd, 1925. (254,733.)

17,002. "High-tension electric cables." Pirelli & Co. September 1st, 1925. (257,894.)

19,819. "Method of and means for insulating high-tension members in electrical gas-purifying apparatus." Lodge-Cottrell, Ltd. (Metallbank und Metallurgische Ges. Akt.-Ges.). August 11th, 1926. (263,698.)

20,750. "Electrical signalling and controlling systems." Metropolitan-Vickers Electrical Co., Ltd. August 28th, 1925. (257,606.)

21,581. "Securing device for the terminal box of electricity meters." Landis & Gyr Soc. Anon. November 21st, 1925. (261,710.)

21,582. "Application of a permanent brake to electricity meters." Landis and Gyr Soc. Anon. November 17th, 1925. (261,711.)

21,737. "Lightning arresters." British Thomson-Houston Co., Ltd.. September 14th, 1925. (258,253.)

22,541. "Transformers." British Thomson Houston Co., Ltd. September 11th, 1925. (258,287.)

22,622. "Sockets for Pupin coils in marine cables." Siemens-Schuckertwerke Ges. September 15th, 1925. (258,584.)

22,623. "Sockets for Pupin coils in marine cables." Siemens-Schuckertwerke Ges. September 15th, 1925. (258,585.)

22,757. "Electric power amplifiers." British Thomson-Houston Co., Ltd. October 1st, 1925 (259,197.)

25,191. "Electric heating devices." Metropolitan-Vickers Electrical Co., Ltd. October 10th, 1925. (259,610.)

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from January 26th :—

Tubolume. No. 474,851. Class 6. Illuminated electric signs.—Gesellschaft fur Elektrische Industrie, Berlin. (British representatives: Cruikshank and Fairweather, 65-66, Chancery Lane, W.C.2.)

Octron (lettering and design). No 475,561. All goods in Class 6. No. 475,562. All goods in Class 8. No. 475,564. Class 13. Electric alarms (as systems in buildings) and complete electric lighting sets for vehicles.—H. S. Electric, Ltd., 32, Charlotte Street, Birmingham.

Monosonic. No. 473,065. Class 8. Instruments and apparatus for use in radio-telegraphy and telephony.—Anglo-American Chemical Co., Ltd., 114-115, Saffron Hill, E.C.1.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

AYR.—Housing scheme (4th section, 68), Woodfield; burgh surveyor.

AYRSHIRE.—Hall at St. Ninian's Episcopal Church (£3,200); the rector.

BARDNEY (Lincs.).—Sugar beet factory, for Lincs. Beet Sugar Co.; Sir Robt. McAlpine & Sons, builders.

BATH.—Additional 140 houses, Southdown, for the T.C.; borough surveyor.

BERKHAMSTEAD (Herts.).—Additional housing scheme (56), for the T.C.; borough surveyor. Bank, High Street, for the Westminster Bank, Ltd.

BIRMINGHAM.—Branch municipal bank at Stratford Road; H. H. Humphries, Hall Green, city engineer.

BRIGHTON.—Reconstruction, 5 & 6, Manchester Street, and 5, Steine Street; Southdown Motor Services, Ltd. Alteration, Theatre Royal, New Road; Theatre Royal Co., Ltd. Development of Patcham Place, including Pavilion; borough engineer. Extensions, New Sussex Hospital (£10,000); the secretary.

BRISTOL.—Housing scheme (174), for the T.C.; L. S. McKenzie, city engineer.

CARLISLE.—Houses (50), for the T.C.; J. & R. Bell, builders.

CATERHAM.—Machinery and plant (£40,000), mental hospital, for the Metropolitan Asylums Board.

CHICHESTER.—Secondary school for boys (£15,000), for West Sussex E.C.; director of education, Chichester. Enlargement, Royal West Sussex Hospital; governors.

COLYTON.—Grammar school; Devon County architect.

CROYDON.—110 houses, Chipstead Avenue, &c.; F. H. Willcocks, Beechwood Avenue.

DOVER.—Harbour buildings; Harbour Board. Harbour improvement scheme; Southern Railway and Dover Corporation.

EDINBURGH.—Department of Zoology at University (£80,000); Sir Robert Lorimer, architect.

ELTON.—Schools (£9,000), for Cheshire E.C.; J. G. Davies and Sons, builders, Frodsham.

EXETER.—Library; J. Bennett, city architect.

FALKIRK.—276 houses for Corporation (£100,000); burgh surveyor.

FINEDON (Northants).—Factory, Irthlingborough Road, for the Highfield Boot Co., Ltd.

FIRBECK (Doncaster).—Housing scheme (1,000), for the Firbeck Colliery Co.

GLASGOW.—Additions to Royal Infirmary (£25,000); medical superintendent. Nursing home at Merryflatts (£25,000); clerk, Govan Combination Parish Council. Works and alterations at Mauldslie Street, Partick, for Scottish Farmers' Dairy Co. (Glasgow), Ltd., 2, Anderson Street, Kinning Park; the manager. Alterations and additions to College Buildings at 83, Buccleuch Street, for Glasgow Veterinary College; the principal. Warehouse and offices at Elliot Street, for Broughton Copper Co., Ltd.; the manager.

GLOUCESTER.—Police station at Almondsbury, for the Gloucestershire County Council; E. S. Sinnott, county surveyor.

GUILDFORD.—Electrical installation, new premises, Worplesdon Road; Mason & Toogood.

GRANGEMOUTH.—Additions for Scottish Dyes, Ltd. £18,500), also water condensation machinery (£4,000); the manager.

GREAT CROSBY.—50 houses; U.D.C. surveyor.

HAMILTON.—222 houses for Corporation; burgh surveyor.

HARROGATE.—Administrative block and sick wards at Primitive Methodist Orphanage, Pannal Ash Road; J. Houfe, architect, Albert Chambers.

HASTINGS.—Pavilion; S. Little, borough engineer.

HAWARDEN.—Housing scheme (68), for the R.D.C.; F. Barrett, surveyor, Wold House.

HOLMFIRTH (Yorks).—Housing scheme (61), for the U.D.C.; surveyor.

HUDDERSFIELD.—Distributing centre, with electrical work, for the Co-operative Society; J. Berry & Sons, architects, 5, Market Place.

HULL.—Extension of Cottingham Infectious Diseases Hospital (£11,370); city architect, Guildhall.

IRISH FREE STATE (Dublin).—Child welfare centre, Lord Edward Street (£25,000); J. Beckett, Ltd., builders.

(Thurles).—Improvements at the County Home (£11,479); Fogarty & Dwyer.

LEEDS.—University buildings (£500,000); Lanchester, Lucas and Lodge, architects, London.

LONDON (Hackney, E.).—3-storey factory, Theydon Road; Merrington Bros., Ltd.

(Aldwych, W.C.).—Proposed four new theatres, restaurant, offices, &c., Aldwych improvement scheme (£1,500,000); C. Gulliver, London Theatres of Varieties, Ltd.

(West Ham, E.).—Remodelling school (£11,333), and extensions to other schools, with central heating (£9,000), for the Borough E.C.; the clerk.

(Edmonton, N.).—Enlargement Lattymer School (£67,000); H. Knight & Sons, for Middlesex Education Committee.

(Islington, N.).—Bank, City Road, for Westminster Bank, Ltd.; H. Cheston & Son, architects.

(Kensal Rise, N.W.).—Alteration and additions, Pavilion Cinema, Chamberlayne Road; Acme Picture Palace Co., Ltd.

(S.E.1).—Partial reconstruction of the "Old Vic" Theatre, Waterloo Bridge Road (£15,000); the manager.

(Balham, S.W.).—Premises for Royal Arsenal Co-operative Society, Hebdon Road and Upper Tooting Road; S. W. Ackroyd.

(Brixton, S.W.).—Kinema and dance hall, Brixton Road; E. A. Stone, architect.

LOWESTOFT.—Pavilion and bathing châlets; borough engineer.

MARCH.—Railway developments, including goods marshalling yard, electrically operated, for the London and North-Eastern Railway Co. (£300,000).

MERTHYR.—Extension, General Hospital; governors.

NEWMARKET.—Hospital extensions; Joint Hospital Board.

READING.—Bank for Lloyd's Bank, Ltd.; J. P. Briggs, F.R.I.B.A.

RETFORD.—Cinema, for Retford Cinema & Motors, Ltd.; Sydney Neve, secretary, Gwydyr Chambers, 140, Holborn, London.

ST. HELENS (Lancs.).—Additional housing scheme (48), Clock Face site, for the T.C.; A. W. Bradley, borough engineer.

ST. NEOTS.—Secondary schools, for Hunts. E.C.; director of education, Shire Hall, Huntingdon.

SHIPLEY.—Electricity supply, Canal Ironworks; J. Parkinson & Sons, Ltd.

SLOUGH.—Bazaar premises, High Street, for F. W. Woolworth & Co., Ltd., Kingsway, London. Shops, Alpha Street, for S. R. Bloxsome. Factory extensions, Wexham Road, for Naylor Bros.

SOUTH AFRICA (Cape Town).—Grain silos, Canterbury Street; Daniel Mills & Sons. Factory, Rhodes Drive; Lamson Paragon (South Africa), Ltd. Soap and chemical factory, Chapel Street; A. H. Gatz.

SOUTHAMPTON.—150 houses on various sites; borough engineer.

STALYBRIDGE.—Houses (64), for the T.C.; Thomas Warrington, builder.

STOCKTON-ON-TEES. — Secondary schools, for Durham E.C.; director of education, Shire Hall, Durham.

STRATFORD-ON-AVON.—Proposed Shakespeare memorial theatre.

SUNDERLAND.—Alterations and additions to the Technical College, for the Education Committee; G. T. Brown and Sons, architects, 51, Fawcett Street.

SUTTON.—County school for boys; Surrey Education Committee.

SWANSEA.—46 houses, Cocket Road and Corse Road; S. Davies.

SWINTON.—Housing scheme (182), Folly Lane; H. Entwistle, engineer and surveyor, Council Offices.

THORNABY-ON-TEES.—Central schools (£15,700), for North Riding E.C.; director of education, Northallerton.

TWICKENHAM.—Secondary schools (£40,677), for Middlesex E.C.; J. Lovell & Son, builders, Gerrards Cross, Bucks.

TYNEMOUTH.—Quay shed (£7,000); borough engineer.

WARSOP.—Houses (107), Church Warsop Estate, for the Housing and Town Planning Trust.

WEMBLEY.—50 houses, Christchurch Estate; U.D.C. surveyor.

WETHERBY.—School (£10,000), for West Riding E.C.; director of education, County Hall, Wakefield.

WIGTON.—School (£6,100), for Cumberland E.C.; director of education, Carlisle.

The

Electrical Review

VOL. C. FEBRUARY 11, 1927. No. 2,568.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Edison's 80th Birthday.

EIGHTY years ago to-day, there was born Thomas Alva Edison—one of the most remarkable characters that have played their part on the stage of the world. Like so many other electrical pioneers, he entered the industry by way of the telegraph, at the age of 15, and has thus been associated with it for no less than 65 years. His latest biography (by no means the first), written by George S. Bryan,* opportunely reached our hands a month ago, and records in most readable fashion the fascinating story of his career—from newsboy to doyen of an industry whose capital value, largely due to his inventiveness, has been estimated at £3,000,000,000 in the United States alone.

Probably Edison is the most prolific inventor that the world has ever known; but unlike many an inventive genius, he made his profession pay. The number of his patents runs into thousands (already in 1910 they numbered 1,328), and some of them were extremely lucrative—yet he cared little for wealth. Hundreds of law-suits were fought in defence of his electric lamp patents, at enormous expense, but he said he "never enjoyed any benefits" from those patents. Few men have followed so many vocations, and with so much success: newsboy, printer and publisher, telegraph operator, telephone inventor, electric light and power engineer, moving-picture and phonograph inventor, manufacturer of lamps, dynamos, cement, storage batteries, and concrete houses—the versatility of his genius is astonishing. A devotee of research, which he prosecuted with an unprecedented intensity and comprehensiveness (10,000 experiments were made in the search for a substitute for the lead-acid accumulator, and 50,000 before final success was achieved), he invariably had a definite commercial aim in view and never embarked on scientific research for its own sake. His well-known saying that "genius is 1 per cent. inspiration and 99 per cent. perspiration" crystallises his views on this subject, though in its excessive modesty it is blatantly unjust to his own inexhaustible fertility of invention, his extraordinary insight into the possibilities of an idea. But he is far from scorning the labours of scientific men; he is an omnivorous

* "Edison: the Man and his Work." London: Alfred A. Knopf. Price 18s.

reader, and possesses the invaluable capacity of quickly absorbing information from books and storing it in a most retentive memory.

His greatest success, probably, was the development of the carbon-filament lamp, an efficient type of dynamo to supply it with current, and the feeder-and-main system of distribution, perfected by his invention of the three-wire system—the whole forming a complete equipment for the electric lighting of a town. The fact that other inventors, such as Swan and Hopkinson in this country, were working on parallel lines, in no way detracts from the credit due to Edison for establishing a system which in one city alone—Chicago—now employs generating plant of more than 1,000,000 kilowatts capacity and supplies electric light, heat, and power to a population of some four million souls. When he was in his prime, his industry was a consuming fire—but his physical constitution, happily, was equal to the strain. He possessed the faculty of inspiring his staff and employés with a large measure of his own impetuous eagerness to obtain results, and was no less distinguished by his qualities as a leader of men, than by his intuitive genius as an inventor—a rare, almost unique, combination.

Returning to Mr. Bryan's book, we heartily commend it to our readers as a most interesting and satisfying work, which will hold their attention from cover to cover; and we tender our congratulations to Mr. Edison not only on having so competent a biographer, but also—what is vastly more important to him— on his having the happiness to bring to fruition so many inventions for the use and benefit of man, and to know that his name is held in honour by every nation.

From his Laboratory at Orange, New Jersey, on the occasion of our Jubilee in 1922, Mr. Edison sent us a felicitously-worded message of congratulation; it is with the greatest pleasure that we now convey to him, on behalf of our readers as well as ourselves, the most cordial greetings on the eightieth anniversary of his birth.

High-pressure Cable Tests.

According to a paper read before the American I.E.E. last year by Messrs. D. W. Roper and H. Halperin (of the Commonwealth Edison Co.), in the past the principal safeguard of the purchaser of electric cable has been the manufacturer's guarantee, since factory tests, in the case of cables operating at a normal voltage above 7.5 kV, were quite perfunctory; they served merely to eliminate sections of very defective workmanship, but failed to indicate the quality of the insulation, unless it happened to be very bad indeed.

Since 1920 nearly all American cable manufacturers have modified the impregnating compounds they used in an effort to minimise dielectric loss; during the same period some users demanded a reduction of the insulation thickness, which resulted in the dielectric stresses being increased. In a number of cases unwisely chosen compounds, and perhaps the insulating papers employed also, developed faults that were more serious than high dielectric loss; the dielectric strength of some cables proved to be deficient, while in others ionisation occurred. Consequently, when manufacturers in the United States about two years ago reduced their five-year guarantee period to two years, it became necessary to attempt to devise tests to be applied in the factory which would permit the purchaser to determine, before delivery of the cable, whether it would be likely to operate satisfactorily in service.

Notwithstanding test modifications, however, trouble continued, and an investigation was accordingly undertaken (correlating with the specifications and test results the operating experience of some 4,000,000 ft. of high-voltage, three-conductor, cable purchased from 10 manufacturers during the past six years) with the object of determining what changes should be made in cable specifications in order to reduce the number of service failures.

The results obtained indicate that the best cable is, in general, made by those manufacturers who exercise the best control over their processes, as shown by the uniformity of test results and inspection data. Laboratory work in this country has proved itself to be of the greatest value in the examination of materials and the checking of process operations in the factories, thus confirming in England the conclusions drawn above.

It may be remarked that Col. E. Mercier, in his recent I.E.E. paper, referring to the 60,000-V cable network in Paris, said that no dielectric acceptance tests were specified, because in his opinion they were useless as a guide to cable users. A good deal of light was thrown on the subject by Mr. Luigi Emanueli in the paper of which a translation appeared in the Electrical Review for December 24th, 1926. The author's ingenious experiments were exceedingly interesting, and appear to afford a working hypothesis on which to base further improvements in the methods of manufacturing cable.

Local Exhibitions and the Public.

We have always maintained that one of the best means of spreading the electrical idea is the local exhibition. While displays of a national character implant general impressions which may or may not be lasting, the local exhibition brings the present or prospective consumer into touch with local contractors and retailers; there is far more hope of doing business when the customer realises that the seller is within easy reach to give advice and service. The value of such exhibitions is, however, largely negatived if the exhibitors' representatives adopt a very superior, technical attitude, and if they are not very precise in their statements regarding the capabilities and costs of their appliances.

A lay correspondent has written at length upon this subject, after visiting a recent local exhibition, in the form of an electric home. He admits that the dwelling was admirably furnished and electrically equipped in a thorough manner, but he complains that the replies to his questions were of a very vague character. Apparently he would have been satisfied with a definite statement regarding the wattage of each appliance, but evidently he could not get this. He quotes an instance, concerning a water heater, in which the reply was actually misleading.

This is quite wrong; but from our own experience we know that it is not altogether unusual. We would go further than our correspondent and say that not only should the consumption be definitely stated, but also the actual cost of running should be given. At a local exhibition this is not difficult; in fact, it is very often done. But we should like to see the practice adopted generally. The public isn't interested in "watts" and other vague quantities. Its standard is £ s. d., and all exhibitors at local displays should conform to this standard.

The Electricity Board.

In fulfilment of general expectations there was issued on Monday, on the eve of the re-assembly of Parliament, the official list of the seven gentlemen who have been appointed to be members of the Central Electricity Board, under the chairmanship of Sir Andrew Duncan. Their names and qualifications are published in our "Personal" column to-day. All we have time to say as we go to press, is that some anticipations have not been realised, that secrets have been well kept, and that the selections reflect on the whole a determination to secure men possessed of those special and varied kinds of experience essential to the elaboration and execution of a broad-minded and sound national policy and the bringing into harmony of diverse interests. Finance, industry, coal, electric power and electricity supply, all have their fully qualified representatives on the Board.

Electrical Developments at Gt. Yarmouth.—I.

The remodelling of the generating station, involving an entirely new boiler house and reconstruction of the turbine room for the installation of up-to-date plant for modern steaming and generating conditions.

THE official inauguration of the extensions at the South Denes generating station of the Great Yarmouth Corporation, which was to take place on Thursday of this week, marks an important stage in the development of the scheme for the reconstruction of the whole of the system of generation and distribution which was commenced a few years ago, and which is believed to be the largest change-over scheme yet sanctioned by the Electricity Commissioners.

The public supply of electricity at Yarmouth was begun in 1895. A scheme had been drawn up by the late Sir W. H. Preece, C.B., for the lighting of the borough, and the entire contract for the required generating plant was placed with Messrs. Crompton & Co., Ltd.

The original station plant had a total capacity of 150 kW, and consisted of two steam reciprocating sets, two 4,500-lb. Babcock & Wilcox boilers, and the necessary auxiliaries and switchgear. The supply was generated at 2,000 V, single-phase, and delivered to the consumers at 100 V. The original capital expenditure for the undertaking was £16,500.

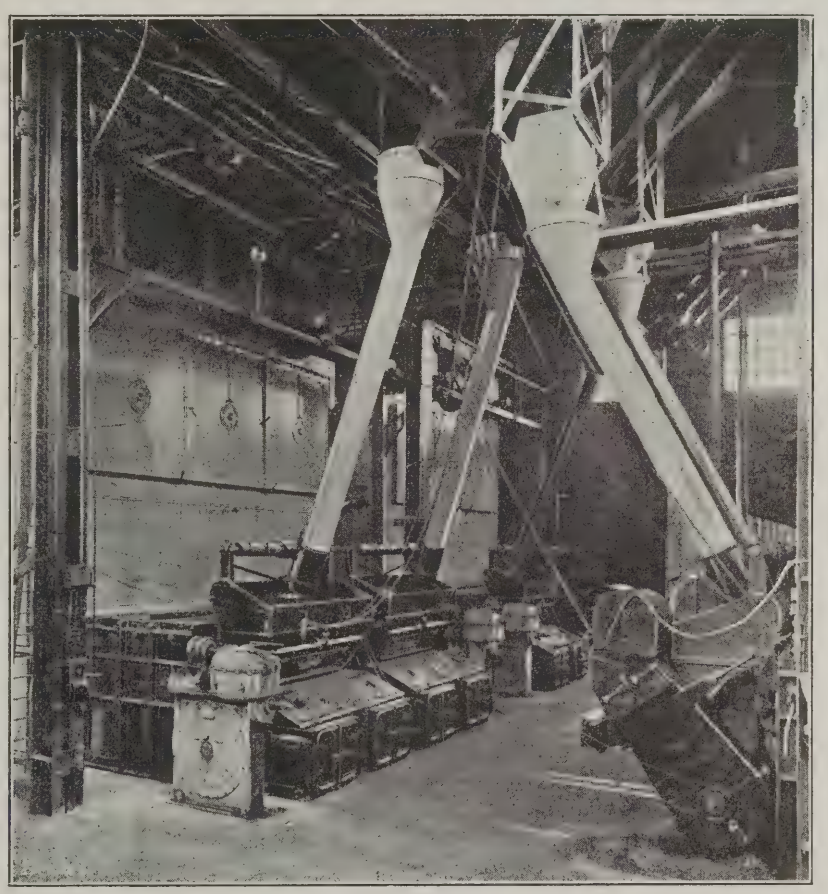

Fig. 1.—New Boiler Plant at Yarmouth.

The capacity of the station was increased from time to time, and in 1920 the Corporation instructed Mr. A. H. Preece, of the firm of Messrs. Preece & Cardew, consulting engineers, to report on the condition of the undertaking, in view of the passing of the Electricity (Supply) Act of 1919, and the urgent need to bring the concern up to date. The total capacity of the works at that time was 2,300 kW, made up of eight sets, the largest being a 600-kW turbo-alternator, whilst the steaming capacity of the boilers was 56,000 lb. of steam per hour, delivered by ten units. The system of generation and supply was still single-phase at 83.5 cycles.

Mr. Preece advised the installation of plant for generating at 50 cycles, and a new 1,500-kW Brush-Ljungström turbo-alternator, 3-phase, 50 cycles, 3,850 V, was put into commission in 1921, together with a 500-kW rotary convertor and one 500-kW frequency changer.

In 1923 a second and similar 1,500-kW set was installed, and also a 1,000-kW frequency changer.

In 1924, as the result of a communication from the Electricity Commissioners, Mr. J. H. Rider, of Messrs. Preece, Cardew & Rider, was requested to report on the undertaking, with special reference to the advisability of changing the system of generation and distribution.

On the appointment in that year of Mr. P. G. Campling, A.M.I.E.E., as engineer and general manager of the Electricity Department, consequent on the death of the late borough electrical engineer, Mr. Gordon Bryant, the Corporation instructed him to prepare a scheme in accordance with Mr. Rider's report for the installation of a new boiler to meet the immediate requirements for the winter of 1925, and for the remodelling of the existing power station and distribution system to the standard system of general supply in accordance with the recommendations of the Electricity Commissioners.

After careful consideration of the existing site of the power station, with regard to the facilities offered for the supply of sea- or rail-borne coal and circulating water, a scheme was drawn up which involved the reconstruction of the generating plant so as to provide for an ultimate output of 40,000 kW. A lay-out was also prepared for a new e.h.p. and l.p. transmission system, in accordance with the desired change-over of the supply from single-phase, 83.5 cycles, to 3-phase, 50 cycles, 4 wire, including the provision of 11 new overground sub-stations. The proposals were adopted by the Corporation and involved an approximate expenditure of £243,000.

The reconstruction of the generating station is of unusual interest, involving some structural alterations of a somewhat delicate nature. The design of the old

station was on the parallel boiler and engine house lines, running east and west, with provision for extensions in the easterly direction. The remodelling reverses the order, and the new plant has been installed at the east end of the station so that additional plant can be put down towards the starting end on the sites of the old

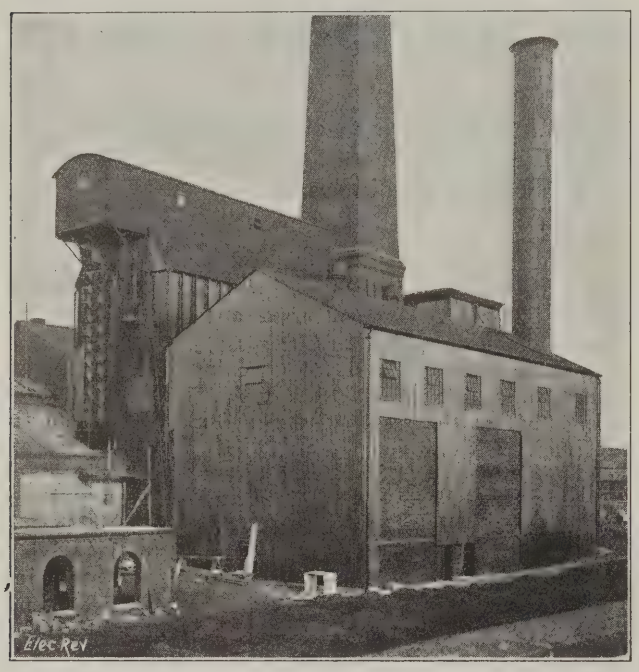

Fig. 2.—Boiler House and Coal Conveyor.

machines which have been or are being scrapped, thus avoiding that mixture of old and new equipment which is often the result of reconstruction schemes. The only portions of the old plant which are to remain are the two 1,500-kW turbine sets already referred to. These are shown in fig. 4, which gives a general view of the old turbine room looking west. The capacity of each of these machines is to be increased to 2,000 kW by the makers, who will take the turbine portions of the sets to their works and either recondition the existing blading or supply new to suit the new steaming conditions of the station. The alternators will be suitable for the increased output.

The development scheme has involved the provision of an entirely new boiler house, a steel-frame structure covered with Robertson sheeting, and increasing the width and height of the east end of the turbine room. These increased dimensions necessitated a new roof, some 7 ft. higher than the old one, with a different centre, the widening being effected on one side of the building only by including what was originally a wing for the station workshops. To effect this, some intricate underpinning of the foundations was essential, credit for which should be given to the Fawcett Construction Co., Ltd.

The new boiler house, fig. 1, at present accommodates two recently installed 30,000-lb. boilers, in addition to the 25,000-lb. boiler installed in 1925, and provision is made for the installation of a fourth unit. As already indicated, future extensions to the boiler house can easily be effected in a westerly direction. The boilers are all of the Babcock & Wilcox water-tube type, the two most recently installed being arranged with Green economisers in single units, and the other with separate economiser plant. The boilers each have a heating surface of between 6,000 and 7,000 sq. ft.; they are equipped with Diamond soot blowers and chain-grate stokers served by traversing coal shoots fed from overhead bunkers. The lower end of each shoot is carried to and fro from end to end of the coal hopper by means of a revolving coarsely-threaded shaft with which the shoot is engaged, thus ensuring a uniform mixture of the fuel used, nuts and fine coal, on the grate. A feature of interest is the grate drives for the 30,000-lb. boilers, a driving unit being employed which has only recently been introduced into this country by the makers of the plant. Each consist of a 4-speed motor-car type gearing driven by a 1-h.p. motor mounted on the apparatus, fig. 1. The drive to the stoker shaft is through a worm equipment, the whole running in an oil bath. The grate speeds range from 16 to 40 ft. per min.

The steaming conditions for the whole of the new equipment are 250 lb. per sq. in. g. and 700 deg. F. superheat. Forced and induced draught are provided for the two new boilers, the former by means of a motor-driven fan under each boiler, and the latter by a similar fan installed at the base of a new steel chimney, common to both boilers, the system being designed to give a maximum flexibility for dealing with low- or high-grade fuels on light or heavy loads The feed water is delivered by means of two Weir turbine pumps, each of 7,500 gals. per hr. capacity, from a hot tank into which the condensate from the turbine plant is fed.

The overhead coal bunkers have a total capacity of 450 tons, and are fed by a gravity bucket conveyor capable of handling 40 tons of fuel per hour, fig. 2. This is driven by an 8-h.p. motor, and travels at 48 ft. per min. The coal is raised from a receiving hopper on the ground level, an automatic filler allowing just sufficient coal to pass into each bucket without spillage.

The firing floor of the new boiler house has been arranged 12 ft. above the old floor, so as to enable a modern ash-handling system to be installed in the basement on the old level. The ash passes from the grates

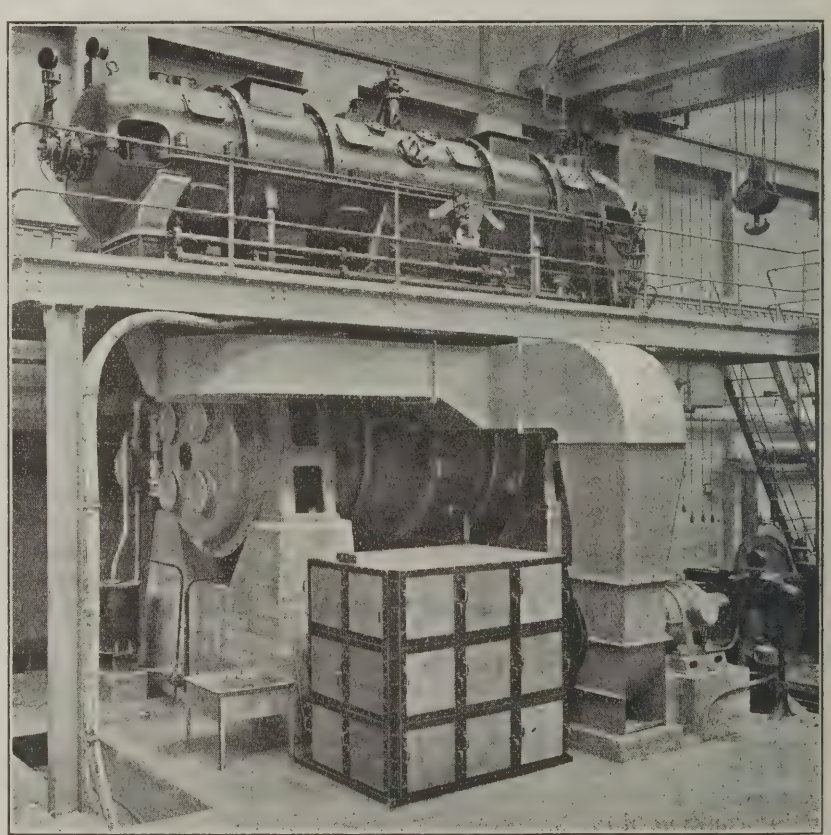

Fig. 3.—3,000-kW Turbo-alternator Plant.

into suitable hoppers, which are emptied as desired into tip wagons which run on rails to the dumping ground.

Arrangements are being made for the installation of a modern overhead coal-handling plant for transport-

ing fuel from vessels at the quay side to the works yard and to the receiving hopper. In this connection it is interesting to note that an old conveniently placed disused pond in the works yard is to be used as a pit for reclaiming the coal by means of the telpher grab.

The boiler equipment is completed by the provision of suitable overhead water tanks and hot wells. The lay-out generally has been designed to ensure the maximum efficiency and economy under all working conditions, and at the same time to afford complete accessibility to all working parts and so reduce the maintenance costs to the lowest possible limits. The whole of the plant, including the buildings above the firing floor, the boilers, coal bunkers, conveyors, mechanical stokers, and all the accessories was manufactured and installed by Messrs. Babcock & Wilcox, Ltd. All the foundation work for the buildings, bunkers and boilers, and the construction of the main flue, were executed by direct labour under the supervision of the engineer and manager.

In the reconstructed section of the turbine room, which is served by a 20-ton three-motor electrically driven overhead Morris crane, 50-ft. span, 120 ft. per min., is installed a 3,000-kW Brush-Ljungström turbo-alternator, fig. 3, of the double-rotation radial-flow type, 3-phase, 3,850 V, 50 cycles, 3,000 r.p.m., capable of a continuous overload of 25 per cent. The machine is mounted directly on its two-flow type surface condenser, which has a cooling surface of 3,000 sq. ft., and is capable of dealing with 32,250 lb. of exhaust steam per hour, maintaining a 28.5-in. vacuum. The air is extracted by a two-stage Brush-Delas ejector, with a dry-air capacity of 19.34 lb. per hr. The condensate is withdrawn by an electrically driven "Pulsometer" centrifugal pump capable of delivering 51,600 lb. of water per hour against a head of 57 ft.

The alternators are air cooled, a fan by Messrs. Standard & Oswald Stott, Ltd., being employed in conjunction with an oil-type air filter by the Premier Engineering Co. A novel feature of the turbo-alternator plant is a small steam turbine employed on the oil-circulation system. This is brought into operation automatically when the circulating pressure drops below a predetermined figure. The control is by means of a flexible diaphragm, which is normally balanced between equal steam and oil pressures on either side.

The cooling water for the condensers is delivered from the river through a 4-ft. gravity-flow pipe line to a sump where it is cleaned by two self-cleaning rotary strainers, made and installed by Messrs. F. W. Brackett & Co., Ltd., each capable of dealing with 800,000 gal. of water per hour. For the circulating water a new pump house accommodates two Mather & Platt vertical-spindle pumps, each having a delivering capacity of 5,280 gal. per min. The condenser discharges are connected to a common main leading into the river at a point below the low-water level, so as to obtain the benefit of siphonic action. Owing to the industrial difficulties of 1926, it has not been possible yet to complete the circulating-water system, and the cooling water for the new turbo-alternator is at present being obtained from the old cooling-tower equipment, a temporary sump having been installed. In this connection it is interesting to note that one of the 55-h.p. vertical-drive motors to be installed in the new pump house is running horizontally and driving a turbine pump in the temporary system.

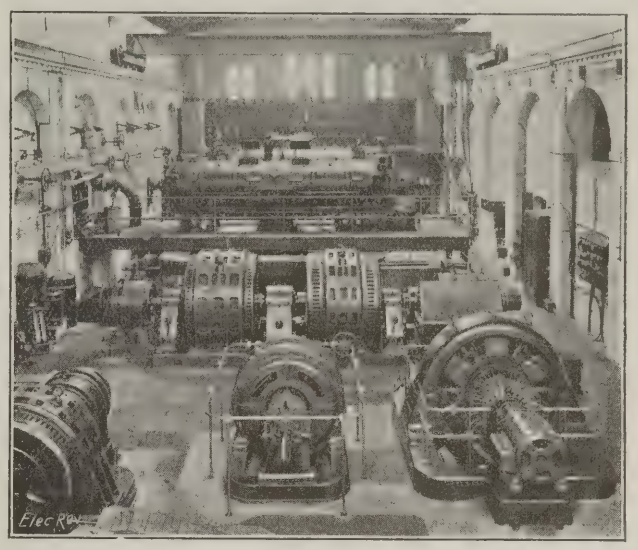

Fig. 4.—Old Turbine Room.

The extensions also include a 500-kW English Electric rotary convertor, with the necessary transformer equipment for receiving from the e.h.p. system, for supplying the tramway undertaking at 525/560 V. This machine is of the six-phase type, 1,500 r.p.m., and is fitted with special commutating poles and a centrifugal speed-limiting device. It is equipped with voltage-adjustment tappings, and provision is made for direct starting. The traction supply is dealt with by a 5-panel B.T.-H. switchboard

New e.h.p. switchgear, fig. 5, has been erected immediately over the switchboard, which was installed originally as the necessary medium between the 3-phase generators and the frequency changers. The latter board is to be used for the station auxiliaries. The new equipment is housed in ten stone cubicles, and is remotely operated, mechanically, from a 10-panel enamelled-slate board equipped with the necessary instruments, and Merz-Price protective gear for the alternators. A Brown Boveri voltage regulator and modern synchronising apparatus are also provided. The switchgear is of the English Electric oil-immersed type, the breakers having a rupturing capacity of 150,000-kVA. Duplicate busbars are provided, and in each case the phases are carried in separate chambers. Arrangements are made for the speed of the turbo-alternator to be controlled from the switchboard, motor-driven governor equipment being installed on the turbine.

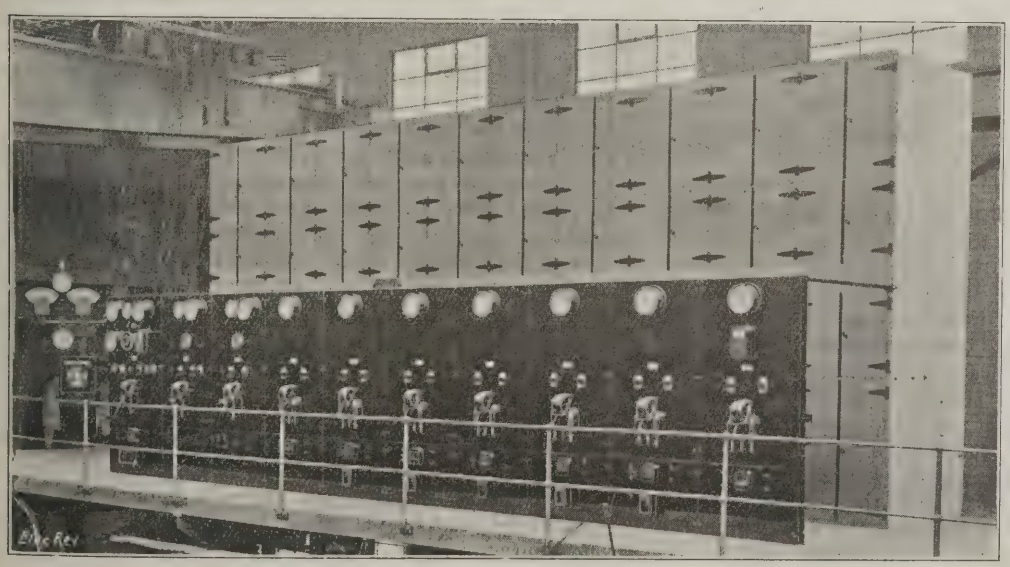

Fig. 5.—New e.h.p. Switchgear.

To meet the 1928 load, a 7,500-kW turbo-alternator and an additional boiler are to be installed.

The Earthing of Portable Domestic Appliances.

Many installation engineers regard the risk of shock as insufficient to justify the earthing of portable apparatus in the home; the danger is, however, in the author's opinion, a real one, and the cost of providing against it by using three-pin plugs and earthing wires is inconsiderable.

By R. H. RAWLL.

IT is not proposed to discuss here the earthing of the framework of more or less permanently fixed electrical apparatus, such as large radiators, wash boilers, geysers, cookers, &c. Fortunately, in those situations where earthing is essential (for example, bathrooms and kitchens), such appliances usually can be easily and efficiently earthed by means of a connection to a convenient water pipe. The earthing of portable apparatus obtaining its supply by means of a flexible cable and plug from a socket, however, does not present such a simple problem, and it is this aspect of the subject which is to be considered.

First of all, it will be perhaps helpful in approaching this subject to consider the reasons and necessity for earthing. It is, of course, well known that the chief reason is to ensure immunity from shock should metal other than conductors become charged. (Incidentally, on those systems of supply whereof one pole is permanently earthed, it fulfils, in addition, another useful function in calling attention to such leakage by the blowing of the fuse connected to the other pole, thus disconnecting the faulty apparatus.) Many persons, however, although they are fully aware of these reasons, do not consider the risk of shock sufficiently great to justify the earthing of portable apparatus in the home. Their argument is usually based on the facts that—

(1) The majority of portable apparatus, *e.g.*, radiators, vacuum cleaners, etc., are used in rooms with wood floors covered with carpets, where the risk of shock to earth, should contact with live metal take place, is practically nil, and

(2) On those rare occasions when a shock is actually experienced, although it is unpleasant, it is not a matter of great importance.

Portable apparatus to-day, however, is not confined to living rooms, and besides appearing in such diverse forms as shaving mugs, toasters, immersion heaters, etc., the numbers in use are much more extensive than a few years ago, and are likely to be more so in the near future. There is, therefore, a greater risk of shock in the home nowadays than hitherto. In the same way, shocks experienced in the past from portable apparatus have usually occurred in situations and under conditions tending to minimise their intensity; while to-day portable apparatus is on the market for use in bathrooms and similar places where a shock can easily be highly dangerous. Even in the old days the risk in the bathroom was realised, hence the provision of a shock-proof type of tumbler switch, when fixed within reach of an occupant of the bath. That this danger of obtaining a severe shock in such conditions is not an exaggeration is shown by the following incident, which occurred quite recently to a consumer of the supply undertaking of which the writer is a member of the staff. This particular individual placed a small immersion heater in a jug of water in the bathroom and then proceeded to have a bath. During his ablutions he observed the water in the jug boiling furiously, and being unable to reach the switch controlling the plug and socket to which the immersion heater was connected, he placed a sponge on top of the jug to prevent the water boiling over. A little while after he stepped out of the bath, and on picking up the sponge received the shock of his life (in more senses than one). The water in the sponge had penetrated the flexible lead at the connection to the immersion heater and rendered the whole thing alive. Considering that the shock was sufficient to throw him to the other side of the bathroom, it requires very little imagination to realise what would have happened had his body been in the bath when he made contact with the live metal. Some engineers are of the opinion that earthing such appliances is by no means a necessity, and in support of their argument point to America, where, although the use of electricity is considerably more extensive than in this country, it is not usual to earth portable domestic appliances; but it is often overlooked that the supply pressure in America for residential purposes is in most cases considerably lower than that prevailing in Great Britain, being in the region of 100 volts. It must also be borne in mind that the Government proposes standardising the pressure for domestic purposes at 230 volts, which, in respect of a.c. systems, in most cases will mean 312 volts to earth as regards intensity of shock. That the Home Office is fully aware of the risk of dangerous shock from portable electrical apparatus in factories is demonstrated by the very definite regulations for earthing all such apparatus or else completely enclosing them in insulating material. It also seems very inconsistent to make a practice of earthing the metallic sheathing of wiring, which is rarely handled, and then to leave unearthed the exposed framework of portable apparatus, which is frequently touched. Even in those cases where the shock is of a slight nature, it often causes nervousness to the user and is the cause of much prejudice against the further use of electricity in the home, on the score of its being "dangerous." In other words, the possibility of electric shocks in the home is a bad advertisement for electricity, particularly at a time like the present, when its use and advantages in the domestic sphere are being boomed. Thus from all points of view, besides that of safety, the earthing of portable apparatus is decidedly necessary.

If it is decided to earth portable apparatus, this is usually effected by means of a 3-pin plug and socket, one contact of which is efficiently connected to earth. The earth connection is made to the apparatus by means of an additional conductor incorporated in the flexible cable. It may be observed that when it is proposed to adopt the above procedure, it is often found that the manufacturer of the particular apparatus has not provided an earthing terminal. All electrical apparatus, whether portable or fixed, should be provided with an earthing terminal in case it should be required.

The cost of this additional item should be practically negligible. It is, of course, possible that with some makes of domestic apparatus the increased potential strain on the insulation, set up by deliberately connecting the framework to earth, would cause a breakdown, but this shows bad design and should not be tolerated as an excuse for not providing the necessary earthing terminal.

It has been already stated that the most likely place in the ordinary house where dangerous shocks may occur from portable appliances is the bathroom. But if a 3-pin plug and socket is fitted only in this position and the remaining plug points in the house are of the 2-pin type, several important disadvantages immediately present themselves. With such an arrangement, apparatus used in the bathroom cannot be utilised in the other rooms, and *vice versa*, on account of the non-interchangeability of the plugs and sockets. One method of getting over this trouble is to provide special apparatus for use in the bathroom only, but since this is obviously a most uneconomical proposition, it is usually ruled out of court at once. (This difficulty can, of course, be overcome by providing special 2-pin/3-pin plug and socket adaptors, but all will agree that such a solution is not an engineering job.) The writer has seen several contractors, when faced with this dilemma, install an ordinary 2-pin plug socket *outside* the bathroom door, and, on inquiring as to the purpose to which it will be put, has been informed that it is for use with portable apparatus in the corridor or on the landing only. In such cases the inevitable occurs. The consumer takes the unearthed appliance into the bathroom with the flexible cable trailing under the door to the socket fixed outside.

The writer's solution of this problem, which he knows is felt keenly by many engineers engaged in installation work, is to provide 3-pin plug sockets at all power points. The objections usually raised to this suggestion are: (1) the extra expense involved, and (2) the necessity of running a special earth wire or using only earthed metallically sheathed wiring or tubing throughout the installation, in order to provide the necessary earth connection at each plug socket. With regard to the first point, in a large number of cases the extra cost of providing 3-pin plugs and sockets is greatly exaggerated. The writer has carefully ascertained the prices of different makes of 3-pin plugs and sockets, compared with the 2-pin variety, and for the 15-ampere size the average extra cost is in the region of 4s., the figure for smaller current-carrying capacities being proportionately less. Added to this, of course, is a small amount to cover the provision of the earthing connection. The labour involved in fixing a 3-pin plug-socket is practically the same as that required for the 2-pin type. The cost of installing four or five power plug points (which are the requirements of the average house) would, therefore, not be increased by much more than £1. Thus, it can hardly be said that undue expense rules out the provision of 3-pin plug sockets. With regard to the other objection, provided lead-covered wiring, or other wiring enclosed in steel conduit, is used throughout the installation, the necessary earth connection, of course, does not present any difficulty. But, even if C.T.S. or v.i.r. in capping and casing is utilised for the wiring, and although 3-pin plug sockets are fitted at all points, it will only be necessary to make earth connections in such places where danger of shock to earth exists; and since these positions are usually in the bathroom, kitchen, or scullery, a neighbouring cold-water pipe generally provides the necessary earth connection It may be objected that to provide 3-pin plug sockets in rooms where the third pin is not earthed is to create a sense of false protection. But in a living room with wood floors covered with carpets, even if the frame of a portable appliance becomes alive, the risk of shock is negligible. But directly the same faulty piece of apparatus is plugged-in at a point where a dangerous contact to earth prevails, the third pin, in this case being earthed, causes the circuit-fuse to blow, and calls attention to the fact that some fault must be present.

It is hoped that these few notes may arouse interest in a subject which hitherto has received very little serious attention, and has been shelved by the majority of installation engineers.

The Trials and Humours of an Estimating Department.

By "ONE OF THEM."

THE engineer in charge of the estimating department of any firm manufacturing all classes of high- and low-voltage switchboards and motor-starting gear does not fill a post which, by any stretch of the imagination, can be called a sinecure. Neither, in general, is it lucrative when one considers the years of study necessary before one can satisfactorily fill such a position. Gone are the posts which, in return for votes, and without work or responsibility attached to them, were filled by Robert Walpole and others regardless of the remuneration. Your engineer cannot be included in the category covered by Walpole's dictum that "Every man has his price." He has a price in the opposite sense, in return for which he ploughs his way through good and bad, clear and vague, and (in the case of foreign correspondence) wretchedly translated inquiries. He is assailed on all sides and at all inconvenient times—directors want him (three at once occasionally), and simultaneously he is called up on the telephone to be given an inquiry now by a good customer and again by a firm which in 20 years has sent multitudinous inquiries, but has never screwed up enough courage to send an order, although in every case it has had "hopes." Bearing in mind all this and other innumerable worries which occur during office hours, it is no wonder that the engineer in question, sitting by the fireside in the evening, and turning to Dickens for a tonic, feels rather envious of, and impatient with, Micawber, who, lucky man, was always waiting for something to turn up.

The good people who send the inquiries seem to conspire to upset your engineer's equanimity at the beginning of each new day, although, taken as a whole, a little dry humour shows itself from time to time. The following examples, taken at random from a large number, will illustrate the funny side of the business:—

(1) "Can you let me have a price for a liquid starter for 185 kVA?"

(2) Extract from lengthy and verbose specification

sent out by an eminent consulting engineer: "The star-delta starters must be so arranged that, with the handle in the 'starting' position, the motor windings are connected in 'star,' and in the 'running' position in delta'"!

(3) Further extract from the same specification:—"The starters are to be packed for shipment with a view to preventing breakage in transit."

(4) "The whole of the switchgear, when erected, must be given three coats of *navel* paint."

(5) Conversation following the submission of a quotation for an alternating-current switchboard, embodying moving iron instruments, in response to inquiry specifying moving-coil shunted instruments:—

A: "I specified moving-coil instruments."
B: "Just so."
A: "But you have allowed for moving iron."
B: "Quite so, but the instruments you mention will not indicate on an a.c. circuit."
A (getting excited): "That's all right, but you have the same heating effect."

(6) An inquiry is received for a switch-panel for use with a 3-wire generator, 400 kW, 500 V d.c., and 800-ampere gear is specified in quotation. The inquirers receive quotation and 'phone to say that we have allowed gear twice as big as we should have done. Upon asking the reason for their criticism, we are told that, as the scheme is three-wire, the current will divide equally between the two outers, therefore 400-ampere gear should be specified!

And so on.

It is no exaggeration to state that if, in the inquiry stage, a full and lucid statement were given as to actual requirements and the conditions under which the gear in question would have to work, the pressure on the staffs of estimating departments would be reduced by 25 per cent. Take one instance of this kind. What is the good of sending an inquiry for a switchboard for controlling 3-wire d.c. generators running in parallel if no indication is given whether the machines are shunt or compound wound and, if the latter, whether there are split- or single-series windings?

Quality *versus* Price.

By ROBERT MARSDEN, M.M.A.E.

WHAT does the average buyer of electrical plant term a fair price? First of all it is essential to place your buyer under one of three headings:—(1) The purchaser with limited means—nowadays the most common; (2) the engineer of a concern who must not exceed a certain sum for his plant; (3) the "specification" man. Generally speaking, the last two types are easily dispensed with as knowing exactly what they want, they also know within a small margin what they are going to pay, and therefore do not present any real difficulty when you are called upon to meet their requirements. Therefore, we are left with the limited means man—invariably a difficult proposition.

As is often the case, it is assumed that he knows very little regarding electrical equipment. In 50 per cent. of these cases you receive a letter containing the sentence: "The equipment is required to drive a 'so-and-so' machine. Please quote your lowest price and best delivery." No particulars of speeds, horse power, pulleys, type of control, &c., are included. Unless it is a well-known machine, the details have to be obtained either by further correspondence (the worst method by far) or by a personal visit. The latter, if at all possible, is by far the better way, for it is impossible to gauge the personality and type of buyer from the letter heading of to-day. If you visit a man, you can show your interest in the problem in a practical way, and often decide everything on site. If you do not get in direct touch, it not uncommonly happens that you lose the order. This particular type of buyer has spent £500 on a machine and invariably wants it to be driven for about £25. In the design of present-day machinery particular features are incorporated, and probably to ensure real service the type of equipment required costs £50. These are days of severe competition, insomuch that it is possible with such a buyer for someone to come along with no reputation to lose and give him his £25 equipment.

What happens?

The thing is unsatisfactory. It repeatedly breaks down, and the buyer loses output; often the very features for which the machine was bought are lost, and last, but by no means least, the *machine operator loses faith in the electrical equipment, and his fears prevent both good work and output.* Therefore, you and the buyer are faced with the argument:—Quality *versus* Price. You know, but the buyer does not, the quality of the goods offered for the job, and if the buyer's price is £40 and your estimate £60, tell him the complete reason for the necessary extra £20? Here is a practical instance: To drive a certain flat-bed printing press, a buyer purchased a drum-controller equipment for £40 and it gave him excellent service. The same buyer was again in the market with a similar press to drive, but this time with an automatic feeder (for the paper); he wanted to run the press at top speed and output. He was quoted, correctly, a push-button control (start, stop, and inch) equipment, which is essential for giving the additional service required, for £60. The estimate was duly received, and it was read and scrapped immediately. *The estimate was not fully explanatory, and the buyer assumed it an unnecessary extravagance.* Without further consultation, he ordered a hand-operated controller elsewhere and suffered in consequence. You cannot blame the buyer for passing over your estimate under the circumstances, and, further, you are not respecting the confidence placed in you if you neglect to state fully why you put forward special features; once again, whilst B.E.S. Specification, 1923, stands electrically for a great deal, it conveys insufficient to the "man-in-the-street" buyer. Therefore tell him the MECHANICAL DETAILS of your design! Any machinery man will appreciate these point. You should see that he gets to know them.

Tell him how they are put together, and stop talking too electrically if your man is "at sea." If you must, and it is necessary at times, then make mechanical analogies. It pays, and you make a friend as well.

Electricity in French Mines.

The French mining regulations require that authorisation must be secured from the French Bureau of Mines for the use of electrical equipment underground in collieries. This has proved easy in the case of mines producing little gas, but quite impossible where they produce a great deal of gas. It is understood, however, that new regulations are now being formulated by the Bureau of Mines, and that they will be more liberal regarding the use of electrical equipment underground.

Rural Electrification and Agriculture.

Electric ploughing is the largest and most remunerative application of electric power in agricultural operations; the development of a suitable electrically-driven tractor for the purpose is the pressing need of the day.

By Major ANDREW McDOWALL, of Mungoswells.

THERE are to-day, broadly speaking, two new developments in the agricultural world—first, the application of electric power to land tillage, the driving of farm machinery, and the encouragement of plant growth; and secondly, the development of sugar-beet as a farm crop. The latter, owing to the subsidy, has for the present become the best, and, in fact, the only paying crop grown in our arable districts, and for this reason sugar-beet may be said to overshadow mean-time rural electrification; but let us remember that the beet industry is drawing in subsidy over £23 per ton of sugar produced, and that the State payments will steadily decrease, when it will be self-evident that the present boom is entirely artificial and that in reality the healthiest movement in present-day farming is the possibility which the Electricity (Supply) Act gives us of supplying our countryside broadcast with cheap power. It is only common sense to suggest that the development of machinery which will allow the ploughman to use this power should be pushed on, and thus with less physical labour to himself the ploughman may increase his daily output by 300 or 400 per cent. At present experiments have made it clear that electrically-driven ploughs can be profitably used. There is, however, a mild controversy as to the method of application, and by a coincidence the writer stumbled the other day on an article in the *Illustrated London News* of 1858, when the same problem was being discussed in connection with the application of steam to land cultivation. Each side then, as now, had its champions, and as all the world knows, the wire-winding sets, in spite of all the cumbrous and expensive gear involved, won the day.

What interests us now is the reason why the wire-winders established their undoubted superiority. It was found that the equipment employing the farm pressure steam of those days, and carrying with it boiler, water, and the heavy wheels necessary for firm grip, was (owing to the weight) almost impossible to manœuvre on land, except when the soil was in a dry condition; also that the coming and going of the engine across the field compressed and churned up the land to such an extent that the mechanical texture of the soil was affected, and the whole scheme of direct haulage was a failure. The wire-winder then carried the day, and as a mechanical method of power tillage reigned without question till the paraffin tractor showed that light, direct-haulage machines could with ease and profit be used on the land without damage to the soil.

This, then, is the position when we are promised a cheap supply of electric power in our rural areas, and the engineers are now making inquiry as to what can be done with their power when we get it in the farmyard. Their inquiries so far have not been too encouraging—a threshing mill running perhaps two days per week, a corn-crusher perhaps one half day, and a few small odds and ends are all they can see, and therefore they tell the farmer his load is unattractive, his line will cost him perhaps £400 per mile to connect up, and his power units will cost perhaps 3d. when delivered, and if the farmer's land is not right astride the power line he decides to let well or ill alone.

What the power engineer forgets to look at on his farm visits is the four or five pairs of horses filing away from the water trough and the tractor men placidly filling endless oil cans with which to stimulate their iron horses in their daily toil.

Why the engineer takes so little interest in this side of farm work it is difficult to say. Clearly in his student days he has been educated to look on anything outside a factory and off a tramway rail as quite outside the scope of his work. I know myself that, had I taken the advice of some well-meaning and senior professors, I would never have moved in electrical-tractor design, far less the actual construction of a tractor for land work.

Engineers unacquainted with the land make the mistake of looking at the farmer's engine shed as his power house, whereas it is only a convenience. The real power house is the stable, and it is only by bagging the tillage load from the horse that they can hope to give the much-talked-of cheap power; further, it is by tackling tillage work that the farmer will most substantially benefit from electric power.

Engineers should firmly grasp the fact that it is the ploughman with his single-furrow, horse-drawn plough that puts up costs to the arable farmer, and that the difference between the actual driving of a mill or milking machine by oil engine or electric motor is a very trifling affair, which will hardly be noticeable on the farm balance-sheet.

By this statement it is not intended to question the superiority of the electrical drive—there is no question about that—but no farmer will spend much on a connecting line if the total result is to be the scrapping of his present oil engine and the small saving he can hope for by the change-over.

When the farmer is convinced that by using electric power he can save substantially in his tillage department, then the whole position is changed. The power company will be as anxious to build the line and secure the increased load as the farmer will be to have it, and once the reliable, ever-ready electric drive is experienced, it will be only a question of a little time before the oil engines are weeded out and electrically replaced. The question of the day, therefore, resolves itself into the development of a suitable tractor. Early in 1923 the writer tried to impress this fact on the authorities in Whitehall and elsewhere; the suggestion, however, was before its time, and as there was then no sign of a State-aided rural-electrification scheme, no encouragement was given. I had, therefore, to carry on as best I could with the construction of a tractor which it was believed would link up our oldest and youngest industries and be of substantial benefit to both.

In considering tractor design, the question of the direct haulage of ploughs or indirect (by means of wire winding) first presented itself, and as a tractor carrying an electric motor can be built light, strong, and at

moderate expense, the temptation to use it in place of the wire winder, with its accompanying expensive and cumbrous gear, became irresistible. On the other hand, the difficulty of feeding a direct-haulage tractor, which must move freely about any irregular field and must not by any chance get entangled with its cable, seemed almost insurmountable.

It became clear that to solve this problem of feeding a radically new type of tractor would require to be designed, and this, after much delay, was finally achieved.

Continental experiments conclusively proved that to attempt to feed a tractor, moving round a rectangular block, by means of a trailing cable could only lead to trouble with the cable and danger to the attendant: this old-established method of rectangular working was therefore scrapped as impracticable, and it was decided that, as ploughing should be done in straight parallel lines, and as a trailing feeder cable can also only be safely handled in straight-line work parallel to the ploughing, these two circumstances should be combined, when a really foolproof and simple method of feeding at once emerges. This tillage scheme has already been ably described in detail by Mr. R. Borlase Matthews in the Electrical Review, July 2nd, 1926, p. 4, and nothing further is necessary here, but the advantages of this system of tractor feeding over the wire winder are not yet fully appreciated.

First, in the matter of expense, the wire-winding equipment will probably cost four times as much as a direct-haulage tractor. Wire-winders, again, will require a minimum of three, and probably four, men to operate, when the direct tractor requires but one. Depreciation will be heavy with wire-winding and light with direct haulage. The feeding of the direct-haulage plant from one point half-way down the furrow is infinitely easier than the two-point feeder scheme required by the best wire winders, and, in addition, feeding should never be done from the furrow ends, as there are other duties to be carried out there, such as picking up the new alignment, bringing the new plough into work, &c., which fully engage the attendant's time and attention. By the half-way, single-point, direct-feeding system, automatic movement of the feeder point is obtained, requiring only general supervision by the attendant and at a time when he is not engaged with other duties.

There is another advantage which electric tractors will have over all rivals. It will be possible (so reliable is the motor and its power supply) to pay the ploughman by results.

If a farmer attempted this with horse teams they would at once wear thin under the pressure, and the men would plough light to ease their sorrows. Paraffin tractors are too unreliable for piece work, and if it is attempted, the tendency is to race the tractor, plough a light furrow, generally scamp the job, and ruin the machine. With a well designed electrical machine, on the other hand, the motor has practically one speed and will run at that speed whether light or heavy loads are taken. In consequence, the ploughman gains nothing by light ploughing, and it is impossible for him to damage the equipment by over-speeding. Also, as the driver has heat and light, as well as power at his command, it becomes possible in good weather to work double shifts, and thus escape from that most fatal predicament of the horse farmer—being behind with his work and unable, when a favourable spell of weather presents itself, to jump on the job which, if timorously done, will mean success, and if delayed may mean failure of the crop.

In addition to the tillage and barn-machinery loads, the farmer with cheap power at his elbow will seek other methods of using it, and it is anticipated that a grinding load will soon develop. Well-built grinders and meal mills can now be obtained at reasonable cost, and farmers will soon learn the advantages of purchasing (through their unions) phosphate rock, lime, and other such materials in bulk, and grinding at home when time permits. It is, in fact, difficult to see the end of electrical developments in rural areas, but our distribution engineers must develop their system and supply cheap farm lines and cheap power.

The Commissioners and supervising officials have arrived early on the scene, and have duly justified their necessity by passing regulations and restrictions which have a crippling effect on distribution schemes and generally block progress. We well know what is going on in other countries where successful electrification is carried out. We have to stand the competition of those countries in our home markets, and clearly it is the duty of the Commissioners to bring us into step with our more progressive neighbours.

The payment of our national debts and the expense of providing, free of charge, a market for the competing goods of our foreign competitors are surely a sufficient handicap without the maintenance of a set of regulations, which practice in other countries has proved to be not only unnecessary, but unreasonable. Let the Commissioners and supply companies remember that the agricultural demand for electric power and equipment may in the not distant future be their best market, and that agriculturists will much prefer a roughish power line to a ragged balance-sheet.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

An Electric Carpet Washer.

An interesting electrical introduction to this country by Messrs. S. G. Leach & Co., Ltd., 26-30, Artillery Lane, London, E.C.1, is the Hamilton Beach carpet washer. As the machine is moved forward over the carpet an action similar to that of the human hand is produced, and two sponge-rubber brushes, rotating at 500 times a minute, scrub the sud of a special compound, H-B, into the fibres of the rug, and the dirt and grease in the carpet are instantly, it is claimed, dissolved. An ingenious semi-squeegee device prevents the solution from spreading, and the whole of the moisture is suctioned back into the receiver pan. Finally, a brush lifts and straightens the nap.

Electric Wax Baths.

The Ingleby electric paraffin wax bath, made by Ingleby Motors, Sweet Street, Leeds, has been installed in various hospitals and institutions throughout the United Kingdom for the treatment of neuritis, rheumatism and other complaints. Results of observations and tests have proved, it is claimed, that the apparatus has considerable healing value in itself, and is also useful as a preliminary for massage and other treatment. It is manufactured in three different types, large horizontal and vertical, and a small horizontal model for local treatment. Some designs are of white glazed fireclay, while others are of white enamelled iron, and all are fitted with self-contained heating apparatus and switches to control the temperature. The baths are wired up in the usual way from a plug or terminal box to a switch panel equipped with an ammeter, d.p. switch and fuses, and are designed for working at pressures of 200/220 V, a.c. or d.c.

A Three-Light Automobile Lamp.

Of particular interest to those interested in motor-car lighting is a 3-light electric lamp, fig. 1, which has recently been put on the market by the Runbaken Magneto Co., Tipping Street, Ardwick, Manchester. A main spotlight lamp, which, it is claimed, throws a quarter-mile beam, is supplied from

the car lighting system, and in addition are an auxiliary lamp and a red rear lamp. The auxiliary is intended to serve in the case of breakdown or during ordinary garage repair work, when the apparatus is used as a portable lamp and the additional bulb is supplied from a small 2-V battery contained in the case. The auxiliary can also be used as a "see-you-home" in the event of failure of the main lamp or the lighting system, and can be fed either from the main supply or from the battery. The rear light is intended for use during

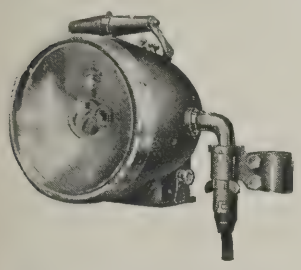

Fig. 1.—3-Light Automobile Lamp.

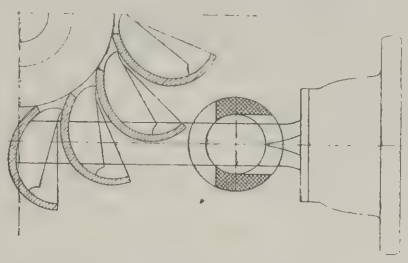

Fig. 2.—Deflector Diagram; Full-load Position.

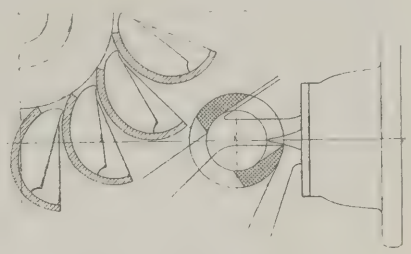

Fig. 3.—Position of Deflector at No Load.

parking, and is also supplied from the auxiliary battery. This lamp is exposed when a driving mirror at the back of the lamp is removed. When the mirror is replaced the locking device automatically switches off the light. A combined spot-light switch and charging indicator can be supplied for fitting to the dashboard. The lamp and its accessories are of nickel-plate finish.

An Electric Washer Combination.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2, is shortly placing on the market a new electrical domestic machine, the "Magnet" Wizard, fig. 4, which appears to be a distinct variation from the electrical domestic appliance being sold at present. Essentially it is a machine for washing and wringing clothes, but it will also perform several other important functions. Arrangements are

Fig. 4.—The "Magnet" Wizard.

made for the easy interchange of parts, and by the simple turning of a switch the machine can be used to make sausages and ice-cream, to mince meat and vegetables, and to clean and sharpen knives. The necessary apparatus for performing each separate function is attached to the general driving shaft, one motor being employed for all the operations. A plug-and-socket device is provided for taking the supply from the mains. The machine is compact in design, occupying little space, and entailing very little supervision. The manufacturers claim that it costs very little to run, and can be handled with safety even by a child.

The Pitman Water Turbine Regulator.

The cheap, reliable and automatic governing of water turbines is a matter of some importance, particularly in the case of small installations. An ingeniously simple deflector regulator has been designed by Mr. Percy Pitman, 25, Victoria Street, Westminster, London, S.W.1, to maintain constant speed on the impulse turbine at all loads, so that the turbine may be allowed to run continually without attention; the device is strongly constructed, becomes fully operative a few seconds after the main water supply has been turned on, and is said to enable a battery of storage cells to be dispensed with entirely in the case of a hydro-electric installation. The essence of the Pitman regulator, which is adaptable to existing water turbines, is a deflector; its various ports are so proportioned as to make the reactions of the two streams on the deflector equal and opposite, the deflector being in equilibrium at all positions. The power required to actuate it is thus very small, and any type of standard centrifugal or oil-pressure governor can be used to operate it; moreover, the deflector can be designed for practically any size of plant, even down to a 1/20-h.p. set. The accompanying diagrams, figs. 2 and 3, are self-explanatory: the deflector is arranged directly in front of the nozzle and embraces the jet, instead of being located above or below it; the water passage through the deflector being slightly constricted towards the outlet end, allows for instant action to take place on all load changes, however small. Fig. 3 indicates diagrammatically the position of the regulator when the whole load is suddenly thrown off the turbine, the deflector having been rotated by the automatic governor gear, diverting the whole of the jet of water momentarily from the wheel buckets. When economy of water is of great importance, the needle valve for reducing the flow of water can be interconnected with the deflector in order to permit of the whole or any portion of the load being instantly cut off without increasing the pressure in the pipe line. A master patent protects the deflector arrangement in this country and abroad. It has been tested at all jet diameters, we understand, with the following results: the normal speed of the turbine was 9 r.p.m.; when the whole load was suddenly thrown off, the speed of the machine did not rise above 926 r.p.m., or approximately 3 per cent. speed rise; no hunting was noticeable during the trials. Messrs. G. E. Milner & Co., Ltd., are the sole licensees for the granting of licences.

The "Emvee" Cord-grip.

The latest addition to the "Emvee" range of wiring requisites made by Metro-Vick Supplies, Ltd., Trafford Park, Manchester, is a special ceiling plate and cord-grip. The plate, while of handsome appearance, possesses no new features, but the cord-grip is a novel device. It is made of non-inflammable moulded insulating material, and is in two parts, as seen in fig. 5. The wiring of the device is very simple. The flexible is threaded through the cord-grip and connected to the porce-

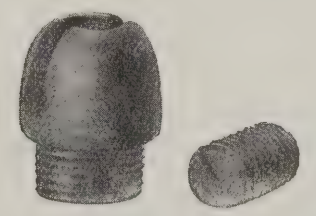

Fig. 5.—The "Emvee" Cord-grip.

Fig. 6.—Ceiling-plate and Cord-grip.

Fig. 7.—The Cord-grip in use.

lain in the usual way. The two leads are then opened out and the screw plug is inserted and tightened up with a screw-driver. There is no risk of short-circuiting, as the leads are kept well apart at the point of entry. It is claimed that the grip will sustain a weight of 56 lb. Fig. 7 shows the appearance of the finished job, while fig. 6 shows the application of the device to one of the company's ceiling plates.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The official report of the Campaign for the week ended February 5th states that electric demonstration houses were opened at Exeter and Hendon. Demonstration houses were to be opened during the current week at Glasgow (2), Birmingham, and Carlisle, and on February 22nd and March 2nd similar houses will be opened at Durham and Chesterfield respectively. Further houses will be opened shortly at Bath and Newcastle-on-Tyne. At Cardiff Messrs. Warden and Co. intend to run an all-electric house in conjunction with the Better Housing and Housekeeping Exhibition, which will be opened on February 22nd. The first Glasgow demonstration house attracted 6,476 visitors during the fortnight, and good attendances are reported from Walsall, Bishop Auckland, and the Denton House, near Manchester. The chairman of Bramhill Urban District Council has offered one of his own houses for demonstration purposes, and at Blackpool a five-roomed bungalow, electrically equipped, has been organised in connection with the *Blackpool Times* Health, Home and Fashion Exhibition. Glasgow Corporation Electricity Department showroom has taken 9,000 competition books. The travelling model house organised by the Birmingham Circle is doing excellent work, and was used at Wolverhampton during the exhibition period. The North-East Coast area reports increasing interest in the Campaign. This is being stimulated in some places by the children's competition. At Greenock a Campaign whist drive is being held on February 25th. A district officer for the Nottingham district states that, from experience to date, he is informed that on an average 75 per cent. of the visitors may be looked upon as potential consumers. The chairman of the North-West area has circularised a large number of supply engineers with a view to setting up more circles. The number of visitors attending the Wembley house has reached 600 per day, and not per week, as has been previously and incorrectly reported. The exhibition held at Wolverhampton attracted over 6,000 people in three days, and 3,000 people visited the exhibition held at Hampstead. An electrical exhibition was opened on February 7th at Falkirk, and the South Wales Electric Supply Power Co. will open an exhibition in Halesowen on February 14th.

In our last issue we reported that an exhibition in connection with the Campaign had been held at Wolverhampton. We are now able to reproduce a view of the display,

The Wolverhampton Electrical Exhibition.

which was held at the Public Baths. It will be seen that a wide variety of appliances was open to public inspection, including several types of fires, cookers, vacuum cleaners, wash boilers, and smaller devices. One section of the exhibition was arranged as a model bathroom, complete with electric geyser, towel rail, fire, shaving pot, and other articles. Members of the Electrical Association for Women paid an official visit to the show.

The "all-electric" house at Muirend, Glasgow, was visited by 6,500 people during the fortnight it was open. Two further "all-electric" houses at Shawlands, which have been arranged by the various local electrical interests in connection with the Campaign, were opened on February 7th and will close on February 19th.

The Exeter District Electrical Circle has opened a demonstration electric house, and it will be kept open until February 18th. The General Electric Co., Ltd., has supplied the complete equipment of the house, comprising "G.E.C." fittings and "Magnet" domestic appliances, and has provided a demonstrator. Mr. A. H. Brooking, of Messrs. Brooking Bros., electrical contractors, Exeter, is acting as secretary to the circle.

The front page of "Home Lighting News," No. 7, bears a map of Great Britain, upon which are marked the localities in which circles have been formed (109). Another feature of the issue is an illustration, plan, and details of the February campaign window display. The back page contains illustrations of six typical demonstration houses, giving particulars of attendance and expenses.

An Electricity Committee and Dutch Cables.

We reported in our last issue that the Salford Electricity Committee had proposed that all its members should proceed to Holland to investigate wages and conditions in the Dutch cable-making industry. At last week's meeting of the Council, however, the chairman of the Committee (Alderman Billington) withdrew the recommendation, explaining that, although he was in favour of a direct investigation, it would be sufficient for the chairman, deputy-chairman, and the engineer to pay a visit to Holland. A councillor suggested that all the required information could be obtained from the appropriate Government department.

Floodlighting for Night Work.

It will be recalled that the grand stand on Epsom Downs was destroyed by fire last year, and it was decided to proceed immediately with the erection of a new and larger structure to take its place. The coal dispute interfered with the progress of the work, and it became apparent that in order to have the new stand ready by Derby Day in June next it would be necessary to carry on at night. Accordingly the electrical contractors, Messrs. Bell Bros., Cannon Street, E.C., arranged with the British Thomson-Houston Co., Ltd., to resort to floodlighting at night. For this purpose 16 16 "B.T.-H." Type 786 floodlight projectors with diffusing mirror reflectors and 1,000-W "Mazda" lamps were mounted on eight masts ranging in height from 10 to 40 ft., erected at suitable points around the site. It is claimed that almost daylight conditions are thus obtained and that the work proceeds as well by night as by day.

Something similar has recently been done at Weston-super-Mare, where the town authorities are engaged on a scheme to lock the tidewater at Glentworth Bay, and so enable visitors to have the benefit of tidal water at all times of the day. It was necessary to proceed with the work between tides at all times of the day and night. Messrs. Nott, Brodie & Co., the contractors, consulted the General Electric Co., Ltd., upon the matter, and the result has been the installation of a number of "G.E.C." floodlight projectors equipped with 1,000-W "Osram" lamps, which now provide adequate illumination for the carrying out of the work through the night.

The Wholesalers' Dinner.

The annual dinner of the Electrical Wholesalers' Federation is to be held on February 24th. A number of prominent men have promised to attend, including Sir Andrew Duncan, the Chairman of the Central Electricity Board, Viscount Peel, and Col. Moore-Brabazon.

Paint Industry Amalgamation.

Messrs. Pinchin, Johnson & Co., Ltd., have entered into an agreement with Messrs. Docker Bros. whereby the two businesses will be associated.

Modern Restaurant Lighting.

The Café Verrey, Regent Street, W., has recently been rebuilt, and the opportunity was taken to equip the building with a thoroughly up-to-date lighting installation. The effectiveness of this can be gauged from our illustration of the main restaurant. The decoration in this hall is carried out on "Empire" lines, and the principal illumination is provided by three centrally-suspended ceiling fittings equipped with 36-in. cut glass bowls surrounded by hand-painted silk valances. A number of wall brackets supplement these and give high-intensity but, at the same time, softly-diffused illumination. Another large apartment, the ball room, is equipped with seven massive mahogany fittings, 36 in. in diameter, supporting hand-painted silk shades. Mahogany wall brackets in consonance with the main fittings are also installed. The banqueting hall has for its main lighting

The Café Verrey, Regent Street, W.

seven 20-in. diameter cut-glass bowls, each fitting having four arms which carry smaller lamps. In the entrance lounge are 12 flambeau-type wall brackets and a massive central ceiling fixture. All the fittings were designed specially by the Fittings and Fixtures Department of the General Electric Co., Ltd., and "Osram" gasfilled lamps are employed. The installation work was carried out by Messrs. Foote & Milne, 15, Stockwell Road, S.W.9.

Lamp Business in Switzerland.

The Philips Lampen Gesellschaft is the name of a new company which has just been formed in Zurich (3, Rue Thalberg), to handle the business in Philips lamps, &c., in Switzerland.

German Exports to New South Wales.

The *Board of Trade Journal* states that during October last New South Wales imported German electrical appliances valued at £1,104 and vacuum cleaners valued at £4,187.

A French View of the British Market.

The French Commercial Attaché in Great Britain has made some interesting observations on the subject of our new Electricity (Supply) Act. After referring to the object of this measure, he reports that the principal British electrical manufacturers have already revised their production programme in anticipation of an increase in the demand, and that several among them during the past few months have even doubled their staff. Importers on their side, he adds, have been equally active. The Commercial Attaché notes also growing activity among the manufacturers of wire, meters, and accessories. Building contractors, he says, are now adopting the system of electrically equipping most of the new houses, as it is foreseen that there will be a general adoption of electricity for domestic purposes. With regard to the houses already constructed, it is estimated that only one-fifth of the 7 to 10 million houses which are within one or other of the distribution systems are already supplied with adequate equipment. The Commercial Attaché therefore emphasises that for electric household appliances, as well as accessory material, new openings are arising in England, and he draws the attention of French export manufacturers to this market.

Big South American Scheme.

A message from Brussels published in Berlin, states that the Compania Hispano-Americana de Electricidad, of Madrid (the successor to the German Transmarine Electricity Co.), proposes to establish in the new harbour at Buenos Ayres a generating station of 900,000 h.p., which will be "the largest works hitherto constructed," and will be equipped with 12 turbines, each of 75,000 h.p.

A Peruvian Hydro-Electric Contract.

It is stated that the Bergmann Electricity Company, of Berlin, has received an order from the Government of Peru in connection with the impending establishment of a hydro-electric works at Tamboraque, near Callao. The negotiations concerning the execution of the general scheme, which contemplates the erection of a station of 12,000 kW and the construction of a high-pressure line of a length of about 25 miles, have not yet been concluded.

German Trade in India.

A new concern is reported to have been formed in Berlin under the title of the A.E.G. India Electric Co., Ltd., with a share capital of 20,000 marks. The company is to regulate the representation of the A.E.G. and allied concerns in India.

A Bradford Exhibition.

Under the auspices of the Bradford Corporation Electricity Department, an exhibition of mercury vapour ultra-violet ray equipment was opened at the electricity showrooms in Sunbridge Road, on February 2nd, by the British Hanovia Quartz Lamp Co., Ltd., and continues until February 12th. Mr. A. K. James is in attendance to explain to inquirers the healing powers of this apparatus.

Irish Electrical Imports.

The imports of electrical goods, excluding machinery, into the Irish Free State during December last, amounted to a value of only £37,004, as compared with £47,404 in the corresponding month of 1925. The aggregate imports during the whole of the past year are returned at £450,249, as compared with £403,585 in the preceding year.

Chinese Notes.

The wireless station at Pehchiko, Nanking, was opened on November 28th last, and it is now in direct communication with most of the other Chinese stations. The cost for commercial messages is the same as that for telegrams.

The Telephone Administration of Tientsin is planning the installation of modern automatic telephones in the foreign concessions. The work of installing the equipment will commence almost immediately.

In order to facilitate the transmission of military dispatches, the provincial authorities of Shantung have decided to install a long-distance telephone system throughout the province, commencing with the ten districts in the Tsinan circuit. Preparations for the installation are now being made.

The long-distance telephone service between Mukden and Chengkiatun has now been opened to the public.

Trade Announcements.

During the recent terrific storm which raged throughout Scotland, the Scottish branch offices of the RAWLPLUG CO., LTD., at 19, Wilson Street, Glasgow, were completely demolished, and stock to the value of many hundreds of pounds was destroyed. The disaster occurred in the day-time, but, fortunately, the entire staff escaped injury. Until further arrangements are made, all the Scottish business will be transacted through the head office in London.

REDMANOL, LTD., has removed to 82, Victoria Street, S.W.1.

New Catalogues and Lists.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—Booklet B.C. 4,335 (32 pp.), describing "Gecophone" radio products, including headphones, loud-speakers, crystal detectors, condensers, l.f. transformers and chokes, filament rheostats, super-heterodyne components, &c. Illustrated and priced.

MESSRS. MAVOR & COULSON, LTD., 47, Broad Street, Mile End, Glasgow.—February calendar-blotter advertising the "Samson" coal-cutting machine. Also Pamphlet No. 261/5, illustrating and describing the company's ironclad control pillars for mining and industrial service.

ELECTRIC FIRES, LTD., Norwich.—Supplementary Folder No. 5, containing illustrations, particulars and prices of the company's "Heatrae" imitation coal fires.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—A series of illustrated descriptive pamphlets dealing with outdoor h.p. switchgear; oil-immersed circuit breakers; earthing resistances; air-break series-parallel starters; and d.c. and a.c. drum controllers and resistances.

MESSRS. J. BLAKEBOROUGH & SONS, LTD., Brighouse, Yorks.—A comprehensive catalogue (No. 100, 228 pp.) of valves and auxiliaries for steam power plant. Each item is illustrated and full dimensions and descriptions are given. A code is included for the use of buyers.

MESSRS. W. E. BURNAND & CO., 66-106, Shoreham Street, Sheffield.—A pamphlet illustrating a machine converted from a generator to a rotary convertor by the firm.

Messrs. Prideaux & Co., Ltd., Midland Lamp Works, Macdonald Street, Birmingham.—A priced and illustrated catalogue of electric light brackets, lanterns, pendants and standards, and electric signs.

Mr. O. N. Beck, 11, Queen Victoria Street, E.C.4.—An illustrated pamphlet dealing with the "Hurricane" electric hand blower for cleaning machinery, &c.

The Hart Accumulator Co., Ltd., Stratford, E.15.—February calendar-blotter advertising "Hart" batteries.

Messrs. Hans Renold, Ltd., Burnage Works, Didsbury, Manchester.—"The Power of the Press," an illustrated folder dealing with chain driving in the printing industry.

Messrs. W. Crockatt & Sons, Ltd., Darnley Street, Glasgow.—Illustrated pamphlet describing the "Simplex" patent electric salinometer for indicating impurity in condensate and boiler-feed water.

Hopkinson Induction Motors, Willesden Lane, North Acton, London, W.3.—Monthly stock list of induction motors.

Mr. E. J. Baty, 157, Dunstable Road, Luton.—Leaflet describing the "Baty" condenser, and quoting terms for giving a "wireless doctor" service.

Radio Instruments, Ltd., 12, Hyde Street, New Oxford Street, London, W.C.1.—Folder describing the company's new rectifier for battery charging.

British Thomson-Houston Co., Ltd., Crown House, Aldwych, London, W.C.2.—Miniature edition (exact replica), measuring 6¼ in. by 4¾ in., for pocket use, of the company's 120-page catalogue of electric wiring supplies and domestic appliances. Pamphlet L.385a, dealing with "Pearl Mazda" vacuum and gasfilled lamps. Priced.

Messrs. F. & A. Parkinson, Ltd., Guiseley.—Abridged list U/6, giving tabulated details and prices for two- and three-phase induction motors from 1 to 1,000 b.h.p.

Messrs. John Moores & Co., Ravald Street Works, Salford.—February price list of various insulating materials for electrical and mechanical purposes.

Neron Lamps, Ltd., 1-3, Brixton Road, London, S.W.9.—Folder price list of "Bilux" lamps.

The Electric Heating Co., George Street, Croydon.—List No. 267, describing and fully illustrating the "Elect" electrical ovens and cookers; also a 36-page pamphlet containing priced and illustrated information regarding "Elect" fires, cookers, irons, and other domestic appliances.

Messrs. I. Calvete, Ltd., 11, Little St. Andrew Street, W.C.2.—An illustrated and priced brochure dealing with "Icall" and "Everay" electro-medical appliances.

Messrs. Watson & Sons (Electro-Medical), Ltd., 43, Parker Street, Kingsway, W.C.2.—A new edition of "Artificial Sunlight," a publication illustrating and describing the company's mercury-vapour, tungsten, and carbon arc lamps. Priced.

Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—February stock list of dynamos and motors.

Marconiphone Co., Ltd., 210, Tottenham Court Road, W.1.—Coloured trade poster; also illustrated and priced folder descriptive of the new indirectly-heated cathode KL.1 valve for operation off the domestic mains.

Bankruptcy Proceedings.

Ernest Frederick Woodgate, 7, St. John's Terrace, Weymouth, Dorset, and Brunswick Cottage, Weymouth, electrical engineer.—This public examination was held recently at Dorchester. The statement of affairs showed liabilities of £155, against assets of £224. In October, 1922, debtor commenced business with a capital of £30. He had not kept a complete set of books, and no accounts had been prepared showing the profits or losses. Several creditors obtained judgments against him, and an execution was levied on his effects early in January, which was paid out. During the strike of last year and when he was being pressed, his solicitor advised him to file his petition. The examination was closed.

F. H. Thomas, electrical engineer, carrying on business with W. E. Evans as Thomas & Evans, at Salubrious Chambers, Salubrious Passage, Swansea.—Bankrupt discharged as from January 1st, 1927.

C. G. Hofman (L. J. Chambers & Co.), wireless components manufacturer and electrical engineer, Andrews Works, Cowthorpe Road, Wandsworth Road, S.W., and 7a, Victoria House, South Lambeth Road, S.W.—Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C.1, released January 1st, 1927.

J. N. Davenport and L. A. Hackett (Davenport, Hackett and Co.), electrical engineers and contractors, 36, Spring Gardens, Manchester.—Last day for proofs for dividend, February 15th. Trustee, Mr. A. Grierson, 21, Spring Gardens, Manchester.

J. H. Dollittle (Zenith Radio Manufacturing Co.), wireless engineer, Virginia House, Portsmouth Road, and 17, Park Street, Guildford.—First and final dividend of 2s. 3½d. in the £, payable February 16th by the Official Receiver, 29, Russell Square, W.C.1.

W. R. Squire, electrical engineer, 11, Steward Street, Spring Hill, Birmingham.—Trustee, Mr. C. Hoult, Official Receiver, 191, Corporation Street, Birmingham, released January 26th.

G. R. Sims, motor and electrical engineer, Hartlepool Street, Thornley, Durham.—Receiving order made February 1st on debtor's own petition.

Private Arrangements.

Southern Sales Co., Rye, Sussex, electrical and radio dealers.—A meeting of creditors was held on January 31st at Winchester House, E.C., when the chair was occupied by Mr. E. H. Hawkins, representing the largest creditors. A statement of affairs was presented which disclosed a surplus of assets over liabilities of £343. The liabilities totalled £4,681, and there were also unsecured loan creditors for £2,448. The net assets were £7,472. The solicitor for the debtors said that he had called the meeting in conjunction with Mr. Fox, the accountant who had prepared the statement of affairs. The business was started by Mr. G. W. Page and his son in 1923. Shortly afterwards a Mr. Garrard became a partner, and in 1924 the business was transferred to Rye. The turnover then increased very rapidly, and in his (the solicitor's) opinion the present position had been brought about by over trading. Various loans totalling £2,448 had been obtained from time to time from friends of the partners. With the exception of £500 of that money, the loan creditors were prepared to stand aside provided some scheme was adopted. It was thought that if the business could be carried on, there was every prospect of the creditors being paid in full. Another suggestion was that the business should be converted into a limited company, the creditors taking first debentures and the loan creditors second debentures. Mr. Page, junr., had retired from the business. For the two years ended February 28th, 1925, the accounts showed that there was a trading profit of £624 on a turnover of £12,219. In the following year there was a further profit of £730, the turnover being £13,651. It was decided that a committee of five should be appointed to investigate the position and report to the creditors as to the best method of securing the continuance of the business, subject to no proceedings being taken against the assets of the business, and to further purchases being for cash only. The committee appointed consisted of Mr. C. Latham, Mr. E. H. Hawkins, and representatives of the North British Rubber Co., the Vacuum Oil Co., and Moseley & Sons.

Company Liquidations.

Watson, Jones, Ltd., wireless and electrical factors, 235a, Blackfriars Road, London, S.E.—A meeting of the creditors was held on February 2nd at Caxton Hall, Westminster. Mr. George Dickinson, certified accountant, of Messrs Leonard Dickinson & Co., 82, Victoria Street, S.W., who presided, stated that he had been appointed to act as the liquidator in the voluntary liquidation. The statement of affairs presented disclosed unsecured liabilities of £8,330 and the assets totalled £4,725, from which had to be deducted £194 for preferential claims, leaving net assets of £4,530, or a deficiency of £3,800. The asssets included cash at bank and in hand, 11s. 3d.; stock-in-trade, £2,232, estimated to realise £1,500; shares in the B.B.C., £10 11s. 3d.; and sundry debtors, £3,174, estimated to produce £2,750. The issued share capital of the company was £4,579, so that there was a deficiency, as regarded contributories, of £8,379. The liquidator said that stock had been taken at cost or market value, and he was informed by Mr. Watson, the managing director, that it had been taken on the lowest possible basis. The book debts were practically all good. Mr. Dickinson said that the company was formed in December, 1925, with a nominal capital of £10,000, of which £4,579 had been issued. £1,579 had been subscribed in cash, and £3,000 worth of shares were allotted to the three partners of the old business which was taken over. Since the inception of the company the turnover had been about £45,000, but the expenses had been so heavy that they had more than wiped out the profit.

In reply to Mr. P. Houston, of Messrs. Corfield & Cripwell, the liquidator said that there were certain suing creditors, and that was one of the reasons why the company had decided to wind up. The company had never made a profit. The four directors were Messrs. Watson, Jones, Eckford, and Bowditch.

Mr. Houston said that the creditors ought to have some figures as to the trading, because it seemed curious that a concern which was formed as late as the middle of December, 1925, and at that time had a surplus of assets over liabilities of £3,000, should within 12 months be in the present position.

The liquidator said that the turnover was £44,726 for the 13 months of the company's trading, and there was a gross profit of £4,456. The gross profit was absorbed by the following expenses:—Wages, £3,300 (that figure included directors' salaries); motor-van expenses, £1,090; travellers' commission, £525; rent, rates and taxes, £636; bad debts, £617; and other small items, bringing up the gross total to £7,721 Three of the directors had drawn £6 per week, and one £7 weekly.

Mr. Watson, a director, said that before the company was formed, they got out a balance-sheet, and it was evident that it would be difficult to carry on without additional capital. Mr. Eckford then came along and offered to put up capital and found certain friends also willing to put up money. The company was formed because Mr. Eckford insisted on it being done. The partnership had been going about 3½ years. The stock was principally wireless apparatus.

After some further discussion, Mr. Hunter, of the Wireless and Radio Trades Guardian Association, said that the case was one where a creditors' nominee ought to liquidate the

company. He proposed that another liquidator should be appointed in the place of Mr. Dickinson. The resolution was duly seconded and, on a show of hands, was carried. A poll was demanded, however, and the liquidator declared that the resolution was lost. An amendment for the appointment of a joint liquidator was also lost. A resolution was then passed confirming the voluntary liquidation, with Mr. Dickinson as liquidator.

NATIONAL WIRELESS CORPORATION, LTD., 112, Westminster Bridge Road, S.E.—The first meeting of the creditors and shareholders of this company was held last week at Carey Street, W.C. Mr. E. T. A. Phillips, Official Receiver, reported that the winding-up order was made last December on the petition of a creditor for £60 in respect of £50 lent to the company and law costs. The company was formed in February, 1925, with a nominal capital of £1,000 to carry on business as radio and general engineers. Subsequently it was decided to increase the capital to £20,000, and at the date of the winding-up order the issued capital was £3,363. The intention was to open retail shops and a wholesale depôt to deal in wireless apparatus. In August, 1925, the capital was increased to £3,500, and a shop was opened at Raynes Park and a warehouse in Little Pulteney Street. The property at Raynes Park had been disposed of to a company, part of the consideration being a debenture for £250 charged on the property. In 1926 an arrangement was made by the directors with a Mr. G. E. Hill and the British Fiduciary Co., Ltd., for the latter to secure subscriptions for the shares on a commission basis. In the transactions which followed, shareholders of the Burndept Wireless Co. were invited to hand over their shares in exchange for the shares of this corporation, and as a result 3,552 Burndept shares had been obtained. Some of the number had taken action against the corporation to obtain an injunction restraining it from acting on their application for shares and from parting with the proceeds of sale of their shares in the Burndept Company, the allegation being that the shares were obtained from them by misrepresentation; it was understood that some of those actions had been settled by Mr. Hill. Various sums had been paid to Mr. Hill as commission. The liabilities of the corporation amounted only to £396, and as the assets were valued at £322, the creditors would doubtless receive a substantial dividend, but the shareholders, whose loss was estimated at between £2,000 and £3,000, could not hope for any return for their money. In the absence of any resolution, the liquidation was left in the hands of the Official Receiver.

ELECTRIC LIGHT AND POWER CONTRACTS FINANCE CORPORATION, LTD.—A petition for the winding up of this company has been presented to the High Court by Messrs. H. Saunders, Ltd., of 40-41, Great Charles Street, Birmingham, and will be heard in London on February 15th.

BRITISH ELECTROLYTIC ZINC CO. (ISHERWOOD PROCESS), LTD.—Winding up voluntarily. Liquidator, Mr. E. Fairweather, Pinners' Hall, Austin Friars, E.C. Meeting of creditors, February 16th, at Pinners' Hall. Particulars of claims to the liquidator by February 21st.

UNIVERSAL RADIO SYNDICATE, LTD.—A meeting of members is called for March 9th at Marconi House, Strand, W.C., to hear an account of the winding up from the liquidator, Mr. F. A. Walrond.

RADIO PHONOPORE AND ELECTRICALS, LTD.—First and final dividend of 2s. 8d. in the £ payable February 28th at 3, Frederick's Place, Old Jewry, E.C.

BRITISH BROADCASTING CO., LTD.—Winding up voluntarily. Liquidator, Sir J. C. W. Reith. A meeting of creditors was held at the Hotel Cecil on February 7th, when the voluntary liquidation was confirmed. (This notice is purely formal, all creditors have been or will be paid in full.)

NEUTRON, LTD.—A petition for the winding up of this company has been presented to the High Court by Messrs. M. & J. Macrae (Macrae Bros.), wireless manufacturers, St. James' Avenue, West Ealing, creditors, and will be heard in London on February 15th.

RADIO CABINETS, LTD.—Winding up voluntarily. Liquidator, Mr. O. A. Hibbert, Capel House, 54, New Broad Street, E.C.2. Meeting of creditors at Capel House on February 15th. Particulars of claims to the liquidator by March 15th.

UNIQUE WIRELESS CO., LTD.—A meeting of creditors was held on February 4th at 132b, Regent Street, W. Liquidator, Mr. A. S. Hobbiss, 9, Beachcroft Mansions, Streatham, S.W.16.

Dissolution of Partnership.

W. D. FLETCHER and H. CALDWELL, electrical supplies merchants, 86, Bath Street, Glasgow.—Messrs. Fletcher & Caldwell have dissolved partnership on the retirement of Mr. Fletcher. Mr. Caldwell will continue the business on his own account and in his own name.

Indian Cable Sports.

We have received interesting particulars of the first annual sports of the Indian Cable Co., Ltd., which took place at Tatanagar, B.N. Railway, on Saturday, January 15th. The factory of the Indian Cable Co. is under the control of British Insulated Cables, Ltd. It is now in its fourth year, and combines wire-drawing and cable-making. It is the only works of its class in India. At the sports referred to the events, which were keenly contested, comprised the usual flat races, high and long jump, putting the weight, and the more spectacular items, such as sack fight, obstacle race, and wrestling. The arrangements were carried through by the Employés' Welfare Committee, which includes amongst its activities, football, cricket, badminton, volley ball, a dramatic club, and a lending library. When one considers the nationalities, tongues, tribes and castes covered by the word "Indian," one commences to realise the difficulties to be overcome in arranging competitions. Hindi, may be likened to Esperanto, a universal language of the North, but it fades away in Central India, and on the sports ground could be heard Punjabi, Nepali, Urdu, Bengali, Hindustani, Santali, Ho, Tamil, Telugu, Malayalam, Kanarese, and Gujarati. North, South, East and West had met to try their skill, individually, and they intermingled in team events. Caste and creed were forgotten and the spirit of sport reigned supreme. Coolies and Rejas who had never before seen an organised sports meeting, competed in the events for novices, the prizes of clothing being supplied by Mr. R. B. Paul (Calcutta), the managing director. The championship cup, given by Mr. F. W. Leake, director, was won by M. Joseph (Madras), of the cotton covering department, with 9 points, P. C. Chatterji (Bengal), of the wire mill, finishing a good second, with 7 points. Brawn met brains in the final of the tug-of-war, the general office being unable to hold the more robust wire mill team. In all it was a most successful meeting, and marks a step in linking up the Empire, not only with cables, but with the bonds of good fellowship.

New Domestic Appliance Venture.

At last week's meeting of John Shaw & Sons, Ltd., Wolverhampton, Mr. G. Terrell (chairman) said that the company had launched out into a new field of activity at Wolverhampton by the opening of an electrical department. They had found that the thousands of ironmongers with whom they did business throughout the country were to some extent extending their operations to the sale of domestic electrical appliances. The department had barely had a month's trial. It would be developed on the lines of the old business. It would not involve them in any new establishment expenses, and would keep them in the forefront as a distributing house. It would, of course, take some little time to build up, but he was hopeful that it would result in substantial profits.

Callender's Hospital Fund.

We have received a copy of the 24th annual report of Callender's Hospital and Distress Fund. This shows that a total of over £880 was distributed between a number of hospitals and kindred institutions; Guy's Hospital received £250, the Erith and District Hospital £105, and the Metropolitan Convalescent Institution £110. In addition to this, 609 hospital letters were issued; 239 surgical appliances were provided at a cost of £102; 120 pairs of spectacles were provided, costing £34; and in a number of other directions the Committee, of which Mr. H. Bragg is chairman and Mr. J. W. Giles hon. secretary and treasurer, did excellent work.

The Shipping, Engineering, and Machinery Exhibition.

This biennial exhibition is to be held at Olympia from September 8th to 24th next. The organisers, Messrs. F. W. Bridges & Sons, Ltd., Avenue Chambers, Southampton Row, W.C.1, inform us that 90 per cent. of the available space has already been booked, mainly by previous exhibitors. Arrangements are being made to invite overseas buyers, and a number of engineering institutions are being requested to pay official visits to the exhibition.

Company Law Amendment.

Parliament reassembled on Tuesday last. One of the first matters which will receive consideration this session is the amendment of the existing company law. *The Times* says that a Bill for this purpose will be introduced into the House of Lords, based upon the recommendations of the Departmental Committee which reported last year. The necessity for two meetings for the passing of a special resolution will be dispensed with, and the Bill will prevent directors from contracting out of all liability for loss except when it is due to their "wilful neglect or default." An undischarged bankrupt will not be permitted to be a director or to take part in the management of any company without the leave of the Bankruptcy Court. The investigation and prosecution of offences will be facilitated, and it is hoped to make it less common for offenders to escape prosecution when a company is wound up voluntarily. Additional facilities will be given to shareholders for obtaining copies of the balance-sheet, and the accounts of holding companies must state how the aggregate profits and losses of their subsidiary companies have been dealt with in the accounts. House-to-house hawking of shares will be prohibited, and steps will be taken to hamper the dishonest touter of shares by making it compulsory to disclose a certain minimum of information which he may find it inconvenient to give.

Book Notices.

"Official South African Municipal Year Book, 1926-27." Edited by W. P. M. Henderson and F. G. Pay. (Pp. 505 and tables.) London: E. G. Allen & Son, Ltd., 12 and 14, Grape Street, W.C.2. Price 25s. net.—This latest edition of the standard municipal compendium for South Africa and Rhodesia has again been brought up to date. All phases of municipal activity are dealt with, the business of electricity supply receiving ample treatment. It is noted that 19 new undertakings were laid down during the past year. Even greater developments may be expected when the Electricity Supply Commission is in a position to supply electricity in bulk from its super-power stations. One of the tables gives full particulars of the plant installed, &c., in municipal power stations.

"The Electrical Trades Directory and Handbook, 1927" ("The Blue Book"). (1,432 pp.) London: Ernest Benn, Ltd. Price 25s. net.—This is the 45th consecutive issue of this directory. The principal features are retained, having been brought up to date. In particular, the section dealing with the law relating to electricity supply has been revised in the light of the new Electricity (Supply) Act. An innovation is the provision of a celluloid thumb index to the various sections of the work.

"A Handbook of Physics Measurements." By E. S. Ferry. Vol. I. Fundamental Measurements, Properties of Matter and Optics. Second edition, revised. Pp. xii+288; figs. 162. Price 12s. 6d. net. "Laboratory Manual for Automotive Electricity." By W. R. Varner and F. C. Smith. Pp. ix+199; figs. 157. Price 10s. net. "Electro-Organic Chemistry." By C. J. Brockman. Pp. xi+381; figs. 15. Price 25s. net. London: Chapman & Hall, Ltd.

"Science Abstracts" (A and B). Vol. XXX. Part I. No. 349 and Indexes to Vol. XXIX. London: E. & F. N. Spon, Ltd. Price 3s. each.

"Machine Tool Driving and Feed Gear Poxes." By H. C. Town, F.R.S.A. "Some Considerations in the Design of Spur and Helical Gearing." By H. Walker, B.Sc. The Association of Engineering and Shipbuilding Draughtsmen. Price 2s. each.

"Technologic Papers of the U.S.A. Bureau of Standards," No. 330, "Resistance of Conductors of Various Types and Sizes as Windings of Single-Layer Coils at 150 to 6,000 kilocycles" (5 cents).

"Gramophone Tips." 1927 edition, has been received from Mr. H. T. Parnett, M.I.E.E., 123, High Street, Old Portsmouth (price 1s. post free). It contains, in addition to the author's excellent "tips," very eulogistic references to the electrical system of recording which has been adopted.

"The Practical Electrician's Pocket Book, 1927." Edited by H. T. Crewe, M.I.Mech.E. Pp. 602+xci; fully illustrated. London: S. Rentell & Co., Ltd. Price 2s. 6d.—In this 29th edition of the above pocket book many of the chapters and sections have been revised, and new ones have been added. The revision work includes the sections on illumination and lamps, and also that on gas, oil, and petrol engines. The new sections deal with fault localisation, a.c. motors, installation testing, and other subjects of interest to the electrical engineer. The section on central stations has again been enlarged.

Scientific Papers of the U.S.A. Bureau of Standards, No. 537: "Formula for the Inductance of a Helix Wire made with Wire of any Section" (25 cents). No. 538: "Spectral Energy Distribution of the Light Emitted by Plants and Animals" (10 cents).

"History of Radio-Telegraphy and Telephony," by G. G. Blake. Pp. xix+425; illustrated. London: Radio Press, Ltd. Price 25s.

"The New Electricity Act," by W. S. Kennedy. Pp. 142. London: Ernest Benn, Ltd. Price 6s. net.

E.D.A. Conference Alteration.

We are informed that as Mr. Morshead finds himself unable to fulfil his engagement to read a paper on "Refrigeration" at the E.D.A. Conference on March 18th, his place will be taken by Mr. N. E. Barber, who will deal with the same subject.

Fulham Civic Week.

The first Civic Week ever to be held by a London borough commenced at Fulham last Saturday. One of the principal features of the week is an exhibition, at the Fulham Baths, of the various industries connected with the Borough, and it is pleasing to note that electricity is well to the fore. The Borough Council Electricity Department has an exhibit occupying six stands showing the domestic application of electricity; various types of domestic apparatus are displayed, and the exhibit is arousing considerable attention. Another interesting exhibit is that of Mr. E. R. Armfield, builder and electrician.

For Sale.

Reigate Corporation invites offers for surplus generating plant installed at the Electricity Works, Wray Common Road. By order of the joint receivers and liquidators of Eastwood, Swingler & Co., engineers, &c., of Osmaston Road, Derby, Messrs. Richardson & Linnell will sell by auction at St. James' Sale Rooms, Derby, on March 8th, the freehold property, plant, buildings, and machinery, &c. (See our advertisement pages to-day.)

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

Messrs. James Forster & Co., reporting on February 5th, state that so long as the lead market here is glutted with extra supplies from the Continent there can be no hope of any alteration in present conditions. On the other hand, an improved demand from consumers both here and on the Continent, especially if coinciding with a decrease in arrivals, would result in a sharp recovery from the present low level of values.

Czech-German Co-operation.

A scheme is being promoted for the transfer of the Podenbach Machine Works, belonging to the Bohemian-Moravian Electrotechnical Works (Krizik) to a new company, in which the shares will be held in equal halves by the present owning company and the Berlin A.E.G., and in this way the new concern will have the advantage of the patents of the American General Electric Company. The other works of the Krizik Company—the cable and insulator works in Bodenbach, the Chaudoir Metal Works, and the Karolinenthal Works—are to be combined into a single company. The Karolinenthal Works will be extended so as to produce high- and low-pressure apparatus and complete switchboard installations.

British Manufacturers' Representatives in Leningrad.

A correspondent states that the arrival in Leningrad is reported of Messrs. Richard and Simons, of the Metropolitan-Vickers Company. In the course of a conversation with a representative of a Moscow newspaper, they are stated to have said that the company was at present executing orders for electrical plant for Russia of the value of 10,000,000 roubles. Two turbo-generators of 20,000 kW were in hand for Baku, while the installation had been completed in Leningrad of a turbine of 30,000 kW for the Krasni Oktyabr station. The company had received orders for the construction of a turbine of 45,000 kW, and for two turbines for the Moscow combination (Moges) of 17,600 kW. It was added that the object of the visit was to enter into negotiations respecting the company's further participation in the electrification of Russia.

Patents in Esthonia.

The *Board of Trade Journal* states that the Esthonian Legislature has passed a law providing for the registration of patents and trade marks belonging to British subjects which were registered in Russia prior to February 24th, 1918. Applications must be sent in by May 23rd next.

Lamps by the Million.

The General Electric Co., Ltd., claims to have made over 200 million "Osram" lamps of all kinds, from the giant lighthouse lamp, which is 2 ft. long, to the smallest pocket torch lamp. The company continues to receive very large orders, among the latest being one from the Admiralty for 215,000, and another from the General Post Office for 150,000.

Lighting and Power Notes.

Aldershot.—Electricity Scheme.—As the result of a conference of representatives of the Town Council, the Farnborough, Farnham, Fleet and Frimley Urban District Councils, and the Hartley, Wintney and Farnham Rural District Councils, it has been decided to approach the Electricity Commissioners with regard to a scheme for supplying electricity in the area concerned which does not appear to have been dealt with by the Commissioners in connection with the supply of electricity in bulk from any station erected or to be erected in the future. Supply companies in the area and the Alton Urban and Rural District Councils are being invited to associate themselves with the Conference.

Audenshaw. — Street Lighting. — The Urban District Council has asked a sub-committee to report upon the question of lighting all the main roads by electricity. Meanwhile it is proposed to arrange for all night electric lighting in Delta Road, electricity being supplied by the Manchester Corporation at 1d. per kWh, with a view to obtaining data in connection with the general question of adopting electricity for street lighting.

Australia.—Tasmania.—We have received from Mr. H. A. Curtis, chief engineer and general manager of the Tasmanian Government Hydro-Electric Department, a copy of his report for the year ended June 30th last, together with branch reports. The income from the operation branch amounted to £172,612, the major part of which was derived from the sale of electricity in bulk. The working expenses amounted to £19,898, and there was a gross profit of £152,714. The Hobart branch earned a revenue of £110,551, against which was charged working expenses of £13,592, and the purchase of bulk supplies amounting to £46,325, leaving a gross profit of £50,635. The Derwent Valley service recorded a revenue of £5,110, and working expenditure of £3,243, leaving a gross profit of £1,867, which was transferred to a main joint account, together with the gross profits from the operation and Hobart branches, and interest, making a total of £205,373 available. Interest and other charges absorbed £211,326, and the net debit balance for the year amounted to £5,953. The result of the preceding year's working was a net loss of £20,170. The output of the Waddamana power station fell from 284,125,900 to 276,314,500 kWh, the decrease being due to the stoppage of the Carbide and Electro-Products works during alterations to the plant. Good progress has been made with the Shannon scheme. The construction of the channel for the diversion of the Shannon River was completed and work on the dam commenced. In the Hobart district new feeder lines have been constructed, existing lines have been changed over from 6,600 to 11,000 V, and a new 500-kVA sub-station, capable of being duplicated, has been constructed.

Launceston (Tasmania).—The report on the working of the city electricity undertaking (engineer: Mr. R. J. Strike) for the year ended June 30th last shows a total income of £61,475, as compared with £63,930 in the preceding year. Working expenses amounted to £42,930, as against £45,196, leaving a gross profit of £18,545 (£18,734). After deducting interest and sinking fund charges there was a net surplus of £2,001, as compared with £3,285, which was transferred to reserve. The sales of electrical energy increased from 5,964,709 to 6,372,370 kWh.

Ayrshire.—Electricity Supply.—At a recent meeting of the Ayrshire Electricity Board it was reported that terms had been arranged for a supply of electricity to Turnberry Hotel and Ayr Harbour for the L.M. & S. Railway Co. It was felt that the present boilers were inadequate, and to remedy this an expenditure of £47,500 would be involved. The Board has the matter in hand.

Bath.—Electrical Development.—The *Financial News* reports that on February 3rd, Madame Sarah Grand, Mayoress of Bath, inaugurated the reconstructed Corporation electricity works, starting a 7,000-kW turbo-alternator. Alderman Sir Harry Hatt, chairman of the Electricity Committee, stated that since 1901 the demand for electricity had increased from 500 to 5,000 kW, the works capacity from 600 to 13,500 kW, the invested capital from £81,000 to about £500,000, and revenue from £11,000 to over £65,000 a year.

Beckenham.—Electricity Supply.—The London and Home Counties Joint Electricity Authority will not sanction the proposal of the Urban District Council to install a further 3,000-kW turbo-generator, and the Electricity Committee has recommended putting forward a case for plant extensions rather than taking a bulk supply as suggested by the Authority.

Bexhill.—Cable Extensions.—The Electricity Committee has prepared a scheme for additional feeder and distributor cables, &c., at a cost of £5,300.

Burnley.—Electrical Progress.—During December the Corporation Electricity Department connected 55 new consumers, and there were 97 applicants waiting for service. There were 36 houses wired, and 100 cookers were connected up. The value of the appliances sold and installed on hire-purchase during 1926 was £5,519.

Canada.—Saskatchewan.—The Saskatchewan Government has appointed a Commission to inquire into the economic practicability of generating electricity at central power plants and water power sites for distribution throughout the province. The Commission was created by Order-in-Council under the Public Enquiries Act. A similar but abortive inquiry was made in 1912.—*Reuter's Trade Service* (Regina).

Cheltenham.—Loan.—The Corporation Electricity Committee is to apply for sanction to a loan of £10,000 for mains and services.

Colchester.—New Power Station.—At a meeting of the Town Council on February 2nd it was reported that good progress was being made with the construction of the new power station, and it was hoped that it would be in operation by July or August next.

Continental.—Switzerland.—The municipal authorities of Zurich have applied to the Aargau Cantonal authorities for a concession to utilise the water power of the Limmat river near Weltingen. The scheme provides for the construction of a dam sufficient for minimum and maximum outputs of 14,000 and 25,000 kW, respectively. The local authorities of Scanfs, in the Engadine, have also applied for a concession to establish a hydro-electric plant near Taralp at a point where it is estimated a minimum of 300,000 h.p. is available. A scheme is also reported to be under consideration for the establishment of a hydro-electric power station on the Lower Aare river, near Klingnau, the electricity from which would be "exported" to Wurtemberg.

Crediton.—Electricity Scheme.—Following a visit paid by a deputation to the Electricity Commissioners with a view to expediting the proposed electricity scheme, it was reported at a recent meeting of the Urban District Council that consent had been obtained for it to proceed with the work of linking up with Exeter for the purpose of an electricity supply. The Council has instructed the engineer to invite tenders for the work.

Hamilton.—New Sub-Station.—Permission was recently granted at the Dean of Guild Court for the erection of a sub-station for the Town Council.

Hawarden.—Electricity Extensions.—The engineer to the Rural District Council (Mr. A. J. Richardson) writes to emphasise, in connection with the note in our issue of January

28th under the above heading, that his Council has merely postponed, not abandoned, the idea of supplying electricity to Cymmau, Ffrith, and Tryddyn.

Hemsworth.—WIRING OF SMALL HOUSES.—The Rural District Council has accepted the tender of the Electrical Distribution of Yorkshire, Ltd., for wiring houses at South Kirkby and supplying electricity on the current limiter system at 1s. 5d. per week during the winter months, and 1s. 2d. per week during the summer months.

Hull.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction to a loan of £187,000 for mains and services.

Liverpool.—ACQUISITION OF UNDERTAKING.—At the last meeting of the Electricity Committee the Town Clerk reported the completion of the agreement for the acquisition of the undertaking of the Hightown Electricity Co. The town clerk, city treasurer, and city electrical engineer were authorised to take the necessary steps for carrying on the undertaking pending the actual transfer thereof to the Corporation. The Electrical Engineer has been authorised to execute such works as may be necessary to enable the Corporation to supply the company's district pending the transfer, at a cost of not exceeding £2,000.

SUB-STATION EQUIPMENT.—Authority has been given for the installation of equipment at the following sub-stations: Hampton Street, Stoneycroft, Walton Hall Avenue, and Norris Green housing estate. An underground sub-station is to be constructed at Princes Park Gates, and h.p. and l.p. mains laid to supply the surrounding district.

London.—SOUTHWARK.—An inquiry was opened at the Town Hall on February 2nd, and continued on the 3rd and 4th, by Col. T. C. Ekin into the application of the Borough Council for sanction to extend its power station. The application was opposed by the London Power Co. and the County of London Electric Supply Co., Ltd., as ratepayers. For the Borough Council it was stated that the electricity undertaking had always been a profitable one since its inception, with the exception of one year. There were three electricity undertakings in the borough, and one had offered a bulk supply at an annual charge of £15,000. The cost of the proposed extension would be approximately £37,500, whereas the capital expenditure which would be incurred by the Council if a bulk supply was substituted would be £40,000. The present capacity of the plant was 4,800 kW, and the maximum demand during 1926 was 3,200 kW. The inquiry is to be resumed to-day (Friday).

Maldens and Coombe.—ELECTRICITY SUPPLY.—The Urban District Council has entered into an agreement with the Wimbledon Borough Council for lighting the whole of the district by electricity.

Manchester.—PROGRESS DURING DECEMBER.—During the month of December the Corporation electricity undertaking showed an increase in connections of 3,160 kW, bringing the total to 300,049 kW; and the number of applications received for supply, including consumers for additional supplies, was 1,010, representing a total of 2,413 kW. The number of hired cookers connected increased by 192, bringing the total actually on circuit to 2,691. Applications for the hire of cookers totalled 93. The maximum supply demanded reached 140,960 kW; this constitutes a record for the undertaking. Two new sub-stations were put into commission during the month.

Montgomery.—ELECTRICITY SUPPLY.—The Town Council recently further considered the question of an electricity supply for the district. The North Wales Power Co. had intimated that some delay would occur before a supply for the district could be given from its system. A letter was also received from Mr. L. S. Davey, Corlan, Montgomery, who stated that he was in a position to put a scheme before the Council and, if that was accepted, there should be no difficulty in providing a supply before the summer. He asked whether the Council would consider the following:—The scrapping of the present gas plant, and giving the free use of the site for the power plant; guaranteeing a definite sum per annum for street lighting; authorising the adoption of overhead wiring. The Council decided to rescind the previous resolutions expressing agreement with the North Wales Power Company's scheme, and to apply to the Electricity Commissioners to be removed from the scheme. Pending a reply, consideration of Mr. Davey's letter was deferred.

Persia.—HYDRO-ELECTRIC SCHEME.—It is reported that the Persian Ministry of Public Works is preparing a Bill relating to a concession for the construction of a dam in connection with the utilisation for electrical purposes of the Abschar Falls, near Parkale (Schimvan).

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

LEAMINGTON.—*The Leamington and Warwick Electrical Co., Ltd.*—Lighting: From 7½d. to 7d. per kWh.

LUDDENDEN FOOT.—*The Electrical Distribution of Yorkshire, Ltd.*—A reduction of ½d. per kWh.

NORTHAMPTON.—*The Northampton Electric Light and Power Co., Ltd.*—The 10 per cent. surcharge made owing to the coal dispute has been removed.

HAWORTH.—Lighting: From 7d. to 6d. per kWh. Power: From 4d. to 3d. per kWh.

HASLINGDEN.—A reduction of ½d. per kWh to domestic consumers.

Retford.—PROGRESS OF ELECTRICITY SCHEME.—The Town Council's consulting engineers, Messrs. A. Hugh Seabrook and Partners, report that the electricity undertaking should be ready to commence supply by about the end of this month.

Rochdale.—STREET LIGHTING.—The Fire Brigade and Lighting Committee has approved in principle a scheme for lighting the main streets of the town by electricity.

Scarborough.—ELECTRICITY EXTENSIONS.—The Corporation electricity works are to be extended at an estimated cost of £47,500. It is proposed to erect a new generating station at Irton within the next five years.

Sheffield-Rotherham.—INTERLINKING SCHEME.—A scheme has been prepared for interlinking the Corporations' power stations at an estimated cost of £41,500. The scheme is subject to the approval of the Electricity Commissioners.

Stoke-on-Trent.—SUPPLY TO PUMPING STATION.—The Corporation Electricity Committee has had further correspondence with the L.M.S. Railway Co. regarding a supply of electricity to the pumping station at Whitmore. The electrical engineer reports that the cost of an e.h.p. line would be £16,640, and he has been instructed to interview the electrical engineer of the company on the matter.

EXTENSION OF SUPPLY.—The electrical engineer is to prepare a report on proposals to provide an electricity supply to Milton and Norton-in-the-Moors.

LOAN SANCTIONED.—Sanction has been received to a loan of £20,000 for mains in connection with the supply of electricity to the new works of the Michelin Tyre Co.

Tain.—ELECTRICITY SUPPLY.—The Town Council has instructed its consulting engineers, Messrs. A. Hugh Seabrook, to take the necessary steps in conjunction with the Parliamentary Agents to obtain a Special Order authorising the Council to supply electricity within the borough.

Torquay.—ELECTRICITY EXTENSIONS.—The Corporation has received sanction to extensions to its generating station at Newton Abbot and the provision of further plant. New boiler plant is to be installed, and the engineer has been instructed to submit a comprehensive scheme for bringing up-to-date the whole system of distribution in the Torquay district. The supply of electricity in bulk to Teignmouth is now in operation. The electricity generated during December showed an increase over the corresponding month of the previous year of 538,006 kWh.

Walthamstow.—LOAN.—The Urban District Council has applied for sanction to a loan of £9,950 for the installation of electric cookers on the housing estates.

Wetherby (Yorks.).—INAUGURATION OF SUPPLY.—An electricity supply for the district was inaugurated on February 1st. Electricity is supplied by the Yorkshire Electric Power Co.

Wigton (Cumberland).—ELECTRICITY SCHEME.—At a meeting of the Rural District Council on February 1st a communication was received from the Allerdale Coal Co. stating that it proposed to apply for powers to provide a supply of electricity for West Cumberland. The area to be covered would extend from Workington in the south-west to Maryport and Allonby in the north-west, and from Cockermouth in the south-east to Aspatria and West Newton in the north-east, the power station to be erected at Great Clifton. The Council is to await further details before giving its support to the scheme.

Wimbledon.—NEW PLANT.—The Electricity Committee is to apply for consent to the extension of plant by the addition of a 6,000-kW turbo-alternator, a new boiler, auxiliary plant and switchgear, at an estimated cost of £75,000.

Worthing.—LOAN.—The Electricity and Waterworks Committee has recommended to the Town Council that application be made for sanction to a loan of £51,640 for electricity extensions, including the installation of a 1,500-kW set at an estimated cost of £27,000.

Tramway and Railway Notes.

Argentina.—TRAMWAY AGREEMENT.—A new agreement has been entered into between the Société des Tramways de Rosario and the municipal authorities of that city, under which the period of the concession has been extended until the end of 1970. The Tramways Co. has undertaken to construct about 34 miles of new lines within the next two years.

Australia.—LAUNCESTON (TASMANIA).—The accounts of the city tramway undertaking (superintendent: Mr. R. J. Strike) for the year ended June 30th, 1926, record a total revenue of £47,974, as compared with £50,531 in the preceding year. Operating expenses amounted to £38,810, as against £35,460, leaving a gross profit of £9,164 (£15,071). Interest and sink-

ing-fund charges absorbed £9,213, and there was a net loss of £49, as compared with a surplus of £5,650 in 1924-25. The number of car-miles run increased from 463,718 to 492,395, but the number of passengers carried decreased from 4,573,275 to 4,486,587.

Bradford.—RAILLESS CARS.—The *Yorkshire Post* states that a proposal for the substitution of railless cars for tramcars has been made by the Tramways Committee and will be submitted to the Corporation in due course. Two years ago the Committee approved a proposal for the relaying of the tramway track from Four Lane Ends to Allerton at an estimated cost of £31,350, but on January 31st it approved a reduced estimate of £29,560 for the substitution of a railless-car system on the Allerton route.

Continental.—AUSTRIA.—Work is proceeding with the electrification of the Saalfelden-Worgl, Kufstein-Worgl, and Innsbruck-Brenner sections of the Austrian State Railways, and it is expected that electrical operation will commence by the end of the present year.

SWITZERLAND.—From Berne it is reported that work is shortly to be commenced on the electrification of the Berne-Neuenberg section of the Swiss Federal Railways.

Halifax.—TRACK RENEWAL.—The Finance Committee has approved a recommendation of the Tramways Committee to reconstruct the tramway track between King Cross and Cote Hill, at an estimated cost of £3,600.

London.—NEW "DISTRICT" LINE.—The *Financial News* states that at a meeting of the Seven Kings Ratepayers' Association on January 31st, the Mayor of Ilford stated that there was a possibility of the District Railway being extended from Barking to the Becontree estate. He said the L.C.C. had offered the necessary land free, and the District Railway Co. was in agreement with the scheme, but the sanction of the London Midland and Scottish Railway Co. had to be obtained before the extension could be made. The L.M.S. had been communicated with, but had not replied. The L.C.C. and the Ilford Council were of opinion that if the company did not give its consent the Government should take action.

FASTER TRAMCARS.—*The Times* reports that the Metropolitan Electric Tramways, Ltd., is introducing new tramcars fitted with higher-powered motors capable of a speed of 30 miles per hour. It is also proposed to eliminate a number of the existing stopping places. The new tramcars are being tried on the route from Paddington to Finchley, and it is intended to place similarly-equipped tramcars on the other routes of the system within the next few months.

Oldham.—ABANDONMENT OF ROUTE.—The Town Council has decided not to reconstruct the tramway track from the centre of the town to Lees, a distance of two miles. The tramway service on this route will be replaced by motor-omnibuses.

Walsall.—ABANDONMENT OF ROUTE.—The Town Council has decided to abandon the Walsall Wood tramway and to substitute an extended motor-'bus service. Application is to be made for sanction to the borrowing of £16,000 for the purchase of new motor-omnibuses.

Telegraph and Telephone Notes.

Bolivia.—NEW RADIO STATION.—A wireless station is to be erected at Lake Gaiba, in Eastern Bolivia, and the purchase completed of apparatus temporarily installed on the s.s. *Saavedra*. The Marconi Company, which holds a 25-year monopolistic contract for telegraph services in Bolivia, has undertaken to provide special apparatus for short-wave transmission.—*Reuter's Trade Service* (La Paz).

Poland.—NEW RADIO SERVICES.—Direct wireless communication has been opened between Poland and Syria, the Lebanon, Transjordania, Palestine, Egypt, Eritrea, and Abyssinia, and *vice versa*. Regular exchanges have been arranged between the central wireless station at Warsaw and the Orient Radio Co.'s station at Beyrouth.—*Reuter* (Warsaw).

India.—LONG-DISTANCE TELEPHONY.—The new telephone trunk line between Calcutta and Delhi is now ready for the use of the public. This, in conjunction with the trunk lines between Delhi and Bombay and between Delhi and Lahore, will enable Calcutta to be in direct telephone communication with Bombay and Lahore. The distance between Calcutta and Bombay *via* Delhi is well over 1,800 miles.

Irish Free State.—TELEPHONE CAPITAL BILL.—In Dail Eireann on January 26th Mr. Ernest Blythe, Minister for Finance, was given permission to introduce the Telephone Capital Bill, which is to grant further money for the development of the telephone system in the Free State. The Bill, in addition to moneys authorised by the Telephone Capital Act of 1924; will enable the Minister for Finance to issue out of the Central Fund such sums, not exceeding £500,000, as may be required by the Minister for Posts and Telegraphs for the development of the telephone system. He may borrow by means of terminable annuities extending over a period not exceeding 20 years.

Jersey.—TELEPHONE SERVICE.—The rent of a telephone in Jersey is only twopence a day, or roughly £3 a year, and calls cost a penny each. There are now 2,847 telephones on the island, or one to every 14 inhabitants, as compared with one to 29 in Great Britain. The Jersey telephone system has almost doubled since 1923, when the States purchased it from the Post Office; there were then only 1,600 telephones on the island.

The Telegraph Service.—PRESS TRAFFIC LOSS.—In the first and second reports of the Select Committee of Public Accounts, just issued by the Stationery Office, it is stated that the telegraph service has rarely if ever paid, and on the basis of the Post Office commercial accounts the losses in the last three years have been:—

1923	...	...	...	£1,697,000
1924	...	...	...	£1,271,000
1925	...	...	...	£1,645,000

The loss is attributed in part to the growing competition of the telephone service, especially for short-distance traffic, but an appreciable portion is undoubtedly due to the annual loss on Press telegraphy, which was estimated in June, 1907, apart from interest on capital, at about £250,000. On the same basis the loss for 1922-23 was estimated at about £360,000. Since then it has fallen, partly because the Press has adopted the policy of leasing telegraph lines, and is now put at about £230,000 a year. The Committee is "of the opinion that this position should not be allowed to continue."

Radio Notes.

Bulgaria.—PROPOSED NEW STATION.—A 5-kW transmitter to replace the present one at Sofia is contemplated; it will cost £30,000 and not be ready before the end of the year. Public subscriptions are to be invited at once by the Government.

China.—NEW STATIONS.—The contract for a 2-kW station, with a wave-length of 250 to 550 metres, for installation at Mukden, was awarded to a French firm. An American firm received the contract for the installation of a 1-kW station with a similar wave-length in Harbin. These two broadcasting stations should be in operation early in 1927, and a new market for receiving sets will be opened, says *Commerce Reports*, as the installation of receiving sets was previously prohibited, except for military purposes, in Manchuria outside of the South Manchuria railway zone. Receiving sets will be taxed and licensed according to type and size; the licence fee for crystal sets to be approximately $3 a year, valve sets $6 a year, and a tax of 10 per cent. *ad valorem*, in addition to the regular Customs duties, will be imposed on imported sets. Dealers in radio receiving sets will be licensed; a deposit of approximately $5 will be required of all dealers prior to the issue of the licence.

High-power Stations.—EUROPEAN CONFERENCE.—A conference of European wireless engineers will shortly be held under the auspices of the International Radio Union to examine the position of high-power European stations working on long wave-lengths. Russian delegates are expected to attend.—*Reuter* (Brussels).

New Zealand.—NEW STATIONS.—The installation of powerful broadcasting stations at Auckland and Christchurch has been completed by the Radio Broadcasting Co. of New Zéaland, Ltd., a subsidised company organised to operate a chain of broadcasting stations throughout New Zealand on a uniform basis, says *Commerce Reports*. The Auckland station is already in service, and the stations at Christchurch, Wellington, and Dunedin soon will be installed. It is estimated that about 8,000 licences were issued in 1926. Practically all of the equipment used in this area is American.

United States.—BROADCASTING REVENUE.—Figures considered to be average in relation to the operation of broadcasting stations in the United States indicate that those who believe that to own a commercial radio station is to possess a "gold mine" may be disillusioned. "Time on the air" is sold for from $25 to $400 an hour, says *World Radio*, and the average is considered to be about $200 per hour. Few stations broadcast more than eight hours a day, and most of them no more than six. If six hours could be sold every day of the year at, say, the average rate of $200 per hour, which is unlikely, the revenue would be $438,000 annually. Most advertisers desire the time between the hours of 8 and 10 at night, and a station that averages one hour per day for 365 days considers it is doing well, which means an average income of $73,000 per year.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—Sydney.—April 6th. New South Wales State Railways. One 7,500-kW turbo-alternator. (B.X. 3179.)*

February 16th. One 100-kVA, 3-phase oil-insulated indoor-type transformer. (B.X. 3200.)*

February 21st. Municipal Council. 660-V cable. (B.X. 3200.)*

Melbourne.—February 21st. State Electricity Commission of Victoria. V.i.r. insulated control cable. (B.X. 3214.)*

April 5th. Postmaster-General's Department. Condensers. (B.X. 3215.)*

March 30th. Victorian Railways. Lightning arrestors. (B.X. 3213.)*

Brisbane.—April 13th. Brisbane City Electric Light Co., Ltd. Transformers. (B.X. 3218.)*

Bedford. — February 28th. Electricity Department. Twelve months' supplies of e.h.p. and l.p. cables and incandescent electric lamps. (See this issue.)

Belfast.—February 18th. Electricity Department. Twelve months' supply of materials, including electrical accessories, lamps, carbon brushes, cables, &c. (January 28th.)

Belgium.—February 27th. Permanent Deputation of the Province of Limburg, Hasselt. Ten static transformers, &c. Service Provinciale d'Electricité, 27, Avenue Bamps, Hasselt (6 fr.).

Bexley.—Electricity and Tramways Department. One 1,400-kVA bank of Scott-connected transformers. Two 140-kVA single-phase induction regulators, e.h.p. and h.p. switchgear and cable connections. (February 4th.)

Bristol.—February 18th. Electricity Committee. Coal- and ash-handling plant, and railway sidings; circulating-water screening plant. (January 28th.)

Canterbury.—February 21st. Electricity Department. L.p. lead-covered and armoured feeder cables. (February 4th.)

Cardiff. — February 23rd. Electricity Department. Twelve months' supply paper-insulated cables. (February 4th.)

Croydon.—March 3rd. Electricity Department. 12,000 tons of coal suitable for use on chain-grate mechanical stokers. (February 4th.)

Dundee.—February 21st. Electricity Department. Two water-tube boilers with superheaters, economisers, mechanical stokers, and coal-handling plant. (January 28th.)

February 28th. Education Committee. Electrical installation for the new secondary school, Perth Road. Messrs. Thoms and Wilkie, architects, 21, South Tay Street, Dundee.

Eastbourne.—February 21st. Electricity Department. E.h.p. cable, static transformers, and e.h.p. switchgear. (January 28th.)

The Electricity Committee is inviting quotations for coal-handling plant, which is estimated to cost £1,150.

Eccles.—February 12th. Electricity Department. Two 500-kVA, 3-phase oil-cooled transformers. Borough Electrical Engineer, Cawdor Street, Patricroft.

Egypt.—Cairo.—March 3rd. Ministry of Public Works. Two internal-combustion engines and accessories for the Egyptian Army Flour Mills, Tura, near Cairo. (A.X. 4187.)*

Hamilton.—February 14th. District Committee of the Middle Ward of Lanark. Electric lighting installation for Longriggend Sanatorium. Mr. P. C. Smith, architect, District Offices, Hamilton.

Harrogate.—February 28th. Electric lighting installation for St. Mark's Church, Leeds Road. Particulars from the Verger.

Huddersfield.—February 19th. Town Council. Electrician's work at maternity home, Greenhead Road. Borough Architect, 26, Ramsden Street.

Hull.—February 14th. Tramways Committee. Stores for 12 months, including car-lighting fittings, lamps, cable and switches, &c. General manager.

India.—February 18th. India Store Department. 100 miles insulated copper wire. March 1st. 300,000 insulators. (See this issue.)

Leeds.—February 18th. Electricity Department. Twelve months' supply of stores, including cables, boxes and fittings, jointing and insulating materials, &c. (January 28th.)

London.—Shoreditch.—February 23rd. Electricity Department. One 1,500-kW automatic sub-station converting equipment and one 20-ton electrically-operated overhead travelling crane. (January 28th.)

London County Council.—February 14th. Electrical installations at the undermentioned schools:—Barrett Street Trade School Extension, Oxford Street, W., lighting, power, telephones, bells, &c.; County Secondary School, Eltham, S.E., lighting, power, telephones and bells; Crondall Street Elementary School, Shoreditch, lighting; Drayton Park Elementary School, Islington, lighting. (February 4th.)

H.M. Office of Works.—February 17th. Electrical accessories. (February 4th.)

Metropolitan Asylums Board.—February 23rd. Carrying out the installation of electric lighting at Millfield, Rustington, near Littlehampton, Sussex. (February 4th.)

Long Eaton.—February 24th. Electricity Department. One 500-kW convertor set and one switchboard platform. (February 4th.)

Morley (Yorks.).—Electrical wiring and services for 48 Corporation houses on the Bradford and Wakefield Road site. Mr. F. Turner, borough engineer and surveyor.

New Zealand.—Wellington.—March 4th. Poverty Bay Electric Power Board. Switchgear and transformers. (B.X. 3160.)*

April 26th. Public Works Department. Secondary battery for the Lake Coleridge scheme. (B.X. 3202.)*

February 12th. Department of External Affairs. Apia hydro-electric power scheme, Samoa. Transformers, lightning arresters, cable, &c. (B.X. 3200.)*

Newark-upon-Trent.—February 22nd. Electricity Department. Gasfilled electric lamps for street lighting for 12 months. (See this issue.)

Oldham.—February 14th. Town Council. Electrical installation for 302 houses, Greenacres and Boarshaw. Borough Engineer and Surveyor, Town Hall.

Peterborough.—February 28th. Electricity Department. One 12,000-kW turbo-generator, with foundations, condensers, air and extraction pumps, air cooler, oil cooler and pipework, e.h.p. switchgear, coal-handling plant, &c. (January 28)

Portsmouth.—Electricity Department. Coal-handling plant. (January 28th.)

South Africa.—Johannesburg.—March 19th. Municipal Council. Transformers. (B.X. 3219.)*

March 3rd. South African Railways and Harbours. Overhead line material. (B.X. 3224.)*

Spalding.—February 26th. Urban District Council. 28 sets of centrifugal pumps (for sewage pumping), including electric motors, automatic starters, floats, valves, pipes, &c. Mr. C. F. Murphy, Lloyd's Bank Chambers, Morpeth.

Tilbury.—February 12th. Urban District Council. H.p. underground cables, l.p. distribution mains, house services, transformers, h.p. and l.p. switchgear and conversion of public street lamps. (January 28th.)

---

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Barking Town.—Special Urban District Council Committee. Recommended:—
Electrical apparatus for heating water and raising steam at baths (£2,647).—Bastian Meter Co., Ltd.
Filtration plant (£1,545).—Paterson Engineering Co., Ltd.

Electricity Committee.
Switchgear for River Road sub-station:—

Metropolitan-Vickers Electrical Co., Ltd. (Recommended.)	**£369**
New Switchgear Construction Co., Ltd. ...	376
English Electric Co., Ltd.	383
Ferguson, Pailin, Ltd.	418
Johnson & Phillips, Ltd.	429
Edison Swan Electric Co., Ltd.	441
General Electric Co., Ltd.	456
Crompton & Co., Ltd.	496
Bertram Thomas	507
British Thomson-Houston Co., Ltd.	616

Birkenhead.—Electricity Committee. Accepted:—
Transformer kiosk at Upton (£187).—Yorkshire Switchgear & Engineering Co., Ltd.

Doncaster.—Electricity Committee.
L.p. cables (£1,597).—Enfield Cable Works, Ltd.
Overhead travelling crane (£889).—Herbert Morris, Ltd.

Dumfries.—Electricity Committee. Recommended:—
Switchgear for Maxwelltown sub-station (£697).—Metropolitan-Vickers Electrical Co., Ltd.

Dundee.—Town Council. Accepted:—
Electric lighting installation at the new library at Broughty Ferry (£126).—Marshall, Hutton & Co.

Eastbourne.—Electricity Committee. Accepted:—
Turbo-generator (£13,954).—W. H. Allen, Sons & Co., Ltd.
Foundations (£665).—Peter Lind & Co.
Boiler (£15,726).—Vickers Boiler Co., Ltd.
Cooling tower (£1,897).—Premier Cooling & Engineering Co.
Cable (year's contract).—Craigpark Electric Cable Co., Ltd.

Glasgow.—Health Committee. Accepted:—
Electric cooking plant at Bellefield Sanatorium (£275).—Corporation Electricity Department.

Tramways Committee. Recommended:—
Supply of a coil winder.—Midland Dynamo and Motor Repairs Co., Ltd.

Heckmondwike.—Urban Council. Accepted:—
Installing electric lighting at houses on the Heaton House estate.—Butler & Horn.

Liverpool.—Electricity Committee. Recommended:—
One h.p. switch cubicle for the control of the new 25,000-kW alternator, with l.p. panels, main cables and small control wiring (£7,531).—Metropolitan-Vickers Electrical Co., Ltd.

London.—LONDON COUNTY COUNCIL.—Education Committee. Wiring and fittings for electric lighting at Frankham Street school, Deptford:—

Alpha Manufacturing & Electrical Co., Ltd. (Recommended.)	**£400**
Anderson, Angell & Co.	419
A. Higginbotham & Sons	449
A. Meckhonik	466
A. Hawkins & Sons	469
Burdette & Co., Ltd.	540
Marylebone Electrical Stores	622
Douglas Electric Lighting & Power Co. ...	670

(The chief engineer's comparable estimate is £420.)

Wiring and fittings for electric lighting at Lomond Grove school, Camberwell:—

Anderson, Angell & Co., Ltd. (Accepted.)	**£327**
A. Dean & Co., Ltd.	324
Commercial Telephone Co., Ltd.	343
Commercial Lighting, Heating & Power Co.	359
Alpha Manufacturing & Electrical Co., Ltd. ...	373
G. E. Taylor & Co.	398
Smethurst & Co. (London), Ltd.	398
Bailey & Incledon, Ltd.	417
A. Higginbotham & Sons	430
Burdette & Co., Ltd.	440
A. Hawkins & Sons	449
F. W. Whymant	460
Marylebone Electrical Stores	533

(The chief engineer's comparable estimate is £350.)

ABERDEEN LINE (G. Thompson & Co., Ltd.).
Electric lamps.—Edison Swan Electric Co., Ltd.; British Thomson-Houston Co., Ltd.; Siemens and English Electric Lamp Co., Ltd.

ADMIRALTY.
Torch batteries.—Edison Swan Electric Co., Ltd.

New Zealand.—The Auckland Electric Power Board has placed a contract with the British General Electric Co., Ltd., for the supply of over half a million yards of triple-braided cable.

Plymouth.—Tramways Committee. Accepted:—
Turbine vacuum cleaner (£175).—Sturtevant Engineering Co., Ltd.
16 sets brake equipment (£2,212); magnet brake equipment for 15 cars (£1,185).—Westinghouse Brake and Saxby Signal Co., Ltd.

Electricity Committee. Accepted:—
Conduit.—Doulton & Co., Ltd.
Two l.p. transformer switches.—Switchgear & Cowans, Ltd.

Stoke-on-Trent.—Hospitals Committee. Recommended: Installation of fire-alarm system at infectious diseases hospital (£209).—Associated Fire Alarms, Ltd.

Torquay.—Electricity Committee. Accepted:—
16,500 yd. cable for the Newton Abbot and Paignton ring main (£13,530).—Hackbridge Cable Co., Ltd.

Windermere.—Urban Council. Accepted:—
Wiring houses for electric lighting (£216).—Thornborough & Co.
Supplying and laying cables (£300).—Windermere and District Electricity Supply Co., Ltd.

Forthcoming Events.

Electrical Engineers' Ball.—Friday, February 11th. At the Hotel Cecil.

Electrical Trades Commercial Travellers' Association.—Friday, February 11th. Holborn Restaurant. 7.30 p.m. Annual dinner.

Electromobile Association.—Friday, February 11th. Royal Society of Arts. 7 p.m. "The Use of Storage Battery Type Electromobiles." Mr. J. C. Elvy.

Junior Institution of Engineers.—Friday, February 11th. London. 7.30 p.m. "The Physiology of Work Under High Air Temperature Conditions." Prof. K. N. Moss.
Friday, February 18th. 39, Victoria Street, S.W. 7.30 p.m. "Modern Concrete Construction." Mr. L. Turner.

Physical Society.—Friday, February 11th. Imperial College of Science, London. 5 p.m. Annual general meeting, and ordinary meeting to follow.

Royal Society of Arts.—Monday, February 14th. London. 8 p.m. Cantor lecture, "Photo Elastic Measurements of Stress Distribution." Prof. E. G. Coker, F.R.S.
Wednesday, February 16th. 8 p.m. "Some Studies in Connection with the Manufacture of Electric Lamps and Thermionic Valves." Mr. C. C. Paterson.

Electrical Association for Women.—Tuesday, February 15th. King's College for Women, Campden Hill, W. 5.15 p.m. "How the American Housewife Solves Her Household Difficulties." Mrs. C. Frederick.

National Association of Supervising Electricians.—Tuesday, February 15th. Chalmers House. 7.15 p.m. Annual general meeting.

South Wales Institute of Engineers.—Tuesday, February 15th. Royal Metal Exchange, Swansea. 6 p.m. "The Romance of Copper." Mr. Ll. B. Atkinson.

Batti-Wallahs' Society. — Wednesday, February 16th. Hotel Cecil. Luncheon. Sir Duncan Watson on "The Prospects of the Electrical Industry."

Institution of Electrical Engineers.—Thursday, February 17th. London. 6 p.m. "Stability of Large Power Systems." Mr. F. H. Clough.

(Western Centre). — Wednesday, February 16th. Museum and Arts Gallery, Bristol. 7 p.m. Faraday Lecture, "What is Electricity?" Prof. W. M. Thornton.
Monday, February 14th. South Wales Institute of Engineers, Cardiff. 7 p.m. "Power Stations and Their Equipment." Mr. W. M. Selvey.

(North-Eastern Centre).—Monday, February 14th. Sopwith's Café, Newcastle-on-Tyne. 7 p.m. Discussion. "The Problem of Rural Supplies."

(North-Western Students' Section).—Tuesday, February 15th. 7.30 p.m. At Queen's Hotel, Manchester. Smoking concert.

(Mersey and North Wales (Liverpool) Centre).—Wednesday, February 16th. At The Temple, Dale Street, Liverpool. Joint meeting with the Liverpool Engineering Society.

(South-Midland Centre). — Wednesday, February 16th. University, Birmingham. 7 p.m. "33,000-V Cables with Metal-sheathed Cores, with Special Reference to the S.L. Types." Mr. P. Dunsheath.

(Sheffield Sub-Centre).—Wednesday, February 16th. Mappin Hall, Sheffield. "Application of X-rays to the Examination of Metals." Dr. E. V. Pullin.

(Irish Centre, Dublin).—Thursday, February 17th. Trinity College, Dublin. 7.45 p.m. "History of Telephone Transmission." Mr. J. D. Ferguson.

Meter Engineers' Technical Association.—Thursday, February 17th. Lighting Service Bureau. 7 p.m. "Meter Testing Methods and their Relationship to Output and Accuracy." Mr. C. W. Pike.

Royal Institution.—Thursday, February 17th. 5.15 p.m. "Acoustical Problems—Bells." Sir Wm. Bragg.

Edinburgh Electrical Society.—Thursday, February 17th. Royal Scottish Society of Art. 8 p.m. "Electric Light as Applied to the Home." Mr. H. E. Hughes.

British Electrical Development Association.—Friday, February 18th. Royal Society of Arts. 7.30 p.m. "Assisted Wiring Schemes." Mr. W. F. T. Pinkney.

Notes.

Fire Alarms at Lytham.

A new fire alarm system is contemplated at Lytham St. Annes, and the Ministry of Health is being asked to sanction a loan of £1,200 for the purpose. Messrs. Carter & Co. (Nelson) are the inventors of the system, which consists of a series of boxes containing loud-speaking telephones. When the alarm is given and the glass is broken, a door automatically flies open, and reveals the telephone whereby direct information can be given.

Lectures.

On Wednesday last Mr. R. P. Howgrave-Graham, M.I.E.E., was to give a lecture demonstration of high-frequency oscillating currents, at pressures up to half-a-million volts, in aid of the Penge and Anerley Philanthropic Society, at the Town Hall, Anerley.

The Principal of East London College (University of London) informs us that owing to illness Mr. J. H. Morrell will be unable to deliver the proposed course of six lectures on "Short Electric Waves" during the present term. It is hoped that he will be able to do so next term.

A Large Electrically-Controlled Bridge.

What is described as the largest bascule lift bridge of its type provided with an elaborate electrical protective system to ensure safe operation, the Roosevelt Avenue Bridge, will soon be completed across the Flushing River to Flushing, Long Island, New York. This new structure will have a double deck and will carry the Manhattan subway trains across the river. Two movable leaves turn upon huge trunnions and open like the blades of a knife to permit the passage of ships, each leaf being 152 ft. long. So delicately is this great weight counterbalanced, however, that four 80-h.p. electric motors can open or close the bridge in 45 seconds against a pressure equal to a 25-m.p.h. wind. The motive power is provided by Westinghouse motors of 328 total h.p. Special attention has been given to ensuring complete safety in the operation of the bridge. When a ship wishes to pass beneath, it signals the bridge operator, who signals to the towerman controlling the operation of the trains that he wishes to open the bridge. The towerman then sets the signals against the trains, and this operation automatically energises the bridge's motive power circuits, permitting the bridge operator to start up the motors, which perform a series of functions necessary for the opening of the bridge. The system is so arranged that each step in the process of opening or closing the bridge must be taken in exactly the right order, and no step can be taken until the previous one has been properly completed. A signal light on the operator's desk at the controllers indicates the proper performance of each step. Should anything jam or should power fail, everything becomes locked in position, so that no part of the mechanism can "run wild." The total cost of the bridge and its approaches is $2,700,000.

Educational.

East London College, Electrical Engineering Department.—A course of five lectures on "High-Voltage Insulation, Particularly the Application of Micanite and Varnish-paper Materials," by Mr. A. Collins, will be delivered on Mondays commencing February 21st, at 6 p.m. (See our advertisement pages to-day.)

Electrically-driven Artificial Silk-Spinning Machines.

Constant effort is being made to improve the method of application of the electric drive to artificial silk-spinning machines, and in view of the increasing use of this class of plant in all parts of the world, the following notes with regard to a machine introduced by Messrs. Ramesohl & Schmidt, of Westphalia, are of interest. The Westphalia electrically-driven centrifugal spinning machine, as it is called, has flexible bearings to compensate for uneven loading of the coiler can when running at high speeds. The rotor of the motor is carried on a tubular shaft running in ball bearings. The spindle carrying the coiler can is supported within this shaft, and also by an additional spring-loaded ball race. This flexible bearing serves to damp out any vibration set up by the coiler can; thus the rotor and practically all the rotating mass runs smoothly. The spindle of the rotor being vertical, the least possible load is put on the bearings, thus reducing the friction to a minimum.

The lubrication is carried out in a novel manner. The bottom part of the casing forms an oil container, and an extension of the hollow spindle of the rotor projects into the oil. On account of the high speed of rotation, the oil rises up this spindle till it reaches the flexible bearing, which is thus well lubricated, as are also the springs which carry it, and the rotor bearing immediately below. The surplus oil is collected by means of a disk placed immediately under the upper bearing of the rotor, and is conducted past an inspection window back to the sump *via* the bottom conical bearing of the rotor. The proper functioning of the lubrication system can therefore be observed from the outside at any time. The solidly-constructed bearings of the machine enable the clearance between the stator and the rotor to be reduced to a minimum; therefore the efficiency is extremely high, while the speed remains constant and the slip is very small.

Starting the machine is effected either by means of an ordinary switch or by a special form of starting switch, which also enables a quick stop to be obtained by reversing two phases of the circuit. The machine is driven by a.c., and the speed depends upon the frequency; as this is usually insufficient in the ordinary way, a secondary circuit with higher frequency is provided in order to obtain the speed desired. This higher frequency is obtained by means of a frequency changer. A slip-ring rotor is driven by a motor, and has the available a.c. supply current fed into the stator, so that the rotor is driven against the field thus set up, and from the slip-rings of the rotor the secondary current of higher frequency is taken to drive the spinning machine; or the primary current may be fed into the rotor through the slip-rings, the secondary current being taken from the stator.

A High-pressure Steam Turbine in Operation.

The Milwaukee Electric Railway and Light Company has started operation of a 7,000-kW steam turbo-generator which uses steam at a pressure of 1,200 lb. The 3,000-kilowatt turbo-generator in the Edgar station of the Edison Electric Illuminating Company, of Boston, Mass., U.S.A., also operates at 1,200 lb. pressure. Both are of General Electric design and manufacture. The Milwaukee turbine receives steam at a pressure of 1,200 lb., superheated to 720 deg. F. It exhausts at 320 lb., the steam being conducted at this pressure to the station mains serving several 30,000-kW machines where more of its energy is extracted. The final exhaust is at one inch absolute.

A pressure of 400 lb. is now common in central stations, with some operating well above this figure; 600 lb. is, however, the maximum, except in the cases of these two 1,200-lb. machines. As recently noted, Mr. Thos. Roles is installing a 1,200-lb. set at Bradford.

Two-fluid Boiler Systems.

Diphenyl oxide, a white chemical with a powerful odour like strong geranium scent, is being used in one boiler to run an engine, and the exhaust vapour from that engine, still very hot, to raise steam from ordinary water in a second boiler, according to Dr. H. H. Dow, a manufacturing chemist of Midland, Mich., U.S.A. Dr. Dow has been experimenting with the system for some months, and states that it has proved itself quite successful and very economical of fuel.

The idea was tried first with mercury as the liquid in the first, or high-temperature boiler, but its great weight and considerable initial expense, together with constant losses, interposed engineering and economic difficulties. Further, leakage of mercury vapour is almost certain to be injurious to the workmen, because mercury is exceedingly poisonous. For these reasons, therefore, Dr. Dow sought for a liquid that is light, cheap, and non-poisonous, and still has a large capacity for carrying heat over into the second boiler to generate steam for the second engine.

A number of organic chemical compounds were found to possess these qualities, but at the temperatures used in boilers they tended to break up into other compounds useless for power purposes and to clog the boilers with carbonaceous materials of no use for carrying heat. Diphenyl oxide, however, has been used and condensed and used over again many times at a pressure of 200 lb. per sq. in. and a temperature of 800 deg. F., with but little deterioration. It weighs little more than water, as contrasted with mercury, which is heavier than lead. Its price is only 30 cents a lb. in quantity lots, which, according to Dr. Dow, makes its cost, volume for volume, less than two per cent. of that of mercury. The compound has been produced hitherto in comparatively limited quantities, because its only use has been in the perfume industry, but Dr. Dow states that there is no limit to the bulk that can be manufactured if it is desired for power plant uses.—*Science.*

High-Power Street Lighting.

The seven blocks of State Street, which lies within Chicago's "Loop" district, often alluded to as the most concentrated shopping district in the world, may now be described as the world's greatest "White Way" as the result of the installation of what is claimed to be the most powerful street-lighting system ever built. This intensive lighting system was financed by the State Street merchants, who estimate their aggregate sales at approximately $1,500,000 a day. It is said that the street is now fully three times brighter than any other in the world, and compares favourably with the lighting in many stores and factories. The light is furnished by 70 "Union" metal standards, placed ten to a block, five on each side of the street, each equipped with G.E.C. fittings containing 2,000-W "Mazda" lamps, said to be the largest ever used for street-lighting purposes.

Fatality.

Herbert Cunliffe, employed in the moulding shop at Messrs. S. S. Stott's Laneside Foundry, Haslingden, on February 3rd received a fatal electric shock whilst assisting a fitter to drill a plate by means of a portable electric drill.

Train Collision Report.

The official report on the inquiry into the circumstances of a derailment and collision which occurred on November 30th at Crofton South Junction, Wakefield, on the L.M. and S. railway, has been issued. It appears that the derailment was caused by the breaking of a brake pull rod of the running engine, and the broken end of the rod striking a sleeper. There were two fractures, and one had at some time been electrically welded, but left in an unsatisfactory manner, and it is held that this was partially responsible for the final collapse of the rod. It is pointed out that the men engaged on the electric welding have attained a considerably higher degree of skill than was at first shown, recent testing by cutting through the joint showing in all cases a satisfactory repair, and that so long as this can be ensured, the practice of electrically welding fractures of the kind is not open to objection.

Storage Batteries in Gassy Mines.

A new use for storage batteries is foreshadowed in the United States. Writing in the American *Mining Congress Journal*, Mr. Graham Bright, a consulting engineer, of Pittsburgh, states that it is only recently that storage-battery power has been used in coal-mining operations in any part except in "gathering" the coal. The element of safety obtained by the use of storage-battery equipment has however, opened up the possibility of extending the use of the battery in gassy mines to practically all underground power requirements, including haulage, cutting, drilling, auxiliary pumping, and ventilation. This would eliminate wires from the mine except at the charging stations. It is stated that battery power has been successfully applied to haulage and cutting operations in the Phelps Dodge Company's mines in New Mexico, and the Consolidation Coal Company's mines in West Virginia.

Electricity on Japanese Farms.

The Japanese Minister of Communications has decided to grant credits to agricultural societies for the purchase of electrical machinery which will assist them in their farming operations. Only 5½ per cent. interest will be charged on the sums advanced. Several agricultural groups in the prefectures of Aichi, Osaka, and Hyogo have already received advances amounting to £26,000 from an *ad hoc* committee. The first purchase by the Aichi prefecture consisted of 53 motors intended for the drying and treatment of rice and seeds. The electrical distribution systems are accordingly being extended. The Commercial Attaché expresses the view that this installation of modern equipment on comparatively small farms constitutes an important step in the development of Japanese agriculture. It is thought that the movement will considerably extend.

Research at Birmingham.

The Joint Standing Committee for Research of the University of Birmingham reports that in the Department of Electrical Engineering work on the following subjects is now being done:—The characteristics of the electric arc, investigated in the research into the transmission of power at high frequencies which is proceeding; the conduction of currents by electrolytes; and the testing of a.c. machines by means of direct current.

Water Power versus Diesel Engines in Bulgaria.

A few years ago the idea of "the electrification of the whole of the country" by means of hydro-electric stations was very popular in Bulgaria, and the State advanced considerable sums to water syndicates and corporations founded in many parts of the country. It has been necessary, however, to moderate many dreams, for most of the rivers in Bulgaria are almost dry in summer, and on an average not more than 1,000,000 hydraulic h.p. is available. It is evident that encouragement must be given to towns which confine themselves to obtaining the power for their electric lighting and local industries from the rivers in the valleys where they are situated. During the last few years many power stations have replaced their steam engines by Diesel (or other) oil engines and use liquid fuel in place of coal. Prof. Danailov has protested in the Slovo against this practice; he points out that Bulgaria is rich in coal still to be exploited, while she has no native liquid fuel. She is therefore obliged to purchase it abroad, to the great detriment of her balance of trade and the quotation of the lev; the professor concludes, therefore, that it is necessary to place heavy import duties on Diesel engines and foreign liquid fuels entering Bulgaria.

In reply, Engineer B. Radev says that it is true that many Bulgarian towns use modern Diesel engines, these being the most practical and economical; indeed, in many towns they are the only possible means of producing electric light. These towns number fourteen at present and possess about 300,000 inhabitants, or 75,000 families. Statistics show that each provincial family in Bulgaria consumes for lighting purposes an average of about 60 kilowatt-hours a year, so that the 75,000 families consume annually about 4,500,000 kilowatt-hours; in order to produce this total, it is necessary to use about 1,600,000 kilograms of liquid fuel at a price of two or three leva a kilogram, making a total of about 3,700,000 leva; the cost of about 35,000 kilograms of lubricating mineral oil used (about 500,000 leva) must be added to this figure. Apart from these fourteen large central electricity stations belonging to the municipalities, there exist in Bulgaria many other privately-owned electricity stations which use Diesel engines. Furthermore, eighteen other Bulgarian towns or co-operative companies have decided to introduce electric lighting into their districts in 1927, and they will also use Diesel engines; 250,000 inhabitants, forming 62,000 families, will profit when electricity replaces paraffin in these districts. If high import duties were placed on imports of Diesel engines, mineral oils and their products, many families would probably be obliged to return to the use of the paraffin lamp, which would add considerably to the money spent abroad by Bulgaria on paraffin. M. Radev concludes that in Bulgaria the *rôle* of the State should not consist in favouring any one category of electric power stations, but in leaving each organisation to choose for itself the system it finds most profitable in view of the special conditions in the locality. The only thing the State ought to do, he says, is to demand of each new municipal electrical enterprise to make its choice in such a way that from the first, or second, year of its working it is able to meet expenses, to pay interest on the capital invested, and provide an annual redemption sum, or be deprived of all credit or other form of encouragement from the State.—*Reuter's Trade Service* (Sofia).

Coal Mines: Certificates of Competency.

The Board for Mining Examinations, with the approval of the Board of Trade, has made rules for the qualifications of applicants for certificates of competency under the Coal Mines Act, 1911. An applicant must be at least 23 years of age, and must submit to the Examining Board testimonials and certificates of his preliminary qualifications, as specified. He must satisfy the Examining Board that he has had practical experience in mining for not less than five years (or not less than three years if he holds an approved degree or diploma), and must pass written and oral examinations. The rules made by the Board for Mining Examinations in August, 1919, are revoked, and the new rules will come into operation on March 1st, 1927. Copies can be obtained from H.M. Stationery Office, price 1d. net.

Advertising Electricity by Films.

With the object of attracting more customers for electricity supply in rural areas, the Bernische Kraftwerke Gesellschaft, Berne, is showing in the principal villages in the canton a film depicting the uses of electricity in agriculture.

Photo-telegraphy.

A service for the exchange of pictures between Austria and Germany by wireless telegraphy will, it is hoped, be inaugurated before long. The Königswusterhausen station in Germany is to serve Rosenhügel as the return station during the preliminary experiment. The public service will be in the hands of the Austrian Marconi Co. (Radio Austria), and the Austrian Broadcasting Co., says *The Times*, will include within its range Great Britain and all other countries willing to co-operate. The system adopted by Austria deals with photographs and graphic reproductions of every kind, 4 in. square.

The tests which are being undertaken by the Austrian Marconi Co. jointly with the Telefunken Gesellschaft, of Germany, which it is hoped will lead to the establishment of a public service for the exchange of news and pictures, will extend over a considerable period. The experiment will be in connection with the Karolus-Telefunken-Siemens system. Tests made last year yielded good results, but only one-way, and were therefore inconclusive.

The results of the first Transatlantic experiments in the transmission of pictures and writing in facsimile by the system have now become available in Europe. Messages of acknowledgment from Rio de Janeiro and Buenos Aires showed that, in spite of atmospheric difficulties, the images were received there with encouraging clearness. Two certified facsimiles were reproduced in *The Times* (of London) on January 28th, which explains that though most of them were rather plainly marked with the vertical lines characteristic of facsimiles received under experimental conditions and some showed slight distortion, the pictures were, on the whole, remarkably clear, and print and script passed the essential test of legibility. The Telefunken Gesellschaft is fully satisfied with the results of this 6,000-mile transmission from the Nauen wireless station to Rio; in view of the atmospheric disturbances there was some doubt whether the images would get through at all. Transmission to Rio was begun on a wave-length of 40 metres, but owing to atmospheric disturbances a change was made to 25 metres. The time taken was from five to ten minutes, compared, it is stated, with 1½ hours required by other systems which have been tried over long distances. A transmitter is being built for the Rio station, and is nearly completed. Short-distance transmission in Europe is regarded as almost past the experimental stage. The average rate of transmission between Berlin and Vienna on the 1,300-metre wave-length is 30 seconds.

Electrical Association for Women.

The first of a series of evening lectures arranged by the above Association for women working in the industry and domestic-science mistresses was given by Mr. J. W. Beauchamp, director, Electrical Development Association, at the Lighting Service Bureau, London, on January 26th. In a very clear and lucid manner Mr. Beauchamp dealt with the history and economics of electricity supply in this country. He also gave an interesting description of the geography of the electrical world, and referred to the principal developments which would take place under the new Electricity Supply Act.

On February 8th Mr. W. E. Bush delivered the second lecture, on "Electric Light in the Home and in the School."

The following lectures have been arranged for: February 18th, "Household Engineering and Efficiency Tests," by Mrs. Christine Frederick (U.S.A.); March 9th, "Simple Household Repairs"; March 23rd, "Electric Power Appliances in the Home"; and April 6th, "Women's Place in the American Electrical Industry," by Mr. T. Settle. All the lectures will take place at 7 p.m.

Miss Reynard, M.A., Warden of King's College for Women, has kindly placed the Lecture Hall of this College at the disposal of the E.A.W. for February 15th, at 5.15 p.m., when Mrs. C. Frederick will lecture on: How the American housewife solves her household difficulties. A limited number of tickets for this lecture are obtainable from the director, E.A.W., 26, George Street, Hanover Square, W.1.

Electricity in Gasworks.

After a brief mention of the uses of pneumatic, hydraulic, and gas power, the applications of steam in a gasworks with an output of more than 15 million therms per annum were detailed in a paper which Mr. H. C. Smith recently brought forward for discussion at the Institution of Civil Engineers. The steam generated on an average day is at the rate of 44,110 lb. per hour from and at 212 deg. F., or 16,718 h.p. The efficiency of transmission of energy from heat in steam to b.h.p.-hr. is 3.5 per cent., which low figure is due to the fact that steam is used in a large variety of scattered units, the majority of which have been in use for several years under non-condensing conditions. The generation and use of electric power in gasworks is dealt with: the efficiency of generation from heat in steam supplied to engines to heat in electricity generated is 10.1 per cent., and the efficiency of generation and transmission from heat in steam supplied to engines to brake-horse-power developed by works motors is 6.1 per cent., which is comparable with the efficiency of 3.5 per cent. given for the use of steam power. Of the 16,718 h.p. of steam generated, 2,647 h.p. is used for gas-making and purposes other than power, and 14,071 h.p. for power purposes; of the latter, 1,524 h.p. is converted into electrical energy, giving 147.8 h.p. of electricity. The author suggests that in designing new gasworks of a similar size to the one under review power would be most economically produced and applied as electricity, generated by steam at a central station, the bulk of the steam being produced by waste-heat boilers; it would then all be used at one point, the exhausts of engines discharging into suitable condensing plant. Assuming that the mean total power required in new works would be the same as in the existing works, 494.0 b.h.p. would be required per average day; if applied as electricity with an efficiency from steam to motor of 6.1 per cent., it would be necessary to generate only 8,098 h.p. of steam instead of 14,071 h.p. as at present; plant capable of generating 818 h.p. or 610 kW would be required, with which a higher efficiency should be obtained than with the 150-kW plant now in use and, assuming this to be 14 per cent., the steam required would be only 5,843 h.p. The saving in steam would amount to 233 tons per diem, which, at 25.3d. per ton, gives a saving of £8,963 per annum, and it is shown that it would be possible to make 83 per cent. of the steam required in the works for gas-making and power purposes (apart from that necessary for the working up of by-products) in waste-heat boilers under average day conditions. Under existing conditions it would only be possible to make 42.1 per cent. of the steam required from the waste heat of the various carbonising processes.

Further Swiss Railway Electrification.

The electrification of the Federal Railways in Switzerland is now bringing before the directors of the secondary lines the desirability of electrifying their railways. The first of these to change its form of traction will probably be the "Directe," a line that unites Berne and Neuchâtel, the traffic of which is seriously threatened by the electrification of the section of the C. F. F. Berne-Bienne and Bienne-Neuchâtel. It is estimated that a sum of 6,800,000 fr. will be required for the project. The Confederation is authorised to advance one-half of this sum, the other half to be provided by the three cantons interested in the scheme, *viz.*, Berne, Neuchâtel, and Fribourg. The Confederation demands that the present situation of the "Directe" must be rendered satisfactory before the loan can be advanced, and the directors have accordingly made certain proposals. It is hoped, therefore, that the work will be put in hand soon, and that the line will be running electrically at the beginning of 1928. The energy needed for the railway will be furnished by the Muhleberg power house of the Forces Motrices Bernoises, and the line will be electrified in the same manner as the Federal Railways. The preparatory labour necessary for giving the supply is already in hand, which will prove a distinct gain of time when once the real work is undertaken. Four electric locomotives and five motor coaches will be used on the line, and a considerable speeding-up of the time-table will be the welcome result, while the saving on the cost at present paid annually for coal will be no less than 375,000 francs.

Fires and Electric Shocks.

The *Birmingham Post* quotes some suggestions for minimising the risks of electric shocks made by the Chief Officer of the Birmingham Fire Brigade (Mr. A. R. Tozer) in a circular issued recently.

It is pointed out that the risks from the 220- and 440-volt systems in houses and shops are accentuated by the adoption in large factories and works of the high-pressure system. Mr. Tozer is anxious to make arrangements which will be satisfactory to users, and at the same time safeguard, to some extent, members of the brigade who may receive a fire call. With the permission of firms, he is willing to place indication plates beside the main doors to premises, and suggests a 6-in. enamelled plate bearing the letters "H.T." Where there is only one entrance red letters on a white ground would, he considers, be suitable, and where there is more than one entrance black letters on a white ground, with the red-lettered plate by the nearest entrance to the electrical control room. On the arrival of the brigade, these plates would give warning of the high-pressure installation, and, if necessary, the Electric Supply Department could be summoned at once to cut off the supply to the works.

Where premises are locked up at night without any person in attendance, it would greatly help the brigade if the electrician were to cut off the current at the distributing board. It is stated that at a number of fires recently Birmingham firemen have received shocks.

A New Mica Insulation.

Phthalic anhydride, a few years ago a chemical curiosity produced from naphthaline or moth balls, has been combined with glycerine to produce a synthetic resin to replace shellac as a binding material in the manufacture of pasted mica insulation or micanite. The resin, which has been developed by the General Electric Company of America, is known as "Glyptal," and has been standardised for use with all rigid mica insulation used in the apparatus made by the company. Experiments have shown that mica plates pasted with the new resin are not only more firmly bonded, but have several other advantages over shellac-pasted plates. It is claimed that the Glyptal-pasted material has from 10 to 60 per cent. more dielectric strength, twice the resistivity, four times the surface resistivity, and only two-thirds the dielectric loss. It is slightly denser, has about twice the transverse strength, and has about the same resistance to abrasion. It shows very little tendency to carbonise, and the products of decomposition do not attack copper, and are non-conducting. An advantage in the use of the new mica insulation is that it does not require new or additional equipment to that used heretofore for micanite insulation. Glyptal can also be used in the manufacture of flexible mica sheets, mica tape, and so on.

Appointments Vacant.

Five transmission line engineers (£400) for the Shannon Hydro-Electric Scheme; high-pressure cable jointer for the Tunbridge Wells Corporation Electricity Department; junior mains assistant for the Borough of Dover Electricity Department; chief clerk (£230), mains foreman (95s.) for the Corporation of Middleton Electricity Department; clerk of works (£250) for the Millom Urban District Council; assistant engineer (£200 +) for the Park Prewett Mental Hospital, Basingstoke; meter tester and repairer for the Borough of Haslingden Electricity Department; showroom manager, wireless correspondent and estimator, order clerk and correspondent, trade counter salesman and storekeeper, for Metro-Vick Supplies, Ltd.; engineer, Consumers' Department (£1,200) for the Perak River Hydro-Electric Power Co., Ltd.; three shift engineers for the Salt Union, Ltd., Runcorn. (See our advertisement pages to-day.)

E.P.E.A. Dinner.

The annual dinner of the Scottish Division of the Electrical Power Engineers' Association was held at Edinburgh on February 5th. Mr. H. J. Taylor, chairman of the division, presided over a company of 80. Councillor Couston, sole convener of Edinburgh Corporation Electricity Committee, proposed the toast of the "Electricity Supply Industry," and in reply Mr. R. B. Mitchell, chief electrical engineer, Glasgow Corporation, referred to the trade revival, which had been quite marked in Glasgow since the beginning of the year, and said that the output figures were very encouraging. He did not think that large undertakings like those of Edinburgh and Glasgow would benefit very materially from the Electricity Act, but the smaller undertakings would. They had bright prospects. The manufacturers of electrical plant had been very busy during the past year, in spite of all that had happened, and they now had their order books very full, more so than since the war.

Mr. Edwin Seddon, chief engineer of the Edinburgh Corporation Electricity Department, gave the toast of "The Association," and Mr. A. W. Crompton, Newcastle, the president, responded.

Institution Notes.

Institution of Electrical Engineers.

NORTH-WESTERN STUDENTS' SECTION.—A dance will be held at the Manchester Municipal College of Technology on Saturday, March 5th. Tickets (4s. 6d. each) can be obtained from members of the Committee or from the hon. secretary.

The Physical Society.

During the year 1926 fourteen ordinary meetings were held, at which 32 papers were presented and 12 demonstrations were given. The average attendance was 54. At the sixteenth annual exhibition trade exhibits were arranged by seventy-two firms, and the Research and Experimental Section contained sixty-one exhibits. On the third day the general public were admitted, and the total attendance at the exhibition was estimated at 3,500. The Council has awarded the Fourth Duddell Medal to Mr. F. Twyman, F.R.S. The new agreement between the Society and the Institution of Electrical Engineers in respect of "Science Abstracts" has been sealed, and is regarded by the Council as satisfactory. The Council has decided to take no formal action in the matter of changing the name of the Society; the words "of London" are to be omitted from all publications except where legally necessary. The number of Honorary Fellows on the roll on December 31st, 1926, was 12, the maximum permissible number. At the same date Ordinary Fellows numbered 666 and Students 12, the net increase being 23.

The annual general meeting is to be held to-day. It will be followed by an ordinary meeting, at which the presidential address will be given by Prof. O. W. Richardson, M.A., D.Sc., F.R.S., on "The Present State of Atomic Physics."

The twelfth Guthrie Lecture will be delivered on Friday, February 25th, by Prof. Sir Ernest Rutherford, O.M., D.Sc., P.R.S., on the subject of "Atomic Nuclei and their Transformations."

INSTITUTE OF PHYSICS.—On the resignation of Prof. A. W. Porter from the honorary secretaryship, Prof. A. O. Rankine, of the Imperial College of Science, has been appointed his successor. Mr. Thomas Martin, M.Sc., D.I.C., has been appointed secretary of the Institute. The office of the Institute of Physics has been transferred from 90, Great Russell Street, to 1, Lowther Gardens, Exhibition Road, London, S.W.7.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

The Electricity Board.—On Monday last the Minister of Transport announced that he had appointed the undermentioned to fill the seven places on the Central Electricity Board under the chairmanship of Sir Andrew Duncan:—

Sir James Devonshire, K.B.E., M.I.E.E., chairman and general manager, the North Metropolitan Electric Power Supply Co. and allied companies. Vice-president Incorporated Association of Electric Power Companies.

Mr. Frank Hodges, J.P., secretary, International Miners' Federation.

Sir James Lithgow, Bart., M.C., T.D., D.L., J.P., ex-president of National Confederation of Employers' Organisations.

Alderman W. Walker, M.I.E.E., M.I.M.E., vice-chairman, Manchester Corporation Electricity Department. Chairman of National Joint Industrial Council for the Electricity Supply Industry and chairman of National Joint Board of the Electricity Supply Industry.

Sir Duncan Watson, J.P., M.I.E.E., chairman of the London and Home Counties' Joint Electricity Authority. Chairman of the Conference of Joint Electricity Authorities, Joint Advisory Boards and Joint Committees.

Mr. W. K. Whigham, director, Bank of England, and member of the Trade Facilities Act Advisory Committee.

Brevet-Colonel the Hon. Vernon Willey, C.M.G., M.V.O., C.B.E., director Lloyd's Bank, late Controller of Wool Supplies, Ministry of Munitions, and ex-president of the Federation of British Industries.

Eastbourne Electricity Committee recommends increasing the salary of the electrical engineer (Mr. J. K. Brydges) from £900 per annum to £1,000.

Mr. W. THYNE, late of Glasgow, has been appointed district manager of the Canterbury telephone district in succession to Mr. A. M. Kidd, who recently retired.

Mr. K. D. CAMPBELL, late sales manager of the Campbell Gas and Oil Engine Co., Ltd., Halifax, has been appointed to a similar position with Petters (Ipswich), Ltd.

The Southport Town Council has adopted a recommendation by the Finance Committee disapproving of a proposal by the Electricity Committee that Mr. W. T. GANN should be appointed deputy electrical engineer at the salary fixed by the E.P.E.A. schedule. An amendment that the appointment be made was negatived by a small majority. Mr. Gann has been first assistant at the electricity works for three years.

The *Yorkshire Post* says that at a meeting of the Hull City Council last Friday a motion to increase the salary of the city electrical engineer was defeated by 27 votes to 15.

Mr. MOXON, electrical engineer, has been awarded £100 by the Southport Council for his services as fuel overseer during the coal strike.

The *Australian Electrical Times* states that Mr. J. G. KILPATRICK, supervising engineer in the Central Administration, P.M.G.'s Department, Melbourne, has been provisionally appointed State engineer for Western Australia in place of Mr. PETER KENNEDY, who has been promoted to South Australia. Mr. Kilpatrick has been attached to the Department's engineering staff since 1915, and has previously had 14 years' experience with the engineering branch of the British Post Office.

On Monday the Newark Town Council appointed Mr. A. J. WARING, A.M.I.E.E., distribution electrical engineer to Torquay Corporation, as borough electrical engineer.

The accompanying portrait is that of Mr. J. SCRIVENER, who is, as we recently reported, managing director of Volta, Ltd., which is handling a new suction cleaner of Swedish manufacture. During the past seven years Mr. Scrivener has been associated with a well-known company specialising in vacuum cleaners, as managing director. He has therefore had a good

Hugh Cecil **Mr. J. Scrivener,** *[London.*

Managing Director of Volta, Ltd.

deal of experience in this particular direction. Mr. Scrivener informs us that although his company has only been functioning for three or four weeks, he is very gratified by the response made by the trade. As soon as the machine is reasonably well distributed throughout the country, the company is undertaking a national advertising campaign.

Mr. HAROLD PARKER has resigned his position as sales manager to Messrs. S. G. Leach & Co., Ltd., London, and has been appointed assistant manager to Walter's Electrical Manufacturing Co., Ltd., of Kensaltown Telegraph Works, Kensal Road, London, W.10. The latter company was established in 1880 as contractor for telegraph instruments, railway signalling apparatus, &c. Mr. Parker was for eight years in India and the Far East, connected with the Metropolitan Vickers Electrical Co., Ltd.

The British Thomson-Houston Co., Ltd. (Lamp Sales Department) announces that in future Mr. F. E. BING will be representing the company for "Mazda" lamps in the place of Mr. A. H. Cooling, who has left the service.

Major G. FETHERSTONE resigned his appointment as British Trade Commissioner in South Africa in order to take charge, as from February 1st, of the South African interests of the group of engineering firms controlled by Agricultural and General Engineers, Ltd.

Mr. L. J. N. KIRKBY has been appointed assistant mains engineer to the City of Chester electricity department.

The Spalding Urban Council has appointed Mr. R. J. CALDERWOOD, gas and waterworks engineer, as manager of the new electricity department, at a salary of £100 per annum.

By the casting vote of the Mayor, Middleton Town Council has increased the salary of the electrical engineer from £500 to £600 per annum.

At a meeting of the Society of Technical Engineers on February 7th, Capt. W. J. Liberty was awarded the Society's "Nersey" premium for a paper on the "History of Artificial Lighting."

Obituary.—Mr. W. S. Bemrose.—The death occurred suddenly, on February 3rd, of Mr. William Scofield Bemrose, who for about 48 years had been in business as an electrical engineer at Rochester. He was in his 75th year, and since his retirement about two years ago the business has been managed by his son, Mr. J. Bemrose, A.M.I.E.E., and other relatives.

Mr. G. H. Fawcus.—We learn with regret of the death of Mr. George Henry Fawcus, A.M.I.E.E., chief engineer and manager of the Altrincham Electric Supply Co., Ltd. Mr. Fawcus, who was born in 1879, received his training under Messrs. Siemens Bros. & Co., Ltd., at Woolwich, and before taking up his position with the Altrincham company he was connected with various power and traction undertakings, including the Waterloo and City Railway, the Blackpool, St. Annes and Lytham tramways, also the Blackburn and Bath tramways. During the war Mr. Fawcus rendered service in connection with the Ministry of Munitions and Coal Mines Control.

Sir Wilfrid Stokes.—We regret to record the death, which occurred on Monday last at the age of 66 years, of Sir Wilfrid Stokes, the well-known engineer and the inventor of the Stokes gun. He will be remembered by our readers as one of the early presidents of the British Engineers' Association and a very active and valued member of the Inventions Branch of the Ministry of Munitions during practically the whole of the war. Sir Wilfrid was also a vice-president of the Federation of British Industries.

Mr. C. Brooker.—The death took place, on January 28th, at the age of 57 years, of Mr. Charles Brooker, who had for nearly 20 years been on the staff of the Marconi Wireless Telegraph Co. at Chelmsford.

Sir James Kemnal.—On Tuesday morning Sir James Kemnal, M.I.E.E., managing director of Messrs. Babcock & Wilcox, Ltd., who had been ailing for some time, died at Bournemouth. The funeral takes place to-day.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Dormer & Wadsworth, Ltd.—Private company. Registered January 31st. Capital, £1,000 in £1 shares. Objects: To adopt an agreement with Engineering Supplies, Ltd., and to carry on the business of general engineering tool makers, formerly carried on by that company at 57a, Denbigh Street, Pimlico, and that of electrical and radio engineers, &c. The first directors are:—H. A. Dormer, 18, Westcliff Parade, Westcliff-on-Sea (director of Engineering Supplies, Ltd.); L. H. Wadsworth, Mount Lodge, Upland Road, Sutton, engineer. Qualification: £100. Remuneration, as fixed by the company. Secretary: G. Dickson, 11, Queen Victoria Street, E.C.4. Solicitors: Tatham, Oblein & Nash, 11, Queen Victoria Street, E.C. Registered office: 57a, Denbigh Street, Pimlico, S.W.1.

J. L. Maughan & Co., Ltd. — Private company. Registered February 2nd. Capital, £1,000 in £1 shares. Objects:—To carry on the business of electrical, mechanical, and wireless engineers, manufacturers of, and dealers in electrical apparatus, cables, wires, conduits, accumulators, batteries, motors, generators, mining machinery and apparatus, lamps, accessories, &c. The subscribers (each with one share) are:—J. Maughan, Look Out Farm, Seaton Delaval, grocer; J. Maughan, Junr., 43, Bywell Terrace, Seaton Sluice, electrical engineer. The first directors are not named. Secretary: J. Maughan, Junr. Solicitors: Keenlyside and Forster, Lloyd's Bank Chambers, Collingwood Street, Newcastle-on-Tyne.

Charnock & Walker, Ltd.—Private company. Registered February 4th. Capital £500 in £1 shares. Objects: To carry on the business of manufacturers and patentees of electric, clockwork, novelty and sky signs, wireless lights and other signs, advertising contractors, &c. The permanent directors are:—J. E. Charnock, Little Hey, Pirbright, consulting engineer; D. D. Walker, Ravensknowle, Springfield Drive, Westcliff-on-Sea, advertising expert. Qualification £100. Secretary: J. E. Charnock. Solicitors: Marcus and Francis, 47-48, Broad Street Avenue, E.C.2.

Howarth, Green & Co., Ltd. — Private company. Registered February 3rd. Capital, £1,000 in £1 shares. Objects:—To carry on the business of importers and exporters of electrical goods, &c. The first directors are:—F T. Green, J. W. Green, W. V. Green, and J. Green, all of Staveleigh House, Knott End, near Fleetwood. Secretary: F. T. Green. Solicitor: E. Napthen, 18, Winckley Square, Preston. Registered office: 12a, Starkie Street, Preston.

A. & C. Receivers, Ltd.—Private company. Registered February 5th. Capital, £100 in £1 shares. Objects:—To carry on the business of manufacturers of, and dealers in all kinds of apparatus, instruments, receiving or transmitting sets, electrical or mechanical parts, fittings and appliances, and all cabinet and other work connected with radio-telegraphy, &c. The subscribers (each with one share) are:—F. H. A. Gittins, Priory Street, Dudley, accountant; F. W. Mail, 214, Bordesley Green, Birmingham, radio mechanic. The first directors are not named. Secretary: F. H. A. Gittins. Solicitors: Loxton & Co., 15, Bridge Street, Walsall. Registered office: 12, Mountrath Street, Walsall, Staffs.

Official Returns of Electrical Companies.

Western Wireless and Electrical Co. (Salisbury), Ltd.—Particulars filed of £1,500 debentures authorised January 27th, 1927, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £1,300.

Rhondda Tramways Co., Ltd.—Satisfaction to the extent of £7,400 on January 13th, 1927, of charges dated March 24th, 1911, November 13th, 1912, and May 11th, 1915, securing £250,000.

Radio Communication Co., Ltd.—Satisfaction to the extent of £66,000 on January 28th, 1927, of debenture dated April 14th, 1926, securing £81,500.

City of Oxford Motor Services, Ltd. (formerly City of Oxford Electric Tramways, Ltd.).—Satisfaction to the extent of £1,800 on January 13th, 1927, of charge dated February 20th, 1914, securing £46,000.

Santon, Ltd.—Charge on 149 and 150, Dock Street, Newport, dated January 14th, 1927, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd., not exceeding £1,800.

Brundall and District Service Co., Ltd. (195,956).—Capital, £4,000 in £1 shares. Return dated October 29th, 1926. All shares taken up. £3,750 paid. £250 considered as paid. Mortgages and charges, nil.

English Cable Supplies, Ltd. (195,754).—Capital, £2,500 in £1 shares. Return dated August 18th (filed October 2nd), 1926. 465 shares taken up. £465 paid. Mortgages and charges, nil.

City Notes.

Yorkshire Electric Power Co.

The accounts which will be submitted at the annual meeting at Leeds, on February 15th, are as follows:—

	1924.	1925.	1926.
	£	£	£
Net profit after payment of interest and debenture stock discount charges	182,764	205,012	257,416
Balance brought forward ...	34,640	46,053	55,051
Total	£217,404	£251,065	£312,467

The dividend on the cumulative preference capital of 6 per cent. (less income tax) absorbs £59,615; a dividend on the ordinary capital at the rate of 8 per cent. (less income tax) (of which 3 per cent. was paid in August) amounts to £102,592; £60,000 is to be placed to general reserve, increasing

the fund to £294,000; £25,000 is to be put to plant renewals fund (increasing it to £75,000); and £65,260 is to be carried forward. Owing to the coal dispute and the general strike the cost of supplying electricity was greatly increased, but the increased revenue and economies made have enabled the company to pass satisfactorily through a very difficult period. There has been a large increase in the number of agreements made with new and old consumers and, granted the restoration of normal trade conditions, a considerable increase of output may be anticipated. Large extensions of mains have been made and many sub-stations built and extended. These new mains include important additions to the 33,000-volt transmission system, enabling the company to deal with the increasing demands for electricity in the most economical way. The Thornhill and Barugh power stations have been fully employed, and the new plant installed at Thornhill is effecting the economies anticipated. The completion of the initial installation of 50,000 h.p. at Ferrybridge power station during the year was delayed by the contractors' difficulties in obtaining materials. The machinery has since been set to work and is now in operation. In February last, 773,000 six per cent. cumulative preference £1 shares were allotted to the shareholders at 21s. each and applied for nearly twice over. A Bill has been deposited in Parliament to authorise the increase of the nominal capital of the company from £4,000,000 to £6,000,000, with power to borrow on mortgage or by the issue of debenture stock up to one-half the total capital. "The Electricity (Supply) Act, 1926, received Royal Assent in December last, after amendments had been made to the Bill originally introduced, which may, it is hoped, make it a workable measure, but some time must necessarily elapse before the scheme of the Central Electricity Board can be brought into operation."

Fife Tramways, Light and Power Co., Ltd.

The report for the year ended December 31st, 1926, states that the trading profits of the undertakings owned and operated by the company amounted to £75,606. Of this sum there was reserved in the accounts of these undertakings an aggregate amount of £10,169. After payment of this company's administration expenses, taxation, &c., there remains at credit of profit and loss account (including £9,694 brought forward) £64,043. Loan interest and interest on debenture stock absorbs £17,409, dividend on preference shares £24,000, and there is transferred to debenture stock redemption account £4,488, leaving £18,145. The directors recommend a dividend on the ordinary shares at the rate of 3 per cent. per annum, less tax, £12,000, leaving £6,145 to be carried forward. The earnings of the power and lighting properties were seriously affected by the complete dislocation caused by the coal dispute in the county of Fife. The working costs and output of these properties are now almost back to normal conditions. The Power Company's generating station is being interconnected with the adjoining undertaking of the Scottish Central Electric Power Co. by a trunk transmission line, which will be completed early in the current year, and a supply in bulk will be given to that company.

Speaking at the annual meeting on February 4th, Mr. Wm. Low (chairman) said that the company had now distribution powers for lighting as well as for power purposes over the whole of the county of Fife, with the exception of the burghs of Kirkcaldy and St. Andrews. It was the intention of the directors to extend the network of mains into the new area during the current year and to commence supply in districts from which urgent demands had been received.

Prospectus.

North Metropolitan Power Station Co., Ltd.—This company was formed to undertake, *inter alia*, the construction of the new Brimsdown power station for the North Metropolitan Electric Power Supply Co. On Monday last it issued a prospectus offering for subscription £850,000 of 5 per cent. debenture stock (at £100 10s. per cent.), representing the whole of the company's capital, with the exception of 100 shares of £1 each. This issue is guaranteed as to principal and interest by the Government under the Trade Facilities Acts, and is redeemable over the years 1931 to 1957 by a cumulative sinking fund operating by annual drawings and/or purchase. The list was to close on or before Wednesday last, but it actually closed at 3.30 p.m. on the day of issue.

An interesting section of the prospectus was that relating to the contracts which have been placed. The contract for "the construction and co-ordination of works" has been awarded to the Foundation Co., Ltd. Other contracts mentioned were:—Turbo-generators and condensing plant (£148,570), C. A. Parsons & Co., Ltd.; part of Foundation Co.'s contract (£74,321), International Combustion, Ltd.; 33,000-V outdoor switchgear and protective equipment (£14,350), Ferguson, Pailin, Ltd.; 11,000-V switchgear (£5,575), A. Reyrolle & Co., Ltd.; transformers (£7,890), British Electric Transformer Co., Ltd.; circulating-water pumps (£5,666), W. H. Allen, Sons & Co., Ltd.; and coal-handling and storage plant (£20,033), Babcock & Wilcox, Ltd.

Traction and Power Securities Co., Ltd.

The annual meeting was held last week. Mr. H. A. Vernet (chairman), who presided, said that a valuation of the company's investments showed them to be £96,000 above the book cost. The net revenue had increased and, in addition to transferring £10,000 to reserve, they had decided to pay an ordinary dividend of 14 per cent., as against 13 per cent. for 1925. After referring to the brighter prospects, the chairman said that, although the company was originally a finance company, it had become an investment trust. Accordingly, the directors proposed to change its title to "The Traction and General Investment Trust, Ltd." The report was adopted and the change of name approved.

Stock Exchange Notices.

The undermentioned have been ordered to be officially quoted:—

Chili Telephone—30,000 shares of £5 each, fully paid, Nos. 150,001 to 180,000.

North Wales Power—£200,000 four and a-half per cent. guaranteed debenture stock, 1930-53.

German Electrical Companies.

The net profits of the A.E.G., which, as mentioned last week, were 10,760,000 marks for 1925-26, compared with 8,363,000 marks in the previous year. The dividend is to be 7 per cent., as compared with 6 per cent. in 1924-25.

The Bank for Electrical Securities of Berlin, which is a financing organisation of the A.E.G. group, intends to increase its share capital by £434,000 to £1,210,000, for the purpose of participating in new business. It is said that the additional funds are to serve for the financing of electricity works abroad, as the work of erecting new stations in Germany is now so far under public control that little room is left for private enterprise.

Yorktown and Blackwater Gas and Electricity Co.

At the recent annual meeting, the chairman (Ald. D. Sparvell) said that the profits for the year enabled the directors to declare dividends of 12½ per cent. and 8¾ per cent. upon the original and additional shares respectively. The revenue from the sale of electricity had increased from £3,754 to £6,266. Their supply, which was received from London, was sold at a favourable rate to consumers.

Marconi's Wireless Telegraph Co., Ltd.

The membership of the Advisory Committee which has been appointed to report upon the future control and conduct of this company, and has been approved by the directors, is as follows:—Sir Hugo Hirst, Bart.; Lord Ashfield; Lord Buckland; and Mr. F. A. Szarvasy. The first meeting was to be held on Monday last.

Chatham and District Light Railways Co.

The revenue for the year ended December 31st last was £73,040 and the expenses £60,048. After providing for depreciation, rent, &c., and adding £1,596 brought forward, there is a balance of £5,862. It is proposed to pay the preference dividend and one of 2½ per cent. on the ordinary shares, leaving £962 to be carried forward. Meeting: February 17th.

Mexican Light and Power Co., Ltd.

It is reported that the board has prepared a funding scheme for the payment of the arrears of interest upon the company's second mortgage bonds and the discharge of the arrears of dividend upon the 7 per cent. preferred stock. The plan will be presented to the stockholders at an early date.

Shawinigan Water and Power Co.

A *Reuter* dispatch from Montreal states that the company has exchanged the old shares of $100 par value for new shares of no par value, on the basis of four new shares in exchange for one old share.

Crossley Bros., Ltd.

Dividend of 3½ per cent. on the preference shares, making 7 per cent. for the year.

Stocks and Shares.

MONDAY EVENING.

THE outstanding financial feature of the present time is the manner in which investment absorbs all the good stock offered. No matter from what quarter the appeal for capital comes, it finds a ready response, provided the security is sound, and that the price asked is in accordance with the general level occupied by similar issues. Money is pouring into stocks and shares in a volume which suggests that trade is less resilient than some of the authorities claim, for capital should be going into industrial channels, rather than into Stock Exchange securities, if there were actually such re-awakening of national industry as Bank chairmen, for example, have been talking about at the recent meetings of proprietors. China is a factor of restraint to some extent, but, apart from causing an occasional spasm of depression, the Far Eastern news does not weigh very heavily.

It has been generally understood that no more loans made under the Trade Facilities Act would be issued. This week, however, there have appeared prospectuses of T.F.A. stocks for a railway in Sudan, and £850,000 in 5 per cent. debenture stock of the North Metropolitan Power Station Company. Both were offered at 100½, and carry, of course, the guarantee of the Imperial Government.

Mexico has gladdened the hearts of her creditors by remitting the sum due for meeting interest obligations for 1926. This brought about substantial rises in the utility companies' bonds and shares. Mexican Light & Power preferred has jumped 12 points, and the common 6½. The bonds of the various concerns are 1 to 2 points higher. The feeling is that Mexico, having given this tangible evidence of her intention—as well as ability—to keep faith with her bondholders, it is reasonable to expect a just settlement of the amounts outstanding between the utility companies and their debtors. A more cheerful sentiment is now prevailing than has been the case for a long time past, although the cynic may possibly recall that Mexico has provided many a disappointment by shattering hopes which previously have appeared to be on the point of fulfilment.

Brazilian Tractions keep steady around 118. Brussels and Montreal continue to be ready supporters of the shares on any decline, but the recent excitement in the market has given place to quieter conditions. British Columbia Electric Railway stocks are again harder, the deferred gaining 4½ points. Colombo Electric Tramways & Lighting Company is said to have received, and refused, an offer from the Ceylon Government for the purchase of its plant and distributing system. The Ceylon Government was prepared to pay £250,000. The Company's 5 per cent. first mortgage debenture is quoted about 88, and stock changed hands last week at 89.

While Metropolitan Railway ordinary has rallied a little, after its steep fall on the dividend disappointment, other Tube railway stocks are heavy. Districts shed 1½, and Undergrounds have drooped. The Metropolitan announces that, in order to cope with its ever-increasing traffic, new arrangements are in contemplation for the installation of a huge additional power unit at Neasden. This has encouraged the hope that last year's poor dividend of 3 per cent.—as compared with 5 per cent. for 1925—was due to the coal stoppage and other industrial conditions which should not recur. A slight demand for London United Tramways debenture served to advance the price 3 points, to 45½; on the other hand, London and Suburban preference fell back to 6s. 6d. British Electric Traction hardened to 145½.

Of debenture stocks that are obtainable in the market, mention may be made of City of London Electric fives at 99¼, free of stamp and fee, January and July interest, and exceedingly well-covered; North Metropolitan Electric Power fives at 97; London Power fives at 98⅜, free of stamp. English Electric 6 per cent. convertible debenture can be bought at 102, to give a flat yield of £5 17s. 6d. per cent. on the money. The conversion terms are that until July this year a £100 debenture can be exchanged for 100 ordinary shares; until July, 1930, for 90 ordinary; and until 1933 for 80 ordinary shares. Perak River Hydro-Electric Power 7 per cent. debenture, which carries participating rights, is obtainable at 92, to yield £7 12s. per cent. Interest on this stock is payable, we may repeat, out of capital during construction of the works. A small amount of Llanelly and District Electric 5 per cent. first mortgage debenture stock is available at 93½, to give £5 6s. 9d. now and 5½ per cent. taking redemption into account. Interest payments are due in January and July.

Bournemouth and Poole ordinary have developed a little activity around £3. Both Bournemouth and Poole have recently issued Corporation loans, and apparently this has revived the expectation that the Electric Supply Company may receive an offer for its undertaking. Improvement in Primitiva Gas shares is ascribed to the desire on the part of the electric lighting authorities to obtain possession of the gas companies' mains for use in conjunction with the supply of electric current to the town. Several English provincial electric power shares are better. Newcastle-on-Tyne ordinary and Yorkshire Electrics are 6d. up. The latter company proposes to seek powers for raising its capital to £6 000,000. County of London ordinary improved a shade, but City Lights have gone back. There is nothing much doing in the market for shares in the London lighting list. New Shropshire A snares are being marketed this week at 25s. 3d.

Henleys are again 1/16th up, at 4½, and the yield on the money is now a shade under 4½ per cent. Brush shares are better at 28s. 3d. The weakness of British Aluminium is still noticeable, the price going back a florin to 46s. 3d. Telephone Manufacturing are a dull market at 7s. 7½d. Siemens' reverted to 30s. Coal and iron shares continue depressed, and the rubber market is in an uninteresting state.

Cable stocks and shares lean to the lower side, Anglo-Americans and Great Northerns being down on the week. Eastern Telegraph ordinary lost 2. Oriental Telephones and United River Plates went back 1/16th each. Marconis attract attention—and a wide diversity of dealings—upon publication of the names of an advisory committee of which Lord Ashfield and Sir Hugo Hirst are amongst the members.

The Import Trade of China.

THE present situation in China gives the following statistics a topical interest; they are, moreover, a guide to the trend of trade. The effects of the political and industrial disturbances which commenced in 1925 are clearly indicated by the preponderance of decreases shown in the last column of our table. It is noteworthy that machinery for electric power stations continued its upward course; the shares of Great Britain and Japan advanced, while that of the United States was almost halved. It is probable that a great deal of the trade credited to Hong-Kong was transacted with the United Kingdom. The Haikwan tael fell in average value from 3s. 7 15/16d. in 1924 to 3s. 5¾d. in 1925.

The Import Trade of Siam.

THE following figures, showing the imports of electrical and similar goods into the port of Bangkok during the year ended March, 1926, are taken from the recently-issued official trade statistics; the figures for the year ended March, 1925, are included for the purposes of comparison, and notes of any increases or decreases are given. Imports stated to be from Singapore and Hong-Kong are for the most part the products of other countries shipped *viâ* these two ports:—

NOTE.—Tical = 1s. 10½d.

A Cathedral Lighting Scheme.

The electrical installation in the St. Magnus Cathedral, Orkney Islands.

IN our issue of March 14th, 1924, reference was made, in the description of the generating station at Kirkwall, Orkney Islands, to the intention to install electric lighting in the fine old St. Magnus Cathedral, fig. 1. This work has now been completed and we are able to give below some particulars of the scheme.

Fig. 1.—St. Magnus Cathedral, Kirkwall.

The lay-out of the building is on the usual cross design, with main, triforium, and clerestory arcades. As is always the case in installing electric lighting in such buildings, the antiquity of the structure and the ecclesiastical associations presented difficulties not met with in everyday work. Every effort has been made to obtain harmony with the surroundings, so that the clash between the 12th and 20th century products is minimised as much as possible.

Fig. 2.—Nave and Clerestories, Illuminated.

The nave lighting is arranged by means of 16 four-light fittings suspended from the centre of the main arches, eight on each side. The fittings are of circular design, and are placed about 12 ft. from the floor level. They each contain four 60-W lamps arranged on two different circuits. Rod suspension is employed for the fittings, and is carried out by a special bayonet catch arrangement to save the making of joints and facilitate the taking up and down of the fittings for cleaning purposes. The arrangement in the choir is exactly similar to that in the nave. A 13-light electrolier is provided over the nave and transept junction at about 30 feet above the floor level. The lamps are arranged in two tiers of six, with one lamp serving as a pilot light on the top of the fitting. This is controlled either from the main switchboard or from the entrance door, so that some light in the building may be obtained independently of the main switches. Each of the transepts is lit by four three-light fittings of semicircular design, and the higher regions by four lights placed on the tie-rods.

In the nave and choir clerestories, a shaded lamp is placed in the apex of each window arch; when these are lit and the nave and choir lights extinguished, a very impressive effect is obtained and the magnificent groining of the cathedral can be seen to advantage, as shown in fig. 2.

The triforiums are lighted by shaded lamps placed in alternate bays; 10-A plugs are fitted to the other bays to provide for temporary decorative illumination when required. The six vestibules are lighted with bowl fittings of the inverted type, and provision has been made for four outside pillar lights at the main entrances.

The vestry, session house, stairs, passages, and so on, are provided with lighting points throughout, and not the easiest part of the work was the lighting of the two spiral staircases leading by some 200 steps to the tower.

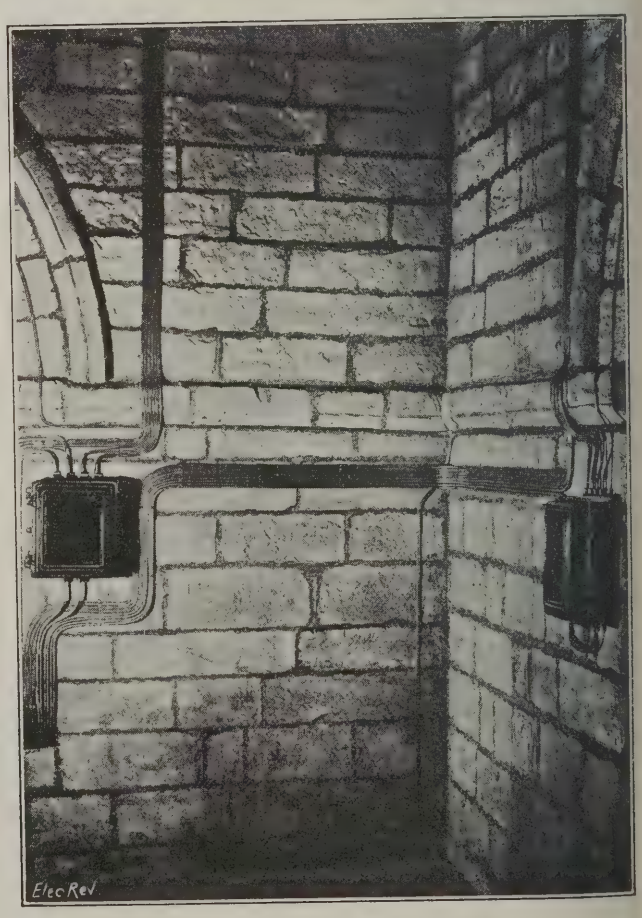

Fig. 3.—Wiring in Square Tower.

The supply is taken from the public mains at 440 V and

is split into two balanced 220-V circuits at the main switchboard. This measures 7 ft. long by 5 ft. high, and accommodates the control gear and measuring instruments mounted on siluminite panels, covered in with sliding plate-glass doors. The outside is suitably finished to match the carved oakwork of the cathedral interior.

The Stannos system of wiring was adopted on account of the salt-laden atmosphere. The wiring has been very successfully concealed practically throughout the cathedral, but where this could not be done it has been painted to match the surrounding stone work. Fig. 3 shows the wiring and sub-fuse boards in the square tower, which is the centre of the distribution. In the clerestories, where very rough walls were met with, oak slips were fixed to the walls on which to clip the wiring. The whole of the fittings were made to special designs in real bronze by Messrs Holders, Ltd., and the Edison Swan Electric Co., Ltd. The installation work was carried out by Messrs. Rendall & Wylie, local contractors, under the supervision of the consulting engineers, Messrs. J. A. Liddle & D. Miller, B.Sc., who were responsible for the preparation of the scheme, and to whom we are indebted for the foregoing notes.

Kiosk-Type Sub-Stations.

New structural designs of Messrs. Switchgear & Cowans, Ltd., eliminating the necessity for interior doors by interlocking the main doors.

HAVING benefited by the primary advantages of the kiosk sub-station, engineers are now demanding further economies for such installations, both with regard to the cost and the space occupied. In this connection it is interesting to learn of some improved models which have been recently introduced by Messrs. Switchgear & Cowans, Ltd.

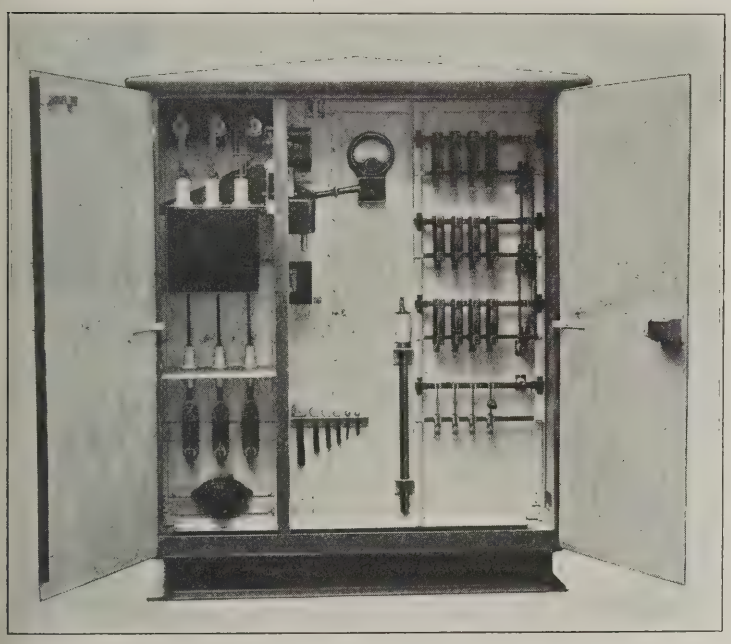

Fig. 1.—100-kVA Terminal Kiosk ; Switchgear Compartments.

In the usual form of kiosk sub-station the h.p. and l.p. compartments are arranged on separate sides of the structure, and interior doors are fitted to the h.p. compartment as a protection against exposed live parts. In the new design by the above firm interior doors have been eliminated by interlocking the main doors, thereby considerably simplying the construction. The h.p. and l.p. compartments are situated both on one side of the kiosk, as shown in fig. 1, which illustrates a terminal feeder sub-station of 100-kVA capacity. Two half doors serve these compartments and the one giving access to the l.p. equipment is secured by a strong Yale lock. The l.p. circuits are distributed through patented unbreakable fuse carriers mounted on steel rods insulated with micanite, no china, slate, or other fragile material being used. The operating handle of the e.h.p. oil circuit breaker is accessible from the l.p. compartment. While the circuit breaker is in the "on" position the door of the compartment cannot be opened, it being interlocked with the circuit-breaker operating gear. It is also secured by a padlock arranged inside the l.p. compartment.

A steel wall separates the two classes of apparatus, and the result is a high degree of compactness with adequate accessibility, it is claimed, for the instruments, tools, operating levers, and easy operation. At the back of the switchgear a large compartment provides for the transformer equipment, occupying the full depth of the kiosk. The two doors of the transformer compartment are interlocked with the h.p.-apparatus door, so that it is impossible to gain access to the transformer until the circuit breaker is in the "off" position and all the live parts are dead. Further, the circuit breaker cannot be closed while the transformer doors are open. Rails are provided for accommodating the transformer wheels.

Similarly arranged kiosk sub-stations for ring-main systems are obtainable; fig. 2 illustrates the transformer compartment side of such a kiosk with an additional compartment accommodating the isolating switches controlling the incoming and outgoing feeder circuits. The structures are well ventilated by louvres at the bottom and a space all round under the eaves of the roof. A feature is the absence of any protruding parts from the exterior which would invite youthful climbers to get on the roof.

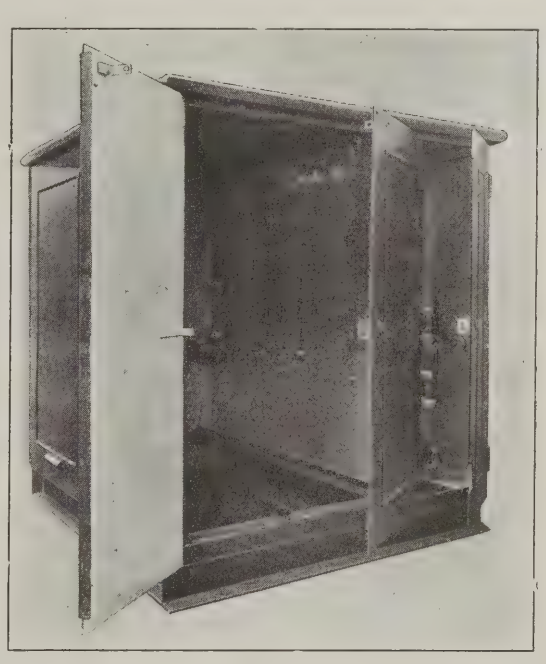

Fig. 2.—Ring-Main Kiosk.

Fires on Electrical Installations.

In order to secure closer co-operation between the fire brigade and the electrical power station in the event of fires affecting electrical installations, the German Association of Electro-Technicians has issued instructions under which all the important distributing stations must have trained men who can be sent at the request of the fire brigade to the place where the fire occurs. On the other hand, the fire brigade must have special electricians trained by the electrical authorities to carry out electrical work. The use of electric lighting in fire fighting is advocated, as it serves its purpose in smoke-filled rooms and facilitates rescue work. Only non-conducting extinguishers, driven by non-conducting means, may be used, and in case of wooden poles catching fire, when water has to be used, the electrical conductors must be made dead before extinguishing the fire, to avoid the risk of electri shock from the stream of water. When the work is over all parts of the undertaking affected by the fire must be completely cut off before anyone is allowed to enter.

A.C. Measuring Instruments.

The more important developments in the design and construction of indicating and recording, as distinct from integrating, meters; and an account of some of the authors' investigations.

By Lieut.-Col. K. EDGCUMBE, R.E. (T.A.), Vice-President, and F. E. J. OCKENDEN, GraduateI.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

THE writing of the paper has been prompted by the large amount of valuable material produced during the last few years, but little of which has been put into such a form as to make it available to the designers of electrical measuring instruments. During the past 35 years only two papers dealing with the subject in a general way have been read before this, or any kindred, body.

The number of different sizes of meter shows a tendency to decrease, concentration being on the 6-in. or 5-in. round sizes for general industrial use, and on the 6-in. or 8-in. sizes for switchboards; for many industrial purposes, 3-in. or 2-in. round instruments are all-sufficient, and are economical in respect of both first cost and space occupied.

The general tendency in construction is to eliminate handwork as far as possible, with the result that stampings and die-castings have largely taken the place of machined parts, thus giving a standardised product which is both cheaper and better than heretofore. It may be well to emphasise the importance of avoiding the use of aluminium, and still more the use of zinc, in their preparation. An alloy containing zinc is almost certain to prove unstable and will sooner or later give trouble, particularly in tropical climates; white-metal die-castings are absolutely stable, even under the most adverse conditions, provided that the use of the above two metals is avoided.

A similar process of evolution has been going on as regards working principles.

It seems safe to prophesy that, in the near future, industrial a.c. requirements will be met as follows:—

Quantity to be measured.	Type of meter.
Current	Moving-iron, with or without current transformers
Low voltages	Moving-iron, directly connected
Moderate voltages ...	Moving-iron, through voltage transformers
Extra-high voltages ...	Electrostatic
Power	Electro-dynamic
Radio-frequency current	Thermo-couple, or thermo-expansion (hot-wire)

A scale subtending an angle of about 120 deg. instead of 90 deg. has now become almost universal in round instruments; probably this has largely contributed to the elimination of the induction type, since the only advantage which can be claimed for the latter is its 300 deg. scale, but it is useless to increase the exactness with which a certain deflection can be read if the inherent errors of the instrument are such that the correctness of the deflection itself is in doubt. The stress in the material of a given spring is proportional to the angle turned through, so that a 300 deg. deflection involves a stress 2½ times as great as that of the 120 deg. This necessitates the use of a thinner spring, with its attendant disadvantages and difficulties of construction. Much progress has been made of late in the design of meters having scale shapes appropriate to the service for which they are intended. In B.S.S. No. 89 of 1926, it is stipulated that the suppressed portion of the scale shall not exceed one-half of the whole.

A feature which is only now beginning to receive the attention it deserves is "ruggedness." The lighter the moving parts, the better will a meter withstand rough treatment; it was at one time believed that a criterion of excellence in this respect was the ratio of the torque (T) corresponding, with a given angular deflection, to the weight (W) of the moving parts; however, an instrument with light moving parts may have a lower "torque/weight" ratio than would be satisfactory for one with a heavier system. It is agreed, in fact, that the "pivot factor" may be expressed as T/W^n, but authorities differ as to the value to be given to n. The pivot factor, if expressed as torque/$W^{1.5}$, should not be less than 0.0004 when T is expressed in gramme-cm. per degree of deflection and W in grammes.

Moving-Iron Ammeters and Voltmeters.—The authors felt convinced that the moving-iron principle, if properly applied, would lead to the construction of a precision ammeter or voltmeter, as good as or better than the electro-dynamic type and suitable for use indiscriminately with a.c. and d.c.; accordingly, the possibilities were carefully explored. That the double iron affords a higher torque for a given expenditure of power than the single, the authors believe to be a fallacy. In any case, it was found that for a given torque the volt-ampere consumption could be made lower with the single iron, owing to the reduced mean length of each turn, and with a single iron of nearly circular shape, so pivoted that it could be drawn into a narrow slot in the centre of an oval coil, as shown diagrammatically in fig. 1, the relative change of self-inductance could be made larger and the product I^2L smaller than with any other form of movement, thus confirming the wisdom of the choice. The authors' coil and moving iron when tested on the Anderson bridge showed an inductance of 0.06 henry with a change of inductance of as much as 30 per cent. from zero to full deflection. The product I^2L was 1,500, the current I and the inductance L being measured in c.g.s. units. An oval coil with an overall width of 1½ in. and a length of ⅝ in. was ultimately decided upon, and by suitably shaping the iron disk and taking advantage of the distorted field given

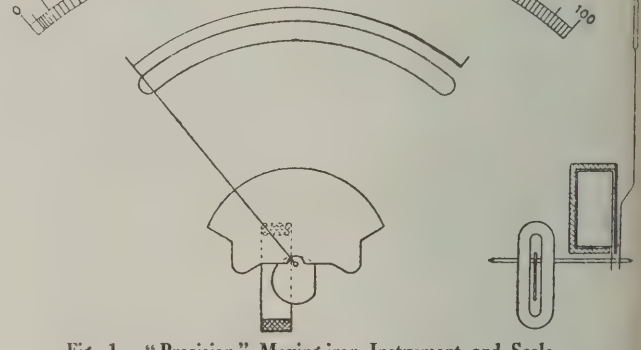

Fig. 1.—"Precision" Moving-iron Instrument and Scale.

by so short a solenoid, it was found possible to obtain a scale of the shape indicated in fig. 1, which, except for the first 10 per cent., is sensibly evenly divided, but exhibits a desirable closing up of the divisions towards the upper end.

Practice has differed greatly as regards the flux density in the iron, values ranging from 500 to 5,000 gauss being found in representative moving-iron meters. It was found that the torque could be increased by as much as 25 per cent. without increasing the weight of the iron, by "dishing up" its edges so that they presented a larger surface to the air where the magnetic lines passed from the one to the other; and it seems probable that any small increase of torque which may result from a thickening of the iron is due principally to this cause.

Moving-iron meters in which the iron was worked at a very low flux density, say, in the neighbourhood of 500 gauss, invariably gave a higher reading with a.c. than with d.c., more especially towards the upper end of the scale. Investigation showed that this was due to the shape of the B/H curve, which is reasonably straight above 1,000 gauss, but below this flattens out considerably. In fact, the permeability of the iron at a flux density of 570 gauss is about 30 per cent. greater than that at 400 gauss, as shown by the slope of the B/H curve at these flux densities. The effect will be clear if it is assumed that a d.c. of 4 amperes, flowing through an ammeter winding, magnetises the iron to 400 gauss; an a.c. of 4 amperes (r.m.s.) will have an instantaneous peak value of about 5.7 amperes, which will carry the flux up to a part of the curve in which the permeability is much greater, so that the meter will read slightly high, as compared with direct current. It is the excursion of the sinusoidal a.c. wave into regions of higher permeability which accounts for the results obtained. That it is due to the wave-form and

not to reversal is shown by the high readings obtained when the iron is magnetised by commutated a.c. These considerations indicated the disadvantages of too low a flux density, but there must also be an upper limit, since the B/H curve flattens out again at higher values of B and it is essential that the density should not be so high that a peaky wave of current would carry it over the knee of the B/H curve. The iron represents a negligibly small part of the total magnetic reluctance, and so long as the peak value of the wave does not greatly exceed 8,000 gauss, the saturation effect, and with it any wave-form error, will be inappreciable.

Taking these facts into consideration, a flux density of 2,000 gauss (r.m.s.) would represent a satisfactory figure; even should the peak value reach 10,000 gauss this could only introduce an error representing a small fraction of 4 per cent. This effect, whilst the exact converse of that previously alluded to, is likely to be less important since then it was the major portion of the wave which was in the region of reduced permeability due to low flux density, whereas now it is merely the peak of the wave which is in the region of reduced permeability due to high flux density.

In an a.c. instrument hysteresis will cause a lag of the flux in the iron behind the magnetising force producing it, and it follows that the net torque at any instant is proportional to BH cos θ, where H is the r.m.s. magnetising force, B the r.m.s. flux density in the iron, and θ the angle of lag between the magnetising force and the flux. A direct measurement of this angle was made: taking as an example a flux density corresponding to full-scale value (B=2,020), the angle of lag was 33 minutes, so that the decrease in the reading due to a.c. hysteresis would be $(1-\cos\theta)100=0.005$ per cent., a negligible amount.

That hysteresis should not cause the reading to be appreciably smaller with a.c. than with d.c. appeared to be so much at variance with the generally accepted view, that it was thought desirable to check the measured angle against the angle calculated from the known characteristics of the iron.

The result showed that the conclusions arrived at in the preceding paragraph are justified. Having eliminated hysteresis as a source of appreciable error, the reason for the undoubted fact that certain moving-iron ammeters do read considerably lower on a.c. than on d.c. was ultimately found to be due almost entirely to eddy currents—a source of error which does not appear to have been sufficiently appreciated in the past, quite undue prominence having been given to hysteresis. For example, a small copper plate only 1 mm. thick placed 10 mm. from the moving iron and normal to the flux, introduced an error of 1 per cent. in the reading, and if brought up to 1 mm. the error increased to 14 per cent. These tests were made at 700 cycles per second; at 50 cycles per second the error in the latter case amounted to 1½ per cent. These comparatively large errors are undoubtedly due to the fact that the flux in the moving iron emerges from it at a high density, forming a sort of jet of flux, a form which is, of all others, best calculated to generate eddy currents. In any case, the selection and heat treatment of the iron require the utmost care, and it is now possible to construct moving-iron instruments which, for all practical purposes, exhibit no hysteresis error whatever, even with direct current.

In the paper are set out in detail the observed characteristics of meters constructed upon the principles enunciated, and the maximum error due to any of the causes enumerated (in the paper) does not exceed 0.1 per cent. in the case of the voltmeter (0-150 V, 7.5 watts) at power frequencies, and in the case of the ammeter (0-10 A, 0.5 watt) at any frequency up to 700 cycles per second, a result which the authors believe to be unique for a moving-iron instrument, and superior to that attainable with an electro-dynamic voltmeter or ammeter of equivalent range and power consumption. A further advantage possessed by this "Precision" instrument lies in the scale shape, fig. 1.

There is no difficulty in producing for any moderate current a single-range ammeter having this degree of precision, so long as care is taken to avoid eddy currents in the mass of the conductors. The design of a multi-range ammeter presents a number of difficulties. Now that truly "precision" current transformers are available the most satisfactory arrangement, so far as a.c. measurements are concerned, is to use a multi-range current transformer. A limited change of range can be effected by winding the coil in sections, which are connected in series or in parallel, as required, but the practical limit of range is, at present, 1 to 2 or 1 to 4. The self-inductance of the ammeter considered is, however, so small as to enable the range to be increased by means of shunts without impairing the accuracy for either direct or alternating current. Possibly the reason for the past neglect of the moving-iron type is that the electro-dynamic principle lends itself so readily to theoretical and mathematical treatment, and has advantages which, however difficult to realise in practice, are sufficiently convincing when discussed in the abstract.

Measurement of Rectified Current.—Rectified a.c. is now used for many purposes, so that its measurement is a matter of some importance. It must not be assumed that a rectified current, because unidirectional, can be treated in all respects as a direct current. A permanent-magnet moving-coil ammeter will measure the d.c. component and will ignore the a.c. component, that is it will measure the mean value of the wave. An induction type ammeter, on the contrary, will measure the a.c. component and will largely ignore the d.c. component, whilst an electro-dynamic or moving-iron ammeter will measure the r.m.s. value of the whole wave. Strictly speaking, therefore, it depends upon the nature of the load which form of ammeter should be selected. All things considered, the moving-coil ammeter, owing to its intrinsic advantages, is to be preferred for the measurement of rectified current under normal conditions.

Electrostatic Voltmeters.—For higher voltages than 7,000 V, owing to the cost and size of voltage transformers, the electrostatic voltmeter has many advantages. Cases also frequently arise in which the current passed by the transformer-operated voltmeter puts it out of court (*e.g.*, for some leakage indicators); again, when portability is important the electrostatic voltmeter has much to recommend it. It is usually preferable that electrostatic voltmeters for alternating voltages exceeding 5,000 V should be connected in series with condensers, by which means the range can be extended as required; it is advisable that the voltage across the meter itself should not be more than, say, 3,000 volts at full deflection. If properly designed, series condensers are quite satisfactory for voltages up to, say, 30 kV, so long as one terminal of the voltmeter can be earthed. For laboratory voltmeters, where a number of series condensers of ample capacity can be used and the conditions are well under control, such voltmeters have been satisfactorily used up to 250 kV above earth, or 500 kV in all.

The direct-connected air-insulated electrostatic voltmeter is entirely free from errors due to frequency, wave-form, temperature, earthing, or otherwise, of either terminal, and so forth, and is available up to 500 kV or more. For laboratory use electrostatic voltmeters have been constructed in which air (or, still better, nitrogen) is used at a pressure of about 150 lb. per sq. in., under which conditions it has a breakdown voltage of some 200 kV per cm. In such meters the control is usually electro-dynamic so that the whole moving system can be enclosed in the high-pressure chamber, the electrostatic element being brought back to zero by varying the current through the electro-dynamic portion.

It is often necessary to determine the peak value of a voltage as well as its r.m.s. value. The simplest method of so doing is by means of the neon tube in conjunction with an Abraham or other extra-high-voltage, air-insulated, electrostatic voltmeter.

Electrostatic voltmeters are liable to damage through overvoltages due to surges, and a fuse alone is unreliable as a means of protection; such meters should be protected by a resistance in series with each pole. The capacity current taken by the voltmeter at power frequencies is so small (of the order of 30 micro-amperes for all ranges at 50 cycles) that a resistance of several megohms will not appreciably affect the reading, so long as the instrument is correctly designed. Protective resistances usually take the form of rods of carbon having an admixture of some substance which increases their specific resistance. It is important that the protective resistance should not be such that its resistance decreases greatly with high voltages or rising temperature, as is sometimes the case.

Thermo-Expansion Instruments.—It is usually assumed that thermal meters, whether of the thermo-expansion (hot-wire) or thermo-couple type, are equally accurate with d.c. and a.c. at any frequency, but such a statement cannot be accepted without considerable qualification where radio-frequency currents are concerned. So long as a single heater is employed, error is limited to that introduced by the increase of resistance due to the Kelvin skin effect, and for small conductors this is usually inappreciable. For example, a single wire suitable for carrying 3 amperes at full scale can be used up to a frequency of 5,000,000 cycles per second without the error due to this cause exceeding 1 per cent. For currents greater than 5 amperes the hot wire becomes so large as to introduce thermal sluggishness, and it is usual to employ two wires in parallel, only one being coupled to the pointer. To measure currents greater than can be carried by two reasonably small wires, it has been customary to arrange a number of such wires or strips round the circumference of a cylinder (squirrel-cage), only one of them being coupled to the pointer. So long as the conductors leading the current into and out of these wires are exactly coaxial with them, the current distribution will be uniform at radio frequencies, and if the ohmic resistances of all the wires are identical the indications will be independent of frequency; these two conditions are, however, extremely difficult to fulfil. A method of securing the necessary even distribution of current at radio frequencies which has not, so far as the authors are aware, been employed, is to arrange the leading-in conductors concentrically, the inner one passing down the axis of the squirrel cage. Even then, the difficulty of ensuring equality of ohmic resistance between the different wires still remains, not to mention constructional complications. The "shuntless" hot-wire ammeter in which a single active wire is divided up into three or five parallel sections, the current being led to and from it by means of flexible ligaments attached to the wire at the appropriate points, has proved fairly successful at power frequencies, but when applied to radio-frequency measurements the difficulty of making the several parallel paths sufficiently symmetrical is enormous.

In general, where radio frequencies are concerned a current of 6 amperes is as high as it is possible to measure direct with any degree of accuracy. Above this, the use of a radio-frequency current transformer is greatly to be preferred. They are now available for any current up to 1,000 amperes, or

more, and give equally accurate readings on all ranges. Moreover, the power consumption is small and they can be fixed in positions in which it would be impossible to install an indicating instrument.

Graphic Meters.—The moving-coil type has been found the best for d.c., whilst for a.c. the ironclad electro-dynamic system is to be preferred. Considerable improvements have been made of late years in the inking arrangements, and pen friction may be eliminated either by allowing the pen point to swing clear of the chart, on to which it is pressed at intervals so as to leave a record of its position, or by causing the electrical movement to operate the pen indirectly, through some form of relay. The "thread recorder" has been considerably used for temperature measurements, but is unsuitable for dealing with rapidly varying quantities such as are met with in most electrical work. The "relay" arrangement for a great many purposes probably represents the most satisfactory form. The latest is that due to Mr. E. I. Everett, and is available for the measurement of comparatively rapidly varying quantities and is, moreover, a deflectional instrument.

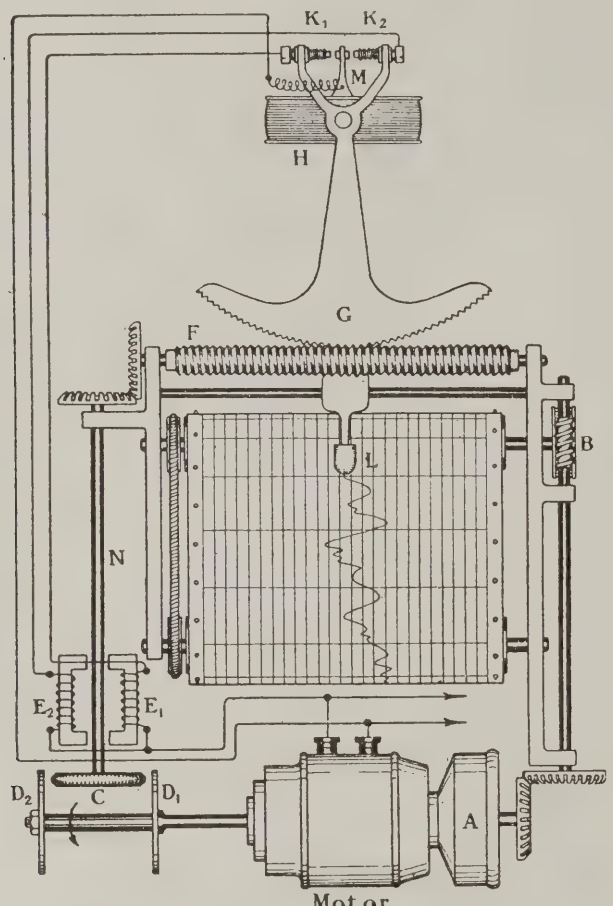

Fig. 2.—Relay Graphic Meter.

The working principle will be clear from fig. 2: H represents the controlling electrical movement which carries a contact arm M; should this arm deflect to the left, for example, it will make contact with K_1, and so cause a current to flow through E_1, which attracts the rod N, thus pressing the leather-rimmed wheel C into contact with the motor-driven disk D_1. The wheel C is thereby driven in a clockwise direction and causes F to rotate in such a sense as to carry the pen (L) towards the right. At the same time G is moved towards the right, thus tending to cause the contacts M and K_1 to part; this will actually occur when the coil H has reached its point of equilibrium, and at once E_1 ceases to keep C in contact with D_1, so that the travel of the pen stops until M once more makes contact with either K_1 or K_2, as the case may be. The motor carries an adjustable centrifugal governor (A) and serves also to drive the chart by means of the vertical spindle and worm B. The governed-motor principle is equally applicable to alternating-current or direct-current systems, but for the former the Warren synchronous motor is to be preferred.

(To be concluded.)

Discussion in London.

Dr. C. V. Drysdale congratulated the I.E.E. on having accepted such a paper, saying he found himself in substantial agreement with its contents from end to end. He had no serious fault to find with anything in it, and was glad that the authors had put some of his own ideas into practice. He agreed with the authors' list of types of instruments which would survive: the hot-wire expansion instrument would not, for the thermo-junction pattern was the better; the dynamometer voltmeter would endure for testing purposes, but the induction indicating types had seen their day. The new nickel-iron element would create a revolution in all electromagnetic instruments and make possible the use of iron where it had formerly been impossible; moreover, for shielding purposes to reduce the internal field it would be very useful indeed, and he hoped it would be universally employed; its possible applications were many. He congratulated the authors on having obtained a very long instrument scale, and was glad to know they appreciated the electromagnetic efficiency of instruments, although the inductance method of looking at the subject was useful for designing the right type of scale. Having to do a great deal of testing, he was, naturally, favourably inclined towards an instrument which would measure equally well both a.c. and d.c. He had been considering for a long time how such a meter could be made, for it would be an extremely useful device: by means of specially formed copper-strip coils (the arrangement of which the speaker demonstrated with the aid of models and lantern slides) which could be connected in series-parallel as required by a cam shaft, avoiding soldered joints altogether, it was possible to devise an instrument that would serve the purpose.

Mr. F. H. Nalder thought the authors had crystallised many of the ideas which had been before instrument makers for some time. He did not agree that long-range instruments were going to die just yet awhile, neither was he in agreement with the authors' contentions about springs: they all had to make suppressed scales. The slightest deformation of a coil would be disastrous in the case of a narrow scale. The paper would afford much food for thought in the future.

Prof. G. MacGregor Morris was of the opinion that the paper could have been divided into three parts and each discussed on a separate night, as there was so much in it. With regard to the driving of the chart of a graphic meter by means of a motor, if the supply of electricity failed the motor would stop, and it seemed therefore that something was needed to tide over such an occurrence. He agreed with the authors' list of meters that would survive; a number of workers were at present engaged upon the investigation of the neon tube electrostatic voltmeter, and he was confident that that type of instrument would be greatly developed, but not many people would care to put their heads near the telephone indicated in the authors' illustration. Dr. Drysdale had anticipated him on several points; he supported him and put in a plea for the logarithmic scale: that was what was wanted in the laboratory, but it was difficult to convince makers and their customers, too, that it was the desirable scale. It was a very great achievement of the authors to have reduced the error of instruments that would measure both a.c. and d.c. to "nil" (*i.e.*, well under 0.1 per cent.). Had the authors had any difficulty in obtaining the proper types of materials for making the disks of moving-iron instruments? He asked that question because certain experiments had indicated that the flux was jerky; it did not move into the iron uniformly, which phenomenon was perhaps due to the grain of the iron.

Mr. A. F. Harris did not favour the use of series condensers for extending the range of electrostatic voltmeters, and he thought the latter could be made smaller than was indicated in the paper.

Mr. S. T. Short was happy to hear that the hot-wire instrument was dying, and the sooner the better. There could be little doubt about the accuracy of the authors' list of types that would survive, but he was sorry to see that the 120-deg. scale was superseding the other; was there some definite angle which, if exceeded, would introduce a definite error? He would like the authors' experiments with moving-iron instruments extended and the disk shaped into the form of a cup, which might be an improvement. It was difficult to appreciate some of the remarks in the paper with regard to the use of shunts in conjunction with moving-iron instruments.

Mr. R. W. Paul pointed out that nothing had been said about damping, which might be more serious to contend with than eddy currents. He was not hopeful about the use of condenser multipliers for electrostatic voltmeters. Instrument makers would like to know more about methods of construction and the general internal arrangement of the instruments.

Mr. C. L. Lipman thought the paper would be helpful to designers, but when its various sub-head sections were considered it appeared to be behind the times in several respects. He referred to the space economy that resulted from the adoption of rectangular instruments, and also to the several advantages of a new type of induction ammeter of high accuracy, quoting figures, but was unable to detail constructional features at the moment; its description would be published, however, as soon as possible. His opinion was that the 300-deg. scale had several advantages and was superior to any others. In the making of satisfactory transformers the metallurgist played an important part.

Mr. W. Phillips alluded to the importance of the new metal, and stated that with the disk pattern of moving-iron instruments he had obtained results similar to those outlined in the paper. In the case of current transformers, he could fully endorse all the authors had said. The great advantage of the new metal was the fact that the curves were so flat; there was not much variation in the error from zero to full scale. When making shields the exercise of great care was necessary, as it was possible for an instrument to be worse with a bad shield than without it; the new metal was extremely susceptible to heat treatment, and it must be treated after having been mechanically handled.

Dr. W. H. Eccles, the president, remarked that the scarcity of papers on the subject before them seemed to be the result

of national neglect of the subject: they had been too busy with other things, which was the more surprising when they considered the great changes that had come about in the quantities to be measured. Recent new instruments were merely variations or combinations of ideas that had been known for 50 years or more; the only really new thing physically was thermionic emission controlled by the third electrode of the valve. With that and the new metal which had been referred to they could look forward.

Lieut.-Col. K. EDGCUMBE, in reply, said that the main bone of contention appeared to be the induction type of instrument; if they wanted a "Big Ben," to be seen anywhere in the engine room, let them use that pattern by all means, but his idea was that the moving-iron type was the better; to-day the control engineer never entered the engine room. The results claimed by Mr. Lipman could, no doubt, be obtained, but what about the weight ratio? Were such instruments really wanted? "We will wait and see."

Mr. F. E. J. OCKENDEN also spoke briefly in reply to some of the points raised, remarking that damping did introduce difficulties, but if the moving system was kept away from the box sufficiently they could be guarded against.

Electrical Installations in Mines.

Precautions that minimise the risk of "open sparking"; and the use of discriminative protection devices.

By J. A. B. HORSLEY, H.M. Electrical Inspector of Mines.

(Abstract of a Paper read before the MANCHESTER GEOLOGICAL AND MINING SOCIETY.)

THERE is no essential difference in the precautions that must be taken on either h.p. or l.p. electrical mining systems if the risk of "open sparking" is to be minimised, and these precautions may be considered under two headings, design and maintenance. The former covers not only the suitability of the apparatus, but also the lay-out of the installation, including the selection and application of the automatic and other devices which are provided to control the system. The British Engineering Standards Association has recently defined flameproof enclosure for electrical apparatus, and has prescribed the tests which should be applied to prove compliance with that definition. The specification will soon be published as B.S.S. No. 229, and it should be studied by those who are concerned with this problem. It makes it perfectly clear that the flameproof quality of the enclosure is limited to conditions of operation within the rating of the apparatus, including recognised overloads.

It would not be commercially practicable to construct apparatus that would resist the destructive effect of an internal short-circuit when the source of energy was relatively very large and when there was but little impedance in the intervening circuit to limit the violence of the fault. Complete automatic protection is not possible without a high standard of maintenance of insulation. To avoid inconvenient interruptions of service, there is a temptation to tamper with the automatic protective devices, and such interference appears to be regarded as a laudable exercise of ingenuity. A working approximation to absolute continuity can be realised by duplicating important feeder cables and items of plant and by subdividing and applying automatic protection to the cable branches in such a way as to limit the interruption, on the occurrence of a fault, to the defective branch. Maintenance of insulation resolves itself into the application of tests to discover incipient faults before a breakdown occurs, either in the cables or apparatus. The ordinary indicating instrument, unless it is under continuous observation, is of little practical value, but the leakage indicator might be useful to this end.

It is not as generally known as it might be that leakage indicators can be applied effectively to earthed systems, excepting only the earthed concentric system in which it is not possible to distinguish between currents due to leakage and those that are normal to the system. A method of leakage indication used by some electric power companies for small transformer sub-stations consists in earthing the neutral point of the secondary winding of the transformer through a small fuse which is shunted by a suitable number of ordinary incandescent lamps connected in series. If an earth fault occurs on the consumers' circuits, the small fuse is blown and the lamps are lighted so long as the fault continues.

This is a very cheap way of obtaining fault indication, but the blowing of the small fuse removes the low-resistance path to earth just at the moment when it is most urgently required to ensure the operation of the automatic protective devices upon the consumers' installation. Such a method may be good enough for small surface installations, but reliable and complete automatic protection is so important for a colliery installation below ground that it should never be accepted for a mine system. The information obtained by the use of a leakage indicator must be supplemented by actual insulation tests of parts of the circuit; and if such tests were made systematically at sufficiently short intervals of time it should be possible to locate and remedy defects before they developed into serious faults; a graphic recorder should be of value in exercising control of this work. Assuming that the apparatus to be protected is capable of withstanding the mechanical stresses arising from the magnetic forces due to abnormal current, and ignoring the destructive effects of the electric arc when there has been a complete failure of insulation, there remains the question of limiting the temperature that the conductors may attain to a value which will not entail permanent injury. This temperature is a function not only of the current, but of the time. Fuses to some extent possess this time-temperature characteristic, and if they were not so much at the mercy of their environment would appear to offer a simple means for limiting the current flowing in the normal path to a predetermined value.

In practice fuses can only be used to cater for short-circuits, and cannot be applied generally so as to prevent a cable or a motor from becoming overheated due to a sustained overload. A ventilated motor built to comply with B.S.S. No. 168-1923, and having a continuous rating, must be capable of being worked at 25 per cent. overload for a period of from 30 to 120 min., 50 per cent. for 1 min., and 100 per cent. for 15 seconds, in all cases without injury to the motor. It will be obvious that no ordinary fuse could prevent an extension of the period of the sustained overload first referred to or distinguish between the permissible and dangerous duration of the short-period overloads. This criticism of the fuse is with reference to mining practice. The author is aware of attempts that are being made with more or less success to produce fuses that may properly be described as instruments of precision, and those who are interested should refer to a paper, entitled "High Power Fusible Cut-outs," by L. C. Grant, published in the *Journal* of the Institution of Electrical Engineers for September, 1926 (Vol. 64, No. 357) [ELECTRICAL REVIEW, April 2nd, 1926, p. 558.]

The ordinary circuit breaker equipped with an overload trip device can be set with greater precision and certainty than can be hoped for with the fuse, but otherwise it shares the limitations of the latter. To allow for starting rushes of current and for overloads which are quite innocuous if not sustained or repeated at too brief intervals, it is necessary to set up the trip of the circuit-breaker so that it shall not trip at less than, say, three times the normal full-load current of the motor that it protects. If a standard continuously rated motor is to be adequately protected against overheating due to a sustained overload, the protective device should operate when the sustained load exceeds the normal full load by more than 25 per cent. These antagonistic requirements can be met quite simply by adding a device, such as an oil-immersed dash pot, which will retard the action of the trip. The delay may either be definite or it may have an inverse time characteristic, which means that the greater the overload the less will be the delay introduced by the device.

For the control of individual motors the variable type of time lag is more suitable, while for protecting a cable system when there are two or more circuit-breakers in series the fixed type of time lag may be used if it is desirable to make the overload protection selective.

A well-known switchgear firm has recently introduced an ingenious adaptation of its standard time lag to meet the case

where the starting torque is abnormally great in proportion to the running torque. This consists in the addition of a "pilot" dash pot, controlling a by-pass valve in such a way that the normal lag is increased for a sufficient length of time to allow the motor to run up to speed. The by-pass then opens and the time lag functions normally.

With "overload" protection alone it is difficult to limit the interruption of service to the branch circuit upon which the overload has occurred if there are several circuit-opening devices in series. It is not always realised that the current which may flow momentarily to a fault through a fuse or a circuit-breaker equipped with an overload trip is not determined by the size of the fuse or the setting of the trip, but by the size and type of the supply plant and the resistance or impedance of the intervening cables and apparatus. There can be no certainty, therefore, that a fault which causes the opening of an overload protective device near the boundary of the electrical system will not simultaneously operate similar protective devices near the source, although the setting of the latter may be 10 times that of the former.

It must also be recognised that the fault current may be limited by the impedance of the circuit to a value below that at which the circuit-breaker is set to operate, but may yet result in local overheating sufficient to originate a fire.

The remedy lies in the use of leakage protection, and if this is applied so as to be selective in action, not only is the interruption limited to the faulty sub-circuit, but in most instances the fault is isolated in its initial stages, *i.e.*, as a single-pole or single-phase fault to earth, before it has developed into a short-circuit between the poles or phases.

Leakage protection, if it is applied so as to interrupt the supply to the whole installation on the occurrence of a fault at any point, is of no practical value. Complete selectivity can be secured upon a.c. systems by the use of pilot wires which are employed to balance the voltage or current at the two ends of the circuit. Even without pilot wires it is possible to secure selective leakage protection for overhead lines, or for two or more cables working in parallel, by the arrangement known as split-conductor protection. The method is easily applied to overhead lines, and it ensures that if one of the wires composing a split should break and fall, the circuit-breaker would be instantly tripped.

The three essential conditions to the safety of apparatus in mines are as follows:—The apparatus must be safe for use within the limits of its rating, in the presence of an explosive mixture of firedamp and air; "the (automatic) protection of the circuit must be such as to ensure, as far as practicable, that the highest recognised overloads for the apparatus shall not be exceeded, having regard to the amount of destructive energy available at the apparatus, calculated from the size of the generating plant and the impedance of the circuit between it and the apparatus" (B.S.S.); the standards of maintenance and discipline must be such as to ensure, in general, that the electrical equipment involved shall be kept as nearly as possible in perfect condition and, in particular, that there shall be no improper or ignorant interference with the essential parts of any flameproof enclosure, nor with the adjustment of the automatic protective devices that are associated therewith.

The third condition is perhaps the most difficult of fulfilment, but it would be nothing less than criminal folly to install and use electricity in a place where firedamp is likely to occur in a dangerous quantity unless those responsible for its introduction were prepared not only to procure the most suitable equipment, but to so organise the supervision of the plant as to ensure, as far as possible, that it should be maintained in its original integrity

Institution of Electrical Engineers.

The Annual Dinner of the Mersey and North Wales (Liverpool) Centre.

ABOUT 80 members and guests were seated at the annual dinner of the Mersey and North Wales (Liverpool) Centre of the Institution of Electrical Engineers, which was held in Liverpool on February 2nd, when Mr. P. J. Robinson, chairman of the Section, presided, and some interesting speeches and an excellent musical programme resulted in an enjoyable evening for all present. The usual loyal toast was given, after which "The City of Liverpool" was proposed by Col. J. F. LISTER, C.M.G., chairman of the South Midland Centre. He said that Liverpool had one of the oldest electric railways in the country, and that the North Country was ahead of other parts in that connection. Great credit was due to the Liverpool electricity undertaking for its low supply charges. The city had nothing much to gain by the new Electricity (Supply) Act. He agreed that the "grid" would be useful within reasonable areas, but not if taken to such parts as North Wales. In Egypt some years ago he saw knife and scissor grinders using electricity to drive their grindstones, which showed that the people were anxious to take an electricity supply if they could get it cheaply.

In reply, the Rt. Hon. the Lord Mayor of Liverpool, Councillor F. C. BOWRING, pointed out that Liverpool was responsible for one-third of the import and export business of the country. Corporations were becoming great trading concerns, and the electricity supply departments were by no means the least important. He paid a tribute to Mr. Frank C. Wilson, J.P., chairman of the Liverpool Tramways and Electric Power and Lighting Committee, and regretted the absence of Mr. H. Dickinson, chief engineer of the electricity undertaking, who was ill. He understood that the much-criticised 25,000-kW set at the Lister Drive station was doing remarkably well.

"The Institution of Electrical Engineers" was proposed by Mr. TOM WHITE, chairman of the Liverpool Housing Committee, who outlined his conception of the objects of the electrical industry, received during a year of office when deputising for Mr. Wilson. If this country mobilised a great army to release us from the thraldom of trade depression, then the general staff should consist of electrical men. In the drawing up of the Electricity Act more opportunity should have been given for electrical men to exercise their abilities. He could not think that the results of the proposed unification of frequency would warrant an expenditure of £10,000,000. He had recently converted his private house to "all-electric," and had received a shock in finding that his quarterly consumption was 4,000 kWh, but he did not grudge the increased expenditure, for he had proved he was getting it back in increased health and comfort. He had induced Liverpool to build 250 all-electric houses, and he was depending on the electrical engineers to bring down the bills. In referring to the waste of sunshine due to the uneconomic methods of burning fuel, he said that the sooner we had collaboration between the medical and electrical professions, the sooner we should have an A1 nation. He had seen the great electrical manufacturing works at Newcastle, Birmingham, Manchester, and Rugby, and they seemed to him as sentinels waiting to defeat trade depression. Eighteen thousand persons had visited the electrical exhibition house at Liverpool in one week. It was an enterprise granted to the City by builders and contractors without a cost of one penny to the community. He was sure that what Liverpool had accomplished electrically could be achieved all over the country by the co-operation of the I.E.E. In 1913 the number of consumers in Liverpool was 10,000; in 1926 the figure was 41,000. Forty-eight million kWh were sold in 1913, and 172 million in 1926. To-day their plant capacity was 103,000 kW, and another 25,000-kW set would be installed next year. Liverpool now headed the list of the great towns of this country as regarded the percentage increase in the consumption of electrical energy.

Dr. W. H. ECCLES, president I.E.E., responded. He reminded Councillor White that he could have added to the laurels of his city by pointing out that Liverpool was the birthplace of wireless telegraphy. Forty years ago Sir Oliver Lodge was working in the Liverpool University on an experimental apparatus which he evolved for transmitting and receiving electrical waves over a distance of two yards. In 1897 Lodge developed a scheme of connections which foreshadowed the progress of the next 14 years. To-day an amateur with apparatus costing only a few pounds could speak to remote parts of the earth. He agreed that Liverpool was not likely to benefit much by the Act, but thought the less said on the matter the better. Perhaps the people would lose a little in patriotically helping the rest of the community. Londoners paid four times as much for their electricity, and said "come on the grid." He was glad to see that power lines were beginning to appear on the landscape in the Liverpool district. The beauty of the Swiss mountains was apparently not discovered until the power lines appeared; it was a matter of psychology. The electrical profession must try and work out that there was beauty in power lines. It was recorded that last year this country exported electrical material to a greater extent than any other country. Britain might well be described as the electrical workshop of the world. The rapid growth of the membership of the Institution was a sign of the electrical expansion in this country.

In proposing "Our Guests" Mr. E. M. HOLLINGSWORTH warmly welcomed the visitors, and the toast was responded to by Councillor Frank Wilson and Mr. H. Wade Deacon, Pro-Chancellor and President of the Council of the University of Liverpool. Mr. WILSON did not think we advertised our wares sufficiently. The average price per unit of electricity used in his house last quarter worked out at 0.728d. He paid a tribute to Mr. Robinson. In a humorous speech, Mr. WADE DEACON expressed great admiration for the vigour of the Institution.

Mr. A. E. MALPAS proposed "The Chairman," and described Mr. Robinson as one of the liver birds of Liverpool.

In reply, the CHAIRMAN referred to the great help he had received from Mr. Oscar C. Waygood, hon. secretary of the Centre.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Electric Flood-lighting.

I notice your review on this subject in the current issue of your paper, and as I have perused the contribution in question presented before the Illuminating Engineering Society at the Lighting Service Bureau recently, perhaps a few comments may be added, by one who has had an extensive practice in the use of the parabola for a period of forty years, and probably knows something of the optical characteristics which define its legitimate and successful application.

The paper referred to principally deals with the illumination of plane surfaces by means of concave reflectors with circular apertures, of parabolic or allied construction, for projecting round beams of light for use on high distance ratios.

The optical characteristics totally prohibit successful application to efficient illumination in broad and even effects over plane surfaces, whether with or without asymmetrical distribution, and the paper consists of the compilation of figures which support this view, indicating quite clearly the defective results to be obtained where such apparatus is used for lighting extensive surfaces such as building frontages, large posters, &c.

An arbitrary figure of 3 ft. 6 in. is given as the minimum projection of the lamp from the surface, but the depth of the surface is not given for such projection. The maximum projection allowed by the L.C.C. is 4 ft. from building line to light source for any depth of surface for lighting frontages. It is well known that such limited projections involve the practice of high distance ratios, and a surface of 40 ft. deep on the L.C.C. limitation would have a distance ratio of 10 to 1, while if the surface was 50 ft. deep the distance ratio would be 12.5 to 1.

Neither round projected beams of light nor asymmetrical projection can be used to give satisfactory results on such practice, and that is why wherever these are found in use the illumination is a failure from the point of view of uniformity.

In theory the apparatus recommended in the paper is totally unsuitable for the purpose, while the results give the impression that the professional is relying upon the immature conception of the amateur.

The lighting of building frontages requires the practice of the very highest art in illumination, and optical knowledge beyond that of projecting distorted beams of light, if the architect is not to have his creation spoiled by artificial lighting. What may please the novice will not satisfy the artistic tastes of the architect, who is interested in good illumination. Good results are what he requires, not light and shade.

Hall's System of Controlled Illumination.
John I. Hall.

Kingston-on-Thames, *February 5th*, 1927.

Power Supply for Wireless Receivers.

I am very sorry that I appear to have annoyed Mr. Turner with my previous letter; it may possibly have been my incautious reference to a certain loud-speaker, or some other matter, but I trust that he will suffer me to point out an inaccuracy in one of his statements.

I did not state that it was entirely my own opinion that the receivers in question were distortionless, but that I was also relying on the opinion of others who were certainly quite competent to judge—competent, that is, if Mr. Turner will admit that the ear of an eminent musician is competent to judge. If we agree that no human ear can be relied upon to decide whether a broadcast receiver is distortionless or not, what is the use of striving after perfect reproduction? Should we not rather try to attain pleasing reproduction?

In reply to Mr. Turner's question—on what tests or facts I based my opinion—I can only point to satisfied users of the receivers in question, who had hitherto rejected all others offered them on the score of quality of reproduction. The opinion recently passed by a Mus. Bac., F.R.C.O., was: "What perfect reproduction!" I put it to Mr. Turner that this is a competent ear within the meaning of my letter, and could safely be used as a standard by anyone purchasing a broadcast receiver.

I am, however, going to amend the statement contained in my first letter, in the hope that I shall get Mr. Turner to answer my main question regarding low-frequency transformers and h.p. consumption, and say that I am getting pleasing reproduction with these receivers, pleasing to myself and to certain professional musicians, of no mean standing, and that I am getting it by means of *three* transformers in the low-frequency amplifier and a maximum h.p. consumption of 8 mA. There is no doubt that Mr. Turner knows quite well to which receivers I am referring, and my only object in writing my first letter was to point out that at least one other firm of vast experience in telephone and radio research work does not apparently agree with Mr. Turner that it is necessary to eliminate the low-frequency transformer in order to obtain good reproduction over the audio frequency range.

I am not in the least interested in museum specimens, my idea being that ordinary broadcast receivers were being discussed, and I should be very glad if Mr. Turner would answer my question as to how it is that I can get "distortionless" (his own word, not qualified in any way in his letter in your issue of January 7th, although he now states that there is probably no such thing as an absolutely distortionless receiver) reproduction with four valves and an expenditure of 8 mA. only, when he has laid down the law that it is impossible, and also that according to him I am merely piling one form of distortion on another.

Leaving all question of competent ears, &c., out of the discussion, my contention is that I can get "distortionless" reproduction with an expenditure of 0.75 watt d.c. supply to the anodes certainly equal, and probably superior, to that obtained by other receivers with 3 to 4 watts d.c. supply.

February 5th, 1927. **Interested.**

[This letter has been shortened.—Eds. Elec. Rev.]

Perhaps this discussion could be rendered less diffuse, and valuable space saved, by more use of definite figures.

The 2-valve loud-speaker sets mentioned by me use 9 milliamperes in the h.p. supply. Taking dry cells first, it has been found that a battery of one of the three leading makes, of 100 or 108 volts, is down to 75 or 80 in one month, and 50 in three months, on the average. The battery costs a little over £1. Now, at the end of three months what is the user to do? He has had an *average* voltage of probably 70 to 80, insufficient for proper loud speaking (100 is low, in fact), and must now replace, and pay £4 to £5 a year for an average of 70 to 80; or buy a 60-volt to put in series with the 50, and put up with the increased internal resistance of the 50 as well. The accumulator, with a first cost of £3 15s. (or less) runs at least two months, and then costs, say, 2s. 6d. for re-charge, or 15s. a year—to which must be added capital charges—and gives practically 100 volts all the time. Capital charges do not bring it anywhere near the £4 to £5 a year for less voltage.

Nothing in this world is perfect, and mention of certain precautions in my former letter should not be taken to imply that I do not consider the drawbacks of the dry battery to be very much greater. At all events, the above figures represent my own experience with 2-valve loud-speaking sets.

As to 3-valve sets, on my own, with one valve reflexed, I get commonly on loud notes a peak amplitude on the grid of the last valve of 18 to 20 volts (swing 36 to 40), and occasionally, as an extreme, 23. This has been measured carefully and repeatedly by the slide-back and another method. That is on 2ZY at 45 miles. This really overloads a DE5A with 150 volts as third valve, but even at that the current is 20 milliamperes. Add 9 to these 20; and I shall be glad to hear of an economical dry battery for this service.

A. O. Griffiths.

Caergwrle, *February 5th*, 1927.

Extra-High-Pressure Transmission.

The article by Mr. Scott in your issue of January 28th certainly raises points of interest. A super pessimist has some use in a community. He makes our flesh creep and does no real harm—so long as he is not taken too seriously.

There are two kinds of reliability—the one implying a freedom from all breakdown, and the other a practical freedom. Neither underground nor overhead transmission can give the former. If absolute reliability is desired it can only be obtained by a duplicated system—whether overhead or underground—supplied from two different sources quite unconnected, and not interconnected as he suggests. The consumer is provided with change-over switches. Such a system is available in some parts of London and is made use of by certain theatres. Outside such conditions, rarely obtainable, we have to imagine that the power station does not fail, and that it is a question of the relative reliability of overhead and underground transmission. Thank heaven it is not a question of a 90 per cent. supply, but of 99.9 per cent., even with a single overhead line, which we aim at. This means one-third of a day a year, during which the consumers' fuses are "dead."

It is not clear why the overhead line is considered by the author to be inferior in reliability to the underground. A duplicate overhead line can be obtained at the cost of a single underground line! With a single underground line one has a probability of a three days' or even a week's failure, due to a single fault, whereas with overhead work we cannot contemplate any one failure lasting more than 12 hours (*i.e.*, the hours of darkness, when it is difficult to do pole work). With a duplicate overhead line the time of failure would not exceed that with a duplicate underground line, and the capital cost would be approximately one-third to one-half. We must add to this disadvantage of the underground main the uncertainty as to the life of underground cable at 33,000 volts and over, and the certainty that a replacement means a cost equal to the original capital outlay, which would ruin any ordinary undertaking concerned in a considerable length of e.h.p. cable.

On the other hand, the whole of the insulators on an overhead line can be changed, if necessary, at about £3 to £5 a pole in a short time, and one has a complete new system of insulators at about £70 per mile. Can it be wondered that those who have to make the choice "plump" for the duplicate overhead line, which may pay its way and is as safe as the duplicate underground line which will rarely, if ever, pay where load centres are a fair distance apart?

I am not so sure that even in time of war the overhead line is in the end more vulnerable than the underground, when time of failure is taken into account. I heard of only one case in England of aircraft injuring a public supply during the war. A bomb blew a piece clean out of an underground cable at Hertford in 1915. If this had been a 33,000-volt cable it would have been a three days' job to rejoint it. If it had been an overhead line the supply would have been on again in a few hours, even if a pole had been struck.

Mr. Scott confuses the frequency of failure with the seriousness of the stoppage. One can have a dozen failures of overhead insulation with less inconvenience to the public than that due to one e.h.p. underground fault. I have just arranged to run 3½ miles of overhead country line to obviate the serious loss of credit which a cable fault will cause on a certain length of underground cable, if one should occur. We cannot face the three days' stoppage which might result.

For the rest, Mr. Scott's elementary schooling of those who are in a position to design 33,000-volt lines, is rather amusing. Imagine an engineer who sends out a window-cleaning gang each week or so to clean the insulators! Why not send someone to change the insulators for a more suitable quality in those localities subject to bad conditions?

Mr. Scott quotes the Post Office policy. Does he *know* that they in general put their trunk lines underground? If they would do so it would be a great relief to us.

W. Fennell.

Northwich, *February 1st*, 1927.

Purchase of Coal to Specification.

The statement in the second paragraph of your leader of January 21st, to the effect that "the importance of buying coal to specification is not fully realised by electrical engineers," seems to me to be of a somewhat sweeping nature, and savours of hasty conjecture rather than considered judgment.

The true situation to-day, and particularly since the war, is quite the reverse. Engineers, as a body, fully appreciate the importance of the subject, but so also do the coal suppliers, who, unfortunately, refuse, most emphatically in certain areas, to enter into any contract based upon calorific value. I have intimate knowledge of several large electricity supply undertakings scattered throughout this country which have made pioneer endeavours to purchase coal on this basis, without, however, any success at all worthy of the vast amount of care and thought required to draft a specification in terms attractive to the suppliers. The matter has been raised from time to time, not only in the technical Press, wherein, especially in the United States, splendid schemes (from the purchaser's point of view!) have been propounded, but also before the I.M.E.A., and the I.E.E., and each time the obstacle has been the suppliers' reluctance.

On the other hand, in all fairness, the reasons for this reluctance are fully appreciated by those who have had anything to do with the purchase of large quantities of coal. At the same time, however, the inherent difficulties of the situation do not, as you state, "compel purchasers to burn anything that will burn, regardless of its calorific value." Coal can always, even during strikes, be obtained from somewhere at a price, however high, in proportion to its size and quality (the latter factor being judged by experienced purchasers by other considerations than a futile analysis of a tiny sample, whose very source and method of choice are even frequently doubtful), and consequently the policy quoted would be one of false economy.

With the context of your references, however, I am in entire accord, and I should like to see the problem tackled, as it will have to be sooner or later, not in a one-sided manner as hitherto, but jointly by the suppliers and the purchasers. Even then the results will still be nil, until the purchasers realise the futility of trying to enforce a contract, with a penalty clause (and perhaps also a bonus clause, if the suppliers are good boys!) based entirely and solely upon such an unstable and utterly uncontrollable factor as calorific value.

The subject of coal is one about which it can truly be said that the more one knows about it the more one realises how little one actually does know.

Maxwell.

January 31st, 1927.

Employment for Unemployed Power Station Engineers.

Being a regular reader of the Electrical Review, and being unemployed, without the dole, I first open the middle page of this journal, *viz.*, "Situations Vacant," and I get busy and spend hours writing out applications for any vacant situation. I should like to say that I, like many more out of work, have had considerable experience, and it is really heart-breaking writing week in and week out without results.

I also look at the Personal Column of the Electrical Review, where it is most interesting to learn of the promotions, &c., of certain engineers. I notice many times in the Personal Column that charge engineers of one station have been appointed as charge engineers at another station. Good luck to them if they require a change, but I am sure my brother engineers who are still out of work, will agree with me that if these jobs were filled by unemployed engineers first, it would shorten the list of unemployed, and naturally they would become E.P.E.A. members. Of course, I am speaking for myself, but I should say my unemployed brothers would do the same. If the chief engineers and E.P.E.A. would go into this together, perhaps the E.P.E.A. would allow non-members to have a list of vacant appointments with a view to becoming members, when they are so fortunate as to obtain employment.

I shall be pleased if something can be done in this way to help the power station engineers who are still out of work.

Unemployed.

January 31st, 1927.

Legal.

The General Engineering Development Trust, Ltd.

Mr. Justice Romer, in the Winding-up Court on February 1st, again had before him the petition of Walter Hill & Co., Ltd., for the compulsory winding up of this company, which is interested in the development of an electrical route indicator known as the "Pathfinder." It was said at the last hearing that the device was successful and in use at a number of places. Mr. Swords asked that the petition should be adjourned for eight weeks, as, he said, a scheme of arrangement was under consideration. His Lordship assented.

British Thomson-Houston Litigation.

In the Chancery Division, on February 4th, Mr. Justice Astbury had before him a motion in the case of the British Thomson-Houston Co., Ltd., against Braidwood for an injunction to restrain the defendant from infringing plaintiffs' two patents relating to leading-in wires and gasfilled electric lamps.

Mr. B. L. O'Malley, for the defendant, said this was a very humble offence. His client was a small shopkeeper at Barnet.

His Lordship: They generally are.

Counsel said he was willing that the motion should be treated as the trial of the action, and consent to the injunction. The defendant had had only six dozen of the infringing lamps, and there was no evidence this had been going on for any length of time.

His Lordship: These defendants are all trying to humbug the plaintiffs.

The motion was treated as the trial of the action, and his Lordship granted a perpetual injunction with the usual costs, ordered delivery up of all infringing lamps in defendant's possession, and an inquiry as to damages unless the parties agreed on a sum.

Mr. Justice Tomlin, in the Chancery Division, on February 4th, again had before him the motion by the B.T.-H. Co., Ltd., for an injunction restraining alleged infringements by J. G. Ritchie, trading as the West Yorkshire Electric Co., of Woodsley Road, Leeds, of plaintiffs' lamp patent. Mr. Trevor Watson, for the plaintiffs, said his Lordship had granted an *ex parte* injunction restraining the defendant from parting with possession of the alleged infringing lamps. He read an affidavit by Percy Freeman, who said he bought a dozen lamps at defendant's premises, Ritchie himself handing them to him and telling him that he had lamps of various voltages in stock, and he would be glad to supply him.

Mr. Ritchie, who appeared in person, read an affidavit to the effect that not only had he not infringed the plaintiff company's patents by selling lamps, but that he never sold any lamps to their representative at all.

His Lordship said this raised a serious issue of fact which he could not try on a motion.

Defendant said this was a serious matter for him, as it was holding up his living.

His Lordship said he would grant facilities for an early trial of the issue, and in the meantime the interim injunction would drop.

Handcock v. Routledge.

According to an Irish newspaper report, Mr. Justice Meredith recently delivered his reserved judgment in the case of Ernest C. Handcock, electrical engineer and commission agent, of Dublin, against Frederick Routledge, also of Dublin, on an application made by the plaintiff for an order for discovery of documents. The action was brought for an account of all orders placed with the defendant as agent for electrical house service meters made by the Dr. Paul Meyer, A.G., of Berlin, and for other electrical material manufactured by the Deutsche K.A. Gesellschaft, of Berlin, as a result of the work and canvassing of the plaintiff, directly or indirectly; an account of all commissions credited or paid to the defendant on account of all such orders, and payment of 50 per cent. of the commission. The plaintiff alleged that under an agreement of March, 1924, with the defendant he was to be paid, as agent, demonstrator and canvasser, 50 per cent. of the commission received by the defendant on all orders for such goods placed with him resulting from the plaintiff's work, directly or indirectly, or in any way influenced by the plaintiff during the continuance of the agreement to September 20th, 1925. The plaintiff had been advised that for the successful carrying on of his action it was essential to have discovery of the docu-

ments in the defendant's custody, as he had no documentary information on the subject. The defendant denied that the agreement mentioned was entered into or was in operation during the time specified, or at all.

Mr. JUSTICE MEREDITH stated that he was by no means satisfied that the question with reference to the rights of the plaintiff could be satisfactorily tried without discovery, and he accordingly made an order for discovery, limited to the period of the continuance of the agreement, as stated by the plaintiff from March, 1924, to September 20th, 1925 .

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

507. "Electric motor starters." Igranic Electric Co., Ltd., and F. Bergmann. October 7th, 1925. (263,584.)

12,055. "Automatic telephone systems." Standard Telephones & Cables, Ltd. (G. Deakin, L. Polinkowsky, and W. Hatton. July 8th, 1925. (263,596.)

17,226. "Wireless signalling apparatus." Soc. Lerolle et Cie. July 5th, 1924. (236,587.)

22,485. "Electric switches." J. C. White. September 9th, 1925. (263,908.)

22,562. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). September 9th, 1925. (263,909.)

24,596. "Receiving systems for wireless telegraphy, telephony, and like purposes." R. H. Elleray. October 2nd, 1925. (263,918.)

24,628. "Picture transmission systems." Standard Telephones & Cables, Ltd. (Bell Telephone Laboratories, Inc.). October 2nd, 1925. (263,919.)

24,754. "Electric remote-control systems." Coventry Automatic Telephones, Ltd., and N. C. Smart October 5th, 1925. (263,926.)

24,810. "Apparatus for the reception of wireless signals." N. Lea and Radio Communication Co., Ltd. October 5th, 1925. (Addition to 240,899.) (263,931.)

24,885. "Dynamo-electric machines." English Electric Co., Ltd., J. C. Wilson, and J. W. Howard. October 6th, 1925. (Cognate application 4,686/26.) (263,940.)

25,010. "Spark plugs." A. Renaudin. October 8th, 1924. (241,204.)

25,011. "Self-exciting synchronous dynamos and motors." J. L. Matabon and C. M. Foucault. December 26th, 1924. (245,068.)

25,023. "Aerial systems for use in wireless telegraphy and telephony." C. S. Franklin. October 7th, 1925. (263,943.)

25,126. "Variable electric condensers." J. R. Spink and J. B. Langley. October 8th, 1925. (263,948.)

25,329. "Telephone transmitters." Standard Telephones & Cables, Ltd. (Bell Telephones Laboratories, Inc.). October 10th, 1925. (263,954.)

25,343. "Electromagnetic relays." British Thomson-Houston Co., Ltd., and E. L. E. Wheatcroft. October 10th, 1925. (263,956.)

25,346. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). October 10th, 1925. (Addition to 169,698, as modified by 195,928.) (263,958.)

25,420. "Electric switchgear." British Thomson-Houston Co., Ltd., H. Trencham, and C. W. Wood. October 12th, 1925. (263,960.)

25,504. "Means for the intermittent operation of electric circuits." F. G. Brettell (R. N. Gardner). October 13th, 1925. (263,961.)

25,567. "Telegraphy and telephony of the kind employing high-frequency oscillations." A. C. L. Turpain and Soc. des Etablissements Gaumont. October 13th, 1924. (241,237.)

25,903. "Electric transformers." British Thomson-Houston Co., Ltd., and J. G. Wellings. October 16th, 1925. (263,967.)

27,168. "Electrical signal lamps." J. A. Orange and Metropolitan-Vickers Electrical Co., Ltd. October 29th. 1925. (263,973.)

27,951. "Electric lamp bulbs." Edison Swan Electric Co., Ltd., and G. A. Percival. November 6th, 1925. (263,979.)

27,987. "Synchronising systems for interconnecting electric distribution circuits." British Thomson-Houston Co., Ltd. (General Electric Co.). November 6th, 1925. (263,980.)

29,391. "Electromagnetic change-over switch for wireless aerial circuits." G. S. Holland. November 21st, 1925. (263,990.)

29,871. "Wireless receiving apparatus." H. W. Cole. November 26th, 1925. (263,991.)

30,995. "Portable electric lamps." A. R. Willmott and A. R. Willmott and Co., Ltd. December 8th, 1925. (263,999.)

31,177. "High-frequency electric signalling systems." Wired Radio, Inc. May 19th, 1925. (252,317.)

32,043. "Electric distribution systems." British Thomson-Houston Co., Ltd., and H. W. C. Liddiard. December 18th, 1925. (264,006.)

17,779. "Means for and methods of electric power transmission." A. M. Taylor. July 11th, 1925. (Cognate applications 18,996/25, 22,189/25, and 23,593/25.) (Addition to 232,275.) (263,952.)

17,880. "Electric switching device for electric luminous advertisements." M. Lautner. July 13th, 1925. (264,195.)

18,133. "Electric power transmission." A. M. Taylor. July 16th, 1925. (Cognate application 451/26.) (264,196.)

23,227. "Electric storage batteries." C. E. Linebarger. September 17th, 1925. (264,205.)

23,468. "Electric switchgear." Anderson, Boyes & Co., Ltd., and H. H. Guthrie. June 14th, 1926. (264,206.)

25,162. "Wireless transmission." M. Kubierschky. October 8th, 1925. (264,209.)

25,208. "Method of winding air-spaced inductance coils." J. Craig. October 9th, 1925. (264,211.)

25,419. "Control of dynamo-electric machines." British Thomson-Houston Co., Ltd., and A. A. Pollock. October 12th, 1925. (264,215.)

25,444. "Apparatus for the rapid quenching of sparking between electrical conductors, produced by excessive voltage." M. Buchholz. October 11th, 1924. (241,230.)

25,463. "Electrically heated hot-plates and other electric heating devices." E. L. Wiegand Co. October 15th, 1924. (241,554.)

25,535. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). October 13th, 1925. (264,222.)

25,603. "Electric lighting and igniting apparatus for motor vehicles." K. A. Barenyi. October 13th, 1925. (264,228.)

25,610. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd., and F. Tench. October 13th, 1925. (Addition to 227,510.) (264,229.)

25,711. "Thermionic valves." G. Marconi and C. S. Franklin. October 14th, 1925. (264,234.)

25,727. "Electric remote control and indicating systems, and apparatus used therein." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories, Inc.). October 14th, 1925. (264,235.)

25,728. "Telephone systems." Standard Telephones and Cables, Ltd. (G. Deakin). October 14th, 1925. (264,236.)

25,784. "Frequency meters, wave-meters, and other measuring instruments for high-frequency electric oscillations, applicable to other wireless apparatus." J. K. Im Thurn and L. S. B. Alder. October 15th, 1925. (264,239.)

25,845. "Electric fuse-boxes." F. W. Abbott. October 16th, 1925. (264,243.)

26,001. "Electrical transformers and like devices for transferring energy from one circuit to another." Secret Wireless, Ltd., and J. D. Chisholm. October 17th, 1925. (264,251.)

26,014. "Draw-out type electric switchgear." G. Pailin and Ferguson, Pailin, Ltd. October 17th, 1925. (264,252.)

26,504. "Process of introducing potassium or caesium or rubidium into electric discharge tubes." H. Wade (Naamlooze Vennootschap Philips' Gloeilampenfabrieken). October 22nd, 1925. (Cognate application 1,693/26.) (264,258.)

26,936. "Electrical circuit-interrupters." P. L. Harlow and Metropolitan-Vickers Electrical Co., Ltd. October 27th, 1925. (263,217.)

27,198. "Switching mechanisms for automatic telephone systems and the like." Siemens Bros. & Co., Ltd., and A. E. Caswell. October 29th, 1925. (264,268.)

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 2nd :—

Metco. No. 476,208. Class 8. Electric cables.—Metropolitan Electric Cable and Construction Co., Ltd., Fuller Works, Grove Road, Chadwell Heath, Essex.

Electricon. No. 473,600. Class 13 Plugs, sockets, switches, connectors, and screws.—Barnard Alfred Spaull, trading as Barnard A. Spaull, 62, Fore Street, London, E.C.2.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Inclusion in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ALFRETON.—Housing scheme (54), for the U.D.C.; surveyor, King Street.

ASHTON-UNDER-LYNE.—Housing scheme (92), Oakfold Estate, for the T.C.; J. Rowbottom, borough surveyor.

BARNES.—Conversion of Barnes Theatre into a kinema; the Palaseum Co.

BEBINGTON.—Housing scheme (218), Stanton Estate, for the U.D.C.; surveyor.

BECKENHAM.—Extension, Cottage Hospital; governors.

BILSTON (Wolverhampton).—Additional housing schemes (178), for the U.D.C.; F. B. Sidwick, surveyor.

BINLEY.—Housing scheme (150), Binley Colliery Co., schools, for Warwickshire E.C.; director of education, Warwick.

BIRKENHEAD.—Offices for Water Department of Corporation; Collin & Son.

BIRMINGHAM.—164 houses, Acocks Green; H. Boot & Sons, Ltd. 118 houses, Hall Green, 862 at Tyseley Farm; Edwards (Birmingham), Ltd.

BLACKBURN.—Extension of the Technical College; school at Roe Park and proposed schools at Intack Mill Hill and Audley; director of education.

BLACKPOOL.—Housing schemes, Layton, St. John's Estate and Bispham (155); borough engineer.

BOLTON.—118 houses, Higher Swan Lane and 312 at Moorfield estate; borough engineer.

BROADSTAIRS.—Residence, North Foreland (£100,000), for Sir Edmund Vestey.

BROMLEY (Kent).—Additional 94 houses, for the R.D.C.; L. O. Wall, clerk, Church House.

BROWNHILLS (Staffs.).—Housing scheme (100), for the U.D.C.; surveyor.

BURSLEM.—500 houses, Holden Hill; Stoke city engineer.

CAERPHILLY.—Houses (50), Senghenydd site, for the U.D.C.; A. J. Rossiter, builder. Mining institute, for Glamorganshire E.C.; Davies & Lloyd, builders.

CAMBERLEY.—Secondary schools (£24,000), for Surrey E.C.; W. W. Finny, secretary, Kingston-on-Thames.

CANADA.—Canadian company is making additions to office buildings over a period of five years ($6,000,000); manufacturers of electric motors, switchgear, pumps and motors, boiler equipment, piping, &c., can obtain particulars from the Department of Overseas Trade, 35, Old Queen Street, S.W. (CX 2190.)

CARSHALTON.—Houses (99), for Sawyers & Co. Houses (64), Carshalton Place, for Tysoe & Harris. Housing scheme (166), Stanley Road, for the U.D.C.; Hugh Macintosh, architect.

CHERTSEY.—Additional housing scheme (200), for the U.D.C.; surveyor.

CHRISTCHURCH. (Hants).—Development of Homelands Estate, with 70 houses; Curry, Ltd.

COVENTRY.—Hospital extensions, for the B.G.; the clerk.

DUMFRIES.—Cold storage factory; J. Henderson, solicitor. Extension of premises for Magneto Accumulator and Electro-Plating Co., Leafield Road; the manager.

DUNFERMLINE.—Operating theatre, orthopædic, X-ray, &c., department and heating installation at the Dunfermline and West Fife Hospital; Hospital Board.

FALKIRK.—Omnibus garage and shop (£2,800) for Walter Alexander & Sons, Camelon; the manager.

GLASGOW.—Reconstruction scheme, Wellington Arcade; Smith (Glasgow) Ltd. Students' Union in University Avenue; Mr. J. K. Hunter, Ayr, assessor of plans. Schools (£300,000); clerk, Education Authority, Bath Street.

GRAVESEND.—192 houses, Kings Farm; J. G. Bennett, Corporation architect.

HEBDEN BRIDGE.—Refuse destructor; surveyor to the Council.

HEMEL HEMPSTEAD.—Extensions, West Herts Hospital; H. Fletcher, secretary.

HIGH WYCOMBE.—Chair factory, Dashwood Avenue, for Worley Bros. & Co. Housing scheme (102), West End, for the T.C.; T. J. Rushbrooke, borough surveyor.

HOCKERGATE.—Secondary school, Townley Estate; Durham County Education Committee.

HULL.—Extensions, Grammar School; Holliday & Barker.

LEOMINSTER.—Senior schools (£9,000), for Herefordshire E.C.; director of education, Hereford.

LEEDS.—X-ray installation, Tuberculosis Dispensary; chief clinical tuberculosis officer of the Corporation. Workshops and offices for Corporation Gas Department, New York Road (£110,000); G. W. Atkinson, architect. 750 houses, York and Selby Estates; city architect. Motor-'bus garage, Goodman Street and Donisthorpe Street; city engineer.

LIGHTWOOD (Staffs.).—Shopping centre, Stone Road; Beckett & Bloore, architects.

LITHERLAND.—Central school; Lancashire Education Committee.

LONDON (L.C.C.).—Electric light installation at the following schools: Holland Road, Brixton; Britannia Road, Fulham; Highbury Hill, Highbury; Brecknock School, Highgate; Springfield School, Kennington; Sirdar Road, Kensington; Carmac Street, Norwood; Bromley Hall Road; Upper North Street, and Janet Street, Poplar; Magdalen Road, Wandsworth; L.C.C. Education Committee.

(Ilford, E.).—300 houses, Springfield Drive Estate; Suburban Developments, Ltd.

(E.C.).—Proposed improvements to the Guildhall (£250,000); City Corporation.

(Deptford, S.E.).—Reconstruction of premises, High Street, for Selfridge & Co., Ltd.

(Lewisham, S.E.).—Additional 128 houses, Grove Park, for the T.C.; borough surveyor.

(Peckham, S.E.).—Reconstruction Crown Cinema, High Street, Biocolot, Ltd.; architect, E. A. Stone.

(Southwark, S.E.).—Building on Stamford Street site; G. Hamblin Fox, 34, Crutched Friars, E.C.

(Holborn, W.C.).—Reconstruction of warehouses, Cockpit Yard, Holborn; Welch & Hollis.

LUTON (Beds.).—Extensions, Bute Hospital (£18,500), for the Board of Management; secretary.

MACCLESFIELD.—Extensions, Westpark Hospital, for the B.G.; Whittaker & Bradburn, architects, 19, King Edward Street.

MALDENS & COOMBE (Surrey).—76 flats, Thorne Road site, for the U.D.C.; R. H. Jeffes, architect, New Malden.

MANCHESTER.—Extension of Exhibition Hall, Liverpool Road; city architect, Town Hall.

MELTON MOWBRAY.—Senior boys' school (£13,000), for Leicestershire E.C.; director of education, Leicester.

MIDDLETON.—Housing scheme (158), Boarshaw Estate; J. H. Randall, Ltd., builders, Sheffield.

NEWARK.—Technical institute, Notts Education Committee.

NEWBURY (Berks).—Roman Catholic church (£16,000); Wilfred C. Mangan, architect, Preston. Hoskings Bros., builders.

NORTHAMPTON.—84 houses, Weedon Road; borough engineer.

PLYMOUTH.—208 houses, Higher Mount Gold Estate (£100,000), for the T.C.; J. Wibberley, borough surveyor.

RAWMARSH (Yorks).—104 houses, Clay Pit Lane site; J. A. Tonge, architect, Council Offices, Parkgate, Yorks. Kinema, High Street, for the Heeley Amalgamated Cinemas, Ltd.

ST. ALBANS.—Central boiler station for heating institution (£10,000), for the B.G.; the clerk.

ST. HELENS.—Tuberculosis dispensary, Hardshaw Street; Lancashire C.C.

SALFORD.—Maternity home and welfare centre, Landseer Street; city engineer.

SALISBURY.—90 houses, Stratford Road; borough engineer.

SEISDON.—Additional 58 houses, for the R.D.C.; surveyor.

SHEFFIELD.—Corporation houses, Longley Estate (111); S. Higton & Son, 30 houses; M. J. Gleeson, Ltd., 63 houses; W. C. W. Alflat, 18 houses.

SURBITON.—Combined dispensary, welfare centre, and school clinic, South Place; Surrey C.C.

WALLINGTON (Surrey).—Houses (39), Coldharbour Estate, for T. Markwick & Co. Housing scheme (114), Bute Road, for the U.D.C.; surveyor.

WARSOP.—Additional 103 houses, with electrical work, Church Warsop, for the Staveley Coal & Iron Co., Ltd.; Structural Contractors, Ltd., builders, Victoria Street, London.

WARWICK.—Heating and lighting services, Hatton mental home (£35,638), for Warwickshire C.C.

WHISTON.—Schools (£28,200), for Lancs. E.C.; director of education, Preston.

WHITEFIELD.—Secondary school for girls; Lancashire Education Committee.

YORK.—Houses (80), for the T.C.; A. V. Clerey, builder, Sunderland.

The

Electrical Review

VOL. C. FEBRUARY 18, 1927. No. 2,569.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code. A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Our Supplement for Retailers.

WITH every copy of the ELECTRICAL REVIEW this week we are circulating the first of a series of Special Supplements dealing with matters that are of direct interest to retail electrical traders, small electrical contractors, men who are in charge of or engaged in the electrical departments of large central and local stores, and staffs engaged in the showrooms of contracting businesses and electricity supply undertakings.

Events are moving very rapidly in the electrical supply development section of the industry, and it is not desirable that the electrical retailing trade, which can do so much to ensure progress along sound but enterprising lines, should be left to conduct its operations in a haphazard or casual sort of fashion. It is felt that, because there have been so many large matters upon which interest has of necessity been concentrated, the class of trader mentioned has been overlooked at the heart of things. This may be true in some measure, though the affairs of the small trader have always received attention in these pages, but whatever may have happened in the past, the recent growth of general interest in electrical products for everyday use suggests that the time has fully arrived when the retail trader should be brought authoritatively into touch with those whose interests are similar to his own, and should be acquainted in ordered form with the great range of electrical manufactures and materials that our producers and wholesale traders have prepared for him to sell to the electricity-using public.

Many estimates have been made regarding the number of shopkeepers and others in the country who are dealing in electrical goods either as a sole or a supplementary line. The influx is so large that we hesitate to express our own opinion. Everywhere one goes electrical goods are finding their way into shop windows and new dealers are beginning operations. Unfortunately in recent years too many such businesses have passed out ignominiously by way of the bankruptcy or liquidation courses through inexperience, mismanagement, unwise trading, &c.

We mentioned last week the determination of one

large company in the Midlands to add an electrical section to its business because of the general movement everywhere noticeable among ironmongers and hardwaremen to turn their enthusiasm in this new direction. It has found, as we reported, that "the thousands of ironmongers with whom it did business throughout the country were to some extent extending their operations to the sale of domestic electrical appliances."

We know that the number of new recruits to the electrical trade runs into many thousands, and we feel that the moment is suitable for placing this Supplement at their disposal.

The regular reader of the Electrical Review receives the Supplement in addition to what is also an enlarged number of the Review, owing to the space required just now for describing the exhibits at the British Industries Fair. Efforts will be made to reach newer retailers who are not already regular readers of the Review, and we venture to ask the co-operation of our supporters in making the Supplement known to those whom they consider likely to profit from a study of its contents. In the first number we give a large place to a review of electromedical apparatus suitable for use in the home, a special class of trade which, we believe, will be new to many retailers, but which should prove to be both popular and profitable.

Let us bring all the outlying units into central communication so that the electrical forward movement may proceed in orderly fashion. We know of no way for this to happen other than through the intelligent study of ideas, measures, and manufactures in the Press.

Electrical Travellers.

There were so many other interesting things covered in the speeches delivered last Friday at the annual dinner of the organisation of commercial electrical travellers that there was little opportunity to dwell upon the actual progress that has been made since the last similar function was held a year ago. The evening was more in the nature of a festival, an occasion for friendliness, than anything else. The two speeches which were of real value from a business point of view were those of Sir Hugo Hirst, Bart., the president, and of Mr. A. E. Iliffe, one of the vice-presidents, and their main interest to the general body of commercial readers of the Electrical Review lies in the emphasis that both speakers put upon the need for commercial electrical travellers to improve themselves in every possible way so that they may become the more efficient salesmen that the electrical trade requires to-day. The commercial traveller has to remember that he is an ambassador, on behalf of his company or firm, to the trade buyer; that he may do much to make or mar the reputation of his employers; that while the judicious making of friends is a part of his occupation, he must equip himself with a sufficient measure of technical information to make himself a creditable representative. We understand that the Association has made substantial progress in membership during the past year and, in the hope that it will, as the result of co-operative action, improve the standard of commercial electrical travelling throughout the land at a time when intelligent touch with the trade buyer is becoming an increasingly important matter, we wish it continued success and commend the body to the sympathetic interest of concerns not yet identified with it.

Libraries and Information Bureaux.

Everyone, at some time or other, finds himself in urgent need of an item of information which, he knows, must be available somewhere—but where? To judge by the thousands of inquiries that our Service Department annually receives—the vast majority of which are promptly answered, by post—such an emergency is neither rare nor easy to deal with. In the past we have discussed the possibility of forming a central bureau to which at least one copy of every trade catalogue should be sent, just as other copyright publications are filed at the British Museum and other official centres, such copies to be kept on file and available for inspection by anyone. A small fee might be charged, which, supplemented by a nominal subscription from each firm represented, would cover the cost of accommodation and enable a competent and helpful staff to be provided.

In London the Patent Office Library has long been the rendezvous of those who desire to consult technical literature; and the various engineering and other scientific institutions possess their own reference libraries, to which non-members can obtain access if properly accredited. The large provincial cities are similarly more or less adequately provided with library facilities—but the whole thing has been unorganised and without system, and consequently inefficient.

Less than three years ago a conference was held at which the subject of collecting and utilising information was discussed, and a committee was apointed which, with the assistance of a grant of £1,500 from the Carnegie United Kingdom Trustees, convoked further conferences, with the result that in March last year the "Association of Special Libraries and Information Bureaux" was inaugurated, "to facilitate the coordination and systematic use of sources of information in science, industry, commerce, public affairs, &c." The chairman of the Council is Mr. J. G. Pearce, B.Sc., M.I.E.E., director of the British Cast Iron Research Association, and the vice-chairman Mr. P. K. Turner, A.M.I.E.E., head of the research department of Burndept Wireless, Ltd. As the grant made by the Carnegie Trustees ended on December 31st, the Association is seeking to enrol new members as speedily as possible. It is preparing a directory of the special sources of information that exist in Great Britain and Ireland, which will be ready next summer, and will be circulated to the members, who will also be entitled to use the services organised by the Association. Such an institution will go far towards meeting the want that we have referred to, and we believe that its claim to the support of institutions of all kinds, as well as libraries, manufacturers, and individuals interested in the control or operation of statistical or information services, is worthy of the serious consideration of our readers.

The Shannon Power Scheme.

The Bill for the administration of the Shannon Power Scheme has been further postponed; its introduction in the Dail cannot take place just yet. It is a very large and technical measure, and one likely to occasion a good deal of discussion. Its main feature will be the constitution of a semi-independent Board, or Commission, on the lines recommended by the Continental experts who were called in to advise the Government in the early stages of the scheme. The decision to establish this Board finally disposes of the idea that the Government was likely to sell or lease the scheme. Naturally, particular interest will attach to the provisions in the Bill for dealing with existing electrical undertakings in the Free State, owned by municipalities, companies, &c. A good deal of anxiety has existed amongst proprietors of Free State electricity concerns as to the intentions of the Government in this regard, and more than one deputation has waited on the Minister for Industry and Commerce for the purpose of making representations on the subject.

The I.E.E. Dinner.

The Institution of Electrical Engineers, incorporated by Royal Charter, was honoured on the occasion of its annual dinner and reunion last week by the presence of H.R.H. the Prince of Wales; there was an unprecedented demand for tickets on the part of the members, so that there was no room for guests other than those officially invited by the Council, and, in fact, there was an overflow into an adjoining room, the total number present being over 600. Evidently the members of the Institution were determined

to seize the opportunity of demonstrating their loyalty to the Crown and their affection for the Heir Apparent who, in return, proposed the health of the Institution in happy phrase, with many humorous references. The keynote of the Prince's speech was the achievement of transatlantic wireless telephony last month, by which, as he put it, his year of office as President of the British Association had been rendered noteworthy, and the Post Office engineers who were present were naturally, and justly, gratified by this apt allusion to their success.

The response of the President, Dr. W. H. Eccles, to the toast was noteworthy for the remarkable optimism which it displayed with regard to the present status and future prospects of the electrical engineering industry in this country. Only three months ago Dr. Eccles addressed the Institution in a pessimistic vein, lamenting the alleged backwardness of our electrical industries in many respects, whereas he now surveys the situation through rose-coloured glasses—a change which we heartily welcome.

The proceedings were marked by a dignity and restraint worthy of the Institution, and in every way the function was a notable success.

British Empire Electrical Research.

The British Electrical and Allied Industries Research Association, under the direction of Mr. E. B. Wedmore, M.I.E.E., justified its existence long ago by investigations which have proved of enormous value to the electrical industries, and consequently to the general public; and the report for the year 1925-26 which was submitted to the sixth annual general meeting last Friday shows that its work is being carried on with unabated zeal and ability, stimulated, moreover, by the favourable report of the Committee of Investigation which examined the work of its first five years, on behalf of the Department of Scientific and Industrial Research.

The researches which it has in hand cover a very wide field, and in some cases are carried on in collaboration with other bodies interested in their subjects. It is pleasing to learn that the Association was never in a stronger position than at present, and that sufficient financial support is available to cover the minimum requirements of its programme. The ordinary members now represent about 85 per cent. of the capital employed in electrical manufacturing, and the associate members representing the electricity supply industry are responsible for about half the total national output. Evidently, therefore, the value of its work is gaining the recognition that is its due; but the fact that money expended on research is both a profitable investment, and essential to the maintenance of our industries, as was declared by the Empire Research Sub-committee last year, is not yet fully realised either by the Government or by the industries concerned—if it were, there would be no lack of funds. As things are, whilst the Association can carry on, it has had to defer many needed investigations, and the policy of the Department of Scientific and Industrial Research, which involves a gradual withdrawal of financial support, renders it imperatively necessary to increase the flow of funds from the industries themselves. In this connection the practice successfully adopted by E.D.A. might well be followed—namely, that of inviting its supporters to contribute annually a fixed percentage based on output or turnover, a trifling amount in comparison with the bulk, but sufficient in the aggregate to provide the Association with an assured revenue not only for the year in prospect, but for the years to follow.

It is difficult to set bounds to the results that might be obtained if adequate funds were provided. Even under present conditions, working on the "minimum scale," the Association records, for instance, successful results arising from its researches on oil switches; errors in current practice have been revealed, and means have been found, by experiment, for definitely reducing the energy released on breaking circuit, under the severest conditions obtainable at Carville, in the ratio of 7 : 1! "The methods now being experimentally developed show promise, therefore, not only of marked increase in rupturing capacity applicable to the heaviest source, but of a degree of control of commercial performance far in advance of anything hitherto attained."

This is indeed cheerful news. Those who are familiar with power-station design are aware of the great space required for high-pressure switchgear, the heavy cost of the plant and buildings, and the liability of the gear to suffer damage in the performance of its duties, involving costly maintenance. If these factors can be reduced in anything like the ratio above mentioned, the whole cost of the six years' work of the Association will be abundantly repaid by the success of this research alone. This is a matter of special interest to the Central Electricity Board, which commences work on March 1st.

Hardly less important was the announcement made by Mr. Ll. B. Atkinson at the luncheon which followed the general meeting—namely, that as the result of collaboration with the National Physical Laboratory the problem of measuring small electrical losses (such as those in the dielectrics of high-pressure cables) had been solved; uncertainties, sometimes amounting to as much as 50 per cent., had been eliminated, and now a degree of accuracy had been reached, by three or four different methods which had formerly given contradictory results but now were in absolute agreement, which had not been attained by any other association or laboratory in the world. This achievement, combined with the erection of a "million-volt" testing plant at the N.P.L. (now in progress), would place in the hands of British manufacturers an instrument unequalled throughout the world.

Such results as these must be regarded as highly satisfactory; we hope they will induce manufacturers, supply authorities, and the Governments of this country and the great Dominions to provide the funds which will enable the Association to multiply its labours and their fruits and, as Mr. Woodhouse suggested, to serve the whole Empire, as the "British Empire Research Association."

The Electric Vehicle.

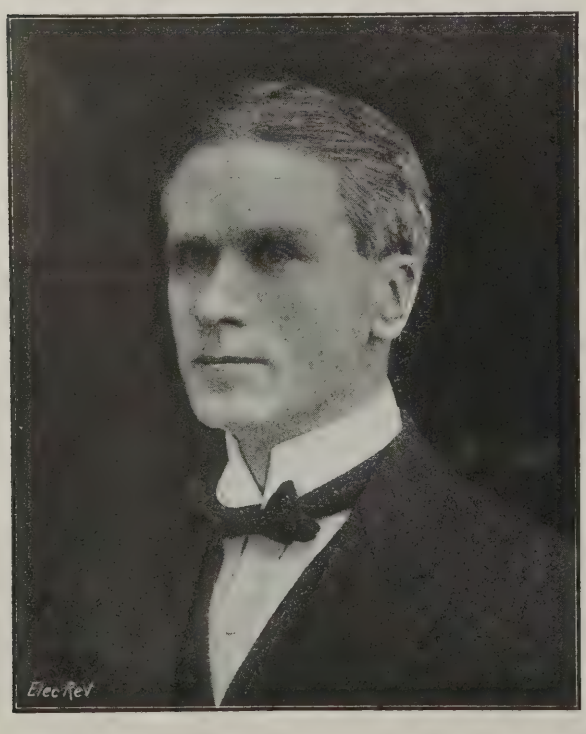
Despite all that has been said and done in the past, and the progress that is being made abroad, the electric vehicle in this country has not kept its place in the forward march of electrical development. The Electric Vehicle Committee of Great Britain, now associated with E.D.A., still publishes its useful periodical, the *Electric Vehicle*, but further evidence of its activities is not available, and its functions do not appear to include the organisation of meetings at which storage-battery traction can be discussed.

The formation of the Electromobile Association last autumn, therefore, must be regarded as a forward movement which is likely to prove of great value to this industry. We understand that it is in no sense competitive with the Electric Vehicle Committee; on the contrary, their objects are identical, and its operations will supplement the work of the Committee, bringing the subject of storage-battery traction before a wider public, and enabling all persons who are in any way interested in it, whether technical or non-technical, to meet and discuss the problems which arise.

As the chairman at the informal meeting last week—Mr. J. H. C. Brooking—pointed out, the principal obstacles to progress are the high price of electric vehicles, and the lack of charging facilities. Much could be said on both these topics; for the moment we shall only add that the secretary, Mr. J. C. Elvy, in opening the discussion, made out a strong case for the electromobile, and we hope to see the new Association grow in membership and influence until its object is attained, and the electric vehicle comes into its own.

The Central Electricity Board.

Sir Andrew Duncan (Chairman) and his Colleagues.



THE formation of the Central Electricity Board marks an epoch in the history of electricity supply in Great Britain. Hitherto, however much the industry has been fostered—or hampered—by legislation, the supply undertakers have been left free to manage their own affairs; in future their operations will in large measure be controlled by the Board, whose powers, taken in conjunction with those of the Electricity Commissioners, will be very wide in scope and stringent in execution. Hence we deem it appropriate to introduce the members of the Board to our readers, at least so far as the limitations of paper and printing permit.

Some of these gentlemen, it is true, who are members of the Institution of Electrical Engineers, need no introduction. Sir Duncan Watson, who has occupied positions of responsibility and influence in the electrical industry for many years, has been chairman of the Joint Electricity Authority for London and the Home Counties for some 15 months, and has thus added materially to the experience which he gained as chairman of the Marylebone Electricity Committee; Sir James Devonshire has also been most intimately associated with electricity supply in the Metropolitan area for an extended period, his conduct of the affairs of the North Metropolitan Electric Power Co., Ltd., being marked by commercial shrewdness allied with public-spirited enterprise; and Alderman W. Walker, who has done splendid work on the social side of the industry, besides taking a prominent part in the management of electricity supply in South Lancashire, is too well-known to require introduction to an electrical public.

But the chairman of the Board, Sir Andrew Duncan, is a newcomer in the electrical field: he will have a very heavy task, calling for the display of the highest administrative capacity and exceptional powers of organisation and control. Fortunately, Sir Andrew has already made his mark in other fields, and if he is taking up the study of a new

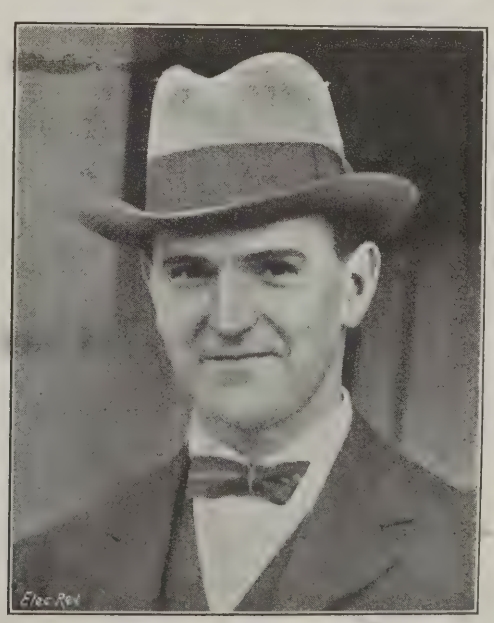
Sir James Lithgow.

subject, he brings to it a proved ability to acquire new knowledge and to use it with effect. Sir James Lithgow and Mr. Frank Hodges are intimately acquainted with the coal-mining industry, and with labour problems; the former is an employer on a large scale, and has made a study of industrial questions, while the latter, no less expert from the employés' point of view, has gained a reputation for sane opinions and economic insight, and is an enthusiastic advocate of electrical development. Mr. Whigham, a director of the Bank of England, and of a great railway company, will guide the Board in matters of finance, and Colonel Willey, a former president of the Federation of British Industries, may be relied upon to "pull his weight"; his personal study of the industrial situation in the United States a year or two ago will be recalled by our readers, and the interest that the F.B.I. has taken in the relation of electricity supply to British industry is common knowledge.



Ald. W. Walker.

The Board will take up its duties on March 1st; by that time time, no doubt, temporary accommodation will have been found for it, and the members will be able to commence operations directly they have appointed their staff and equipped their offices, for it is credibly reported that the Electricity Commissioners have already prepared certain schemes for the Midlands and for the industrial area of Scotland which will immediately be submitted to the consideration of the Board, and will, no doubt, be put in hand with the least possible delay.

Mr. Frank Hodges.

Wireless Export Trade.

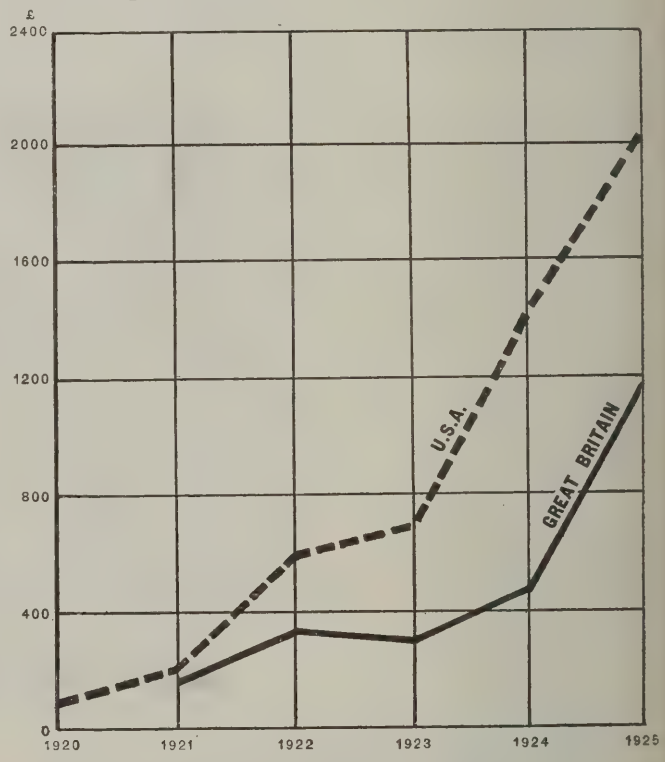
Last year's unsatisfactory British position.

(Communicated.)

OFFICIAL figures which have just become available show that during the past year the total British exports of manufactured wireless apparatus and valves declined in value to £1,266,384 from the 1925 total of £1,289,749. This is not a large drop, but it is unsatisfactory because the trend of export trade in this branch has shown a strong upward movement of late years, although not so marked as in the case of the United States. The figures for the British exports of wireless apparatus during the past few years have been:

1921	...	...	£155,273
1922	...	...	376,777
1923	...	...	300,156
1924	...	...	465,292
1925	...	...	1,106,445

It is not possible in a survey taken over five years to include the additional figures relating to valve exports, as for a portion of the time they were classified with other goods, and it was only during 1925 that separate figures became available.



In the case of the United States, our principal competitor in many overseas markets, the total exports of wireless material of all kinds during the same period are officially valued at:

1921	...	...	£208,401
1922	...	...	597,484
1923	...	...	710,889
1924	...	...	1,243,487
1925	...	...	2,042,018

During the whole of the period it will be seen that each year's exports have shown a steady advance. Owing to the changes of classification already mentioned, it is not possible to make an *exact* comparison in the export trade of the two countries, but this may be set out roughly in the form shown in the adjoining chart. If it were possible to give exact figures relating to British exports of valves over the foregoing period, our returns would be improved somewhat. American exports definitely exceed British in the case of Asia, Africa, and Australia.

The set-back in British wireless exports last year cannot be put down entirely to the effects of the coal stoppage, as it is doubtful whether any industry is likely to suffer less from any increase in fuel prices. A more likely reason is to be found in the keener competition which is now to be encountered in oversea markets, joined to the fact that as a large proportion of British wireless manufacturers are only in a comparatively small way of business, they are not able to cultivate export markets on the same large scale as some of the American wireless corporations. To this there are, of course, notable exceptions. The "Amplion" loud-speaker, for instance, is selling largely in such highly-protected countries as the United States and Germany; Ferranti transformers are likewise entering the same markets, while the activities of such firms as Burndept and Sterling are world-wide. But on the whole, in spite of notable exceptions, the individual wireless manufacturer lacks the appreciation, the organisation, and the necessary data upon export markets which are features of the older-established electrical trade.

The patent position also has not been without its effect upon British export trade in wireless. Under the terms of the licence which is granted to the majority of makers of wireless receivers for the use of patents, the export of these instruments is expressly forbidden. If, therefore, the receiver is regarded as the logical unit of the wireless trade, we are faced with the fact that here is a large industry which has grown up although export, to all intents and purposes, is banned. The manufacturer whose main trade is in receiving instruments therefore has to organise an entirely separate trade in component parts before he is able to think of cultivating export markets!

The Export of Wireless Material.

Whatever may be the reason for the decline, the marked fall in last year's figures is one which merits the most serious attention of all manufacturers connected with the wireless industry. A trade which has in the short space of five years grown practically from zero to more than a million and a quarter sterling is one whose possibilities and future are deserving of the most unremitting study and cultivation.

Electrical Prospecting in Ore Fields.

A Canadian correspondent states that electrical prospecting has lately come greatly into favour with mining companies, and is now very largely employed in the exploration of copper and gold properties in the Rouyn area of Quebec; a Swedish electrical company has been operating there for some time with marked success. Mr. Sherwin F. Kelly, mining engineer and geologist, and a licensee of the French Schlumberger patent for electrical prospecting, is now in the field, under a contract with the Boischatel Mines, to prospect their property. Mr. Kelly, who has had a wide mining experience, is said to have operated the Schlumberger system very successfully in several of the Canadian mining districts, and recently has done important work for the Ontario Department of Mines. A number of other companies, both in Ontario and Quebec, are arranging to use the Schlumberger system; extra equipment has been ordered from France, and experienced operators have been engaged to go to Canada.

Electrical Developments at Gt. Yarmouth.—II.

A new e.h.p. and l.p. transmission system, with eleven new overground sub-stations, to meet the requirements of the change-over scheme from single-phase, 83 cycles, to three-phase, 50 cycles.

IN our last issue, under the above heading, it was mentioned that in connection with the change-over scheme for the system of distribution at Yarmouth from single-phase, 83 cycles to 3-phase, 50 cycles, a new e.h.p. and l.p. transmission system was sanctioned, involving the installation of eleven new sub-stations. This work is now completed, and the sub-stations are all on load. The actual change-over work is also well advanced, the old l.p. network being utilised for the consumers' supply at 200 V.

The lay-out of the town is not so favourable to the design of a distribution system as that of most places, the concentrated area being long and narrow and in two portions, one on each bank of the Yare. By a careful study of the various districts, however, relative to the loadings and future requirements, a satisfactory system has been put down to give the maximum economy compatible with supply continuity. The e.h.p. transmission is at the generating pressure, 3,850 V. Six feeders serve the whole area in the form of four ring-main systems, two or more sub-stations being supplied by each feeder, and interconnecting cables employed for linking up the "subs." The ring in each case is normally broken at one end of one of the interconnecting mains, which is left connected but not on load. The main feeders are of 0.1 sq. in. section, and the interconnectors 0.05 sq. in., all being suitable for 6,600-V working.

Four of the sub-stations serve the area on the Gorleston side, and the two feeders supplying these involve submarine cables at the river crossing. These are designed for 33,000-V working in order to provide for future developments. The sub-stations are of brick and concrete construction and of a uniform design.

Fig. 1.—Exterior of one of the Sub-stations.

Fig. 1 shows the exterior of one of the buildings. Separate compartments are provided for the transformers and the switchgear, served by a communicating doorway, the elevation of the transformer section being such as to provide for the additional ventilating and lifting requirements. The e.h.p. and l.p. switchgear are arranged on either side of the relative compart-

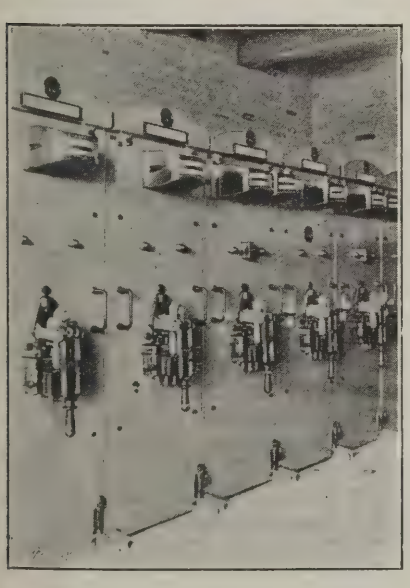


Fig. 2.—E.h.p. Sub-station Switchgear.

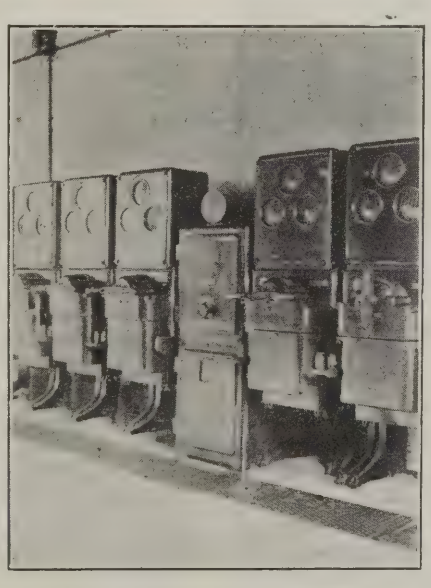

Fig. 3.—Pedestal-type l.p. Switchgear.

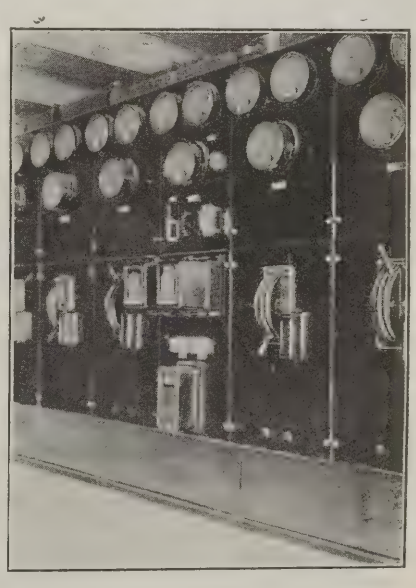

Fig. 4.—L.p. Panel Equipment.

ment, a wide gangway being provided between the two classes of equipment, and ample working space at the back of each switchboard. Suitable roller-shutter doors are arranged opposite the transformers, fig. 1.

A standard capacity of 250 kW has been adopted for the transformers, and, according to the actual load demands, two or more of these provide for total sub-station loadings up to 1,000 kW.

Truck-type cubicle switchgear, supplied by the British Thomson-Houston Co., Ltd., has been adopted throughout for dealing with the supply on the e.h.p. system. Fig. 2 shows the equipment of this type installed in one of the "subs." On the l.p. side

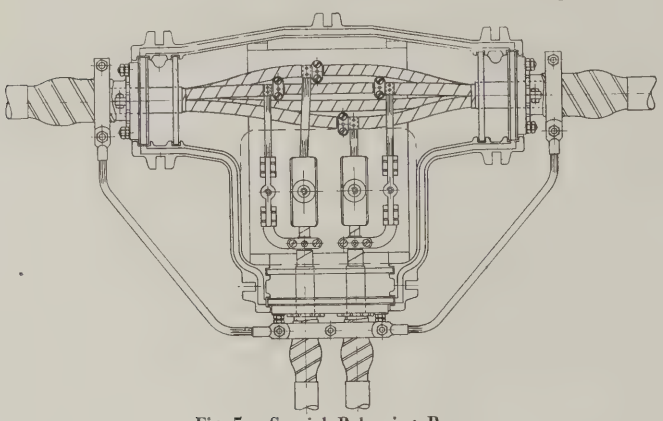

Fig. 5.—Special Balancing Box.

varying types of switchgear have been installed, including panel equipment by Messrs. Johnson and Phillips, Ltd., Messrs. Crompton & Co., Ltd., and the B.T.-H. Co., Ltd., and also pedestal-type switchgear by the English Electric Co., Ltd. Fig. 3 shows the last mentioned equipment, which is provided with draw-out type oil circuit breakers. Fig. 4 is a view of the l.p. switchgear in one of the sub-stations employing the panel equipment. The apparatus is made up of from four to seven units, panels or pillars, in each case, including a summation unit equipped with the necesary recording and indicating instruments for the sub-station supply.

The main l.p. distributors are arranged in the form of a complete ring in each of the Yarmouth and Gorleston areas, looping in and out of all the sub-stations in each case; but the cables are normally disconnected at suitable intermediate points between the supply sources, so that each local feed is entirely

Fig. 6.—L.p. line at Hopton.

separate. Four-core 0.2-sq. in. cable is used for these mains throughout.

Where possible, the old underground static sub-stations of the original single-phase system have and are being used as connecting chambers between the 3-phase distributors and the single-phase network, a practice which has proved of great advantage both with regard to economy, obviating in many cases the installation of street pillars, and in facilitating the work of balancing up on the old concentric mains. In most cases street-pillar type, 3-phase, 4-way distribution units are adopted in these disconnecting chambers, the leads to the outers of the old network cables being bunched on the neutral bar.

Of particular interest is a method adopted to overcome the difficulty of balancing up where a long length of concentric cable is employed between two of these chambers. A special 4-way box, designed by the mains engineer, Mr. A. J. Hastings, is employed in these cases. This serves as a straight-through connection for the 4-core main and provides for two concentric T connections with a fuse and a link switch in each. The concentric cable is split, and each end is connected to a different phase. It will be seen that by using two of these boxes between two supply points the concentric can be balanced on the three phases and each section fed from both ends. Fig. 5 shows the arrangement of this box, for the drawing of which we are indebted to Messrs. British Insulated Cables, Ltd. Each of these boxes is installed in a suitably covered manhole in the pavement. For extensions to the old single-phase network twin cables are employed; four-core cables are laid in entirely new sections.

It is of interest to note that two recent extensions, to Hopton and Caister, involve schemes for rural electrification. In each case overhead lines are employed for the l.p. distribution, wooden poles being employed with the lines carried on porcelain insulators. Fig. 6 shows a section of the line at Hopton. This district is served by a sub-station of the steel-kiosk type, fig. 7, supplied by Messrs. Johnson & Phillips, Ltd., which houses a 50-kW transformer and the necessary e.h.p.

Fig. 7.—Kiosk-type Sub-station.

and l.p. switchgear, and is fed by means of an underground cable from the Gorleston ring.

The undertaking has adopted assisted-wiring schemes in certain parts of the area, and some methods of running the house services in these and other cases are notable for their simplicity and the resulting economy. To take a typical example of a dozen houses, all supplied, a 4-core service main is run to a mid-way point at the base of the houses, in the front garden, a 4-way fuse box (3-pole and link) being housed in a wooden cupboard on the wall. From this point C.T.S. singles are run in a pipe up the wall, and along the guttering boards by means of porcelain cleats. In other instances the wires are suspended between the chimney blocks by means of insulated brackets.

When completed, the change-over will have involved the rewinding of and rewiring for some 600 consumers' motors, the recalibration or changing of about 6,000 supply meters, and the changing of approximately 130,000 lamps in districts where the supply on the old system was at 100 V.

The cables employed throughout for both the e.h.p. and l.p. systems, involving some 60 miles, were supplied by Messrs. British Insulated Cables, Ltd., and Messrs. Johnson & Phillips, Ltd. The transformers, including those employed at the works, were supplied by the Brush Electrical Engineering Co., Ltd., the English Electric Co., Ltd., the Hackbridge Electric Construction Co., Ltd., Messrs. Bruce Peebles & Co., Ltd., and Messrs. Johnson & Phillips, Ltd. The lay-out for the whole system was designed by the engineer and manager of the undertaking, Mr. P. G. Campling, A.M.I.E.E.

A Radio Crystal Detector Circuit.

The importance of correct arrangement is not always realised; a simple change of connections, the necessity for which is not apparent at first sight, often improves reception.

By THOMAS CARTER.

KNOWLEDGE, even considerable expert knowledge, of the behaviour of heavy electrical engineering plant is no sure and instinctive guide to a realisation of the way to arrange wireless-telephony apparatus in a circuit so that the best possible results shall be obtained. I found a fresh instance of this a little time ago, when by a simple change in connections, the necessity for which I was naturally the first to say I ought to have seen before, I succeeded in greatly improving reception where it had previously been bad when listening to headphones connected at the end of long extension wires. A wireless engineer of large practical experience and others interested in wireless work have agreed that, like me, they never before realised the importance of correctly arranging the circuit I was dealing with: and I certainly am not aware of any published reference to it. It may be that the right way is thought to be so obvious that the disadvantage of the wrong way is not worth mentioning; but evidently it is not altogther so, and the following notes may be of use to others.

My receiving set is about two miles and a quarter from the Newcastle (5NO) transmitting station; it works with a comparatively short inside aerial A and earth wire E, and consists merely of a variometer V, a crystal detector R, and terminals M and N for headphones T, all arranged, until recently, as shown in fig. 1. A link L was provided, when the set was first put together, to make it easy to try the effect of connecting a condenser in series with the aerial; by removing it and leaving its terminals unconnected, the aerial could be cut off entirely. Excellent results were obtained on several sets of headphones in parallel when the connections of fig. 1 were used, and no trouble of any kind was experienced until an attempt was made to carry extension wires for the headphones, as shown in fig. 2, from M and N to terminals P and Q in another part of the house, on the same ground-floor level as the room in which the detector and the variometer are fixed. The extension was taken across partly at ceiling height and partly along a chair-moulding on the wall about 3 ft. above the floor, and when it was in use nothing could be heard clearly at all because of a rushing noise in the headphones. The diagram shows that the wire MQ acts as a second aerial, connected to the proper aerial between L and V, and the noise was apparently an interference effect due to the presence of two dissimilar aerials, it being impossible to tune the set to suit both at once. The extension was not often required at first; when it was, the removal of the link L left only one aerial MQ, and moderately good reception could be obtained by altering the variometer setting; MQ, however, being at a fairly low level, necessarily gave distinctly poorer results than A, which extends to the top of the house. It afterwards became necessary to use the extension almost as often as not, and something had therefore to be done to improve reception at PQ, and at the same time to avoid the inconvenience of having frequently to take out and put in the link L and retune the circuit by altering V. It suddenly occurred to me (I hope it would have done so much earlier, had the need arisen) that interference between MQ and A could be got rid of by connecting R to the aerial side of V instead of to the earthed side, and, consequently, T to the earthed side instead of to the aerial side. The change from the arrangement shown in fig. 2 to that shown in fig. 3 was therefore made, and at once the results were as good at PQ as at MN, except that at PQ only there was a very slight, not at all disturbing, extraneous noise, due to the passage of MQ and NP near some of the electric light wires of the house, which are fed from an a.c. supply.

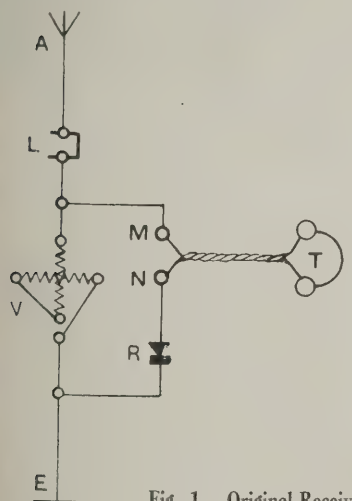

Fig. 1.—Original Receiving Circuit.

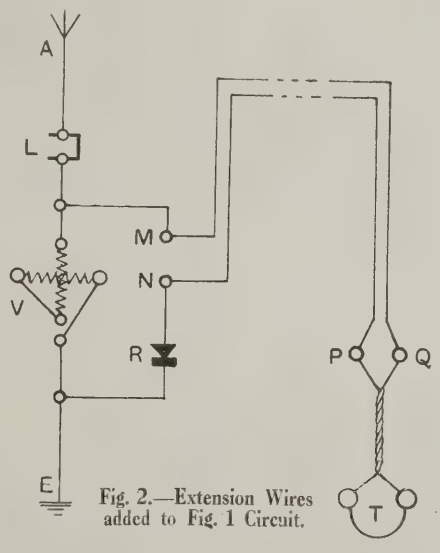

Fig. 2.—Extension Wires added to Fig. 1 Circuit.

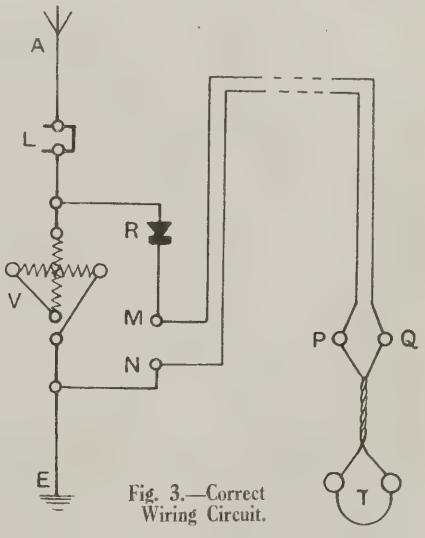

Fig. 3.—Correct Wiring Circuit.

Although I have never seen any previous reference to the matter, I do recollect reading advice to the effect that headphones should be connected to the earthed end of the aerial circuit, because the capacity of the listener's body may tend to spoil reception in some way, even with a crystal circuit. Whether or not this is likely, I do not know; I have not come across any such result to a noticeable degree; but, for what is presumably the much more important reason my recent experience has made me aware of, headphones should certainly be connected to the earthed end of the circuit if there is any likelihood that extension wires may be used. So everything points to the usefulness of adopting the connections of fig. 3, which are always safe, in preference to those of fig. 2, which, in some circumstances quite likely to occur, may lead to annoyingly imperfect reception.

Standard Performances for Electrical Machinery.

A critical review and some observations on Specifications Nos. 169 and 226, dealing with the working requirements of motors and generators, of the British Engineering Standards Association.

By F. T CHAPMAN, D.Sc.

A USER who has purchased an electrical machine will generally expect from it a certain definite performance. At the same time he will desire to obtain this performance at an annual cost which approaches the minimum, although he can rarely afford to lay out sufficient capital actually to reach that figure. The annual cost depends, on the one hand, on the efficiency of the machine and, on the other, on the rate of deterioration or on the natural life of various parts of the machine, under working conditions.

The output obtainable from a given machine is limited only by its powers of endurance in certain directions (if we except very small machines), but beyond a fairly definite point the rate of depreciation is so high that the service rendered by the machine becomes unduly expensive. The deterioration which occurs is due mainly to the gradual destruction of the insulation through its exposure to high temperature, but sparking at commutators and mechanical deterioration must also be guarded against.

It is known that if ordinary fibrous insulating materials be subjected to temperatures of the order of 150 deg. C. they deteriorate very rapidly, whereas if their working temperature does not exceed 50 deg. C. their life, under otherwise favourable conditions, will be indefinitely long. Between these two limits the working temperature and duration of life will be connected by some inverse relation of an indefinite and unknown character, and there is clearly scope for wide differences of opinion as to the optimum temperature in any given case.

In order to ensure for his machine a reasonably long life, the purchaser or his adviser usually specifies the results which must be obtained from a test or series of tests which are carried out before its acceptance. At one time the specifications adopted by various prominent authorities differed from each other in important details. The manufacturer could not produce a set of machine designs to be made up wholly, or in part, from stock, in the certainty that they would meet the requirements of the majority of his prospective customers, so for his standard designs he adopted a specification which he regarded as sound in itself and as likely to commend itself at any rate to a large proportion of buyers.

While insulating materials and the methods of employing them were in the process of development, and while little was as yet known of the powers of resistance to higher temperatures which the materials possessed, very conservative figures for the limits of temperature rise were adopted in some cases, such as 35 deg. C., for instance.

Insulating materials were rapidly improved, however, better methods of applying them and of handling them were adopted, and research indicated that they could withstand considerably higher temperatures than had been allowed hitherto. But the actual safe temperature remained a matter of opinion and, as this changed, the position in regard to specifications became more difficult than before, until, in 1915, an authoritative pronouncement was made in the "Standardisation Rules" (No. 72) issued by the British Engineering Standards Committee, as this body was then called. These rules embodied the opinions of a large number of representative men, and they said, in effect, that if certain working temperatures were not exceeded, with certain specified types of insulating materials, a satisfactory economic length of life could be depended on. They also stated the maximum temperature of the surroundings in which a machine would be normally employed, and so by difference they obtained the temperature rise which was compatible with a reasonably long working life.

These temperature limits met with very general acceptance by those concerned, but the wide adoption of improved methods of measuring temperatures in large machines by means of embedded temperature detectors, and some other matters, have made a further revision necessary, especially as in one respect the Rules ran counter to established practice. They contemplated only two test ratings: (*a*) a continuous rating, whereby a machine was rated according to the output it could maintain continuously without its temperature exceeding the specified limit; this is widely accepted abroad, and its simplicity is a strong recommendation for it, and (*b*) a short-time rating.

Previous to the issue of these Rules there had come into wide use in this country a rating which involved an appreciably lower temperature rise, and permitted an overload to be carried for a considerable time after the steady temperature due to the rated load had been reached, the final temperature remaining within the limits of safety. Thus, to take a definite example, a motor rated at 100 h.p. might be specified to give a temperature rise of 40 deg. C. when run continuously at that load, and a further rise of, say, 15 deg. C. when overloaded 25 per cent. for two hours immediately on the completion of the test at 100 h.p. In another form of specification the second temperature is not given definitely, but is defined as "safe." It cannot be seriously contended that this specification is a good one in itself, but it had acquired some vested interests, and the path of the British manufacturer was made somewhat easier when it turned the tables on Rules 72 and appeared in February, 1923, as the "British Standard Continuous Rating" in Specification No. 168, applicable to motors and generators of industrial sizes from 1 b.h.p. per 1,000 r.p.m. upwards. However, when specifications were prepared for large generators and motors (exceeding 2.5 b.h.p. per r.p.m.), the British Engineering Standards Association spoke with two voices and issued simultaneously at the end of 1925 two specifications, namely, No. 169 and No. 226. In the former the hazy "safe" overload is perpetuated while, according to the latter,

a machine is rated at a load which it will carry continuously with the maximum safe temperature rise. The existence of these two specifications is almost certain to lead to some confusion; we can imagine, for instance, a man responsible for the operation of a machine rated in accordance with No. 226 overloading it 25 per cent. for two hours, or until warned by unmistakable signs of distress, under the impression that No. 226 is the specification which permits overloads. And what about the foreign buyer? When he wants a 100-h.p. motor such as he buys elsewhere, the British manufacturer has no such standard machine to offer, but can supply a 110-h.p. machine British standard rated at 100 h.p. and very safe for two hours at 125 h.p. The British manufacturer has our sympathy in these circumstances, but the remedy is in his own hands—for the B.E.S.A. is his own instrument.

The purpose of standardisation in a case like this is to improve the economy of manufacture and thereby to cheapen the product, to the general benefit of the whole community. With some types of manufacture it is possible to standardise form and dimensions as well as performance, but the manufacture of electrical machinery has not yet reached that stage. The maker must design the machine and give it a rating, but a standard can be set for its performance at that rating, in certain particulars which are of fundamental importance to the purchaser as affecting the annual cost. The fundamental purpose of the standard specification of performance is to enable a very definite meaning to be assigned to the rating applied to a machine by the maker. It informs the purchaser, or, at any rate, it is intended that he should be informed, with some exactness what he may expect of the machine.

One of the items in the performance of the machine which is definitely standardised by the Association is the temperature rise. A purchaser who has read and understood the appropriate specification will realise that he will be unwise in working the machine in such a way that the temperature of any part of the insulation exceeds for any length of time a certain figure which he can deduce from the specification. For Class A insulation (impregnated fibrous materials, &c.), this limiting temperature for the hottest point appears to be 105 deg. C., and for Class B insulation (compound mica insulation, &c.) 125 deg. C.

The tables of permissible temperature rise at accessible points are based upon a cooling air temperature of 40 deg. C., and various differences between the temperatures measurable and those which may be expected to exist at the hottest points in the machine. The figures which have been taken have high authority behind them, and no exception can be taken to them. Armed with these tables of permissible temperature rise, the user of a machine may check its operation under working conditions and ascertain whether he is overloading it.

The questions arise: "Does it matter to the purchaser that his machine has been rated according to this specification or to that?" and: "Is more information conveyed by one than by another?"

Let us suppose that a user is contemplating the purchase of a machine which he will require to run for an ordinary type of working day extending over ten hours and to develop for the most part about 1,000 h.p., with two peaks of about one hour's duration at the commencement and at the middle of the day respectively, each running up to 1,100 h.p.

If only Specification No. 169 were in operation he might consider purchasing a machine rated at 1,000 h.p., which would run continuously at this load with a temperature rise not exceeding 40 deg. C. on a certain part, and would sustain a further load of 1,250 h.p. for two hours without exceeding the safe temperature. Such a machine would obviously not reach the maximum safe economical temperature when run under the desired conditions. Probably a cheaper machine rated at 950 h.p. according to this specification would fill the required rôle adequately.

On the other hand, he might consider purchasing a machine rated at 1,000 h.p. according to Specification No. 226 which, when run at 1,000 h.p. continuously and at this output, would attain a temperature rise of 55 deg C. This machine would obviously be too small, but a machine rated in this manner at 1,050 h.p. would probably be right.

So far as the information conveyed by the rating is concerned, it cannot be said that one specification is better for our hypothetical purchaser than the other, since his problem can only be solved by the aid of further information supplied by the manufacturer in either case; but the number of purchasers who will want machines to withstand 25 per cent. overload at the end of a day's work must be much smaller than that of those who want them to run continuously at a sensibly constant load. Specification No. 226, therefore, appears to have greater chances of straightforward application than No. 169, and it is both simpler and more direct.

The case for the specification permitting overloads, from the manufacturer's point of view, is that the standard frames which were in use before the issue of No. 226 were designed with an overload specification in view, and that they do not lend themselves to a well-graded set of ratings on the continuous basis. This argument, as applied to large machines, is not very strong, though it may be of some importance in the case of machines of smaller sizes coming within the range of operation of Specification No. 168, and it is clearly desirable from the point of view of the electrical community as a whole that as little unnecessary capital as possible should be sunk in alterations to standard frames upon the development of which large sums have been spent already. A policy of changing over to a continuous maximum rating as standard lines become obsolete appears to be the right one, each frame having two sets of ratings assigned to it in the meantime.

(To be continued.)

French Colliery Electrification.

Before a recent meeting of the French Society of Civil Engineers, M. Guerre, general director of the Courrieres Mining Company, discussed at some length the measures adopted for restoring the collieries in the Nord and the Pas de Calais which were devastated during the period of the great war. Except where some reason existed for preserving a few steam-power installations, he stated that the essential characteristic had been the general electrification of the pits. The electrical concessions had been unified on the basis of a 3-phase system at 45,000 volts, 50 periods, for transmission to a distance, 15,000 volts for the internal networks of the companies, and 3,000 volts for the distributing services. This had led to the establishment of steam power stations; that of the Lens mines at Pont-a-Vendin supplied 50,000 kW with a reserve of 10,000 kW; that at the Noeux mines furnished 16,000 kW, and this capacity was being doubled; the Beuvry station fed at 45,000 volts the Drocourt mines, the Société Electrique du Nord-Ouest, and the Compagnie Electrique du Nord, and at 15,000 volts the Noeux mines and the Société des Materiaux de Construction de la Loisne. Near the town of Harnes the Courrieres station was to be of a capacity of 80,000 kW, divided into eight turbo-alternator sets of 8,000-10,000 kW, five of the sets being already in operation. Installed at Sin-le-Noble the Aniche mines station was to be equipped with four sets of 10 000 kW and two sets of 5,000 kW, of which three sets and one set respectively were in service. Moreover, the old station of the Anzin mines had simply been reinstated pending the construction of a large new station. All the stations were equipped with most recent plant, permitting of a large saving in manual labour.

Electricity in Gasworks.

Electricity is produced as a by-product in gas manufacture at the Beckton works of the Gas Light and Coke Co. under a scheme which consists of taking heat from burnt producer gases which are exhausted into the atmosphere and using it to raise steam. The power so obtained is used to generate electricity at a power house in the works. In this way energy which would otherwise be wasted is made available for works' service. After 12 months' operation the scheme has proved extremely successful, and an additional 2,500-kW generating set for the power house has now been ordered from the Metropolitan-Vickers Co., which supplied the original equipment, says the *Financial Times*. When the extensions are completed the generating station will be capable of producing power sufficient to drive motor totalling well over 6,000 horse-power.

British Electrical and Allied Industries Research Association.

Annual Luncheon, and Report of the Council for 1925-26.

THE annual luncheon, in connection with the annual general meeting, of the B.E.A.I.R.A. was held at the Savoy Hotel, London, on Friday, February 11th, Mr. W. B. Woodhouse, the newly-elected president, being in the chair.

Proposing the toast of "The E.R.A.," Dr. W. H. Eccles, F.R.S., President of the Institution of Electrical Engineers, said that electrical engineering was the most exact and the most mathematical of all branches of engineering, and the safety factors in respect of the design of electrical plant were not comparable with the five or ten of the civil or the mechanical engineer. Therefore, it was appropriate that electrical engineering should have a closer touch with pure science, as the E.R.A. had, than any of the other engineering research associations. When they compared the standards of living to-day as between different countries, his observations had led him to the conclusion that the standard was higher in America and in Northern Italy, where the development of the use of electricity had been carried to a higher degree than in Great Britain. These comparisons suggested that we were not doing as much as we ought in this country with regard to research generally, or even in electrical research. In scientific discovery the British nation had always been most fertile, but we had been slow in working the inventions out; too many inventions were in use in this country to-day which had been purchased from abroad, but which had had their origin in this country. That arose from the fact that there was too little co-operation between pure and applied science. It should be the task of the E.R.A. to form some working liaison between the two. He did not expect industry to finance pure scientific research; that was a national matter, and more money ought to be spent by the nation than had been spent hitherto. Industry, however, should spend more money upon research for its own quick profit, but there must be co-operation between the two.

Mr. Ll. B. Atkinson, supporting the toast, after commenting in general terms upon the necessity for prosecuting research in order to cope with the evil of unemployment, spoke of the development of the research associations under the Government scheme and of the co-operation that had taken place between them and the universities, technical colleges, and manufacturers' research laboratories, as well as the National Physical Laboratory, which co-operation made it possible to call upon the services of the trained observers who were essential. He laid special stress upon the immense assistance the Association had had from the N.P.L. in connection with work laid out by committees of the Association, but carried out by the trained staffs at Teddington. One instance related to the problems of insulation, which were becoming increasingly important. The measurement of small electrical losses was an exceedingly important matter, and all kinds of reports had come in concerning it from all parts of the world. Until recently, however, there had been enormous uncertainties and inaccuracies, even as much as 50 per cent., and it had been the task of one of the committees of the E.R.A. to try, in conjunction with the N.P.L., to solve the problem. To-day, through the assistance of the N.P.L., a degree of certainty and accuracy in this matter had been reached which had not been achieved by any other association or research laboratory in the world. It was now known that three or four different methods could be used which would give absolutely coincident results instead of, as in the past, contradictory results. Further, the N.P.L. decided some time ago to put in plant for tests up to a pressure of one million volts. Nothing of that kind existed in this country, although it did in other countries. So far, perhaps, we had not felt handicapped, but the State had now taken upon itself the responsibility for a general distribution scheme which was going to involve pressures roughly four times as great as those generally used in this country, and it was absolutely necessary that manufacturers should have facilities for working to those higher pressures. This testing plant was in course of erection at the N.P.L., and when it was in full operation, manufacturers would have an instrument at their disposal the like of which existed in no other country, and which would give them a better technique than that which existed in any other part of the world. His point was that, as the State had accepted responsibility with regard to electricity supply and also for research, the opportunities should not be crippled by cutting down the financial assistance for the National Physical Laboratory. If he were right that in research there lay a flanking movement against unemployment, then the great research laboratory at Teddington, which belonged to the State, ought to be backed up to the uttermost by the State, instead of spending our funds on unemployment relief.

Mr. W. B. Woodhouse, replying to the toast, referred to the annual report of the Association, which stated that the Association was never in a stronger position, and that the result of the work it had done was to bring about a recognition that the important services it performed could not be obtained without the organisation of such a co-operative institution. That, however, did not at all mean that those connected with the Association were satisfied that it was working on the scale it should be. As the financial support grew, so could the work be extended. After a reference to some of the important researches which the Association had initiated, prominent among which was mentioned the heating of buried cables, attention was called to work to be done on switchgear. He supported Dr. Eccles's plea for such co-operation that immediately a difficulty was met or a discovery made, the men of science and the practical men should work together, because it was only by team work that rapid results could be achieved. If the funds of the Association could be increased tenfold, he was satisfied personally that the results would be increased more than tenfold. The Association was endeavouring to do what the Prince of Wales had mentioned at the dinner of the Institution of Electrical Engineers on the previous evening—namely, to "back up invention." This country had the talent and the men with the inventive brains, and the Association was there to back them up and get the result of their efforts into commercial use as rapidly as possible. A point mentioned in the foreword to the annual report by the chairman of Council, Mr. Everest, was that the Association was entitled to look for support from all interests throughout the Empire which participated in the results directly or indirectly. He personally wished to emphasise that this was the British Electrical Research Association; it might more properly be called "the British Empire Research Association," and co-operation on the part of the Dominions overseas would be welcomed. It would be inefficient and uneconomical at the moment to set up small research associations in the Colonies, and therefore he looked for greater support for the Association from the Dominions.

Mr. A. R. Everest briefly proposed the toast of "The President," which Mr. Woodhouse acknowledged.

Annual Report.

The sixth annual report of the Council to the Association, for the year ended September 30th, 1926, was presented to the annual general meeting on Friday last week. It states that the year was one of great activity, following upon the stimulus given by the favourable report of the Committee of Investigation which examined the work of the first five years. Special attention is drawn to work on insulating materials and electric control apparatus. The former has resulted in the preparation of a number of proposals for standard purchasing specifications in a field in which this class of work was urgently required. Investigations into the nature of the breakdown of insulation and methods of measurement of the properties which are essential in good insulation now show great promise, substantial contributions to knowledge and technique having been made during the year.

The researches on electric circuit breakers have yielded a number of reports, not yet ripe for the use of members, which, however, establish a number of new facts of great importance, the industrial applications of which have been made the subject of further applications for patents. One series of experiments is especially notable as showing a remarkable reduction in the energy released and corresponding stresses on opening heavy circuits by the use of devices incorporating features of design based on the discoveries made.

With the limited funds at disposal it is impossible to materially extend the field covered, but in the expectation of further support from interested sections of the industry, preliminary work has been put in hand for the improvement of magnetic materials and work which should prove of value to the radio industry.

The Association was never in a stronger position. Its aims and objects are now better understood, the success of its

methods is beginning to be recognised, and it is realised that the important services it performs could not be obtained without the organisation of such a co-operative institution.

The financial support promised and in sight is now adequate to meet the bare requirements of the minimum scale of working. Nevertheless, to keep the work within the limitations of the present income it has been necessary to defer many promising programmes indefinitely, and in view of the diminishing scale of contributions made by the Department of Scientific and Industrial Research, it is recognised that efforts to increase the Association's income must be actively continued if the present restricted scale of operations is to be maintained. Those in closest touch with the work are best able to appreciate the great possibilities of the future and the great advantages which will accrue to the industry when the Association is able to extend its operations in the present fields and open up hitherto untrod paths to progress.

Progress has been made in the study of the breakdown of electrical insulation from the standpoint of pure physics. A committee has been formed to deal with the properties of dielectrics at radio frequencies, and a report on the thermal resistivity of dielectrics has been issued. The researches on insulating papers, varnishes, and filling compounds have enabled purchasing specifications to be drafted, covering the factors of importance. The effect of oil on hard composite dielectrics, and tests on synthetic resins, have been the subjects of reports published during the year, and the work necessary for the revision of the B.E.S.A. specification for the purchase of insulating oils has been completed; the previous work of the E.R.A. has made it possible to raise the standards materially.

The results of dielectric loss measurements on cables have been analysed at the National Physical Laboratory, with a view to the elimination of discrepancies; and experimental work on pole foundations has been carried on. Investigations conducted at the Carville power station on oil switches and circuit breakers have explained large variations observed in previous tests; the results obtained have already revealed errors in current practice, and now point the way to new methods of circuit-breaking. Experimental designs of a simple nature have been developed in which the energy released on breaking circuit under the severest conditions obtainable at Carville has been definitely reduced about 7 : 1. The methods now being experimentally developed show promise, therefore, not only of marked increase in the rupturing capacity applicable to the heaviest source, but of a degree of control of commercial performance far in advance of anything hitherto attained.

Researches on steam condenser tubes and steam turbines have been carried on in co-operation respectively with the Institute of Metals and the Institution of Mechanical Engineers. Other investigations deal with magnet steel, instrument springs, die-casting, &c.

There are 15 sectional committees and 50 sub-committees and panels, supervising the various investigations, and over 50 Government departments, engineering institutions, research associations, universities and colleges, and companies have co-operated in the work.

Reviews.

Successful Crystal and One-Valve Circuits.—By J. H. Watkins. Pp. xi+104; figs. 86. London: Sir Isaac Pitman & Sons, Ltd. Price, 3s. 6d. net.

Sixty circuits are described, all of which, with one or two exceptions, can be made up for an expenditure of about five pounds. Constructional drawings are not given, but the circuit diagrams and explanations should enable the average amateur experimenter to make up any of the sets.

By confining himself to crystal and one-valve circuits, the author is able to deal simply with the principles of all the latest arrangements which usually appear to be very complicated, mainly through the multiplication of valves, and this, we think, is the aspect of the book which may make it useful to amateurs who would otherwise be discouraged at the start from tackling many of the latest circuits.

Mr. Watkins has devoted very little space to fundamental theory, and the novice would do well to commence by reading up some fuller introduction to the subject. We do not feel able to recommend this book to our readers.

Electrical Technology.. By H. Cotton, M.Sc. London: Sir Isaac Pitman & Sons, Ltd.

This work was issued in eight weekly parts from October 23rd, 1926 (price 1s. each), and is written in two sections, Direct Current and Alternating Current, with an introduction dealing with the fundamental units. It is intended primarily for the aid of the electrical student in the preparation for examinations, but judging from the synopsis of the chapters and the first weekly part of the book, it is of a nature which should be of considerable assistance to the practical student. In chapter I, The Magnetic Circuit, for instance, in which are given the usual text-book magnetisation curves and calculations, is described and illustrated a heavy-type electro-magnet used for the lifting of irregular scrap. Chapter III opens the work on d.c. machines and deals immediately with the constructional features of the machines and their parts; this will probably appeal to many practical students who often find themselves at sea when "diving" into a highly-mathematical text book for some information wanted hurriedly. Other chapters which should prove of particular interest are: Chapter X, Illumination; Chapter XXIII, Phase Advancing; and Chapter XXV, Electrical Oscillations. According to a preface by Mr. Cotton, the last-mentioned chapter is the exception in the book, in that advanced mathematics are used, differential equations being necessary.

We understand that if the idea of publishing the book in weekly parts has met with sufficient response, the publishers will issue other text books in a similar form.

The Theory of Electricity. By G. H. Livens, M.A. 2nd Edition. Pp. 427; figs. 46. London: Cambridge University Press. Price, 16s. net.
